Ans. The three quantities are : (*i*) magnetic declinatio (*ii*) angle of dip and (*iii*) horizontal component of earth magnetic field.

Q. 4.08. Define declination at a place. *(H.S.S.C.E. 200*

Ans. Declination at a place is the angle between th geographic and magnetic meridian.

Q. 4.09. At a certain location in Africa, a compas needle points 15° west of the geographic north. What is th angle of declination at that point ? *(H.S.S.C.E. 199*

Ans. The declination, θ = 15°west of the geograph north.

Q. 4.10. How does the knowledge of declination at place help in navigation ? *(H.S.S.C.E. 1999*

Ans. Declination at a place is the angle between th geographic and magnetic meridians. By knowing th declination, the ship can be steered in the required directio so as to reach the destination.

Q. 4.11. A small magnet is pivoted to move freely in th magnetic meridian. At what place on the earth's surfac will the magnet be vertical ? *(C.B.S.E. 199*

Ans. At the magnetic poles of the earth.

Q. 4.12. What would be the direction of a compas needle, when placed exactly at the geo-magnetic north pol *(C.B.S.E. 1998*

Ans. It will stand vertical with its north pole downwar and south pole upwards.

Q. 4.13. Which direction would a compass point to, located right on the geomagnetic north or south pole ? *(C.B.S.E. 2000 ; Text Questio*

Ans. The magnetic compass needle can point in an direction on the geomagnetic north or south pole. It because, horizontal component of earth's field is zero at thes points. (The earth's field is vertical).

Q. 4.14. Define angle of dip at a given place ? *(H.S.S.C.E. 2002, 199*

Ans. Dip at a place is the angle made by the directio of earth's total magnetic field with the horizontal directio

Q. 4.15. What is the value of angle of dip at any plac situated on the magnetic equator of the earth ? *(H.S.S.C.E. 1999 ; C.B.S.E. 199*

Ans. It is 0°.

Q. 4.16. The angle of dip at a location in southern India is about 18°. Would you expect a greater or lesser dip angle in Britain ? *(Text Question)*

Ans. Britain is close to the magnetic north pole. Therefore, angle of dip is greater in Britain than in India. It is about 70°.

Q. 4.17. What is the expected value of dip at the magnetic poles of the earth ? *(H.P.S.S.C.E. 2000)*

Or

What is the maximum value of angle of dip ? At what places, does it occur ?

Ans. It is 90°. The magnet becomes vertical ($\delta = 90°$) at both the magnetic north and south poles.

Q. 4.18. Define neutral point in the magnetic field of a bar magnet. *(P.S.S.C.E. 2002, 1999)*

Ans. Refer to section 4.03.

Q. 4.19. It is found that the neutral points lie along the axis of a magnet placed on a table. What is the orientation of the magnet w.r.t. the earth's magnetic field ? *(I.I.T. 1976, 1974)*

Ans. The neutral points lie along the axis of the magnet ; when the magnet is placed along magnetic N-S line, with its north pole towards the south of the earth.

Q. 4.20. A magnet is placed with its north pole towards north of the earth. Predict the position of the neutral points.

Ans. On equitorial line of the magnet.

Q. 4.21. A magnet is placed with its north pole towards south of the earth. Predict the position of the neutral points.

Ans. On axial line of the magnet.

Q. 4.22. What is the principle of tangent galvanometer?

Ans. It is based on tangent law.

Q. 4.23. Write the mathematical form of tangent law in magnetism. *(H.S.S.C.E. 2002, 1994)*

Ans. $B = B_H \tan\theta$

Q. 4.24. State tangent law in magnetism. *(P.S.S.C.E. 2002 ; C.B.S.E. 2000 ; H.S.S.C.E. 1998)*

Ans. If a small bar magnet is suspended in two mutually perpendicular uniform magnetic fields $\vec{B}$ and $\vec{B}_H$, such that it comes to rest making an angle θ with the direction of field $\vec{B}_H$, then $B = B_H \tan\theta$

Q. 4.25. Define reduction factor of a tangent galvanometer. *(C.B.S.E. 2001)*

Ans. *The reduction factor of a tangent galvanometer is numerically equal to the current (in ampere) through the galvanometer, which produces a deflection of 45°, when the plane of its coil lies in the magnetic meridian.*

Q. 4.26. What is the principle of a vibration magnetometer ?

Ans. When a bar magnet freely suspended in earth's magnetic field is displaced from its equilibrium position, it executes simple harmonic motion.

Q. 4.27. Enumerate the factors on which the time of vibrations depends in a vibration magnetometer. *(I.S.C.E. 1995)*

Ans. The time period of vibration in a vibration a magnetometer depends on *(i)* the moment of inertia of the bar magnet, *(ii)* its magnetic moment and *(iii)* the horizontal component of earth's magnetic field.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 4.01. What is the probable cause of earth's magnetism ? *(P.S.S.C.E. 2002, 2000, 1999 ; H.P.S.S.C.E. 1997)*

Ans. The exact cause of earth's magnetism is not yet known. It must be basically due to magnetic effect of currents. Earth rotates about its axis of rotation. Since every substance is made of charged particle, the rotating earth is equivalent to circulating current and it gives rise to earth's magnetism.

Q. 4.02. Define three independent quantities conventionally used to specify the earth's magnetic field at a point. *(H.P.S.S.C.E. 1999 S)*

Or

Name and define the three magnetic elements at a place. *(P.S.S.C.E. 1997, 1992 ; C.B.S.E. 1991)*

Or

What are the parameters of earth's magnetic field ? Define each. *(P.S.S.C.E. 1999, 1993)*

Ans. Three magnetic elements are : declination, dip and horizontal components of earth's magnetic field.

For definitions, refer to section 4.02.

Q. 4.03. A magnetic needle is placed on a cork floating on a still lake in the northern hemisphere. Does this needle together with the cork move towards the north of the lake ? *(I.I.T. 1973)*

Ans. The magnetic needle does not experience any net force and hence the needle together with the cork will not move towards the north of the lake. However, if the needle is inclined to the magnetic meridian, a torque will act on the needle and after a few oscillations, the needle will set itself along the magnetic meridian.

Also refer to chapter 3 (Magnetic dipole)-conceptual SAQ 3.07.

Q. 4.04. Define angle of dip. Deduce the relation connecting angle of dip and horizontal component of components of earth's magnetic field. *(C.B.S.E. 2002)*

Ans. *The angle of dip at a place is defined as the angle made by the direction of the earth's total magnetic field with the horizontal direction.*

For the derivation of relation between δ and B_H, refer to section 4.02.

Q. 4.05. Define the terms magnetic inclination and horizontal component of earth's magnetic field at a place. Establish the relationship between the two with the help of a diagram. *(C.B.S.E. 1998)*

Ans. Refer to section 4.02.

Q. 4.06. Define the term angle of dip. Derive the relation between angle of dip and the resultant magnetic field of earth at a place. *(C.B.S.E. 2001)*

Ans. Refer to section 4.02.

Q. 4.07. Horizontal and vertical components of earth's magnetic field at a place are 0·22 tesla and 0·38 tesla respectively. Find the resultant intensity of earth's magnetic field. *(H.S.S.C.E. 1995)*

Ans. Here, $B_H = 0{\cdot}22$ T ; $B_V = 0{\cdot}38$ T

Now,
$$B = \sqrt{B_H^2 + B_V^2}$$
$$= \sqrt{(0\cdot 22)^2 + (0\cdot 38)^2} = \sqrt{0\cdot 1928} = \mathbf{0{\cdot}44\ T}$$

Q. 4.08. Horizontal components and vertical component of earth's magnetic field at a place are equal. What is the angle of dip at this place ?

(H.S.S.C.E. 2002 ; C.B.S.E. 2000, 1999, 1997)

Or

The ratio of vertical component to the horizontal component of earth's magnetic field at a given place is 1. What is the angle of dip at that place ?

(C.B.S.E. 1998 S)

Ans. Here, $B_V = B_H$

Now, $\tan\delta = \frac{B_V}{B_H} = 1$ or $\delta = 45°$

Q. 4.09. Horizontal component of earth's magnetic field at a place is $\sqrt{3}$ times the vertical component. What is the value of angle of dip at this place ? *(C.B.S.E. 1997)*

Ans. Here, $B_H = \sqrt{3}\, B_V$

Now, $\tan\delta = \frac{B_V}{B_H} = \frac{B_V}{\sqrt{3}\, B_V} = \frac{1}{\sqrt{3}}$ or $\delta = 30°$

Q. 4.10. The ratio of the horizontal component to the resultant magnetic field of earth at a given place is $\frac{1}{\sqrt{2}}$. What is the angle of dip at that place ? *(C.B.S.E. 1998 S)*

Ans. Here, $\frac{B_H}{B} = \frac{1}{\sqrt{2}}$

Now, $\cos\delta = \frac{B_H}{B} = \frac{1}{\sqrt{2}}$ or $\delta = 45°$

Q. 4.11. The horizontal component of earth's magnetic field at a place is $0{\cdot}3 \times 10^{-4}$ T. If the angle of dip is 60°, what is the total earth's magnetic field ? *(H.S.S.C.E. 2001, 1992,)*

Ans. Here, $\delta = 60°$; $B_H = 0{\cdot}3 \times 10^{-4}$ T

Now, $B_H = B\cos\delta$

or $$B = \frac{B_H}{\cos\delta} = \frac{0{\cdot}3 \times 10^{-4}}{\cos 60°} = \frac{0{\cdot}3 \times 10^{-4}}{0{\cdot}5}$$
$$= 0{\cdot}6 \times 10^{-4}\ \text{T}$$

Q. 4.12. The horizontal component of earth's magnetic field is 0·2 gauss and total magnetic field is 0·4 gauss. Find angle of dip. *(H.S.S.C.E. 1996)*

Ans. Here, $B_H = 0{\cdot}2$ G ; $B = 0{\cdot}4$ G

Now, $B_H = B\cos\delta$

or $\cos\delta = \frac{B_H}{B} = \frac{0{\cdot}2}{0{\cdot}4} = 0{\cdot}5$ or $\delta = 60°$

Q. 4.13. If a compass needle be placed on the magnetic north pole of the earth, then how does it behave ? If a dip needle be placed at the same place, then what will be its behaviour ?

Ans. A compass needle is free to rotate in horizontal plane, while a dip needle can freely rotate in vertical plane.

The earth has only vertical component of its magnetic field at the magnetic poles. The vertical component of earth's field will exert torque on the magnetic needle so as to align it along its direction. As the compass needle can not rotate in vertical plane, it will rest horizontally, when placed on the magnetic north pole of the earth. On the other hand, the dip needle will come to rest along vertical.

Q. 4.14. Define dip and tangent law in magnetism.

(H.S.S.C.E. 1993)

Ans. For dip, refer to section 4.02 and for tangent law, refer to section 4.04.

Q. 4.15. State tangent law in magnetism. Which are t two required magnetic fields in a tangent galvanometer

(P.S.S.C.E. 1999 S, 199

Ans. For statement of tangent law, refer to section 4.0

One of the two required magnetic fields in a tange galvanometer is the field produced by the coil of t galvanometer on passing current and the other is t horizontal component of earth's magnetic field.

Q. 4.16. Why do we set the coil of tangent galvanomet in the magnetic meridian ? How is accuracy of adjustme tested ? *(C.B.S.E. 1999*

Ans. A tangent galvanometer is based on tangent la The magnet in the magnetometer box has to be placed in tw uniform mutually perpendicular magnetic fields. So that t magnetic field produced on passing current through the c of the galvanometer is perpendicular to the horizont component of earth's magnetic field, the coil is set in magne meridian.

The accuracy of the setting of the galvanometer can tested by rotating the coil through exactly 90° and th passing current through it. In case, the setting was accura the galvanometer will not show any deflection on passi current.

Q. 4.17. State the working principle of a tange galvano-meter. Write the mathematical expression f measuring currents using the tangent galvanometer.

(C.B.S.E. 199

Ans. It is based on tangent law in magnetism. F statement of principle, refer to section 2.04.

The current measured by using a tangent galvanomet is given by

$$I = K\tan\theta,$$

where $K = \frac{B_H}{G} = \frac{2a}{n\mu_0} B_H$ is called reduction factor.

Q. 4.18. State two factors by which a tangent galvan meter can be made more sensitive. Why is a tange galvanometer not considered to be practically a very usef instrument ? *(C.B.S.E. 200*

Ans. The tangent galvanometer can be made mo sensitive by (*i*) increasing the number of turns of its coil a (*ii*) decreasing the radius of the coil.

In a tangent galvanometer deflection produced is n directly proportional to the current passed through it. Sin it can not measure current directly, it is not considered to practically a very useful instrument. A tangent galvanomet is usually used to detect the current in an electric circuit.

Q. 4.19. What is reduction factor of a tangent galvan meter ? Explain. *(H.S.S.C.E. 199*

Ans. Refer to section 4.05.

Q. 4.20. Two tangent galvanometers of the same radi of coils, have their number of turns in the ratio 2 : 3. Whi galvanometer has larger value of reduction factor ?

(C.B.S.E. 200

Ans. Let K_1 and K_2 be reduction factors of the tv tangent galvanometers having number of turns 2 n and 3 respectively. Then,

$$K_1 = \frac{2a}{(2n)\mu_0} B_H \quad \text{and} \quad K_2 = \frac{2a}{(3n)\mu_0} B$$

It follows that galvanometer having lesser number turns has larger value of reduction factor.

Q. 4.21. Deduce an expression for comparing the reduction factors of two tangent galvanometers, connected in series, showing mean deflections θ_1, θ_2 for a given current. *(C.B.S.E. 2001)*

Ans. Let K_1 and K_2 be reduction factors of the two galvanometers. Since the two galvanometers are connected in series, same current I will pass through them. Therefore,

$$I = K_1 \tan\theta_1 \quad \text{and} \quad I = K_2 \tan\theta_2$$

Thus, $K_1 \tan\theta_1 = K_2 \tan\theta_2$ or $\dfrac{K_1}{K_2} = \dfrac{\tan\theta_2}{\tan\theta_1}$

Q. 4.22. Give three advantages of a moving coil galvanometer over the tangent galvanometer. *(P.S.S.C.E. 1999 S)*

Ans. 1. In a moving coil galvanometer, the deflection produced is directly proportional to the amount of current passed through it.

2. A moving coil galvanometer does not require any particular setting. The coil of a tangent galvanometer has to be set in magnetic meridian.

3. The magnetic field produced by the coil of tangent galvanometer is not uniform over the whole length of the small magnet of the magnetometer box.

Q. 4.23. A magnet makes angular oscillations in a horizontal plane with time periods T_1 and T_2 at two places, where the horizontal components of earth's magnetic field are B_H and B'_H respectively. Deduce an expression to compare the horizontal components at the two places. *(C.B.S.E. 2001)*

Ans. Let M be magnetic moment and I be moment of inertia of the magnet.

Then, $T_1 = 2\pi\sqrt{\dfrac{I}{M B_H}}$ and $T_2 = 2\pi\sqrt{\dfrac{I}{M B_H'}}$

$\therefore$ $\dfrac{T_1}{T_2} = \sqrt{\dfrac{B_H'}{B_H}}$ or $\dfrac{B_H}{B_H'} = \dfrac{T_2^2}{T_1^2}$

abc TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For **a**mbitious, **b**rilliant & **c**urious Students

Q. 4.01. If you made a map of magnetic field lines at Melbourne in Australia, would the lines seem to go into the ground or come out of the ground ? *(Text Question)*

Ans. The magnetic field lines of earth would seem to come out of the ground. It is because, Melbourne (Australia) is in southern hemisphere.

Q. 4.02. The earth's core is known to contain iron. Yet geologists do not regard this as a source of earth's magnetism. Why ? *(Text Question)*

Ans. The molten iron is above its Curie temperature and hence it cannot retain magnetism.

Q. 4.03. The earth's field departs from its dipole shape substantially at large distances (greater than about 30,000 km). What agencies may be responsible for this distortion ? *(Text Question)*

Ans. At large distances, the earth's magnetic field gets modified by the field produced by the motion of ions in the earth's ionosphere.

Q. 4.04. The earth field, it is claimed, roughly approximates the field due to a dipole of magnetic moment 8×10^{22} J T^{-1} located at its centre. Check the order or magnitude of this number in some way. *(Text Question)*

Ans. The magnetic field at a point on equatorial line of the magnetic dipole (earth as magnetic dipole) is given by

$$B = \frac{\mu_0}{4\pi} \cdot \frac{M}{r^3}$$

Here, $M = 8 \times 10^{22}$ J T^{-1}

and $r = 6{\cdot}4 \times 10^6$ m (radius of earth)

$$\therefore \quad B = 10^{-7} \times \frac{8 \times 10^{22}}{(6{\cdot}4 \times 10^6)^3} = 0{\cdot}3 \times 10^{-4}\ \text{T} = 0{\cdot}3\ \text{G}$$

It is really of the order of the observed field of earth.

Q. 4.05. Interstellar space has an extremely weak magnetic field of the order of 10^{-12} T. Can such a weak field be of any significant consequence ? Explain. *(Text Question)*

Ans. A weak field of the order of 10^{-12} T can cause the charged particles to move along circular paths of very large radii. Over a small distance, we may not be able to notice the deflection in the path of the charged particles but over large interstellar distance, the deflection is quite noticeable.

Q. 4.06. The charged currents in the outer conducting regions of the earth's core are thought to be responsible for earth's magnetism. What might bethe 'battery' (*i.e.* the source of energy) to sustain these currents ? *(Text Question)*

Ans. A possible explanation can be the phenomenon of radioactivity.

Q. 4.07. The earth's magnetic field varies from point to point in space. Does it also change with time ? If so, on what time scale does it change appreciably ? *(Text Question)*

Ans. Yes, it changes with time. After a few hundred years, the earth's magnetic field undergoes an appreciable change.

Q. 4.08. The earth may have even reversed the direction of its field several times during its history of 4 to 5 billion years. How can geologists know about the earth's field in such distant past ? *(Text Question)*

Ans. Analysis of the rock magnetism (earth's magnetic field gets recorded in certain rocks during solidification, though weekly) offers clues to geomagnetic history.

Q. 4.09. A dip needle with a circular scale is mounted on a horizontal axis [Fig. 4.18]. How can the direction of the magnetic meridian be found with the help of this needle ?

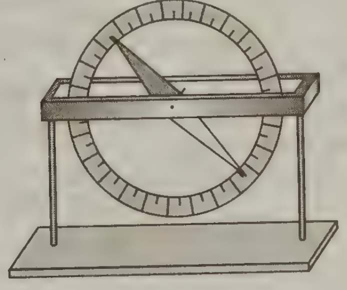

Fig. 4.18

Ans. Rotate the needle, till its take a vertical position. In this position, the two poles of the dip needle experience force due to the vertical component of the earth's magnetic field. The horizontal component of the earth's magnetic field exerts only a sideways pressure on the needle. In this position, the dip needle lies in a plane perpendicular to the magnetic meridian. If the needle is turned through 90° about a vertical axis, it will lie in magnetic meridian.

Q. 4.10. Geologists claim that besides the main magnetic N-S poles, there are several local poles on the earth's surface oriented in different directions. How is such a thing possible at all ? *(Text Question)*

Ans. The earth's magnetic field is only approximately a dipole field. The local N-S poles may be oriented due to the different deposits of magnetised minerals.

Q. 4.11. In order to keep the dip needle [refer to Fig. 4.19] in a horizontal position, a load of 0·01 gf is suspended from its top end. Find the magnitudes of the horizontal and vertical components of the intensity of earth's magnetic field. Given that the angle of dip is 40° and the pole strength of the dip needle is 0·98 A m.

Ans. Let m be pole strength of each pole of the dip needle and $2l$ be its length. The dip needle experiences a torque due to the vertical component of the earth magnetic field. The torque due to the load Mg suspended from its top end opposes the torque on the needle due to the vertical component of the earth's magnetic field [Fig. 4.19]. When the dip needle is horizontal,

$$m\,B_V \times 2l = Mg \times l$$

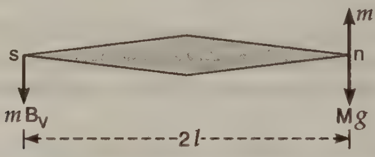

Fig. 4.19

or $$B_V = \frac{Mg}{2m}$$

Here $m = 0{\cdot}98$ A m

$Mg = 0{\cdot}01$ gf $= 0{\cdot}01 \times 980 \times 10^{-5}$ N ;

$$\therefore \quad B_V = \frac{0{\cdot}01 \times 980 \times 10^{-5}}{2 \times 0{\cdot}98} = 5 \times 10^{-5}\ \text{T}$$

Since angle of dip, $\delta = 40°$, the horizontal component earth's magnetic field is given by

$$B_H = \frac{B_V}{\tan\delta} = \frac{5\times10^{-5}}{\tan 40°} = \frac{5\times10^{-5}}{0{\cdot}8391} = 5{\cdot}96 \times 10^{-5}\ \text{T}$$

Q. 4.12. How many neutral points on a horizont board are there and why, when a magnet is hel vertically on the board ? *(I.I.T. 198*

Ans. Consider a magnet NS placed vertically on a hor zontal board as shown in Fig. 4.20. The neutral point on th horizontal board will be obtained, where the component

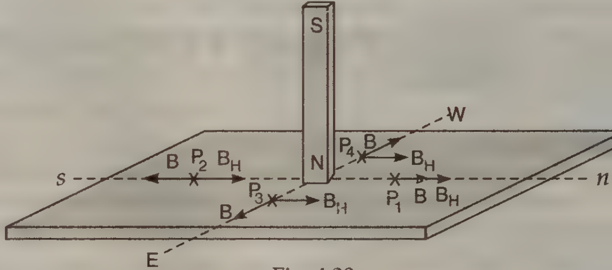

Fig. 4.20

magnetic field (B) due to magnet in the plane of board neutralised by the horizontal component of earth's magnet field (B_H). The directions of magnetic fields B and B_H hav been shown at four points P_1, P_2, P_3 and P_4. It follows th the two fields can balance each other only at point P Therefore, when a magnet is placed vertically on a horizont board, only one neutral point will be obtained.

FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Explain the possible causes of earth's magnetic field. *(P.S.S.C.E. 1998 S)*
2. Define parameters of earth's magnetic field. *(P.S.S.C.E. 2000)*
3. Explain the three magnetic elements of earth at a place. *(H.S.S.C.E. 2002)*
4. Define magnetic elements of earth's magnetic field at a place. *(P.S.S.C.E. 2000)*
5. Explain the terms : (*i*) Declination, (*ii*) Dip and (*iii*) the magnetic field due to earth at a point.
6. Explain briefly magnetic elements. *(P.S.S.C.E. 1991)*
7. What are the elements of the earth's magnetic field ? Explain them briefly. *(Pre-degree Kerala, 1994 ; P.S.S.C.E. 1993)*
8. Name the elements of earth's magnetic field at a place. Explain their meaning. *(C.B.S.E. 1995)*
9. Derive tangent law in magnetism. *(H.S.S.C.E. 1996 ; Karnataka, 1988)*
10. State and prove tangent law in magnetism. *(P.S.S.C.E. 2001, 2000, 1999 ; H.S.S.C.E. 2001, 1998 S, 199 (H.P.S.S.C.E. 199*
11. Describe the working of a tangent galvanometer. Defi its reduction factor. *(H.S.S.C.E. 200*
12. State the underlying principle of a tangent galvanomet Write briefly, how it can be used to determine th horizontal component of earth's magnetic field at a give place. *(C.B.S.E. 1998*
13. Describe the use of a vibration magnetometer for com paring magnetic moments of two bar magnets of same si and mass. *(C.B.S.E. 1998 ,199*
14. Explain, how can magnetic moments of two unequ magnets be compared with the help of vibratio magnetometer. *(C.B.S.E. 1996 ; H.S.S.C.E. 199*
15. How will you compare the magnetic moments of two b magnets of equal size using a vibration magnetometer *(H.S.S.C.E. 200*
16. Describe, how the horizontal components of earth magnetic field at two places may be compared by using vibration magnetometer. *(C.B.S.E. 199*

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. (*a*) Explain the three magnetic elements of earth's magnetic field at a place.
(*b*) What are the possible causes of Earth's magnetism ? Explain. (*P.S.S.C.E. 2001*)
2. Define neutral point. How will you find the magnetic moment of a bar magnet by locating its neutral point, when magnet is placed with its north pole towards (*a*) north pole of the earth and (*b*) south pole of the earth ?
3. Explain the principle, construction and theory of tangent galvanometer. (*P.S.S.C.E. 1999, 1998 S, 1993 ; H.S.S.C.E. 1999 S ; C.B.S.E. 1993*)
4. With the help of a diagram, explain the principle and working of a tangent galvanometer. (*C.B.S.E. 1996*)
5. Explain the construction, principle and theory of tangent galvanometer. State its merits also. (*P.S.S.C.E. 2000*)
6. Describe with the necessary theory, the working of a tangent galvanometer. How is it used for the measurement of current ? (*Pre-degree Kerala, 1991*)
7. Describe the principle and construction of a deflection magnetometer. How will you compare the magnetic moments of two equal bar magnets by placing the deflection magnetometer in end-on position.
8. Describe the principle and construction of a deflection magnetometer. How will you compare the magnetic moment of two equal bar magnets by placing the deflection magnetometer in broad side-on position.
9. Describe briefly the principle, construction and theory of a vibration magnetometer. (*I.S.C.E. 1994*)
10. State and derive tangent law in magnetism. Describe giving relevant formulae, how you will determine the magnetic moment (M) of a magnet and the horizontal component (B_H) of the earth's magnetic field using deflection and vibration magnetometers. (*H.S.S.C.E. 1995*)

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Magnetic elements

1. A ship is sailing due west according to a Mariner's compass. If the declination of that place is 18° east of north, what is the true direction of the ship ? [**Ans.** 72° west of north]
2. The vertical and horizontal components of earth's magnetic field at a place are 0·2 G and 0·3464 G respectively. Calculate the angle of dip and earth's magnetic field at that place. [**Ans.** 30°, 0·4 G]
3. At 52° from the magnetic meridian, a magnetic needle in a vertical plane makes an angle of 45° with the horizontal plane. Find the actual angle of dip at that place. [**Ans.** 31·62°]
4. A dip circle is so set that it moves freely in the magnetic meridian and shows angle of dip equal to 45°. Now the dip circle is rotated through 30°. What value of dip, will the needle show now ? (*Roorkee, 1983*) [**Ans.** 49·1°]

Type B. On Neutral points

5. A small bar magnet has a magnetic moment 5 A m^2. The neutral point is obtained on axial line, when it is placed in magnetic meridian with its north pole pointing south of earth and neutral point is obtained on equitorial line, when it is placed with its north pole pointing north of earth. If horizontal component of earth's field is 0·38 G, find the position of neutral points in two cases. [**Ans.** 29·7 cm, 23·6 cm]
6. A short bar magnet is placed in a horizontal plane with its axis in the magnetic meridian. Null points are found on its equitorial line (*i.e.* its normal bisector) at 12·5 cm from the centre of the magnet. The earth's magnetic field at the place is 0·38 G and the angle of dip is zero.
(*a*) What is the total magnetic field at points on the axis of the magnet located at the same distance (12·5 cm) as the null-points from the centre ?
(*b*) Locate the null-points, when the bar is turned around by 180°.
Assume that the length of the magnet is negligible as compared to the distance of the null-points from the centre of the magnet. [**Ans.** (*a*) 1·14 G ; (*b*) 15·7 cm]
7. A short bar magnet placed in a horizontal plane has its axis aligned along the magnetic north-south direction. Null points are found on the axis of the magnet at 14 cm from the centre of the magnet. The earth's magnetic field at the place is 0·36 G and the angle of dip is zero. What is the total magnetic field on the normal bisector of the magnet at the same distance as the null points (*i.e.* 14 cm) from the centre of the magnet ? (*Text Problem*) [**Ans.** 0·54 G]
8. If the bar magnet in problem no. 7 is turned around by 180°, where will the new null points be located ? (*Text Problem*) [**Ans.** 11·1 cm]

Type C. On Tangent law and Tangent galvanometer

9. In a tangent galvanometer, when a current of 10 mA is passed, the deflection is 31°. By what percentage, the current has to be increased, so as to produce a deflection of 42°. [**Ans.** 50%]
10. A 2 turn coil of radius 10 cm is placed with its plane in the magnetic meridian. A small magnetic needle is suspended at the centre of the coil by a torsion free silk thread. On passing a current through the coil, the needle is deflected through 45°. Calculate the strength of the current, if the horizontal component of the earth's magnetic field at the location is 1·6 × 10^{-5} T.
Given, $\mu_0 = 4\,\pi \times 10^{-7}$ T m A^{-1}. (*I.S.C.E. 1993*) [**Ans.** 1·273 A]
11. A tangent galvanometer with a coil of 35 turns and mean radius 11 cm is used at a place, where horizontal component of earth's magnetic field, $B_H = 0{\cdot}32$ gauss. When a current is passed through the galvanometer, the deflection is 35°. Calculate the current. [**Ans.** 0·112 A]
12. A circular coil of radius 20 cm and 20 turns of wire is mounted vertically with its plane in magnetic meridian. A small magnetic needle is placed at the centre of this coil and it is deflected through 45°, when a current is passed through the coil. Calculate current in the coil, if H = 0·34 × 10^{-4} T. (*I.I.T. 1983*) [**Ans.** 0·54 A]
13. The coil in a tangent galvanometer is 16 cm in radius. Find the number of turns of the wire that should be wound on it, if a current of 40 mA is to produce a deflection of 45°. Horizontal component of earth's magnetic field = 0 · 36 × 10^{-4} T. (*C.B.S.E. 2001 S*) [**Ans.** 229]
14. The radius of a tangent galvanometer is 16 cm. Find the number of turns in it, if a current of 4·0 A is to produce

a deflection of 45°. Horizontal component of earth's magnetic field is $0{\cdot}31 \times 10^{-4}$ T. (*H.S.S.C.E. 1997*) **[Ans. 2]**

15. Two tangents galvanometers have coils of the same radii, differing only in their number of turns. They are connected in series. When a steady current is passed in the circuit, the mean deflections in the galvanometers are θ_1, θ_2. Deduce an expression for the ratio of the number of turns of the galvanometers. (*C.B.S.E. 2000*)

[Ans. $\frac{n_1}{n_2} = \frac{\tan\theta_1}{\tan\theta_2}$]

16. Two tangent galvanometers having number of turns in the ratio $\sqrt{3} : 2$ are connected in series to a d.c. source. If the mean deflections of the two tangent galvanometers are 30° and 45° respectively, calculate the ratio of radii of the coils of the tangent galvanometers. (*C.B.S.E. 2002*)

[Ans. 1·5]

17. Two tangent galvanometers A and B have their number of turns in the ratio 1 : 3 and diameters in the ratio 1 : 2. Explain with reason : (*a*) Which galvanometer has a greater reduction factor ? (*b*) Which galvanometer shows greater deflection, when both are connected in series to a d.c. source ? (*C.B.S.E. 1999*) **[Ans. (*a*) A ; (*b*) B]**

Type D. On Vibration magnetometer

18. A magnet executes 55 vibrations in one minute, where horizontal component of earth's field is 0·36 G. If the moment of inertia of the bar magnet is 10^{-5} kg m^2, find the magnetic moment of the bar magnet. **[Ans. 9·215 A m^2]**

19. A magnetic needle pivoted through its centre of mass and free to rotate in a plane containing a uniform magnetic field of 100 G is displaced slightly from its stable equilibrium. The frequency of its angular oscillations of small amplitudes is measured to be 1·5 s^{-1}. If the moment of inertia of the needle about its axis of rotation is $7{\cdot}5 \times 10^{-6}$ kg m^2, determine the magnetic moment of the needle. **[Ans. 0·067 A m^2]**

20. A magnet makes 30 vibrations per minute at a place, where horizontal component of earth's field is 0·18 G. At another place, if it takes 1·6 seconds to complete one vibration. What is the value of horizontal component of earth's field there ? **[Ans. 0·28 G]**

MISCELLANEOUS PROBLEMS

21. A magnetic needle free to rotate about the vertical direction (compass) points 3·5° west of the geographic north. Another magnetic needle free to rotate in a vertical plane parallel to the magnetic meridian has its north tip pointing down at 18° with the horizontal. The magnitude of th horizontal component of the earth's magnetic field at th place is known to be 0·40 G. What is the direction ar magnitude of the earth's magnetic field at the place ?

[Ans. 0·42 G making an angle of 18° with horizont in the magnetic meridian ; while the magnet meridian is 3·5° west of geographic meridiar

22. A bar magnet of length 8 cm and having a pole streng of 1 A m is placed vertically on a horizonal table with i N-pole on the table. A neutral point is found on the tab at a distance of 6 cm south of the magnet. Calculate th earth's horizontal magnetic field. **[Ans.** $2{\cdot}18 \times 10^{-5}$

23. Two tangent galvanometers have radii 0·075 m and 0·1 r number of turns 15 and 10 and resistances of 8 ohm ar 12 ohm respectively. If on connecting them in parallel a circuit, the first galvanometer gives a deflection of 6C then calculate deflection in the second galvanometer.

[Ans. 30

24. A bar magnet, held horizontally, is set into angul oscillations in earth's magnetic field. It has time perio T and T′ at two places, where the angles of dip are δ ar θ_2 respectively. Deduce an expression for the ratio of tl resultant magnetic fields at the two places.

(*C.B.S.E. 1999*) $\left[\textbf{Ans. } \frac{B}{B'} = \frac{\cos\delta'}{\cos\delta} \times \left(\frac{T'}{T}\right)^2\right.$

25. A magnet is suspended so that it may oscillate in tl horizontal plane. It performs 20 oscillations per minute a place where the angle of dip is 30° and 15 oscillations p minute, where the angle of dip is 60°. Compare the earth total magnetic field at these two places. **[Ans.** $16 : 9\sqrt{3}$

26. A magnet makes 10 oscillations per minute at a plac where the angle of dip is 45° and the total intensity earth's magnetism is 0·4 G. Calculate the number oscillations made per second by the same magnet another place, where the angle of dip is 60° and intensi of the field is equal to 0·5 G. (*M.N.R. 198*

[Ans. 0 · 157 s

27. A magnet free to oscillate under the earth's horizont field has a period of T seconds. Another magnet of leng 16 cm is kept east of it with its middle point at a distan of 20 cm and its axis in magnetic meridian. The tin period of the first magnet is reduced to half. Find the pc strength of the other magnet. Given, horizont component of earth's field = 0·2 G. **[Ans.** 37·5 A r

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. Proceed as in solved problem no. 4.02.

2. $\tan\delta = \frac{B_V}{B_H} = \frac{0{\cdot}2}{0{\cdot}3464} = 0{\cdot}5774$ or $\delta = 30°$

Now, $B_H = B\cos\delta$ or $B = \frac{B_H}{\cos\delta} = \frac{0{\cdot}3464}{\cos 30°} = \mathbf{0{\cdot}4\ G}$

3. At 52° of magnetic meridian, the apparent value of horizontal component of earth's magnetic field,

$$B_H' = B_H \cos 52°$$

Apparent angle of dip δ' is given by

$$\tan\delta' = \frac{B_V}{B_H'} \quad \text{or} \quad \tan 45° = \frac{B_V}{B_H \cos 52°}$$

or $\frac{B_V}{B_H} = \cos 52° = 0{\cdot}6157$

But $\frac{B_V}{B_H} = \tan\delta$,

where δ is true angle of dip.

$\therefore \tan\delta = 0{\cdot}6157$ or $\delta = \mathbf{31{\cdot}62°}$

4. Proceed as in solved problem no. 4.04.

5. ***In first case*** **:** At the neutral point on axial line of a sho magnet,

$$\frac{\mu_0}{4\pi}\cdot\frac{2M}{r^3} = B_H \quad \text{or} \quad \frac{10^{-7}\times 2\times 5}{r^3} = 0{\cdot}38 \times 10^{-4}$$

or $r^3 = 0{\cdot}0263$ or $r = 29{\cdot}7 \times 10^{-2}$ m = **29·7 cm**

In second case **:** At the neutral point on equitorial line o short magnet,

$$\frac{\mu_0}{4\pi}\cdot\frac{M}{r^3} = B_H \quad \text{or} \quad \frac{10^{-7}\times 5}{r^3} = 0{\cdot}38 \times 10^{-4}$$

or $r^3 = 0{\cdot}0132$ or $r = 23{\cdot}6 \times 10^{-2}$ m = **23·6 cm**

6. At the neutral point on equitorial line of a short magne

$$\frac{\mu_0}{4\pi}\cdot\frac{M}{r^3} = B_H \quad \text{or} \quad \frac{10^{-7}\times M}{(12{\cdot}5\times 10^{-2})^3} = 0{\cdot}38 \times 10^{-4}$$

(*a*) Now, $B_{axial} = \frac{\mu_0}{4\pi} \cdot \frac{2M}{r^3} = \frac{10^{-7} \times 2 \times 0{\cdot}74}{(12{\cdot}5 \times 10^{-2})^3}$

$$= 0{\cdot}76 \times 10^{-4}\ \text{T} = 0{\cdot}76\ \text{G}$$

Therefore, total magnetic field,

$$B = B_{axial} + B_H = 0{\cdot}76 + 0{\cdot}38 = \mathbf{1{\cdot}14\ G}$$

(*b*) When magnet is turned through 180°, neutral points will be obtained on axial line.

Now, at the neutral point on axial line of a short magnet,

$$\frac{\mu_0}{4\pi} \cdot \frac{2M}{r^3} = B_H \quad \text{or} \quad \frac{10^{-7} \times 2 \times 0{\cdot}74}{r^3} = 0{\cdot}38 \times 10^{-4}$$

or $\quad r^3 = 3{\cdot}895 \times 10^{-3} \quad$ or $\quad r = 0{\cdot}157\ \text{m} = \mathbf{15{\cdot}7\ cm}$

7. At the neutral point on axial line of a short magnet,

$$\frac{\mu_0}{4\pi} \cdot \frac{2M}{r^3} = B_H \quad \text{or} \quad \frac{10^{-7} \times 2 \times M}{(14 \times 10^{-2})^3} = 0{\cdot}36 \times 10^{-4}$$

or $\quad M = 0{\cdot}494\ \text{A m}^2$

Now, $B_{equi} = \frac{\mu_0}{4\pi} \cdot \frac{M}{r^3} = \frac{10^{-7} \times 0{\cdot}494}{(14 \times 10^{-2})^3}$

$$= 0{\cdot}18 \times 10^{-4}\ \text{T} = 0{\cdot}18\ \text{G}$$

Therefore, total magnetic field,

$$B = B_{equi} + B_H = 0{\cdot}18 + 0{\cdot}36 = \mathbf{0{\cdot}54\ G}$$

8. When magnet is turned through 180°, neutral points will be obtained on equitorial line.

Now, at the neutral point on equitorial line of a short magnet,

$$\frac{\mu_0}{4\pi} \cdot \frac{M}{r^3} = B_H \quad \text{or} \quad \frac{10^{-7} \times 0{\cdot}494}{r^3} = 0{\cdot}36 \times 10^{-4}$$

or $\quad r^3 = 1{\cdot}37 \times 10^{-3} \quad$ or $\quad r = 0{\cdot}111\ \text{m} = \mathbf{11{\cdot}1\ cm}$

9. Now, $\quad I = K \tan\theta$

$$\therefore \quad \frac{I_1}{I_2} = \frac{\tan\theta_1}{\tan\theta_2}$$

or $\quad I_2 = I_1 \times \frac{\tan\theta_2}{\tan\theta_1} = 10 \times \frac{\tan 42^\circ}{\tan 31^\circ} = 15\ \text{mA}$

% increase required in the value of current,

$$\frac{I_2 - I_1}{I_1} \times 100 = \frac{15 - 10}{10} \times 100 = \mathbf{50\%}$$

10. $I = \frac{2a}{n\mu_0} B_H \tan\theta = \frac{2 \times 10 \times 10^{-2} \times 1{\cdot}6 \times 10^{-5} \times \tan 45^\circ}{2 \times 4\pi \times 10^{-7}}$

$$= \mathbf{1{\cdot}273\ A}$$

11. Proceed as in problem no. 10.
12. Proceed as in problem no. 10.
13. $I = \frac{2a}{n\mu_0} B_H \tan\theta \quad$ or $\quad n = \frac{2a}{\mu_0 I} B_H \tan\theta$

or $n = \frac{2 \times 16 \times 10^{-2} \times 0{\cdot}36 \times 10^{-4} \times \tan 45^\circ}{4\pi \times 10^{-7} \times 40 \times 10^{-3}} = \mathbf{229}$

14. Proceed as in problem no. 13.
15. Let n_1 and n_2 be number of turns in the two tangent galvanometers. Suppose that a current I passes through the two galvanometers, when they are connected in series.

For first tangent galvanometer,

$$I = \frac{2a}{n_1 \mu_0} B_H \tan\theta_1 \quad \ldots(i)$$

For second tangent galvanometer,

$$I = \frac{2a}{n_2 \mu_0} B_H \tan\theta_2 \quad \ldots(ii)$$

From equations (*i*) and (*ii*), we have

$$\frac{2a}{n_1 \mu_0} B_H \tan\theta_1 = \frac{2a}{n_2 \mu_0} B_H \tan\theta_2$$

or $\quad \frac{n_1}{n_2} = \frac{\tan\theta_1}{\tan\theta_2}$

16. Let a_1 and a_2 be radii of the coils of the two tangent galvanometers. As the number of turns of the coils of the two galvanometers are in the ratio $\sqrt{3} : 2$, let $\sqrt{3}\,n$ and $2\,n$ be the their number of turns. Suppose that a current I passes though the galvanometers, when they are connected in series.

For first galvanometer, $\theta = 30^\circ$

$$\therefore \quad I = \frac{2a_1}{\sqrt{3}\,n\mu_0} B_H \tan 30^\circ \quad \ldots(i)$$

For second galvanometer, $\theta = 45^\circ$

$$\therefore \quad I = \frac{2a_2}{2n\mu_0} B_H \tan 45^\circ \quad \ldots(ii)$$

From equation (*i*) and (*ii*), we have

$$\frac{2a_1}{\sqrt{3}\,n\mu_0} B_H \tan 30^\circ = \frac{2a_2}{2n\mu_0} B_H \tan 45^\circ$$

or $\quad \frac{a_1}{a_2} = \frac{\sqrt{3} \times \tan 45^\circ}{2 \times \tan 30^\circ} = \frac{\sqrt{3} \times 1}{2 \times 1/\sqrt{3}} = \frac{3}{2} = \mathbf{1{\cdot}5}$

17. Here, $n_1 = n$, $n_2 = 3\,n$, $a_1 = a$ and $a_2 = 2\,a$

(*a*) Reduction factor, $K = \frac{2a}{n\mu_0} B_H$

$$\therefore \quad K_A = \frac{2a_1}{n_1\mu_0} B_H = \frac{2a}{n\mu_0} B_H$$

and $\quad K_B = \frac{2a_2}{n_2\mu_0} B_H = \frac{2 \times 2a}{3n \times \mu_0} B_H = \frac{2}{3} K_A$

Therefore, $K_A > K_B$ *i.e.* **galvanometer A has a greater reduction factor.**

(*b*) Let θ_1 and θ_2 be deflections produced in the two galvanometers, when they are connected in series.

For first galvanometer,

$$I = K_A \tan\theta_1 = \frac{2a}{n\mu_0} B_H \tan\theta_1 \quad \ldots(i)$$

For second galvanometer,

$$I = K_B \tan\theta_2 = \frac{4a}{3n\mu_0} B_H \tan\theta_2 \quad \ldots(ii)$$

From equations (*i*) and (*ii*), we have

$$\frac{2a}{4\mu_0} B_H \tan\theta_1 = \frac{4a}{3n\mu_0} B_H \tan\theta_2$$

or $\quad \frac{\tan\theta_1}{\tan\theta_2} = \frac{2}{3}$

Therefore, $\theta_1 < \theta_2$ *i.e.* **galvanometer B shows greater** deflection.

18. Now, $T = 2\pi\sqrt{\frac{I}{M B_H}} \quad$ or $\quad M = \frac{4\pi^2 I}{T^2 B_H}$

Here, $T = \frac{60}{55}$ s, $B_H = 0{\cdot}36\ \text{G} = 0{\cdot}36 \times 10^{-4}\ \text{T}$

and $\quad I = 10^{-5}\ \text{kg m}^2$

$$\therefore \quad M = \frac{4\pi^2 \times 10^{-5}}{(60/55)^2 \times 0{\cdot}36 \times 10^{-4}} = \mathbf{9{\cdot}215\ Am^2}$$

19. Here, $B = 100\ \text{G} = 100 \times 10^{-4} = 0{\cdot}01\ \text{T}$, $I = 7{\cdot}5 \times 10^{-6}\ \text{kg m}^2$

$$\nu = 1{\cdot}5\ \text{s}^{-1}$$

Now, $T = 2\pi\sqrt{\frac{I}{MB}}$

or $\quad M = \frac{4\pi^2 I}{T^2 B} = \frac{4\pi^2 I \nu^2}{B}$

$$= \frac{4\pi^2 \times 7{\cdot}5 \times 10^{-6} \times (1{\cdot}5)^2}{0{\cdot}01} = \mathbf{0{\cdot}067\ A\ m^2}$$

20. Let B_H and B_H' be horizontal components of earth's magnetic field at the two places. If T and T′ are periods of oscillation at the two places, then

$$T = 2\pi\sqrt{\frac{I}{M B_H}} \quad \text{and} \quad T' = 2\pi\sqrt{\frac{I}{M B_H'}}$$

$$\therefore \quad \frac{T}{T'} = \sqrt{\frac{B_H'}{B_H}} \quad \text{or} \quad B_H' = B_H \times \frac{T^2}{T'^2}$$

Here, $B_H = 0{\cdot}18$ G ; $T = 60/30 = 2$ s and $T' = 1{\cdot}6$ s

$$\therefore \quad B_H' = \frac{0{\cdot}18 \times (2)^2}{(1{\cdot}6)^2} = \mathbf{0{\cdot}28\ G}$$

21. Here, $\theta = 3{\cdot}5°$ west of geographic north,
$\delta = 18°$ and $B_H = 0{\cdot}40$ G

Now, $B_H = B \cos \delta$

$$\text{or} \quad B = \frac{B_H}{\cos \delta} = \frac{0{\cdot}40}{\cos 18°} = 0{\cdot}42\ \text{G}$$

Thus, magnetic field at the place is **0·42 G** making an angle of 18° with horizontal in magnetic meridian, where the magnetic meridian is 3·5° west of geographic meridian.

22. Refer to conceptual SAQ 4.12.
The neutral point will be obtained at point P_2 on the horizontal table as shown in Fig. 4.21.

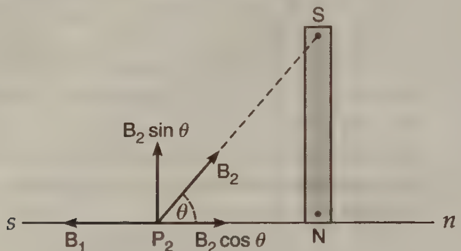

Fig. 4.21

At the neutral point, the horizontal component of earth's magnetic field (B_H) is balanced by the horizontal component of the magnetic field due to the magnet.

Magnetic field due to N-pole of the magnet at the neutral point P_2,

$$B_1 = \frac{\mu_0}{4\pi} \cdot \frac{m}{(NP_2)^2} = \frac{10^{-7} \times 1}{(0{\cdot}06)^2}$$

$$= 2{\cdot}78 \times 10^{-5}\ \text{T (along } P_2\, s)$$

Magnetic field due to S-pole of the magnet at the neutral point P_2,

$$B_2 = \frac{\mu_0}{4\pi} \cdot \frac{m}{(SP_2)^2}$$

$$\text{Now, } SP_2 = \sqrt{(NS)^2 + (NP_2)^2}$$

$$= \sqrt{(0{\cdot}08)^2 + (0{\cdot}06)^2} = 0{\cdot}1\ \text{m}$$

$$\therefore \quad B_2 = \frac{10^{-7} \times 1}{(0{\cdot}1)^2} = 10^{-5}\ \text{T (along } P_2\, S)$$

The magnetic field B_2 makes an angle θ with the horizontal table as shown in the figure.

Therefore, component of field B_2 along horizontal

$$= B_2 \cos\theta = B_2 \times \frac{NP_2}{SP_2} = 10^{-5} \times \frac{0{\cdot}06}{0{\cdot}1}$$

$$= 0{\cdot}6 \times 10^{-5}\ \text{T} \qquad \text{(along } P_2\, N)$$

Therefore, net horizontal component of the field of magn

$$= B_1 - B_2 \cos\theta = 2{\cdot}78 \times 10^{-5} - 0{\cdot}6 \times 10^{-5}$$

$$= 2{\cdot}18 \times 10^{-5}\ \text{T} \qquad \text{(along } P_2\, s)$$

At the neutral point,

$$B_H = B_1 - B_2 \cos\theta = \mathbf{2{\cdot}18 \times 10^{-5}\ T}$$

23. Here, $a_1 = 0{\cdot}075$ m ; $a_2 = 0{\cdot}1$ m ; $n_1 = 15$; $n_2 = 10$;
$R_1 = 8\ \Omega$; $R_2 = 12\ \Omega$, $\theta_1 = 60°$

Let I be total current in the circuit. As the tw galvanometers are connected in parallel, current throug the first galvanometer,

$$I_1 = \frac{I R_2}{R_1 + R_2} = \frac{I \times 12}{8 + 12} = 0{\cdot}6\ I$$

and current through the second galvanometer,

$$I_2 = \frac{I R_1}{R_1 + R_2} = \frac{I \times 8}{8 + 12} = 0{\cdot}4\ I$$

For first galvanometer,

$$I_1 = \frac{2 a_1}{n_1 \mu_0} B_H \tan\theta_1$$

$$\text{or} \quad 0{\cdot}6\ I = \frac{2 \times 0{\cdot}075}{15 \times \mu_0} B_H \tan 60°$$

$$\text{or} \quad I = \frac{2{\cdot}89 \times 10^{-2}\ B_H}{\mu_0} \qquad \text{...(}$$

For second galvanometer,

$$I_2 = \frac{2 a_2}{n_2 \mu_0} B_H \tan\theta_2$$

$$\text{or} \quad 0{\cdot}4\ I = \frac{2 \times 0{\cdot}1}{10 \times \mu_0} B_H \tan\theta_2$$

$$\text{or} \quad I = \frac{5 \times 10^{-2}\ B_H}{\mu_0} \tan\theta_2 \qquad \text{...(}$$

From equations (*i*) and (*ii*), we have

$$\frac{5 \times 10^{-2}\ B_H}{\mu_0} \tan\theta_2 = \frac{2{\cdot}89 \times 10^{-2}\ B_H}{\mu_0}$$

$$\text{or} \quad \tan\theta_2 = 0{\cdot}578$$

$$\text{or} \quad \theta_2 = \mathbf{30°}$$

24. Let B and B′ be earth's magnetic field, at the two place Then, horizontal components of earth's magnetic field the two places are given by

$$B_H = B \cos\delta \quad \text{and} \quad B_H' = B \cos\delta'$$

$$\text{Now,} \quad T = 2\pi\sqrt{\frac{I}{M B_H}}$$

$$\therefore \quad \frac{T}{T'} = \sqrt{\frac{B_H'}{B_H}} = \sqrt{\frac{B' \cos\delta'}{B \cos\delta}}$$

$$\text{or} \quad \frac{B}{B'} = \frac{\cos\delta'}{\cos\delta} \times \left(\frac{T'}{T}\right)^2$$

25. By proceeding as in problem no. 24, it can be obtained th

$$\frac{B}{B'} = \frac{\cos\delta'}{\cos\delta} \times \left(\frac{T'}{T}\right)^2$$

Here, $T = 60/20 = 3$ s, $T' = 60/15 = 4$ s ;
$\delta = 30°$ and $\delta' = 60°$

$$\therefore \quad \frac{B}{B'} = \frac{\cos 60°}{\cos 30°} \times \left(\frac{4}{3}\right)^2 = \frac{1/2}{\sqrt{3}/2} \times \frac{16}{9} = \frac{\mathbf{16}}{\mathbf{9\sqrt{3}}}$$

26. As obtained in problem no. 24,

$$\frac{B}{B'} = \frac{\cos\delta'}{\cos\delta} \times \left(\frac{T'}{T}\right)^2$$

$$\therefore \quad T' = T\sqrt{\frac{B\cos\delta}{B'\cos\delta'}}$$

Here, $T = 60/10 = 6\text{ s}$; $\delta = 45°$, $B = 0{\cdot}4\text{ G}$;
$\delta' = 60°$ and $B' = 0{\cdot}5\text{ G}$

$$\therefore \quad T' = 6\sqrt{\frac{0{\cdot}4\times\cos 45°}{0{\cdot}5\times\cos 60°}} = 6{\cdot}382\ s$$

Therefore, number of oscillations made by the magnet per second,

$$v' = \frac{1}{T'} = \frac{1}{6{\cdot}382} = 0{\cdot}157\ \text{s}^{-1}$$

27. ***When magnet oscillates in earth's magnetic field :***
Let B_H be horizontal component of earth's magnetic field. Then,

$$T = 2\pi\sqrt{\frac{I_1}{M_1\,B_H}}, \qquad \text{...}(i)$$

where M_1 and I_1 are magnetic moment and moment of inertia of the first magnet.

When magnet oscillates in the combined field of earth and the second magnet :

Let B_H' be effective magnetic field along horizontal.
Then, $\quad B_H' = B_H \pm B_2,$
where B_2 is magnetic field produced by the second magnet at the location of the first magnet.

If T' is period of oscillation of the first magnet in the combined field, then

$$T' = 2\pi\sqrt{\frac{I_1}{M_1\,B_H'}}$$

Since $T' = T/2$ *i.e.* $T' < T$, B_H' must be greater than B_H *i.e.* $B_H' = B_H + B_2$

$$\therefore \quad \frac{T}{2} = 2\pi\sqrt{\frac{I_1}{M_1\,(B_H + B_2)}} \qquad \text{...}(ii)$$

From equations (*i*) and (*ii*), we have

$$2\pi\sqrt{\frac{I_1}{M_1\,B_H}} = 2\times 2\pi\sqrt{\frac{I_1}{M_1\,(B_H+B_2)}}$$

$$\text{or} \quad B_H + B_2 = 4\,B_H \quad \text{or} \quad B_2 = 3\,B_H$$

$$\text{or} \quad B_2 = 3\times 0{\cdot}2\times 10^{-4} = 0{\cdot}6\times 10^{-4}\ \text{T}$$

From the statement of the problem, it follows that the first magnet oscillates at a point, which lies on the equitortial line of the second magnet.

If M_2 is magnetic moment of the second magnet, then

$$B_2 = \frac{\mu_0}{4\pi}\cdot\frac{M_2}{(r^2 + l_2^2)^{3/2}},$$

where $\quad r = 20\text{ cm} = 0{\cdot}2\text{ m}$
and $\quad l_2 = 16/2 = 8\text{ cm} = 0{\cdot}08\text{ m}$

$$\therefore \quad 0{\cdot}6\times 10^{-4} = \frac{10^{-7}\times M_2}{\left[(0{\cdot}2)^2 + (0{\cdot}08)^2\right]^{3/2}}$$

$$\text{or} \quad 0{\cdot}6\times 10^{-4} = 10^{-5}\,M_2$$

$$\text{or} \quad M_2 = \frac{0{\cdot}6\times 10^{-4}}{10^{-5}} = 6\ \text{A m}^2$$

Therefore, pole strength of the second magnet,

$$m_2 = \frac{M_2}{2\,l_2} = \frac{6}{16\times 10^{-2}} = \mathbf{37{\cdot}5\ A\ m}$$

CHAPTER 5

Classification of Magnetic Materials

5.01. SOME IMPORTANT TERMS

The following terms and concepts are used to classify the magnetic substances and to understand their response to the magnetic fields :

1. Magnetic intensity. Consider that inside vacuum, a magnetic field B_0 exists. Then, magnetic intensity is defined by the relation

$$H = \frac{B_0}{\mu_0}, \qquad \text{...(5.01)}$$

where $\mu_0 = 4\pi \times 10^{-7}$ tesla metre ampere^{-1} is absolute permeability of vacuum. Since unit of magnetic field is tesla, the unit of magnetic intensity is

$$[H] = \frac{\text{tesla}}{\text{tesla metre ampere}^{-1}} = \textbf{ampere meter}^{-1}\ (\textbf{A m}^{-1})$$

Magnetic intensity is also known as **H-field** or **magnetic field strength.** The unit of magnetic intensity *i.e.* **A m^{-1}** is also equivalent to **N m^{-2} T^{-1}** or **N Wb^{-1}** or **J m^{-3} T^{-1}** or **J m^{-1} Wb^{-1}.**

The older unit of magnetic intensity is **oersted.** It is related to gauss (the older unit of magnetic field) as given below :

$$\textbf{1 oersted} = \frac{\textbf{1 gauss}}{\mu_0}$$

$$\text{Therefore, } \textbf{1 oersted} = \frac{10^{-4}\,\text{T}}{4\pi \times 10^{-7}\,\text{T m A}^{-1}} \simeq \textbf{80 A m}^{-1}$$

2. Intensity of magnetisation. *It is defined as the magnetic moment developed per unit volume, when a magnetic specimen is subjected to magnetising field.* It is denoted by I.

If a magnetic specimen of volume V acquires magnetic dipole moment M due to the magnetising field, Then,

$$I = \frac{M}{V} \qquad \text{...(5.02)}$$

Since unit of magnetic moment is ampere metre^2, the unit of intensity of magnetisation is

$$[I] = \frac{\text{ampere metre}^2}{\text{metre}^3} = \textbf{ampere metre}^{-1}\ (\textbf{A m}^{-1})$$

i.e. intensity of magnetisation and the magnetic intensity have the same units. The intensity of magnetisation is also called simply **magnetisation.**

If the magnetic specimen has area of cross-section a and length $2\,l$, then its volume,

$$V = a \times 2\,l$$

Further, if m is pole strength developed, then magnetic moment of the specimen,

$$M = m \times 2\,l$$

Therefore, equation (5.02) gives

$$I = \frac{m \times 2l}{a \times 2l} = \frac{m}{a} \qquad \text{...(5.03)}$$

Hence, *intensity of magnetisation may also be defined as the pole strength developed per unit area of cross-section of the specimen.*

3. Magnetic flux. *Magnetic flux through a surface is defined as the number of magnetic field lines passing normally through the surface.* It is denoted by ϕ.

Consider that a surface area $\Delta \vec{S}$ is held in a magnetic field of induction $\vec{B}$. hen, magnetic flux passing normally through the surface is given by

$$\phi = \vec{B} . \Delta \vec{S}$$

The SI unit of magnetic flux is **weber (Wb).**

4. Magnetic induction. Consider that a soft iron bar (ferromagnetic material) s placed in a uniform magnetic field B_0 set up in vacuum. The uniform magnetising ield B_0 has been represented by parallel lines in Fig. 5.01.

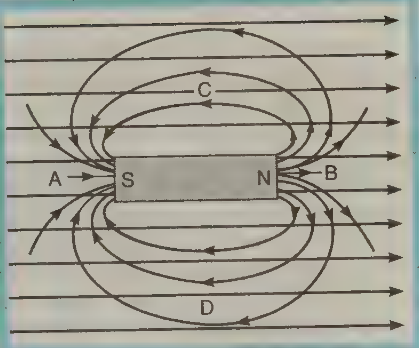

Fig. 5.01

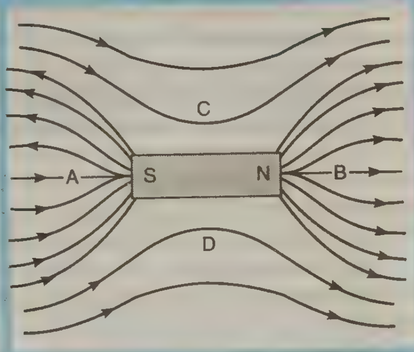

Fig. 5.02

As soon as the iron bar is placed inside the magnetic field, it gets magnetised. ts left end becomes S-pole, while its right end becomes N-pole. Because of induced nagnetism, it produces its own magnetic field. In the regions A and B, the nagnetising field is strengthened, while in the regions C and D, the magnetising ield is opposed by the field produced due to the magnetisation of soft iron bar. The esultant field is as shown in Fig. 5.02.

The magnetic induction is defined as the number of magnetic lines of induction (magnetic field lines inside the material) crossing per unit area normally through the magnetic substance. It is denoted by B.

The magnetic induction B is the sum of the magnetic field B_0 and the magnetic field $\mu_0 I$ produced due to the magnetisation of the substance. Thus,

$$B = B_0 + \mu_0 I = \mu_0 H + \mu_0 I$$

or $$B = \mu_0 (H + I) \qquad ...(5.04)$$

Magnetic induction is also known as **magnetic flux density** or simply **magnetic field.** The SI unit of magnetic induction is **tesla (T)** or **weber metre^{-2} (Wb m^{-2}).** These units of magnetic induction are equivalent to **N m^{-1} A^{-1}** or **J A^{-1} m^{-2}.**

The older unit of magnetic induction is **guass (G).**

1 tesla = 10^4 gauss (G)

5. Magnetic susceptibility. *The magnetic susceptibility of a magnetic substance is defined as the ratio of the intensity of magnetisation to the magnetic intensity.* It is denoted by χ_m.

Therefore $$\chi_m = \frac{I}{H} \qquad ...(5.05)$$

The magnetic susceptibility of a magnetic substance gives the measure of its aptness to acquire magnetism. As magnetic susceptibility is the ratio of two quantities having same units (A m^{-1}), it has ***no units.***

6. Magnetic permeability. *The magnetic permeability of a magnetic substance is defined as the ratio of the magnetic induction to the magnetic intensity.* It is denoted by μ.

Therefore, $$\mu = \frac{B}{H} \qquad ...(5.06)$$

The magnetic permeability of a magnetic substance gives the measure of its conducting power towards the passage of magnetic lines of induction. Its unit in SI is

$$[\mu] = \frac{\text{tesla}}{\text{ampere metre}^{-1}} = \textbf{tesla metre ampere}^{-1} \textbf{ (T m A}^{-1}\textbf{)}$$

i.e. both μ and μ_0 have the same units.

Dividing both sides of the equation (5.04) by H, we have

$$\frac{B}{H} = \mu_0 \left(1 + \frac{I}{H}\right)$$

Using equations (5.05) and (5.06), we have

$$\mu = \mu_0 (1 + \chi_m)$$

or $$\frac{\mu}{\mu_0} = 1 + \chi_m \qquad ...(5.07)$$

Since $\frac{\mu}{\mu_0} = \mu_r$, the ***relative permeability*** of the magnetic substance, the equation (5.07) becomes

$$\mu_r = 1 + \chi_m \qquad ...(5.08)$$

5.02. CLASSIFICATION OF MAGNETIC MATERIALS

Iron and steel are not the only substances, which are attracted by a magnet or which can be magnetised. In fact, all the substances possess magnetic properties. On the basis of their magnetic behaviour, Faraday divided the magnetic materials into three classes :

(i) **Diamagnetic.** *Those substances, which when placed in a magnetic field are feebly magnetised in a direction opposite to that of the magnetising field, are called diamagnetic substances.*

When a diamagnetic substance is placed inside an external magnetic field, the magnetic field inside the diamagnetic is found to be slightly less than the external magnetic field. It is observed that when a diamagnetic sample is placed inside a non-uniform magnetic field, it tends to move from stronger part to the weaker part of the magnetic field. It may be pointed out that the diamagnetic effects are too feeble to be detected, unless the applied magnetic field is strong. The behaviour of a diamagnetic substance is independent of temperature. Further, a diamagnetic substance has the nature similar to that of a dielectric having non-polar atoms. A few examples of diamagnetic substances are copper, zinc, bismuth, silver, gold, lead, glass, marble, water, helium, argon sodium chloride, etc.

(ii) **Paramagnetic.** *Those substances, which when placed in a magnetic field are feebly magnetised in the direction of the magnetising field, are called paramagnetic substances.*

When a paramagnetic substance is placed inside an external magnetic field, the magnetic field inside the paramagnetic is found to be a slightly greater than the external magnetic field. In contrast to the behaviour of diamagnetics, a paramagnetic substance tends to move from weaker part of the magnetic field to stronger part, when placed in a non-uniform magnetic field. Further, in contrast to diamagnetic, the behaviour of a paramagnetic is temperature dependent. Also, the paramagnetic effects are perceptible only with a strong magnetic field. The nature of a paramagnetic is similar to that of a dielectric having polar atoms. A few examples of paramagnetic substances are aluminium, sodium, antimony, platinum, copper chloride, manganese, chromium, liquid oxygen, etc.

(iii) **Ferromagnetic.** *Those substances, which when placed in a magnetic field are strongly magnetised in the direction of the magnetising field, are called ferromagnetic substances.*

When a ferromagnetic substance is placed inside a magnetic field, the field inside the ferromagnetic substance gets greatly enhanced. As a result, when a ferromagnetic is placed in a non-uniform magnetic field, it quickly moves from weaker part to stronger part of the magnetic field. In other words, the ferromagnetic effects are perceptible even in the presence of weak magnetic field. Further, the ferromagnetic behaviour of a substance becomes temperature dependent above certain temperature, which is characteristic of that substance. It is called ***Curie temperature.*** The nature of a ferromagnetic may be compared to that of a ferroelectric type dielectric. A few examples of ferromagnetic materials are iron, nickel, cobalt, alnico, etc.

The nature of diamagnetic, paramagnetic and ferromagnetic substances can be successfully explained on the basis of ***electron-theory of magnetism,*** which makes use of the fact that an atom may possess magnetic moment due to orbital and spin motion of the electron in the atom.

5.03. DIAMAGNETISM ON THE BASIS OF ELECTRON THEORY

We know that in an atom, electrons revolve in circular orbits and as such they behave as tiny current loops and possess magnetic dipole moments. The magnetic dipole moment of an electron revolving with velocity v in an orbit of radius r is given by

$$\mathrm{M} = \frac{e\,v\,r}{2}, \qquad \text{...(5.09)}$$

where e is magnitude of charge on the electron. Now, angular momentum of electron is given by

$$\mathrm{L} = m_e\,v\,r,$$

where m_e is mass of electron.

$$\therefore \qquad v = \frac{\mathrm{L}}{m_e\,r}$$

Substituting for v in equation (5.09), we have

$$\mathrm{M} = \frac{e}{2\,m_e}\mathrm{L} \qquad \text{...(5.10)}$$

In vector notation, equation (5.10) may be expressed as

$$\vec{M} = -\frac{e}{2\,m_e}\vec{L} \qquad ...(5.11)$$

The equation (5.11) tells that magetic dipole moment vector is directed in a lirection opposite to that of angular momentum vector.

In a diamagnetic material, there are no unpaired electrons. Further, the two lectrons of a pair possess orbital motion in opposite directions. Fig. 5.03 shows the rbital motion of an electron revolving in clockwise direction. The angular nomentum vector $\vec{L}$ of such an electron is along OZ′ and the magnetic dipole noment vector $\vec{M}$ is directed along OZ. For the orbital motion of an electron in anti-lockwise direction, the orientation of vectors $\vec{M}$ and $\vec{L}$ will be as shown in Fig. 5.04 .e. the angular momentum vector $\vec{L}$ is along OZ, while the magnetic dipole moment ector $\vec{M}$ is along OZ′. Thus, the two electrons of a pair possess magnetic moments qual in magnitude and opposite in direction and hence the magnetic moment of any pair of electrons due to their orbital motion is zero. For similar reasons, the diamagnetic atoms do not possess magnetic moments due to spin motion of electrons.

However, when external magnetic field $\vec{B}$ is applied, then magnetic Lorentz orce

$$\vec{F} = -e(\vec{v} \times \vec{B})$$

acts on the electron.

In case of an electron revolving in clockwise direction [Fig. 5.05], magnetic Lorentz force $\vec{F}$ acts radially outwards and it tends to decrease the centripetal force on the electron. As a result, its velocity decreases to $v - \Delta v$ and hence magnetic dipole moment to $\vec{M} - \Delta\vec{M}$. On the other hand, in case of electron revolving in anti-clockwise direction [Fig. 5.06], the force $\vec{F}$ acts radially inwards and it tends to increase the centripetal force on the electron. It results in increase of velocity of the electron to $v + \Delta v$ and hence magnetic dipole moment to $\vec{M} + \Delta\vec{M}$. Thus, on applying external magnetic field, the magnetic dipole moments of the two electrons in a pair no longer remain equal. The pair of electrons possesses a net magnetic dipole moment $2\,\Delta\vec{M}$ in a direction opposite to the direction of applied magnetic field. The magnetic dipole moments of paired electrons in all atoms of the diamagnetic add up to account for the small magnetic moment of the specimen along a direction opposite to that of the applied field. The diamagnetic material, thus, gets feebly magnetised along a direction opposite to that of the applied field, which explains the behaviour of diamagnetics, when placed in external magnetic field.

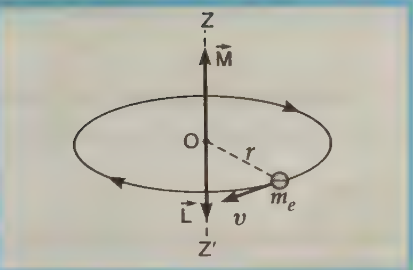

Fig. 5.03

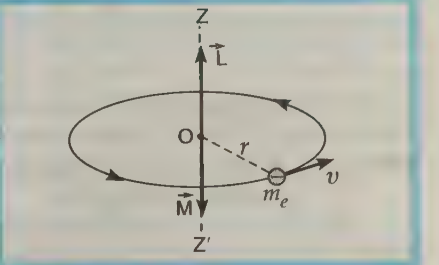

Fig. 5.04

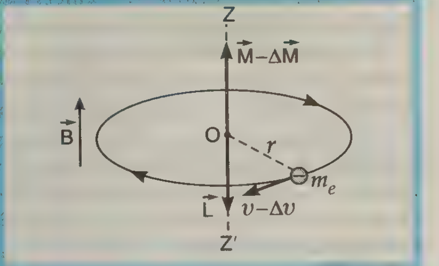

Fig. 5.05

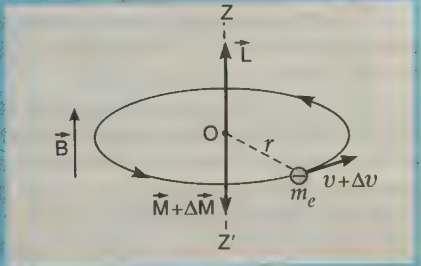

Fig. 5.06

5.04. PARAMAGNETISM ON THE BASIS OF ELECTRON THEORY

The atom of a paramagnetic substance possesses magnetic moment due to the orbital motion of the unpaired electron in the atom or due to spin motion of the electrons. The interaction between the atomic magnetic dipoles of the paramagnetic substances is very weak and therefore they may be regarded as independent of each other. Due to thermal agitation, the atomic magnetic dipoles are randomly oriented as shown in Fig. 5.07.

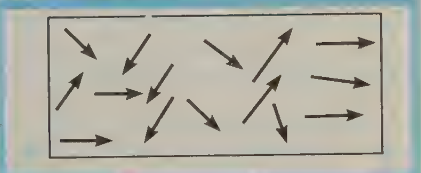

Fig. 5.07

When external magnetic field is applied, the field tries to align the magnetic dipoles along its own direction but the thermal agitation hampers the alignment and the magnetic dipoles try to go in random directions. Therefore, when the temperature is low and the applied magnetic field is increased, more and more magnetic dipoles align themselves along the direction of the applied magnetic field. At a given temperature, the maximum or saturation value of the alignment of magnetic dipoles will occur for a certain value of the applied magnetic field [Fig. 5.08].

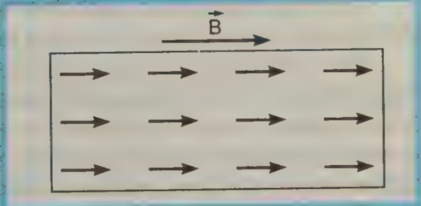

Fig. 5.08

For paramagnetic materials, it is observed that before such saturation occurs, the intensity of magnetisation of the material is

(*i*) *directly proportional to the magnetic intensity i.e.*

$$I \propto H$$

(*ii*) *inversely proportional to the absolute temperature of the material i.e.*

$$I \propto \frac{1}{T}$$

Combining the above two factors, we have

$$I \propto \frac{H}{T}$$

or $$I = C\frac{H}{T}, \qquad \text{...(5.12)}$$

where the constant of proportionality C is called ***Curie's constant***. From equation (5.12), we have

$$\frac{I}{H} = \frac{C}{T}$$

or $$\chi_m = \frac{C}{T} \qquad \text{...(5.13)}$$

i.e. the magnetic susceptibility of paramagnetic material is inversely proportional to its absolute temperature. It is called ***Curie's law in magnetism.***

5.05. FERROMAGNETISM ON THE BASIS OF ELECTRON THEORY (DOMAINTHEORY)

The atom of a ferromagnetic material also possesses non-zero magnetic moment as in case of a paramagnetic substance. However, due to a quantum mechanical effect, called ***exchange interaction,*** an unpaired electron in one atom interacts strongly with the unpaired electron in the neighbouring atom in such a way that they spontaneously align themselves in a common direction over a small volume of the material. These small volumes of uniform magnetisation are called ***domains.*** Although domains are extremely small in size ($\approx 10^{-18}$ m^3 in volume), yet each domain contains a large number of atoms ($\approx 10^{11}$ atomic magnetic dipoles).

The magnetic moments of the atoms in one domain are parallel to each other and hence a domain possesses a small value of net magnetic dipole moment. In the absence of external magnetic field, the direction of magnetic moments in different domains are oriented randomly in different directions [Fig. 5.09]. The result is that one domain cancels the effect of the other, so that the net magnetic moment of the material is zero. The ferromagnetic material, thus, appears unmagnetised in the absence of an external magnetic field.

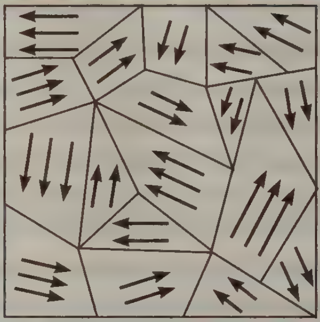

Fig. 5.09

When external magnetic field is applied, say from left to right ; the magnetic moments of domains progressively align along the direction of the external field in the following two ways :

(*i*) If the ferromagnetic material is homogeneous and pure, then the domains in which the magnetic moments are parallel to the external field expand continually at the expense of remaining domains and ultimately the magnetic moments align themselves along the direction of the magnetic field. As shown in Fig. 5.10 (*a*), the magnetic moments in domain A only are parallel to the direction of external magnetic field. Then, as illustrated through Fig. 5.10 (*b*), (*c*) and (*d*), the domain A continually expands at the expense of other three domains and ultimately all the magnetic moments become parallel to the direction of external magnetic field.

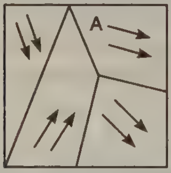

Fig. 5.10 (*a*)

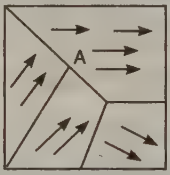

Fig. 5.10 (*b*)

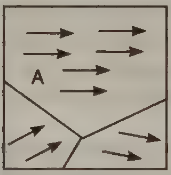

Fig. 5.10 (*c*)

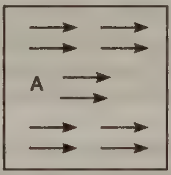

Fig. 5.10 (*d*)

(*ii*) If the external magnetic field is very strong, then magnetic moments in all the domains align themselves along the direction of applied magnetic field.

Once the magnetic moments align themselves along the direction of applied magnetic field, the ferromagnetic material appears magnetised. If the magnetised ferromagnetic material is heated, the alignment of magnetic moments within the domain gets disturbed. The order of disturbance increases with increase in temperature and at the ***Curie point,*** the material is reduced to paramagnetic material.

The susceptibility of a ferromagnetic substance above its curie temperature is inversely *proportional to the excess of temperature above the Curie temperature.* It is called *Curie-Weiss law.*

5.06. PROPERTIES OF DIA, PARA AND FERROMAGNETIC SUBSTANCES

The three types of magnetic materials possess the properties as listed below :

(*a*) Properties of diamagnetic substances. 1. *A diamagnetic substance is feebly repelled by a magnet.*

When a diamagnetic substance is placed near a magnet (*i.e* in the magnetic field due to the magnet), its atoms acquire a small magnetic dipole moment in a direction opposite to that of the external magnetic field. As a result, the diamagnetic substance moves from stronger part of the magnetic field to its weaker part *i.e.* it is feebly repelled by the magnet.

2. *When a rod of diamagnetic substance is suspended inside a magnetic field, it slowly sets itself at right angles to the direction of the field as shown in Fig. 5.11*

It happens, because a diamagnetic substance is weakly repelled by a magnet.

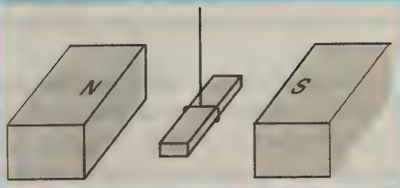

Fig. 5.11

3. *If a diamagnetic liquid contained in a watch glass is placed on two closely spaced pole-pieces of a magnet, it suffers a slight depression in the middle [Fig. 5.12]. However, the liquid shows a rise in the middle, when the pole-pieces are moved apart [Fig. 5.13].*

When the pole-pieces of the magnet are close to each other, the magnetic field in the middle is stronger than that near the poles of the magnet. Since a diamagnetic substance moves from stronger part of the magnetic field to the weaker part, the liquid depresses in the middle.

When the pole-pieces are moved apart, the magnetic field becomes weaker in the middle. As a result, the diamagnetic liquid shows a rise in the middle.

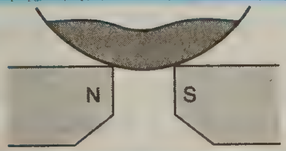

Fig. 5.12

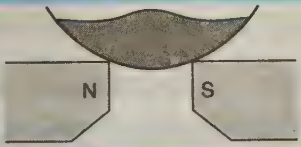

Fig. 5.13

4. *For a diamagnetic substance, the intensity of magnetisation (I) has a small negative value.*

It is because, on being placed in a magnetic field, a diamagnetic substance gets slightly magnetised in a direction opposite to that of the field.

5. *When a diamagnetic material is placed inside a magnetic field, the magnetic field lines become slightly less dense in the diamagnetic material [Fig. 5.14].*

When a diamagnetic substance is placed in a magnetic field, a small magnetization occurs opposite to the direction of the field. As a result, the magnetic field lines become less dense inside the diamagnetic material.

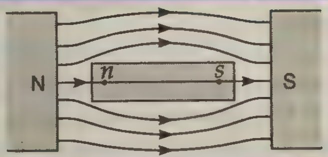

Fig. 5.14

Key point

On placing a bar of diamagnetic material between two poles of a magnet, its end facing N-pole of the magnet becomes south pole, while the other end facing S-pole becomes north pole [Fig. 5.14]. It is because, due to the magnetic field of the magnet, a small magnetization occurs opposite to the direction of the field.

6. *The magnetic susceptibility (χ_m) of a diamagnetic substance has a small negative value.*

Since for a diamagnetic substance, I has a small negative value, from the relation

$$\chi_m = \frac{I}{H},$$

it follows that χ_m will have a small negative value. It is of the order of 10^{-6} to 10^{-3} (negative).

7. *The relative permeability (μ_r) of a diamagnetic substance is slightly less than 1.*

Since for a diamagnetic substance, I has a small negative value, from the relation

$$\mu_r = 1 + \chi_m,$$

it follows that μ_r will be slightly less than 1.

8. *When a diamagnetic substance is placed inside a magnetising field (H), the magnetic induction or magnetic flux density (B) in the diamagnetic substance is lesser than that in vacuum (μ_0 H).*

Since for a diamagnetic substance, I has a negative value, from the relation

$$B = \mu_0 (H + I),$$

it follows that B will be less than μ_0 H.

9. *The diamagnetic substances do not obey Curie's law.*

It is because, the susceptibility of a diamagnetic substance does not change with temperature for practical purposes. However, bismuth (at low temperature) is an exception to this general property of diamagnetic substances.

(*b*) Properties of paramagnetic substances. 1. *A paramagnetic substance is feebly attracted by a magnet.*

When a paramagnetic substance is placed near a magnet, its atoms (possessing small magnetic dipole moments) align themselves along the direction of the magnetic field due to magnet. As such, the paramagnetic substance moves from weaker part of the magnetic field to its stronger part *i.e.* it is feebly attracted by the magnet.

2. *When a rod of paramagnetic substance is suspended inside a magnetic field, it slowly sets itself parallel to the direction of the magnetic field [Fig. 5.15].*

It happens, because a paramagnetic substance is weakly attracted by a magnet.

3. *If a paramagnetic liquid contained in a watch glass is placed on two closely spaced pole-pieces of a magnet, it shows a slight rise in the middle [Fig. 5.16]. On the other hand, when the poles are moved apart, the paramagnetic liquid gets depressed in the middle [Fig. 5.17]*

As said earlier, when the pole-pieces of the magnet are close to each other, the magnetic field in the middle is stronger than that near the poles of the magnet. Since a paramagnetic substance moves from weaker part of the magnetic field to the stronger part, the liquid rises in the middle. The reverse happens, when the pole-pieces of the magnet are moved apart.

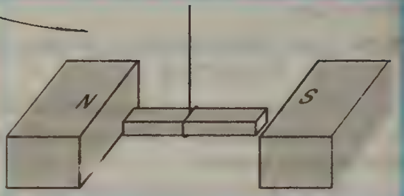

Fig. 5.15

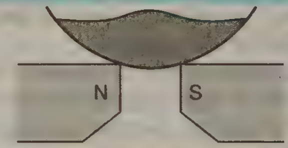

Fig. 5.16

4. *For paramagnetic substances, the intensity of magnetisation (I) has a small positive value.*

It is because, on being placed in a magnetic field, a paramagnetic substance gets slightly magnetised in the direction of the field.

5. *When a paramagnetic material is placed inside a magnetic field, the magnetic field lines become slightly more dense in the paramagnetic material [Fig. 5.18].*

When a paramagnetic substance is placed in a magnetic field, a small magnetisation occurs in the direction of the field. As a result, the magnetic field lines become more dense inside the paramagnetic substance.

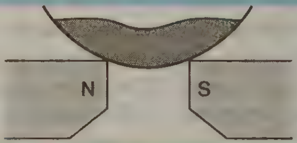

Fig. 5.17

6. *The magnetic susceptibility (χ_m) of a paramagnetic substance has a small positive value.*

Since for a paramagnetic substance, I has a small positive value, from the relation

$$\chi_m = \frac{I}{H},$$

it follows that χ_m also has a small positive value. It is of the order of 10^{-5} to 10^{-3}.

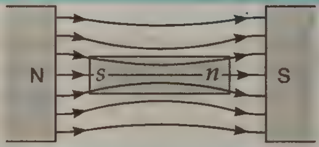

Fig. 5.18

7. *The relative permeability (μ_r) of a paramagnetic substance is slightly greater than 1.*

Since for a paramagnetic substance, I has a small positive value, from the relation

$$\mu_r = 1 + \chi_m,$$

it follows that μ_r will be slightly greater than 1.

8. *When a paramagnetic substance is placed inside a magnetising field (H), the magnetic flux density (B) in the paramagnetic substance is greater than that in vacuum (μ_0 H).*

Since for a paramagnetic substance, I has a small positive value, from the relation

$$B = \mu_0 (H + I),$$

it follows that B will be greater than μ_0H.

9. *The paramagnetic substances obey Curie's law i.e. the susceptibility of paramagnetic substances is inversely proportional to its absolute temperature.*

It follows that a paramagnetic substance tends to lose its magnetic character on being heated.

(c) Properties of ferromagnetic substances. The properties of ferromagnetic substances are similar in nature to those of paramagnetic substances but the effect is much more pronounced in case of ferromagnetics. Their properties are as listed below :

1. *A ferromagnetic substance is strongly attracted by a magnet.*

2. *When a rod of ferromagnetic substance is suspended in a magnetic field, it quickly aligns itself along the direction of the magnetic field as shown in Fig. 5.15.*

3. *The ferromagnetic materials move from weaker part of the magnetic field to the stronger part.*

Ferromagnetism is not found in liquids and gases. However, if a finely powdered ferromagnetic solid contained in a watch glass is placed on the two pole-pieces of a magnet, the material rises in the middle as in the case of paramagnetics [Fig. 5.16]. When the pole-pieces are moved apart, the material depresses in the middle [Fig. 5.17].

4. *When a ferromagnetic material is placed inside a magnetic field, the magnetic field lines becomes highly dense in the ferromagnetic substance as shown in Fig. 5.19.*

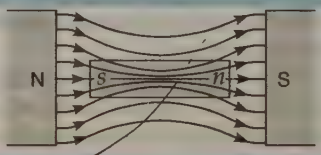

Fig. 5.19

When a ferromagnetic material is placed in a magnetic field, a large magnetisation occurs in the direction of magnetic field.

5. *For a ferromagnetic substance, the intensity of magnetisation (I) has a large positive value.*

It is because, on being placed in a magnetic field, a ferromagnetic substance gets strongly magnetised in the direction of the field.

6. *The magnetic susceptibility (χ_m) of a ferromagnetic substance has a large positive value.*

It follows from the relation : $\chi_m = \frac{I}{H}$

It is of the order of several thousands.

7. *The relative permeability (μ_r) of a ferromagnetic substance is extremely large as compared to 1.*

It follows from the relation : $\mu_r = 1 + \chi_m$

It is of the order of several thousands.

8. *When a ferromagnetic substance is placed inside a magnetising field (H), the magnetic flux density (B) in the ferromagnetic substance is much larger than that in vacuum (μ_0 H).*

It follows from the relation : $B = \mu_0 (H + I)$.

9. *The ferromagnetic substances do not obey Curie's law.*

The susceptibility of ferromagnetic substances decreases with the rise of temperature in a complicated manner. At a certain temperature, called ***Curie point*** or ***Curie temperature***, a ferromagnetic substance starts behaving as a paramagnetic substance. In case of iron, the Curie point is 1043 K. After Curie point, the susceptibility of a ferromagnetic substance varies inversely with its absolute temperature. In other words, a ferromagnetic substance obeys Curie's law only above its Curie point.

Key point

Both in paramagnetic and ferromagnetic substances, magnetism decreases, when they are heated. In is because, as temperature rises, the alignment of molecular magnets gradually decreases due to thermal agitation.

5.07. HYSTERESIS

Consider that a specimen of ferromagnetic material is placed in a magnetising field, whose strength and direction can be changed. Suppose that the specimen is unmagnetised initially. When the magnetising field (H) is increased, the intensity of magnetisation (I) of the material of the specimen also increases. It is found that when the magnetising field is made zero, the intensity of magnetisation does not become zero but still has some finite value. It becomes zero only, when magnetising field is increased in reverse direction. In other words, intensity of magnetisation does not become zero on making magnetising field zero but does so a little late and this effect is called ***hysteresis***.

The jargon . . . . .

The dictionary meaning of the word hysteresis is 'coming late'

The lag of intensity of magnetisation behind the magnetisation field during the process of magnetisation and demagnetisation of a ferromagnetic material is called hysteresis.

Fig. 5.20 shows the magnetisation curve of a ferromagnetic material, when it is taken over a complete cycle of magnetisation. Corresponding to point O, the magnetising field (H) is zero and likewise intensity of magnetisation (I) is also zero. As magnetising field is increased, intensity of magnetisation also increases along OA. Corresponding to point A, the intensity of magnetisation becomes maximum. The increase in value of the magnetising field beyond H_0 does not produce any increase in the intensity of magnetisation. In other words, corresponding to point A, the specimen of the ferromagnetic material acquires a state of magnetic saturation. If magnetising field is now decreased slowly, intensity of magnetisation decreases but not along the path AO. It decreases along the path AB. Corresponding to point B, magnetising field becomes zero but some magnetisation equal to OB is still left in the specimen. Here, OB gives the measure of ***retentivity*** of the material of the specimen.

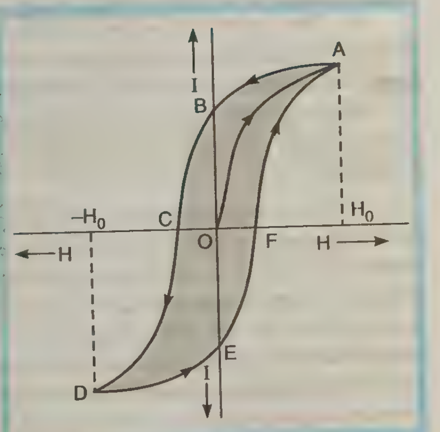

Fig. 5.20

The value of the intensity of magnetisation of a material, when the magnetising field is reduced to zero, is called retentivity of the material. It is also known as ***residual magnetism*** or ***remanent magnetism*** or ***remanence***.

To reduce intensity of magnetisation to zero, the magnetising field has to be increased in reverse direction. As it is done so, the intensity of magnetisation decreases along BC, till it becomes zero corresponding to point C. Thus, to make intensity of magnetisation zero, magnetising field equal to OC has to be applied in reverse direction. Here, OC gives the measure of ***coercivity*** of the material of the specimen.

Key point

Hysteresis is shown by only ferromagnetic substances.

The value of reverse magnetising field required so as to reduce residual magnetism to zero, is called coercivity of the material.

When the magnetising field is further increased in reverse direction, intensity of magnetisation increases along CD as the magnetising field is increased. Corresponding to point D (when the magnetising field becomes $-H_0$), it again acquires a saturation value, which is symmetrical to that corresponding to point A. If the magnetising field is decreased from $-H_0$ to zero, the intensity of magnetisation follows the path DE. Finally, when magnetising field is increased in original direction, the point A is reached via EFA. If the magnetising field is repeatedly changed between H_0 and $-H_0$, the curve ABCDEFA is retraced. The curve ABCDEFA is called the ***hysteresis loop***. It is found that the area of the ***hysteresis loop*** (I – H curve) is proportional to the net energy absorbed per unit volume by the specimen, as it taken over a complete cycle of magnetisation and demagnetisation. The energy so absorbed by the specimen appears as the heat energy.

Note. If hysteresis loop is drawn by plotting a graph between magnetic induction (B) and intensity of magnetisation, then area of the hysteresis loop is numerically equal to the work done per unit volume (or energy absorbed per unit volume) in taking the magnetic specimen over a complete cycle of magnetisation.

Self-test Question

The integral $\oint B\, d I$ represents the area of I – B curve when a magnetic substance is taken over a complete cycle of magnetisation. Show that it has dimensions of energy per unit volume.

Key point

The area of I – H curve is proportional to and area of I – B curve for a magnetic substance is numerically equal to net energy absorbed per unit volume by it, as it is taken over a complete cycle of magnetisation.

5.08. COMPARISON OF HYSTERESIS LOOPS FOR SOFT IRON AND STEEL

The shape of the hysteresis loop is a characteristics of a ferromagnetic substance. It gives the idea about many important magnetic properties of the substance.

Fig. 5.21. shows hysteresis loops for soft iron and steel. Whereas the hysteresis loop for soft iron is narrow, the hysteresis loop for steel is quite wide. The following conclusions can be drawn from the study of the hysteresis loops of soft iron and steel.

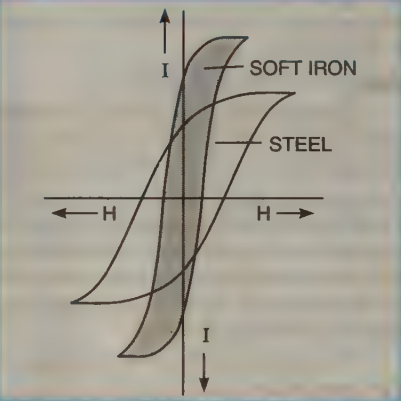

Fig. 5.21

1. The area of hysteresis loop for soft iron is much smaller than that for steel, therefore loss of energy per unit volume in case of soft iron will be very small as compared to that in case of steel, when they are taken over a complete cycle of magnetisation and demagnetisation.

2. Soft iron acquires maximum intensity of magnetisation for comparatively much lesser value of magnetising field than in case of steel. In other words, soft iron is much strongly magnetised (or more susceptible to magnetism) than steel.

3. The retentivity of soft iron is greater than that of steel. On removing magnetising field, quite a large amount of magnetisation is retained by soft iron.

4. The coercivity of steel is much larger than that of soft iron. Therefore, the residual magnetism in steel can not be destroyed that easily as in case of soft iron.

5.09. APPLICATIONS OF FERROMAGNETIC SUBSTANCES

The choice of a particular ferromagnetic material for a practical application is decided from the magnetic properties, such as retentivity, coercivity and area of the hysteresis loop.

1. Permanent magnets. The materials used for making permanent magnets should possess a high value of both retentivity and coercivity. Soft iron has high retentivity but due to small value of coercivity, it is unsuitable for making permanent magnets. Steel possesses fairly larger value of retentivity and a high value of coercivity. No doubt, large magnetising fields are needed to magnetise steel but once magnetised, the magnetisation is retained to a large extent due to its large retentivity. The magnetisation in steel is not easily destroyed, even if it gets exposed to stray reverse magnetic fields or when handled roughly. The area of hysteresis loop is large for steel but it is of no consideration as a permanent magnet has never to be taken through a cycle of magnetisation. Cobalt steel (52% iron, 36% cobalt, 7% tungsten, 3·5% chromium, 0·5% manganese and 0 · 7 % carbon) and carbon steel (98% iron, 0·86% carbon and 0·9% manganese) are used for making permanent magnets. The alloy alnico (55% iron, 10% aluminium, 17% nickel, 12% cobalt and 6% copper) is also very suitable for making permanent magnets. The only disadvantage is that alnico is brittle. The following table gives the retentivity and coercivity of cobalt steel, carbon steel and alnico :

Key point

The ferromagnetic materials used for making permanent magnets should possess high value of both retentivity and coercivity.

Material	Retentivity (A m^{-1})	Coercivity (T)
Cobalt steel	18×10^3	0·95
Carbon steel	$3{\cdot}6 \times 10^3$	0·95
Alnico	42×10^3	0·76

2. Electromagnets. These are the magnets, which can be turned on and off by switching the current on and off. Obviously, the materials used for making an electromagnet should possess high retentivity and low coercivity. Since such a material has to undergo magnetisation and demagnetisation again and again, the area of hysteresis loop of the material used for making electromagnet should also be small. All these requirements are best fulfilled by soft iron. An electromagnet is made by winding a coil of insulated wire around a soft iron core. When electric current is passed through the wire, magnetic field set up in the coil magnetises the soft iron core. When the current is switched off, the magnetic field disappears and the soft iron core loses its magnetism. The electromagnets are used in electric bells, relays, telephones, etc. In factories, electromagnets are used to lift heavy machines and bulks of iron scrap.

3. Transformer cores. For better inductive effect, the two coils of a transformer are always wound on a core of ferromagnetic material. When alternating current is passed through a transformer, the core of the transformer undergoes a large number of cycles of magnetisation and demagnetisation every second. During each cycle, energy proportional to the area of the hysteresis loop for the material of core is wasted in the form of heat. So that efficiency of the transformer is high, the material chosen for making the core of the transformer should have narrow hysteresis loop. On account of this, soft iron is used to make the core of transformers. Mumetal (76% nickel, 17% iron, 5% copper and 2% chromium) also possesses a narrow hysteresis loop and is used for making the core of transformers.

Key point

The ferromagnetic materials used for making electromagnets or core of a transformer should possess high retentivity, low coercivity and small area of I – H curve.

SOLVED NUMERICAL PROBLEMS

Type A. On Magnetisation, Permeability and Susceptibility

Problem 5.01. The permeability of mumetal is measured to be 0 · 12 T A^{-1} m. Find its relative permeability and susceptibility.

Sol. Here, $\mu = 0 \cdot 12 \text{ T A}^{-1} \text{ m}$

We know, $\mu_0 = 4\pi \times 10^{-7} \text{ T A}^{-1} \text{ m}$

$$\therefore \quad \mu_r = \frac{\mu}{\mu_0} = \frac{0{\cdot}12}{4\pi \times 10^{-7}} = \mathbf{9 \cdot 59 \times 10^4}$$

Also, $\chi_m = \mu_r - 1 = 9 \cdot 59 \times 10^4 - 1 = \mathbf{9 \cdot 59 \times 10^4}$

Problem 5.02. An iron rod of 0 · 5 cm^2 area of cross-section is subjected to a magnetising field of 1200 A m^{-1}. If susceptibility of iron is 599, calculate (*i*) μ (*ii*) B and (*iii*) ϕ (magnetic flux) produced.

Sol. Here, $A = 0 \cdot 5 \text{ cm}^2 = 0 \cdot 5 \times 10^{-4} \text{ m}^2$;

$H = 1200 \text{ A m}^{-1}$; $\chi_m = 599$

We know, $\mu_0 = 4\pi \times 10^{-7} \text{ T A}^{-1} \text{ m}$

(*i*) $\mu = \mu_0 (1 + \chi_m) = 4\pi \times 10^{-7} (1 + 599)$

$= \mathbf{7 \cdot 54 \times 10^{-4} \text{ T A}^{-1} \text{ m}}$

(*ii*) $B = \mu H = 7 \cdot 54 \times 10^{-4} \times 1200 = \mathbf{0 \cdot 905 \text{ T}}$

(*iii*) $\phi = B A = 0 \cdot 905 \times 0 \cdot 5 \times 10^{-4}$

$= \mathbf{4 \cdot 525 \times 10^{-5} \text{ Wb}}$

Problem 5.03. A Rowland ring of mean radius 15 cm has 3500 turns of wire wound on a ferromagnetic core of relative permeability 800. What is the magnetic field in the core for a magnetising current of 1 · 2A ? (*Text Problem*)

Sol. Here, $I = 1 \cdot 2 \text{ A}$; $\mu_r = 800$; $a = 15 \text{ cm} = 0 \cdot 15 \text{ m}$;

Total number of turns = 3500

Length over which the wire is wound,

$l = 2\pi a = 2\pi \times 0 \cdot 15 \text{ m}$

Therefore, number of turns per unit length,

$$n = \frac{3500}{l} = \frac{3500}{2\pi \times 0{\cdot}15}$$

If u_r is relative permeability of the core, then

$$B = \mu_0 \mu_r n I = \frac{4\pi \times 10^{-7} \times 800 \times 3500 \times 1{\cdot}2}{2\pi \times 0{\cdot}15}$$

$= \mathbf{4 \cdot 48 \text{ T}}$

Type B. On Curie's Law

Problem 5.04. For a magnetising field of intensity 2×10^3 A m^{-1}, aluminium at 280 K acquires intensity of magnetisation of $4 \cdot 8 \times 10^{-2}$ A m^{-1}. Find the susceptibility of aluminium at 280 K. If the temperature of the aluminium is raised to 320 K, what will be its susceptibility and intensity of magnetisation ?

Sol. Here, $H = 2 \times 10^3 \text{ A m}^{-1}$;

$I = 4 \cdot 8 \times 10^{-2} \text{ A m}^{-1}$ and $T = 280 \text{ K}$

$$\text{Now,} \quad \chi_m = \frac{I}{H} = \frac{4{\cdot}8 \times 10^{-2}}{2 \times 10^3} = \mathbf{2 \cdot 4 \times 10^{-3}}$$

Aluminium is a paramagnetic substance and hence obeys Curies' law. If χ_m' is susceptibility of aluminium at temperature T′ (= 320 K), then

$$\frac{\chi_m'}{\chi_m} = \frac{T}{T'} \quad \text{or} \quad \chi_m' = \chi_m \times \frac{T}{T'}$$

$$\text{or} \quad \chi_m' = 2 \cdot 4 \times 10^{-3} \times \frac{280}{320} = \mathbf{2 \cdot 1 \times 10^{-5}}$$

If I′ is intensity of magnetisation of aluminium at 320 K, then

$I' = \chi_m' H = 2 \cdot 1 \times 10^{-5} \times 2 \times 10^3$

$= \mathbf{4 \cdot 2 \times 10^{-2} \text{ A m}^{-1}}$

Type C. On Hysteresis loss

Problem 5.05. An iron sample having mass 8 · 4 kg is repeatedly taken over cycles of magnetisation and demagnetisation at a frequency of 50 cycles s^{-1}. It is found that energy equal to $3 \cdot 2 \times 10^4$ J is dissipated as heat in the sample in 30 minutes. If the density of the iron is 7200 kg m^{-3}, calculate the value of energy dissipated per unit volume per cycle in the iron sample.

Sol. Let Q be the energy dissipated per unit volume per second in the given iron sample. Then, total energy lost by the sample in a given time t,

$$W = Q \times V \times \nu \times t, \qquad \ldots(i)$$

where V is volume of the sample and ν is frequency of magnetisation and demagnetisation.

Here, $W = 3 \cdot 2 \times 10^4$ J; $V = \dfrac{\text{mass}}{\text{density}} = \dfrac{8 \cdot 4}{7200}$ kg m^{-3},

$\nu = 50$ cycle s^{-1} and $t = 30$ minutes $= 30 \times 60$ s

From equation (*i*), we have

$$Q = \frac{W}{V \times \nu \times t} = \frac{3 \cdot 2 \times 10^4 \times 7200}{8 \cdot 4 \times 50 \times 30 \times 60}$$

$$= \mathbf{304 \cdot 8 \ J \ m^{-3} \ cycle^{-1}}$$

abc TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For **a**mbitious, **b**rilliant & **c**urious Students

Problem 5.06. A bar magnet has pole strength 4·5 A m, magnetic length 12 cm and cross-sectional area 0·9 cm^2. Find (*a*) intensity of magnetisation (I), (*b*) magnetic intensity (H) at the centre and (*c*) magnetic induction (B) at the centre of the magnet.

Sol. Here, $m = 4 \cdot 5$ A m ; $2l = 12$ cm $= 0 \cdot 12$ m and

$$A = 0 \cdot 9 \ cm^2 = 0 \cdot 9 \times 10^{-4} \ m^2$$

(*a*) Now, $I = \dfrac{m}{A} = \dfrac{4 \cdot 5}{0 \cdot 9 \times 10^{-4}} = \mathbf{5 \times 10^4 \ A \ m^{-1}}$

(from S-pole to N-pole)

(*b*) The magnetic intensity due to a magnetic pole at a distance r is given by

$$H = \frac{1}{4\pi} \cdot \frac{m}{r^2}$$

For a point at the centre of the magnet,

$$r = \frac{2l}{2} = \frac{0 \cdot 12}{2} = 0 \cdot 06 \ m$$

Therefore, magnetic intensity at the centre of magnet due to its N-pole,

$$H_1 = \frac{1}{4\pi} \cdot \frac{4 \cdot 5}{(0 \cdot 06)^2}$$

$= 99 \cdot 5$ A m^{-1} (towards S-pole)

Also, magnetic intensity at the centre of magnet due to its S-pole,

$$H_2 = \frac{1}{4\pi} \cdot \frac{4 \cdot 5}{(0 \cdot 06)^2}$$

$= 99 \cdot 5$ A m^{-1} (towards S-pole)

The resultant magnetic intensity at the centre of the magnet,

$$H = H_1 + H_2 = 99 \cdot 5 + 99 \cdot 5$$

$= \mathbf{199 \ A \ m^{-1}}$ **(towards S-pole)**

(*c*) Now, magnetic induction at the centre of the magnet,

$$B = \mu_0 (H + I)$$

Since H and I have opposite direction and I is greater than H,

$$B = 4\pi \times 10^{-7} (-199 + 5 \times 10^4)$$

$= \mathbf{6 \cdot 26 \times 10^{-2} \ T}$ **(towards N-pole)**

Problem 5.07. A sample of paramagnetic salt contains $2 \cdot 0 \times 10^{24}$ atomic dipoles, each of dipole moment $1 \cdot 5 \times 10^{-23}$ J T^{-1}. The sample is placed under homogeneous magnetic field of 0 · 84 T and cooled to a temperature of 4 · 2 K. The degree of magnetic saturation achieved is equal to 15%. What is the total dipole moment of the sample for a magnetic field of 0 · 98 T and a temperature of 2 · 8 K (assume Curie's law) ? (*Text Problem*)

Sol. Magnetic dipole moment of each dipole

$$= 1 \cdot 5 \times 10^{-23} \ J \ T^{-1}$$

Number of atomic dipoles $= 2 \cdot 0 \times 10^{24}$

Therefore, possible magnetic dipole moment of the sample,

$$M = 1 \cdot 5 \times 10^{-23} \times 2 \cdot 0 \times 10^{24} = 30 \ J \ T^{-1}$$

At temperature of 4 · 2 K, the magnetic saturation is 15%.

Therefore, dipole moment achieved at 4 · 2 K,

$$M_1 = 30 \times \frac{15}{100} = 4 \cdot 5 \ J \ T^{-1}$$

According to Curie's law,

$$M \propto \frac{B}{T} \quad \text{or} \quad \frac{M_1}{M_2} = \frac{B_1}{T_1} \times \frac{T_2}{B_2}$$

or $$M_2 = M_1 \times \frac{T_1}{T_2} \times \frac{B_2}{B_1}$$

Here, $M_1 = 4 \cdot 5$ J T^{-1} ; $T_1 = 4 \cdot 2$ K ; $T_2 = 2 \cdot 8$ K ;
$B_1 = 0 \cdot 84$ T and $B_2 = 0 \cdot 98$ T

$$\therefore \quad M_2 = \frac{4 \cdot 5 \times 4 \cdot 2 \times 0 \cdot 98}{2 \cdot 8 \times 0 \cdot 84} = \mathbf{7 \cdot 875 \ J \ T^{-1}}$$

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 5.01. Define intensity of magnetisation of a magnetic material. How does it vary with temperature of a paramagnetic material ? (*C.B.S.E. 2001*)

Ans. *Intensity of magnetisation of a substance is defined as the magnetic moment developed per unit volume, when it is subjected to a magnetising field.*

The intensity of magnetisation of a paramagnetic substance is inversely proportional to its absolute temperature.

Q. 5.02. Write down the dimensional formula of magnetic flux. (*H.S.S.C.E. 2001*)

Ans. The dimensional formula of magnetic flux is [M L^2 T^{-2} A^{-1}]. For details, refer to SAQ 4.03.

Q. 5.03. Name the physical quantity which is measured in weber ampere^{-1}. (*H.S.S.C.E. 1994*)

Ans. $$\left[\frac{B}{M}\right] = \frac{\text{weber metre}^{-2}}{\text{ampere metre}^{-2}} = \text{weber ampere}^{-1}$$

Thus, ratio of magnetic induction to the magnetic noment is measured in weber ampere^{-1}.

Q. 5.04. Define magnetic susceptibility. (*H.S.S.C.E. 2001*)

Ans. *It is defined as the ratio of the intensity of magnetisation f a substance to the intensity of magnetising field.*

Q. 5.05. Define magnetic permeability. (*I.S.C.E. 1998*)

Ans. It is defined as the ratio of the magnetic induction B) to the magnetic intensity (H).

Mathematically, $\mu = \frac{B}{H}$.

Q. 5.06. An iron rod of 0 · 1 m² area of cross-section is ubjected to a magnetising field of 1000 A m^{-1}. Calculate ts magnetic permeability. Given susceptibility of iron is 599. (*H.S.S.C.E. 2001*)

Ans. Here, $A = 0 \cdot 1\ m^2$; $H = 1000\ A\ m^{-1}$ and $\chi_m = 599$

We know, $\mu_0 = 4\pi \times 10^{-7}\ T\ A^{-1}\ m$

Now, $\mu = \mu_0 (1 + \chi_m) = 4\pi \times 10^{-7} (1 + 599)$

$= \mathbf{7 \cdot 54 \times 10^{-4}\ T\ A^{-1}\ m}$

Q. 5.07. Name the source of magnetic properties of materials.

Ans. Magnetism is an effect of electric charges in motion. The magnetic properties of the materials due to the atomic magnets, which are the tiny circulating currents in the form of electrons revolving in atomic orbits.

Q. 5.08. What is meant by the non-magnetic material ?

Ans. Non-magnetic materials are those materials, which cannot be affected very much by the strong magnetic field.

Q. 5.09. What is a diamagnetic substance ? (*P.S.S.C.E. 1997*)

Ans. A substance, which when placed in a magnetic field gets feebly magnetised in a direction opposite to that of the magnetising field, is called a diamagnetic substance.

Q. 5.10. Name any two diamagnetic substances. (*P.S.S.C.E. 1999 S*)

Ans. 1. Zinc 2. Bismuth.

Q. 5.11. What happens, when a diamagnetic substance is placed in a varying magnetic field ? (*P.S.S.C.E. 2002, 1998*)

Ans. It moves from stronger part of the magnetic field to the weaker part.

Q. 5.12. Why is diamagnetism independent of temperature ? (*H.P.S.S.C.E. 1996 ; Text Question*)

Ans. The atoms of a diamagnetic do not have intrinsic magnetic dipole moment. In a diamagnetic sample, the magnetic moment of the sample on placing in a magnetic field is always opposite to the direction of the field. It is not affected by the thermal motion of the dipoles.

Q. 5.13. The magnetic susceptibility for a sample has a small negative value. To which class of magnetic substances, does the specimen belong ?

Ans. Diamagnetic.

Q. 5.14. What is paramagnetic substance ? (*P.S.S.C.E. 1999, 1998 S*)

Ans. A substance, which when placed in a magnetic field gets feebly magnetised in the direction of the magnetising field, is called a paramagnetic substance.

Q. 5.15. Name any two paramagnetic substances. (*P.S.S.C.E. 1999 S*)

Ans. 1. Aluminium 2. Manganese.

Q. 5.16. The value of intensity of magnetisation is small positive for a specimen. Is it diamagnetic or paramagnetic or ferromagnetic ?

Ans. Paramagnetic.

Q. 5.17. Why does a paramagnetic sample display greater magnetisation (for the same magnetising field), when cooled ? (*Text Question ; H.P.S.S.C.E. 1998 S*)

Ans. When cooled, the tendency of the thermal agitation to disrupt the alignment of magnetic dipoles decreases in case of paramagnetic materials. Hence, they display greater magnetisation.

Q. 5.18. State Curie law in magnetism. (*H.P.S.S.C.E. 2001*)

Ans. Refer to section 5.04.

Q. 5.19. What is Curie point ?

Ans. It is the temperature for a ferromagnetic substance above which, it behaves as paramagnetic.

Q. 5.20. How does the magnetic induction of a paramagnetic material vary with temperature ? (*C.B.S.E. 2000, 1999*)

Ans. It decreases with increase of temperature.

Q. 5.21. How does the intensity of magnetisation of a paramagnetic material vary with increasing applied magnetic field ? (*C.B.S.E. 1996*)

Ans. The intensity of magnetisation of a paramagnetic material increases directly with increase in applied magnetic field.

Q. 5.22. How can paramagnetic and diamagnetic materials be distinguished by studying their behaviour in a magnetic field ? (*I.S.C.E. 1994*)

Ans. In a non-uniform magnetic field, a paramagnetic substance will move from weaker part of the magnetic field to the stronger part, while a diamagnetic substance will move from stronger to weaker part of the field.

Q. 5.23. State two properties of ferromagnetic substances. (*P.S.S.C.E. 2002*)

Ans. Refer to section 5.06.

Q. 5.24. Why do magnetic field lines prefer to pass through ferromagnetic substances (*e.g.* iron) than through air ? (*C.B.S.S.E. 1999*)

Ans. Ferromagnetic substances have relative permeability quite greater than 1. Hence, the magnetic field lines prefer to pass through them.

Q. 5.25. What type of magnetic material is used in making permanent magnets ? (*C.B.S.E. 1999 S, 1996*)

Ans. For making permanent magnet, a material having high coercivity is used.

Q. 5.26. Why is it possible to make permanent magnets out of steel ? (*I.S.C.E. 1998*)

Or

Why do we prefer to use the alloy alnico for making permanent magnets ? (*H.P.S.S.C.E. 1998*)

Ans. It is because, steel (or alnico) has a large coercivity.

Q. 5.27. Soft iron is used to make electromagnets. Why ? (*H.S.S.C.E. 2000*)

Ans. It is because of the fact that hysteresis loop for soft iron is narrow. Due to this, loss of energy per unit volume is small, when soft iron is taken over complete cycle of magnetisation.

Q. 5.28. Which is the material used in making the core of a transformer or a moving coil galvanometer ? *(C.B.S.E. 1999 S, 1996)*

Ans. Soft iron is used in making the core of the galvanometer. It makes the magnetic field strong as magnetic field lines tend to cross through a ferromagnetic.

Q. 5.29. Why soft iron is used in making the core of a transformer ? *(P.S.S.C.E. 2002)*

Ans. The area of hysteresis loop for soft iron is very small. Since energy dissipated during a complete cycle of magnetisation and demagnetisation is proportional to area of the hysteresis loop, a small amount of energy will be wasted, when core of the transformer is made of soft iron.

Q. 5.30. The hysteresis loop of a soft iron piece has a much smaller area than that of a carbon steel piece. If the material is to go through repeated cycles of magnetisation, which piece will dissipate greater heat energy ? *(Text Question)*

Ans. The carbon steel piece will dissipate greater heat energy as its hysteresis loop has greater area.

Q. 5.31. State two methods to destroy the magnetism of a magnet. *(P.S.S.C.E. 2002)*

Ans. 1. By applying magnetising field in reverse direction.

2. By heating the magnet.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 5.01. What is meant by magnetic field and magnetic field intensity ? *(H.S.S.C.E. 1994)*

Ans. Refer to section 5.01.

Q. 5.02. Define magnetic flux. Write its dimensions. *(P.S.S.C.E. 2000, 1998 S)*

Ans. Magnetic flux through a surface is defined as the number of magnetic field lines passing normally through that surface. Mathematically,

$$\phi = \vec{B} \cdot \Delta\vec{S},$$

where the letters have their usual meanings.

Dimensional formula of magnetic flux $[\phi] = [ML^2T^{-2}A^{-1}]$

Q. 5.03. Define magnetic susceptibility and magnetic permeability.

Ans. Refer to section 5.01.

Q. 5.04. What is relative permeability of a magnetic material ? How is it related to the magnetic susceptibility ? *(I.S.C.E. 1997)*

Ans. The relative permeability of a material is defined as the ratio of its absolute permeability to the absolute permeability of vacuum.

Mathematically, $\mu_r = \dfrac{\mu}{\mu_0}$

Relative permeability (μ_r) and magnetic susceptibility are related to each other as

$$\mu_r = 1 + \chi_m$$

Q. 5.05. What do we infer from the large value of the susceptibility of the material ? For example, susceptibility of iron is more than that of copper. Explain.

Ans. The susceptibility of a material is defined as the ratio of the intensity of magnetisation (I) to the magnetic intensity (H) *i.e.*

$$\chi_m = \frac{I}{H}$$

In other words, greater the value of the susceptibility of a material, greater will be the value of intensity of magnetisation for it *i.e.* more easily it can be magnetised. Thus, greater value of susceptibility for iron means that iron can be magnetised more easily than copper.

Q. 5.06. Distinguish between dia, para and ferro magnetic substances. Give one example of each. *(H.S.S.C.E. 1999 ; C.B.S.E. 1994)*

Or

Give one difference each between diamagnetic, para-magnetic and ferromagnetic substances. *(C.B.S.E. 1992)*

Ans. A diamagnetic is feebly magnetised in a direction opposite to the direction of magnetising field, whereas a paramagnetic is magnetised feebly and ferromagnetic strongly in the direction as that of the field.

For examples, refer to section 5.06.

Q. 5.07. Give any four properties of a diamagnetic substance. *(P.S.S.C.E. 1999 S)*

Ans. Refer to section 5.06.

Q. 5.08. The susceptibility of a magnetic material is $-0 \cdot 085$. Identify the magnetic type of the substance. A specimen of this material is kept in a uniform magnetic field. Draw the modified field pattern. *(C.B.S.E. 2001)*

Ans. Since the susceptibility of the material has a small negative value, the given material is diamagnetic in nature.

When this material is kept in a uniform magnetic field, the magnetic field lines will become slightly less dense as shown in Fig. 5.14.

Q. 5.09. State two properties each of a para and dia-magnetic substances. *(P.S.S.C.E. 2000, 1999, 1998 S, 1997 S)*

Ans. Properties of paramagnetic substances. 1. When placed in magnetic field, a paramagnetic material gets feebly magnetised along the direction of field.

2. It obeys Curie's law in magnetism.

Properties of diamagnetic substances. 1. When placed in magnetic field a diamagnetic substance gets feebly magnetised in a direction opposite to that of the field.

2. It does not obey Curie's law.

Q. 5.10. Distinguish between a diamagnetic substance and a paramagnetic substance stating two points of difference. *(C.B.S.E. 2001 S)*

Ans. Refer to section 5.06.

Q. 5.11. Two substances A and B have their relative permeabilities slightly greater and less than unity respectively. What do you conclude about A and B ? *(I.S.C.E. 1997)*

Ans. We know, $\mu_r = 1 + \chi_m$

Since relative permeability of substance A is slightly greater than 1, it follows that its susceptibility is small positive and hence it is a **paramagnetic** substance.

On the other hand, as relative permeability of B is ightly less than 1, its susceptibility is small negative and ence it is a **diamagnetic** substance.

Q. 5.12. Give any four properties of a paramagnetic ubstance. (*P.S.S.C.E. 1999 S*)

Ans. Refer to section 5.06.

Q. 5.13. Does the magnetisation of a paramagnetic salt epend on temperature ? Give reason for your answer. (*C.B.S.E. 1990*)

Ans. Yes, the magnetisation of a paramagnetic salt epends on temperature. The atoms of a paramagnetic aterial possess small magnetic dipole moments but these tomic dipoles are randomly oriented. When external agnetic field is applied, the magnetic dipoles try to align but e thermal agitation hampers the alignment. Hence, the agnetisation of a paramagnetic salt depends on the emperature.

Q. 5.14. Distinguish between diamagnetic and paraagnetic substances in terms of their susceptibility, permebility and nature of magnetism, when placed in a uniform agnetic field. (*I.S.C.E. 1995*)

Ans. Refer to section 5.06.

Q. 5.15. Would the maximum possible magnetisation f a paramagnetic sample be of the same order of magnitude s the magnetisation of a ferromagnetic ? (*Text Question*)

Ans. Yes, a paramagnetic sample with saturated agnetisation will have the same order of magnetisation as e magnetisation of a ferromagnet. However, the saturated agnetisation will require magnetising field too high to chieve. Further, there may be a minor difference in the trengths of the atomic dipoles of paramagnetic and erromagnetic materials.

Q. 5.16. Why are all pieces of iron not magnet even hough iron is a ferromagnetic material ?

Ans. In iron, the atomic magnetic dipoles are randomly riented in the form of small domains, such that the net agnetic moment of the specimen is zero. It becomes magnet nly on applying external magnetic field. When external field s applied, the magnetic dipoles align along the direction of he field and the specimen becomes magnet as it now ossesses non-zero magnetic moment.

Q. 5.17. An iron bar magnet is heated to 1000° C and hen cooled in a magnetic field free space. Will it retain agnetism ? (*C.B.S.E. 1990*)

Ans. At 1000°C, which is quite above the Curie emperature for iron (770° C), the iron will behave as aramagnetic. Moreover, when a magnet is heated, it loses its magnetism. Hence, iron bar magnet on heating to 1000° C and then cooled, will not retain its magnetism.

Q. 5.18. Is the permeability of a ferromagnetic material independent of the magnetic field ? If not, is it more for lower or higher fields ? (*Text Question*)

Ans. No, permeability of a ferromagnetic material depends upon the applied magnetic field. It is more for lower value of applied field. Graph between B and H is of the shape as shown in Fig. 5.20. Obviously, the value of B will be more for lesser value of H.

Q. 5.19. Give two points to compare the magnetic properties of steel and soft iron. (*C.B.S.E. 1990*)

Ans. 1. The area of the hysteresis loop for steel is larger than that for soft iron. On account of this, the loss of energy per unit volume in case of steel will be much larger as compared to that in case of soft iron, when they are taken over a complete cycle of magnetisation. For this reason, soft iron is used to make core of a transformer.

2. The coercivity for steel is very large as compared to that for soft iron. For this reason, steel is used to make permanent magnet.

Q. 5.20. What are the uses of studying the hysteresis curve for a given material ?

Ans. The main use of the study of hysteresis curve of a material is that it gives an estimate of the *hysteresis loss*. Moreover, the study of the hysteresis curve helps in knowing the retentivity and coercivity of the material. Their knowledge helps in selecting proper materials for making core of transformers, permanent magnets and electromagnets.

Q. 5.21. Why do we use steel or alnico for making permanent magnets ?

Ans. The material used for making a permanent magnet should have high value of coercivity and also high value of retentivity. Moreover, the area of hysteresis curve should also be large. A permanent magnet is never taken through a complete cycle of magnetisation and hence large area of hysteresis curve will not be a demerit of such a material. Steel and alnico fulfil all these requirements.

Q. 5.22. What sort of hysteresis loop should a material have, if it is to be used for the core of a transformer ?

Ans. The core of a transformer undergoes cycles of magnetisation again and again. During each cycle of magnetisation, energy numerically equal to the area of the hysteresis loop is spent per unit volume of the core. Therefore, for high efficiency of transformer, the energy loss will be lesser, if the hysteresis loop is of lesser area *i.e.* narrow. Since, soft iron has narrow hysteresis loop, it should be used as the core of a transformer.

abc TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 5.01. A strong horse-shoe magnet is closed by a piece A made of iron [Fig. 5.22 (*a*)]. The weight of the iron iece A corresponds to the lifting force of the magnet and he magnet can easily hold the piece of iron. If the poles of he magnet are now touched on the sides with a piece B made of soft iron [Fig. 5.22 (*b*)], the iron piece A will drop t once. Explain the above observation with a proper xplanation.

Ans. When the horse-shoe magnet is closed by piece of ron A, the magnetic field lines run through the magnet and he piece of iron A as shown in Fig. 5.22 (*a*). As a result of the

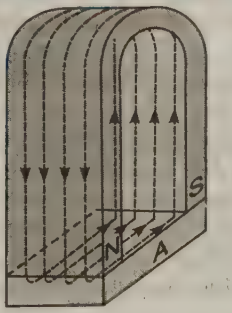

Fig. 5.22(a)

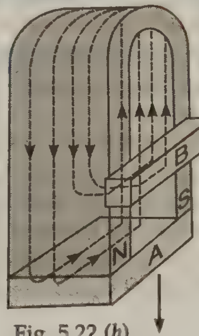

Fig. 5.22 (b)

strong attraction, the piece of iron A is held by the horse-shoe magnet.

When the piece of iron B is placed in contact on the sides of horse-shoe magnet, part of the magnetic field lines are short circuited through this piece of iron [Fig. 5.22 (*b*)]. The number of lines of force penetrating the piece A sharply decreases. As a result, the attraction between the magnet and the iron piece A also decreases and it drops.

Q. 5.02. A long rod R made of soft iron is placed in vertical position. If a strong magnet NS is brought to the top of the rod as shown in Fig. 5.23 (*a*), the rod gets magnetised so intensely that it is able to hold at its other end several small pieces of iron. If the same magnet NS is placed so as to stick to the rod at its side near the bottom, the magnetisation of the rod is too weak to hold the pieces of iron [Fig. 5.23 (*b*)]. Explain, why the magnet N S acts differently in these two cases.

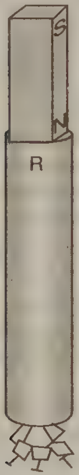

Fig. 5.23 (*a*)

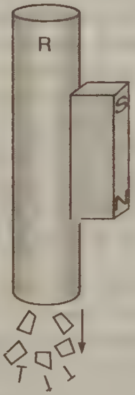

Fig. 5.23. (*b*)

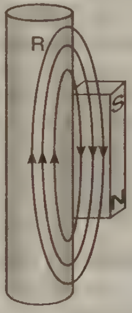

Fig. 5.23. (*c*)

Ans. The rod holds the small pieces of iron as it gets intensely magnetised due to the magnet placed at its top as shown in Fig. 5.23 (*a*).

When the magnet is placed on the side of the rod [Fig. 5.23 (*b*)], most of the magnetic lines of force are short-circuited inside the part of rod adjoining the magnet as shown in Fig. 5.23 (*c*). As such, the rod does not remain intensely magnetised as before. The result is that the pieces of iron drop.

Q. 5.03. A certain region of space is to be shielded from magnetic fields. Suggest a method. (*Text Question*)

Ans. It can be done by surrounding the region with soft iron rings. Magnetic field lines will be drawn into the rings and the enclosed space will be free of magnetic field.

Q. 5.04. If a toroid uses bismuth for its core, will the field in the core be (slightly) greater or (slightly) less than when the core is empty ? (*Text Question*)

Ans. Since bismuth is diamagnetic, the field in the core will be slightly less than that when the core is empty.

Q. 5.05. Several steel needles are freely suspended on hooks from a small brass disc as shown in Fig. 5.24. If the pole of a strong magnet is brought up to the needles from below ; the needles will first be drawn apart and then will again assume a vertical position, when the magnet is brought right up to them. As the magnet is removed, the needles will again be drawn apart forming a cone-shaped bunch. Explain the causes of such behaviour of the needles.

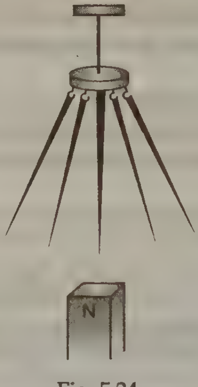

Fig. 5.24

Ans. All the steel needles develop south-poles at their lower ends due to induced magnetism and are drawn apart due to mutual force of repulsion between them.

When the magnet is sufficiently close to the needles, the force of attraction between the needles and the magnet exceeds the mutual force of repulsion between them. Under the effect of net attractive force due to the magnet, the steel needles assume a vertical position.

When the magnet is removed, the needles are again drawn apart due to the mutual repulsive force between the needles because of the residual magnetism left on the needles.

Q. 5.06. Magnetic field lines are always nearly normal to the surface of a ferromagnet at every point (This fact is analogous to the static electric field lines being normal to the surface of a conductor at every point). Why ?

(*Text Question*)

Ans. The exact explanation is beyond the scope of the book. However, it may be said that when a material has $\mu_r >> 1$, the field lines meet the material nearly normally.

Q. 5.07. A small thin iron nail is suspended from a light fire-proof thread [Fig. 5.25]. A strong electro-magnet is placed near the nail and a flame from a gas burner is produced between the nail and the electromagnet. The flame licks the nail, when it is attracted by the magnet. As the current through the solenoid of the electro-magnet is switched on, the nail will be at once deflected into the flame and will then get out of the flame to assume its original position. After a lapse of time, the nail will again be drawn to the magnet. Explain, what causes these periodic oscillations of the nail.

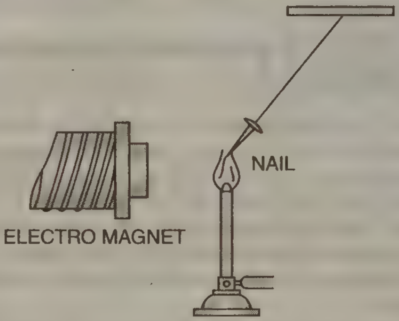

Fig. 5.25

Ans. When the iron nail is drawn into the flame on being attracted by the electromagnet, it loses its ferromagnetism on getting heated. As a result, the interaction between the nail and he electromagnet decreases abruptly and it returns to its nitial position. As the nail cools, it regains its ferromagnetism nd again gets attracted towards the magnet and is drawn nto the flame. The process repeats itself and the nail executes periodic oscillations.

Q. 5.08. Suppose a man proposes a theory that the earth's magnetic field is due to permanent magnetisation of molten iron core of earth. Will you accept this theory ? Give reasons for your answer. *(Roorkee, 1980)*

Ans. Curie temperature of iron is 770°C and the temperature of earth increases by $6°C\ km^{-1}$. Since radius of earth is 6400 km, the temperature of the iron core of earth will be so high that it can not retain magnetism. Hence, such a theory is not acceptable.

Q. 5.09. What kind of ferromagnetic material is used for coating magnetic tapes in a cassette player or for building 'memory stores' in a modern computer ? *(Text Question)*

Ans. Ceramics are used for coating magnetic tapes in a cassette player or for building memory stores in a modern computer. Ceramics are specially treated barium iron oxides and are also called *ferrites*.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Explain the terms (*a*) magnetic intensity, (*b*) intensity of magnetisation, (*c*) magnetic flux, (*d*) magnetic induction, (*e*) magnetic susceptibility and (*f*) magnetic permeability. Give their SI units.
2. Distinguish between paramagnetic, diamagnetic and ferromagnetic substances. *(H.S.S.C.E. 2002 ; C.B.S.E. 1992)*
3. What is the difference between ferromagnetic, paramagnetic and diamagnetic substances ? Classify the following materials in respect of the magnetic behaviour : (*i*) Mercury (*ii*) Water (*iii*) Iron (*iv*) Aluminium.
4. What are the categories, in which magnetic materials are classified ? Explain their differences. *(C.B.S.E. 1992 S)*
5. What are dia, para and ferromagnetic substances ? Give one example of each. *(H.S.S.C.E. 2002)*
6. Classify materials on the basis of their behaviour in a magnetic field. Under which category does iron come ? How does the magnetic property of iron change with increase of temperature ? *(C.B.S.E. 1995)*
7. What are diamagnetic substances ? Explain diamagnetism on the basis of electron theory. *(H.S.S.C.E. 2001)*
8. How are materials classified according to their behaviour in a magnetic field ? Why does the magnetisation of a paramagnetic salt increase on cooling ? *(C.B.S.E. 1991)*
9. State and explain Curie's law in magnetism. *(P.S.S.C.E. 2001, 2000 ; C.B.S.E. 1997)*
10. What are ferromagnetic substances ? Explain briefly domain theory to explain ferromagnetism. *(H.P.S.S.C.E. 2002)*
11. Give any six properties of diamagnetic substances. *(P.S.S.C.E. 2001)*
12. Compare any four properties of diamagnetic and paramagnetic substances. *(H.S.S.C.E. 2001)*
13. Explain magnetic hysteresis. *(H.S.S.C.E. 2001)*
14. What is hysteresis loop ? Explain with its help the terms related to it. *(H.P.S.S.C.E. 1999)*
15. What is a hysteresis loop ? Explain the different portions of a complete hysteresis loop.
16. Explain the phenomenon of hysteresis. Draw a hysteresis loop showing the remanence and coercive force. *(I.S.C.E. 1996)*

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. Distinguish between ferromagnetic, paramagnetic and diamagnetic materials. Explain diamagnetism and paramagnetism on the basis of electron theory. Give main properties of diamagnetic materials.
2. Describe briefly, how ferromagnetism can be explained on the basis of the domain theory. Give the important properties of ferromagnetic and diamagnetic substances.
3. What are dia, para and ferromagnetic materials ? Discuss their important properties. *(H.P.S.S.C.E. 1994 ; C.B.S.E. 1992, 1991 ; P.S.S.C.E. 1992)*
4. Define coercivity and remanence. How are soft iron and hard steel distinguished by the values of these quantities ? Sketch the hysteresis loop for soft iron and hard steel. What do you infer about these materials from their hysteresis loops ?

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Magnetisation, Permeability and Susceptibility

1. A magnet weighs 75 g and its magnetic moment is $2 \times 10^{-4}\ A\ m^2$. If the density of the material of the magnet is $7{\cdot}5 \times 10^3\ kg\ m^{-3}$, calculate the intensity of magnetisation. **[Ans.** $20\ A\ m^{-1}$**]**
2. The magnetic induction and magnetising field in a sample of magnetic material are $1{\cdot}0\ Wb\ m^{-2}$ and $2 \times 10^3\ A\ m^{-1}$ respectively. Find (*a*) magnetic permeability (*b*) relative permeability of the material, (*c*) magnetic susceptibility and (*d*) intensity of magnetisation. Given, $\mu_0 = 4\pi \times 10^{-7}\ T\ A^{-1}\ m$. **[Ans.** (*a*) $5 \times 10^{-4}\ T\ m\ A^{-1}\ m$; (*b*) 397·9 ; (*c*) 396·9 ; (*d*) $7{\cdot}94 \times 10^5\ A\ m^{-1}$**]**
3. The magnetising field of $1600\ A\ m^{-1}$ produces a magnetic flux of $2{\cdot}4 \times 10^{-5}$ weber in a bar of iron of cross-section $0{\cdot}2\ cm^2$. Calculate relative permeability, intensity of magnetisation and susceptibility of the bar. **[Ans.** 596·8, $9{\cdot}534 \times 10^5\ A\ m^{-1}$, 595·8**]**
4. The core of a toroid having 3000 turns has inner and outer radii of 11 cm and 12 cm respectively. The magnetic field

in the core for a current of 0·70 A is 2·5 T. What is the relative permeability of the core ? *(Text Problem)* **[Ans.** 684·5**]**

5. A Rowland ring has 10^3 turns per unit length. On passing a current of 2 A, magnetic induction is measured to be 1·5 Wb m^{-2}. Calculate (*i*) relative permeability of the core, (*ii*) magnetic susceptibility, (*iii*) magnetising field intensity and (*iv*) magnetisation. **[Ans.** (*i*) 596·8 ; (*ii*) 595·8 ; (*iii*) 2000 A m^{-1} ; (*iv*) $1·192 \times 10^6$ A m^{-1}**]**

Type B. On Curie's law

6. The susceptibility of magnesium at 300 K is $1·2 \times 10^{-5}$. At what temperature will the susceptibility equal to $1·44 \times 10^{-5}$? **[Ans.** 250 K**]**

Type C. On Hysteresis loop

7. The hysteresis loss for a specimen of iron weighing 12 kg is equivalent to 300 J m^{-3} cycle^{-1}. Find the loss of energy per hour at 50 cycles s^{-1}. Given, density of iron = 7500 kg m^{-3}. **[Ans.** $8·64 \times 10^4$ J**]**

MISCELLANEOUS PROBLEMS

8. Assume that each iron atom has a permanent magnetic moment equal to 2 Bohr magneton (1 Bohr magneton = $9·27 \times 10^{-24}$ A m^2). The number density of atoms in iron is $8·52 \times 10^{28}$ m^{-3}. Find the maximum value of (*a*) intensity of magnetisation and (*b*) magnetic induction in an iron bar. **[Ans.** (*a*) $1·58 \times 10^6$ A m^{-1} (*b*) 1·99 T**]**

9. A paramagnetic gas consists of atoms each with a dipole moment of $1·5 \times 10^{-23}$ J T^{-1}. The temperature of the gas is 27°C and its number density (number of atoms per unit volume) is 2×10^{26} m^{-3}. (*i*) What is the maximum magnetisation of the sample possible, when it is placed in an external magnetic field ? (*ii*) Do you think, the sample can achieve close to maximum magnetisation for a magnetic field of 3 T ? Given, Boltzmann's constant = $1·38 \times 10^{-23}$ J molecule^{-1} K^{-1}. *(Text Problem)* **[Ans.** 3×10^3 A m^{-1}, No**]**

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. If V is volume of the magnet, then

$$I = \frac{M}{V}$$

Now, $$V = \frac{\text{mass}}{\text{density}} = \frac{75 \times 10^{-3}}{7·5 \times 10^3} = 10^{-5}\ m^3$$

$$\therefore \quad I = \frac{2 \times 10^{-4}}{10^{-5}} = \mathbf{20\ A\ m^{-1}}$$

2. Here, B = 1·0 Wb m^{-2} ; H = 2×10^3 A m^{-1}

(*a*) Magnetic permeability,

$$\mu = \frac{B}{H} = \frac{1·0}{2 \times 10^3} = \mathbf{5 \times 10^{-4}\ T\ m\ A^{-1}}$$

(*b*) Relative permeability, $$\mu_r = \frac{\mu}{\mu_0} = \frac{5 \times 10^{-4}}{4\pi \times 10^{-7}} = \mathbf{397·9}$$

(*c*) Magnetic susceptibility, $\chi_m = \mu_r - 1 = 397·9 - 1 = \mathbf{396·9}$

(*d*) Intensity of magnetisation,

$$I = \chi_m H = 396·9 \times 2 \times 10^3$$
$$= \mathbf{7·94 \times 10^5\ A\ m^{-1}}$$

3. Here, H = 1600 A m^{-1} ; $\phi = 2·4 \times 10^{-5}$ Wb,

$$A = 0·2\ cm^2 = 0·2 \times 10^{-4}\ m^2$$

Now, magnetic induction, $$B = \frac{\phi}{A} = \frac{2·4 \times 10^{-5}}{0·2 \times 10^{-4}} = 1·2\ T$$

Also, $$\mu = \frac{B}{H} = \frac{1·2}{1600} = 7·5 \times 10^{-4}\ T\ m\ A^{-1}$$

Therefore, relative permeability,

$$\mu_r = \frac{\mu}{\mu_0} = \frac{7·5 \times 10^{-4}}{4\pi \times 10^{-7}} = \mathbf{596·8}$$

Again, $B = \mu_0 (H + I)$

$$\therefore \quad I = \frac{B}{\mu_0} - H = \frac{1·2}{4\pi \times 10^{-7}} - 1600$$
$$= 9·55 \times 10^5 - 1600 = \mathbf{9·534 \times 10^5\ A\ m^{-1}}$$

Finally, $\chi_m = \mu_r - 1 = 596·8 - 1 = \mathbf{595·8}$

4. Mean radius of toroid,

$$r = \frac{11 + 12}{2} = 11·5\ cm = 11·5 \times 10^{-2}\ m$$

Therefore, number of turns per unit length of the toroid,

$$n = \frac{\text{total number of turns}}{2\pi r} = \frac{3000}{2\pi \times 11·5 \times 10^{-2}}$$
$$= 4·152 \times 10^3\ m^{-1}$$

Now, magnetic field in the core of solenoid,

$$B = \mu_0 \mu_r n I \quad \text{or} \quad \mu_r = \frac{B}{\mu_0 n I}$$

or $$\mu_r = \frac{2·5}{4\pi \times 10^{-7} \times 4·152 \times 10^3 \times 0·70} = \mathbf{684·5}$$

5. Here, $n = 10^3\ m^{-1}$; I = 2 A ; B = 1·5 Wb m^{-2}

(*i*) Magnetic induction due to the solenoid,

$$B = \mu_0 \mu_r n I \quad \text{or} \quad \mu_r = \frac{B}{\mu_0 n I}$$

or $$\mu_r = \frac{1·5}{4\pi \times 10^{-7} \times 10^3 \times 2} = \mathbf{596·8}$$

(*ii*) $\chi_m = \mu_r - 1 = 596·8 - 1 = \mathbf{595·8}$

(*iii*) $$H = \frac{B}{\mu} = \frac{B}{\mu_0 \mu_r} = \frac{1·5}{4\pi \times 10^{-7} \times 596·8}$$
$$= \mathbf{2000\ A\ m^{-1}}$$

(*iv*) $I = \chi_m H = 595·8 \times 2000 = \mathbf{1·192 \times 10^6\ A\ m^{-1}}$

6. According to Curie's law ; $\chi_m = \frac{C}{T}$

$$\therefore \quad \frac{\chi_m}{\chi_m'} = \frac{T'}{T}$$

or $$T' = T \times \frac{\chi_m}{\chi_m'} = \frac{300 \times 1·2 \times 10^{-5}}{1·44 \times 10^{-5}} = \mathbf{250\ K}$$

7. Here, hysteresis loss per unit volume per cycle

$$= 300\ J\ m^{-3}\ cycle^{-1}$$

Time, t = 1 hour = 3600 s, frequency, ν = 50 cycles s^{-1}

Therefore, number of hysteresis cycle in 1 hour,

$$N = \nu \times t = 50 \times 3600 = 1·8 \times 10^5$$

Volume of the iron specimen,

$$V = \frac{\text{mass}}{\text{density}} = \frac{12}{7500} = 1·6 \times 10^{-3}\ m^3$$

Hence, loss of energy in one hour,

W = hysteresis loss per unit volume per cycle × V × N

$$= 300 \times 1·6 \times 10^{-3} \times 1·8 \times 10^5 = \mathbf{8·64 \times 10^4\ J}$$

8. *(a)* Here, number of atoms per unit volume in iron,

$$n = 8{\cdot}52 \times 10^{28}\ \text{m}^{-3}$$

Magnetic moment of each iron atom $= 2\,\mu_B$

$$= 2 \times 9{\cdot}27 \times 10^{-24} = 1{\cdot}854 \times 10^{-23}\ \text{A m}^2$$

Now, intensity of magnetisation is equal to magnetic moment per unit volume.

Therefore, the maximum value of magnetisation,

$$I_{max} = n \times 2\,\mu_B = 8{\cdot}52 \times 10^{28} \times 1{\cdot}854 \times 10^{-23}$$

$$= \mathbf{1{\cdot}58 \times 10^6\ A\ m^{-1}}$$

(b) Now, $B = \mu_0\,(H + I)$

Since no magnetic field is applied, $H = 0$

$$\therefore \quad B = \mu_0\, I = 4\,\pi \times 10^{-7} \times 1{\cdot}58 \times 10^6 = \mathbf{1{\cdot}99\ T}$$

9. *(i)* Here, number of atoms per unit volume in the paramagnetic gas,

$$n = 2 \times 10^{26}\ \text{m}^{-3}$$

Magnetic moment of each gas atom $= 1{\cdot}5 \times 10^{-23}\ \text{J T}^{-1}\ \text{m}$

Therefore, maximum value of magnetisation,

$$I_{max} = 2{\cdot}0 \times 10^{26} \times 1{\cdot}5 \times 10^{-23} = \mathbf{3 \times 10^3\ A\ m^{-1}}$$

(ii) The maximum magnetisation will occur, if the atomic dipole remain aligned along the direction of applied magnetic field at the temperature of the gas.

In other words, maximum magnetisation will be achieved on applying magnetic field of 3 T, if the thermal energy of an atomic dipole is quite small as compared to its potential energy.

Now, potential energy of an atomic dipole,

$$U = M\,B = 1{\cdot}5 \times 10^{-23} \times 3 = 4{\cdot}5 \times 10^{-23}\ \text{J}$$

Also, thermal energy of an atomic dipole.

$$U' = \frac{3}{2}\,k\,T = \frac{3}{2} \times 1{\cdot}38 \times 10^{-23} \times (273 + 27)$$

$$= 6{\cdot}21 \times 10^{-21}\ \text{J}$$

Since $U' >> U$, all the atomic dipoles can not remain aligned to the applied field. Hence, maximum magnetisation **cannot be achieved** in the paramagnetic gas under given conditions.

Competitive Examination File (Unit III)

REVISION AT A GLANCE

Chapter 1. Magnetic Effect of Current

☐ **Biot Savart's Law.** According to this law, *the magnetic field (in magnitude) due to a current element of length dl carrying a current I at a point at distance r from it, is given by*

$$|\vec{dB}| = \frac{\mu_0}{4\pi} \cdot \frac{|\vec{dl} \times \vec{r}|}{r^3} = \frac{\mu_0}{4\pi} \cdot \frac{I\,dl \sin\theta}{r^2},$$

where θ is the angle between the direction of the current and the line joining the current element to the point and μ_0 is absolute permeability of the free space. The direction of magnetic field $\vec{dB}$ is that of $I\,\vec{dl} \times \vec{r}$. It can also be found by using ***right hand thumb rule.***

The absolute permeability of free space, $\mu_0 = 4\pi \times 10^{-7}\ \mathrm{T\,A^{-1}\,m}$.

☐ **Magnetic field due to a current carrying conductor.** The magnetic field at a point at perpendicular distance a from a straight conductor carrying current I is given by

$$B = \frac{\mu_0}{4\pi} \cdot \frac{I}{a}(\sin\phi_1 + \sin\phi_2),$$

where ϕ_1 and ϕ_2 are angles, which the lines joining the two ends of the conductor to the observation point make with the perpendicular from the observation point to the conductor.

In case, the straight conductor is of infinite length $\left(\phi_1 = \phi_2 = \frac{\pi}{2}\right)$, the magnetic field is given by

$$B = \frac{\mu_0}{4\pi} \cdot \frac{2I}{a}$$

☐ **Magnetic field due to a current carrying circular coil.** For a coil of radius a, consisting of n turns and carrying current I,

(*i*) the magnetic field at a point on axis at distance x from its centre is given by

$$B = \frac{\mu_0}{4\pi} \cdot \frac{2\pi n I a^2}{(a^2 + x^2)^{3/2}}$$

(*ii*) the magnetic field at its centre is given by

$$B = \frac{\mu_0}{4\pi} \cdot \frac{2\pi n I}{a}$$

☐ **Ampere's circuital law.** It states that *the line integral of magnetic field $\vec{B}$ around any closed path or circuit is equal to μ_0 times the total current I threading through the closed circuit.*

Mathematically : $\oint \vec{B} \cdot \vec{dl} = \mu_0 I$

☐ **Magnetic field due to a solenoid.** *A long insulated wire closely wound in the form of a helix, such that its length is very large as compared to its diameter is called a solenoid.*

If a solenoid of n turns per unit length carries a current I, then

(*i*) magnetic field at a point well inside the solenoid is given by

$$B = \mu_0 n I$$

(*ii*) magnetic field at a point on one end of the solenoid is given by

$$B = \frac{1}{2}\mu_0 n I$$

Some Useful Facts

1. Whereas the source of electric field is electric charge, the source of magnetic field is current element (not a magnetic charge).

2. The magnatic field due to a straight conductor is zero, when the observation point lies along the length of the conductor.

3. The magnetic field due to a part of circular conductor of radius a and carrying current I is given by

$$B = \frac{\mu_0}{4\pi} \cdot \frac{I}{a}\theta,$$

where θ is the angle, which the circular part subtends at its centre.

Chapter 2. Motion of charged particle

☐ **Force on a charge in electric field.** A charge q inside an electric field of strength $\vec{E}$ experiences force $\vec{F}$, which is given by

$$|\vec{F}| = |q\vec{E}| = qE$$

Force is in **newton**, when q is in **coulomb** and E in **newton coulomb^{-1}**.

☐ **Motion of a charge inside electric field.** If a potential difference V is applied between two parallel plates, a uniform electric field is set up between the plates. Its strength is given by

$$E = \frac{V}{d}$$

A charge q of mass m experiences force

$$F = qE,$$

which produces an acceleration,

$$a = \frac{qE}{m}$$

The charge moving inside an electric field follows a ***parabolic*** path.

☐ **Force on a charge moving inside a magnetic field.** A charge q moving with velocity $\vec{v}$ inside a magnetic field of strength $\vec{B}$ is given by

$$|\vec{F}| = q|\vec{v} \times \vec{B}| = Bqv \sin\theta$$

Force is in **newton**, when B is in **tesla**, q in **coulomb** and v in **m s^{-1}**.

The charge does not experience any force, if it is at rest or if it moves along the direction of magnetic field. The force is maximum, when charge moves perpendicular to the direction of magnetic field.

The above expression is used to define **tesla**, the unit of strength of magnetic field.

The strength of magnetic field is called one tesla, if a charge of one coulomb, when moving with a velocity of 1 m s^{-1} along a direction perpendicular to the direction of the magnetic field experiences a force of one newton.

1 tesla (T) = 1 weber metre^{-2} (Wb m^{-2}) = 1 newton ampere^{-1} metre^{-1} (N A^{-1} m^{-1})

☐ **Lorentz force.** The total force experienced by a charge moving inside the electric and magnetic fields is called Lorentz force. It is given by

$$\vec{F} = q(\vec{E} + \vec{v} \times \vec{B})$$

☐ **Motion of charge inside magnetic field.** A charge q of mass m moving with velocity $\vec{v}$ inside a magnetic field of strength $\vec{B}$ experiences force,

$$|\vec{F}| = q|\vec{v} \times \vec{B}| = Bqv \sin\theta,$$

where θ is angle between the direction of motion of charge $(\vec{v})$ and the direction of magnetic field $(\vec{B})$. This force acts perpendicular to both $\vec{v}$ and $\vec{B}$ *i.e.* the direction of motion of the charge and the direction of applied magnetic field.

(*i*) If $\vec{v}$ and $\vec{B}$ are perpendicular ($\theta = 90°$), the force on the charged particle makes it to move along circular path, whose radius is given by

$$r = \frac{mv}{Bq}$$

(*ii*) If $\vec{v}$ and $\vec{B}$ act at an angle θ, then due to the component of velocity $v \sin\theta$ (perpendicular to $\vec{B}$, the charge moves along circular path of radius r, which is given by

$$r = \frac{mv \sin\theta}{Bq}$$

while due to the component of velocity $v \cos\theta$ (along $\vec{B}$), the charge at the same time moves along the direction of magnetic field. As a result, the charge moves along a ***helical path*** and pitch of the helical path is given by

$$\text{pitch} = \frac{2\pi mv \cos\theta}{Bq}$$

☐ **Cyclotron.** It is a particle accelerator and is used to accelerate positive ions. Under the action of magnetic field, the positive ions move along spiral path and gain energy as they cross the alternating electric field again and again.

☐ **Cyclotron frequency.** In a cyclotron, the frequency of applied alternating electric field is equal to frequency of oscillation of the positive ion and this frequency is called cyclotron frequency. It is given by

$$\nu = \frac{Bq}{2\pi m},$$

where m and q are mass and charge of the positive ion and B is strength of the magnetic field.

☐ **Maximum energy attained by positive ions.** The positive ions of charge q and mass m attain maximum energy is given by

(*i*) $E_{max} = \frac{1}{2} \cdot \frac{B^2 q^2 R^2}{m}$

where R is radius of the dees of the cyclotron.

(*ii*) $E_{max} = 2n(Vq)$

where n is number of revolutions completed by the positive ions before leaving the dees.

☐ **Force on a current carrying conductor placed inside a magnetic field.** A conductor of length l carrying current I and placed inside a magnetic field of strength B is given by

$$|\vec{F}| = |I\,\vec{l} \times \vec{B}| = BIl \sin\theta$$

The conductor experiences maximum force, when the magnetic field acts at right angle to the length of the conductor ; and the force is zero, when the length of the conductor is parallel to the direction of the magnetic field.

☐ **Force between two infinitely long parallel current carrying conductors.** When two infinitely long parallel conductors carrying currents I_1 and I_2 are placed a distance r apart, then force on the unit length of a conductor due to the other conductor is given by

$$F = \frac{\mu_0}{4\pi} \cdot \frac{2 I_1 I_2}{r}$$

The force is attractive, if currents in two conductors is in same direction ; and repulsive, if currents are in opposite directions.

The above expression gives definition of **ampere,** the unit of current.

One ampere is that current, which when flowing through each of the two parallel conductors of infinite length and placed in vacuum at a distance of 1 metre from each other, produces between them a force of 2×10^{-7} newton per metre of their lengths.

☐ **Torque on a current carrying coil placed inside a magnetic field.** When a coil of area A having n turns and carrying current I is suspended inside a magnetic field of strength B, then torque on the coil is given by

$$\tau = nBIA\sin\theta,$$

where θ is angle between the direction of magnetic field and normal to the plane of the coil.

If the direction of magnetic field makes an angle α with the plane of the coil, then

$$\tau = nBIA\cos\alpha$$

The torque on the coil is maximum, when the plane of the coil is parallel to the magnetic field *i.e.* $\theta = 90°$ or $\alpha = 90°$.

☐ **Sensitivity of a galvanometer.** *A galvanometer is said to be sensitive, if it gives a large deflection, even when a small current is passed through it or when a small voltage is applied across its coil.*

☐ **Current sensitivity.** *It is defined as the deflection produced in the galvanometer on passing unit current through its coil.*

Current sensitivity , $\frac{\theta}{I} = \frac{nBA}{k}$ $\left(\textbf{rad } \mu\textbf{A}^{-1}\right)$

☐ **Voltage sensitivity.** *It is defined as the deflection produced in the galvanometer, when a unit voltage is applied across its coil.*

Voltage sensitivity, $\frac{\theta}{V} = \frac{nBA}{kR}$ $\left(\textbf{rad } \mu\textbf{V}^{-1}\right)$

Here, R is resistance of the coil of the galvanometer.

Shunt. *A small resistance usually put in parallel to the coil of a galvanometer is called shunt.*

The most part of the current in the circuit passes through the shunt and thus shunt allows only a very small part of current to pass through the galvanometer.

Ammeter. *It is an instrument used to measure current in an electrical circuit.*

A galvanometer of resistance G can be converted into an ammeter of range I by putting a small resistance S in parallel to its coil, which is given by

$$S = \frac{I_g \times G}{I - I_g}$$

Here, I_g is maximum current that can pass through the galvanometer.

The resistance of the ammeter so obtained is given by

$$R_A = \frac{GS}{G+S}$$

Ammeter is a low resistance instrument and it is always connected in series to the circuit.

☐ **Voltmeter.** *It is an instrument used to measure potential difference across a conductor in an electrical circuit.*

A galvanometer of resistance G can be converted into a voltmeter to read upto V by connecting a large resistance R in series to its coil, which is given by

$$R = \frac{V}{I_g} - G$$

The resistance of the voltmeter so obtained is given by

$$R_V = G + R$$

Voltmeter is a high resistance instrument and it is always connected in parallel to the conductor, across which potential difference is to be measured.

Some Useful Facts

1. A stationary charge experiences force inside electric field. A magnetic field does not exert any force on a stationary charge.

2. The expression for torque on a current carrying coil *i.e.*

$$\tau = n\,B\,I\,A\sin\theta$$

holds for a planar current loop of any shape having the area A.

3. A magnetic field, in which the plane of the coil in all position remains parallel to the direction of magnetic field is called ***radial magnetic field.*** A field magnet having concave poles produces radial magnetic field.

Chapter 3. Magnetic dipole

☐ **Magnetic dipole.** *An arrangement of two unlike poles of equal strength and separated by a small distance is called magnetic dipole.*

The distance between the two magnetic poles is called the magnetic length of the magnetic dipole. It is denoted by $2\vec{l}$, a vector from south to north pole of the magnetic dipole.

☐ **Magnetic dipole moment.** *The product of the pole strength of either magnetic pole and the magnetic length of the magnetic dipole is called its magnetic dipole moment.* It is denoted by $\vec{M}$.

Mathematically : $\vec{M} = m(2\vec{l})$ **(ampere metre^2)**

Here, m is pole strength of the magnetic dipole.

☐ **Magnetic field due to a bar magnet.** The magnetic field due to a bar magnet of length $2l$ and having magnetic dipole moment M at a distance r from its centre

(*i*) on its axial line is given by

$$B = \frac{\mu_0}{4\pi}\cdot\frac{2Mr}{(r^2 - l^2)^2}$$

(*ii*) on its equitorial line is given by

$$B = \frac{\mu_0}{4\pi}\cdot\frac{M}{(r^2 + l^2)^{3/2}}$$

☐ **Torque on a magnetic dipole in a magnetic field.** When a magnetic dipole of magnetic dipole moment $\vec{M}$ is placed in a uniform magnetic field of strength $\vec{B}$ making an angle θ with the direction of magnetic field, it experiences a torque, which is given by

$$|\vec{\tau}| = |\vec{M} \times \vec{B}| = M\,B\sin\theta$$

☐ **Potential energy stored in a magnetic dipole on rotating inside a magnetic field.** The work done in rotating a magnetic dipole against the torque acting on it, when placed in magnetic field is stored inside it in the form of potential energy. When magnetic dipole is rotated from initial position $\theta = \theta_1$ to final position $\theta = \theta_2$, then potential energy stored is given by

$$U = M\,B\,(\cos\theta_1 - \theta_2)$$

☐ **Current loop and magnetic dipole.** A current loop of area A carrying current I behaves as a magnetic dipole having magnetic dipole moment,

$$M = I\,A \text{ (ampere metre}^2\text{)}$$

Some Useful Facts

1. The atom or molecule of a substance behaves is a complete magnet.

2. An atom behaves as a magnetic dipole due to the fact that electrons revolving around the nucleus constitute small current loops.

3. A circular current loop produces magnetic field, in the same manner as a magnetic dipole does.

4. A free magnetic pole does not exist.

5. Magnetic lines of force should be better called as magnetic field lines.

Chapter 4. Earth's magnetism

☐ **Geographic meridian.** *A vertical plane passing through the axis of rotation of the earth is called the geographic meridian.*

☐ **Magnetic meridian.** *A vertical plane passing through the axis of a freely suspended magnet is called the magnetic* meridian.

☐ **Magnetic elements.** The quantities, ***magnetic declination, magnetic inclination (dip)*** and ***horizontal component of earth's magnetic field*** completely determine the earth's magnetic field at a given place and are called magnetic elements.

***Magnetic declination** at a place is the angle between the geographic meridian and magnetic meridian.* It is denoted by θ.

***Magnetic inclination (dip)** at a place is the angle between the direction of the intensity of the total earth's magnetic field and th horizontal.* It is dentoed by δ.

Horizontal component of earth's magnetic field is the component of earth's total magnetic field along the horizontal It is denoted by B_H.

If B is intensity of earth's total magnetic field, then the horizontal component of earth's magnetic field is given by

$$B_H = B\cos\delta$$

Also, the vertical component of earth's magnetic field,

$$B_V = B\sin\delta$$

so that $$B = \sqrt{B_H^2 + B_V^2}$$

and $$\tan\delta = \frac{B_V}{B_H}$$

☐ **Neutral point.** *It is that point, where the magnetic field due to a bar magnet is completely cancelled by the horizontal componen of earth's magnetic field.*

(*i*) When a bar magnet is placed with its north pole towards south of the earth, the neutral points are obtained on axia line of the magnet. If d is the distance of the neutral point from the magnet,

$$\frac{\mu_0}{4\pi}\cdot\frac{2Md}{(r^2-l^2)^2} = B_H$$

(*ii*) When a bar magnet is placed with its north pole towards north of the earth, the neutral points are obtained on equitoria line of the magnet. If d is the distance of the neutral point from the magnet,

$$\frac{\mu_0}{4\pi}\cdot\frac{M}{(r^2-l^2)^{3/2}} = B_H$$

☐ **Tangent law.** *It states that when a short bar magnet is suspended freely under the combined action of two uniform magneti fields of intensities B and B_H acting at 90° to each other, the magnet comes to rest making an angle θ with the direction of magnetic fiel B_H, such that*

$$B = B_H\tan\theta$$

☐ **Tangent galvanometer.** A tangent galvanometer is a moving magnet and fixed coil type galvanometer. It is base on tangent law and is used to measure very small currents.

If a tangent galvanometer has coil of radius R and number of turns n, then deflection θ produced on passing current is given by

$$I = \frac{2a}{n\mu_0}B_H\tan\theta = \frac{B_H}{G}\tan\theta = K\tan\theta$$

Here, $G = \frac{n\mu_0}{2a}$ is called ***galvanometer constant*** and

$K = \frac{B_H}{G} = \frac{2a}{n\mu_0}B_H$ is called ***reduction factor*** of tangent galvanometer.

☐ **Vibration magnetometer.** It is based on the principle that a magnet suspended inside a magnetic field experience a torque. It is used to compare magnetic moments of two bar magnets or to determine horizontal component of earth's magneti field.

If a bar magnet of magnetic dipole moment M and moment of inertia I is free to oscillate under the action of horizonta component of earth's magnetic field B_H, then its time period is given by

$$T = 2\pi\sqrt{\frac{I}{MB_H}}$$

Some Useful Facts

1. The magnetic field of earth is same as that would be due to a huge bar magnet located deep inside the earth with it north pole towards south of the earth.

2. The magnetic field due to a short bar magnet at a distance r on its axial line is twice the magnetic field at the sam distance on its equitorial line.

3. The reduction factor of a tangent galvanometer increases due to increase in the radius of its coil and decrease in it number of turns.

Chapter 5. Classification of Magnetic materials

☐ **Diamagnetic substances.** *Those substances, which when placed in a magnetic field are feebly magnetised in a direction opposit to that of the magnetising field.*

☐ **Paramagnetic substances.** *Those substances, which when placed in a magnetic field are feebly magnetised in the direction o the magnetising field.*

☐ **Ferromagnetic substances.** *Those substances, which when placed in a magnetic field are strongly magnetised in the direction the magnetising field.*

☐ **Intensity of magnetisation.** *It is defined as the magnetic dipole moment developed per unit volume or the pole strength developed r unit area of cross-section of the specimen.* It is given by

$$I = \frac{M}{V} = \frac{m}{a}$$

Here, V is volume and a is area of cross-section of the specimen. Magnetic induction, intensity of magnetisation and agnetic intensity are related to each other as below :

$$B = \mu_0 (H + I)$$

☐ **Magnetic permeability.** *The magnetic permeability of a material is defined as the ratio of the magnetic induction (B) of the aterial to the strength of magnetising field (H).* It is given by

$$\mu = \frac{B}{H}$$

If μ_r is relative permeability of a medium, then

$$\mu_r = \frac{\mu}{\mu_0}$$

☐ **Magnetic susceptibility.** *The magnetic susceptibility of a material is defined as the ratio of the intensity of magnetisation (I) nd the strength of magnetising field (H).* It is given by

$$\chi_m = \frac{I}{H}$$

It can be proved that $\mu = \mu_0 (1 + \chi_m)$

o that $\mu_r = 1 + \chi_m$

☐ **Curie temperature.** *It is the temperature for a ferromagnetic substance above which, it behaves as a paramagnetic substance.*

☐ **Curie's law.** It states that *the magnetic susceptibility of a paramagnetic substance varies inversely with its absolute temperature.*

Mathematically : $\chi_m \propto \frac{1}{T}$ or $\chi_m T = \text{constant}$

☐ **Hysteresis.** *The lagging of intensity of magnetisation (or magnetic induction) behind the magnetising field, when a magnetic pecimen is taken through a cycle of magnetisation, is called hysteresis.*

☐ **Retentivity.** *The value of intensity of magnetisation of the magnetic material, when the magnetising field is reduced to zero, is alled its retentivity.*

☐ **Coercivity.** *The value of the reverse magnetising field, which has to be applied to the magnetic material so as to reduce the residual nagnetisation to zero, is called its coercivity.*

ome Useful Facts

1. The atoms of a diamagnetic substance do not possess any magnetic moment, while those of paramagnetic and erromagnetic substances possess a net non-zero magnetic moment.

2. The diamagnetism is fundamental to all the magnetic substances. However, diamagnetism is overshadowed by aramagnetism and ferromagnetism in paramagnetic and ferromagnetic materials respectively.

3. The energy is spent in taking a ferromagnetic substance over a complete cycle of magnetisation. It is numerically equal o the area of I-H curve or $\frac{1}{4\pi}$ times the area of B-H curve.

NUMERICAL PROBLEMS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Magnetic Effect of Current

Problem 1.01. A current of 1 A is flowing in the sides of an equilateral triangle of side 4·5 × 10⁻². Find the magnetic field at the centroid of the triangle.

(Roorkee, 1991)

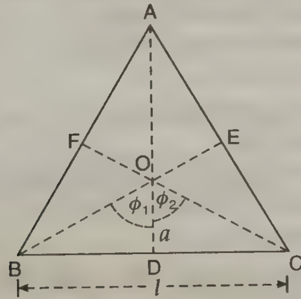

Fig. 1.01.

Thought Process

Let O be the centroid of the equilateral triangle ABC [Fig 1.01]. The current through each of the three sides of the triangle will produce magnetic field at point O having the same magnitude and direction. If B is magnetic field produced due to any one of the three sides at point O, then the net magnetic field at point O due to the whole ΔABC,

$$B' = 3B$$

If If $\Delta\, BOD = \phi$ and $OD = a$, then as obtained in section 1.03,

$$B = \frac{\mu_0}{4\pi} \cdot \frac{I}{a} (\sin \phi_1 + \sin \phi_2)$$

Sol. Here, I = 1 A, each side of the Δ ABC, $l = 4{\cdot}5 \times 10^{-2}$ m

It follows that

$$\phi_1 = \phi_2 = 60°,\ a = \frac{BD}{\tan 6°} = \frac{l/2}{\sqrt{3}} = \frac{4{\cdot}5 \times 10^{-2}}{2\sqrt{3}}\ \text{m}$$

Hence, magnetic field at the centroid O due to current flowing through Δ ABC,

$$B' = 3 \times \frac{\mu_0}{4\pi} \cdot \frac{I}{a} (\sin \phi_1 + \sin \phi_2)$$

$$= \frac{3 \times 10^{-7} \times 1 \times 2 \times \sqrt{3}}{4{\cdot}5 \times 10^{-2}} (\sin 60° + \sin 60°)$$

$$= \frac{6\sqrt{3} \times 10^{-7}}{4{\cdot}5 \times 10^{-2}} \left(\frac{\sqrt{3}}{2} + \frac{\sqrt{3}}{2} \right) = \mathbf{4 \times 10^{-5}\ tesla}$$

Problem 1.02. Two long straight parallel wires are 2 m apart (perpendicular to the plane of the paper as shown in Fig. 1.02. The wire A carries current of 9·6 A directed into the plane of the paper. The wire B carries a current such that the magnetic field of induction at the point P at a distance $\frac{10}{11}$ m from the wire B is zero. Find

(*i*) the magnitude and direction of the current in B.

(*ii*) the magnitude of the magnetic field of induction at the point S.

(*iii*) the force per unit length on the wire B.

(I.I.T. 1987)

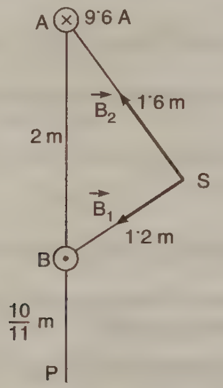

Fig. 1.02.

Sol. Here, current through the wire A,

$I_1 = 9{\cdot}6$ A (directed into the paper)

Distance of point P from wire A, $a_1 = 2 + \frac{10}{11} = \frac{32}{11}$ m

Distance of point P from wire B, $a_2 = \frac{10}{11}$ m

(*i*) Suppose that I_2 is the current through the wire, so that magnetic field induction at point P due to the two wires becomes zero. For this, current in wire B has to be directed outwards of the paper, so that the magnetic fields produced at point P due to the two wires are equal in magnitude and opposite in direction. Thus, for magnetic field induction at point P to be zero,

$$\frac{\mu_0}{4\pi} \cdot \frac{2 I_1}{a_1} = \frac{\mu_0}{4\pi} \cdot \frac{2 I_2}{a_2}$$

or, $$I_2 = I_1 \times \frac{a_2}{a_1} = \frac{9{\cdot}6 \times 10/11}{32/11}$$

= 3 A (directed outwards of the paper)

(*ii*) In fact, points A, B and S form a right angled triangle. It is because, $AB^2 = AS^2 + BS^2$.

Therefore, magnetic field induction at point S due to wire A ,

$$B_2 = \frac{\mu_0}{4\pi} \cdot \frac{2 I_2}{BS} = \frac{10^{-7} \times 2 \times 9{\cdot}6}{1{\cdot}6}$$

$= 12 \times 10^{-7}$ T (along perpendicular to AS *i.e.* along $\overrightarrow{SB}$)

Magnetic field induction at point S due to wire B,

$$B_2 = \frac{\mu_0}{4\pi} \cdot \frac{2 I_2}{BS} = \frac{10^{-7} \times 2 \times 3}{1{\cdot}2}$$

$= 5 \times 10^{-7}$ T (along perpendicular to BS *i.e.* along $\overrightarrow{SA}$)

As the two fields B_1 and B_2 are linclined at 90°, the resultant magnetic field at point S is given by

$$B = \sqrt{B_1^2 + B_2^2} = \sqrt{(12 \times 10^{-7})^2 + (5 \times 10^{-7})^2}$$

$= \mathbf{13 \times 10^{-7}\ T}$

(*iii*) The force per unit length on the wire B,

$$F = \frac{\mu_0}{4\pi} \cdot \frac{2 I_1 I_2}{AB} = \frac{10^{-7} \times 2 \times 9{\cdot}6 \times 3}{2}$$

$= \mathbf{2{\cdot}88 \times 10^{-6}\ N\ m^{-1}}$

Problem 1.03. Two long parallel wires carrying current 2·5 ampere and I ampere in the same direction (directed into the plane of the paper) are held at P and Q respectively, such that they are perpendicular to the plane of paper. The points P and Q are located at a distance of 5 metres and 2 metres respectively from a collinear point R as shown in Fig. 1.03.

(*i*) An electron moving with a velocity of 4×10^5 m s^{-1} along the positive X-direction experiences a force of magnitude $3{\cdot}2 \times 10^{-20}$ N at the point R. Find the value of I.

(*ii*) Find all the positions at which a third long parallel wire carrying a current of magnitude 2·5 ampere may be placed, so that the magnetic induction at R is zero.

(I.I.T. 1990)

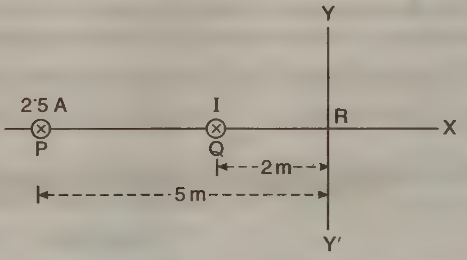

Fig. 1.03.

Sol. Here, current through the wire at point P,

$I_1 = 2{\cdot}5$ A

current through the wire at point Q, $I_2 = I = I$

distance of wire at point P from R,

$r_1 = PR = 5$ m

distance of wire at point Q from R,

$r_2 = QR = 2$ m

If B_1 and B_2 are magnetic fields produced at point R due to the wires at points P and Q respectively, then the net magnetic field at point R,

$$B = B_2 + B_2 = \frac{\mu_0}{4\pi} \cdot \frac{2 I_1}{r_1} + \frac{\mu_0}{4\pi} \cdot \frac{2 I_2}{r_2}$$

$$= \frac{\mu_0}{4\pi} \times 2\left(\frac{I_1}{r_1}+\frac{I_2}{r_2}\right)$$

$$= 10^{-7} \times 2\left(\frac{2\cdot5}{5}+\frac{I}{2}\right) = 10^{-7}\,(1+I)$$

The direction of magnetic field B at point R will be along negative Y-axis. Therefore,

$$\vec{B} = 10^{-7}\,(1+I)\,(-\hat{j}) = -10^{-7}\,(1+I)\,\hat{j}$$

(*i*) velocity of electron, $\vec{v} = 4\times10^{5}$ m s^{-1} along X-axis

$$= 4\times10^{5}\,\hat{i}\ (\text{m s}^{-1})$$

Also, charge on electron, $q = -e = -1{\cdot}6\times10^{-19}$ C

Therefore, force on electron,

$$\vec{F} = q\,(\vec{v}\times\vec{B})$$

$$= (-1{\cdot}6\times10^{-19})\,[(4\times10^{5}\,\hat{i})\times\{-10^{-7}\,(1+I)\,\hat{j}\}]$$

$$= 6{\cdot}4\times10^{-21}\,(1+I)\,\hat{k}$$

But $F = 3{\cdot}2\times10^{-20}$ N

$$\therefore \quad 6{\cdot}4\times10^{-21}\,(1+I) = 3{\cdot}2\times10^{-20}$$

or $$1+I = \frac{3\cdot2\times10^{-20}}{6\cdot4\times10^{-21}} = 5$$

or $$I = 4\text{ A}$$

(*ii*) The magnetic induction at point R will be zero, if the third wire produces magnetic field just equal and opposite to the combined field produced by the two wires at points P and Q. Suppose that the third conductor carrying current I = 2·5 A is placed at a distance *r* from the point R, then

$$\frac{\mu_0}{4\pi}\cdot\frac{2I_3}{r} = 10^{-7}\,(1+I)$$

or $$\frac{10^{-7}\times2\times2\cdot5}{r} = 10^{-7}\,(1+4)$$

or $$r = 1\text{ m}$$

If the third wire is placed at 1 m on right side of point R, the current through it should be in the same direction as through the wires at P and Q. On the other hand, the current through the third wire should be in opposite direction, if it is placed on left of the point R. Thus, the third conductor can be placed in the two positions explained above.

Chapter 2. Motion of Charged particle

Problem 2.01. The region between $x = 0$ and $x = L$ is filled with uniform, steady magnetic field $B_0\,\hat{k}$. A particle of mass *m*, positive charge *q* and velocity $v_0\,\hat{i}$ travels along X-axis and enters the region of the magnetic field. Neglect gravity throughout region.

(*a*) Find the value of L, if the particle emerges from the region of magnetic field with its final velocity at angle 30° to its initial velocity.

(*b*) Find the final velocity of the particle and the time spent by it in the magnetic field, if the magnetic field now extends upto 2·1 L. (*I.I.T. 1999*)

Sol. (*a*) Fig. 2.01 shows magnetic field $B_0\,\hat{k}$ (represented by ⊙) acting along Z-axis in the region $x = 0$ and $x = L$. The positive charge *q* moves with velocity $v_0\,\hat{i}$ along OX.

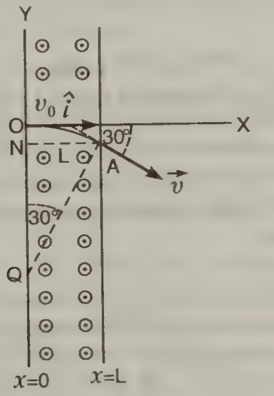

Fig. 2.01.

The force on charge *q* is given by

$$\vec{F} = q\,(\vec{v}\times\vec{B}) = q\,(v_0\,\hat{i}\times B_0\,\hat{k}) = -B_0\,v_0\,q\,\hat{j}$$

The force on positive charge *q* acts along negative Y-axis. Under the effect of this force, the charge moves along a circular path. If *r* is the radius of the circular path, then

$$\frac{m\,v_0^2}{r} = -B_0\,v_0\,q \quad\text{or}\quad r = \frac{m\,v_0}{B_0\,q} \qquad ...(i)$$

The velocity vector $\vec{v}$ of the positive charge at point A acts along tangent to the circular pathOA and it makes an angle of 30° with OX. If Q is centre of the circular path OA, then ∠OQA = 30°. From point A, drop perpendicular AN on Y-axis. Then, NA = L. From right angled ∠QNA, we have

$$\sin 30^\circ = \frac{NA}{QA} = \frac{L}{r}$$

or $$L = r\sin 30^\circ = \frac{m\,v_0}{B_0\,q}\times\frac{1}{2}$$

or $$L = \frac{m\,v_0}{2\,B_0\,q} \qquad ...(ii)$$

(*b*) From equations (*i*) and (*ii*), its follows that

$$r = 2\,L$$

If the magnetic field extends upto 2·1 L [Fig. 2.02], the

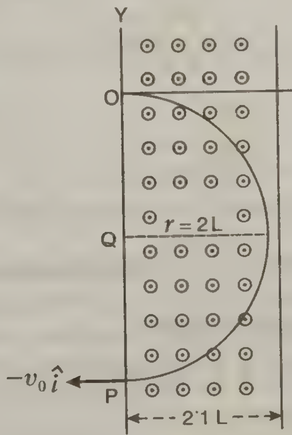

Fig. 2.02

positive charge will complete its semi-circular path inside the magnetic field and will emerge out of magnetic field at point P with the final velocity,

$$v = -v_0\,\hat{i}$$

The time spent by the positive charge inside the magnetic field,

$$t = \frac{\pi r}{v_0} = \frac{\pi}{v_0} \times \frac{m v_0}{B_0\, q}$$

or $$t = \frac{\pi m}{B_0\, q}$$

Problem 2.02. A beam of protons with a velocity 4 × 10^5 m s^{-1} enters the uniform magnetic field of 0·3 tesla at an angle of 60° to magnetic field. Find the radius of the helical path taken by the proton beam. Also, find the pitch of the helix (which is the distance travelled by a proton in the beam parallel to the magnetic field during one period of rotation). Given, mass of proton = 1·67 × 10^{-27} kg.

(I.I.T. 1986, 1981)

Hint. Refer to section 2.04. If q is charge on proton, then the radius of helical path, $r = \dfrac{m v \sin\theta}{Bq}$

Setting $B = 0{\cdot}3$ T ; $m = 1{\cdot}67 \times 10^{-27}$ kg ;

$q = 1{\cdot}6 \times 10^{-19}$ C ; $v = 4 \times 10^5$ m s^{-1} ; and $\theta = 60°$;

it can be obtained that radius of the helical path,

$r = 1{\cdot}205 \times 10^{-2}$ m = **1·205 m**

Also, pitch of the helix

$$= v \cos\theta \times \text{time period of circular path}$$

$$= v \cos 60° \times \frac{2\pi m}{Bq}$$

It can be obtained that pitch of the helix

$= 4{\cdot}372 \times 10^{-2}$ m = **4·372 cm**

Problem 2.03. An electron gun G emits electrons of energy 2 keV travelling in the positive X-direction. The electrons are required to hit the spot S, where GS = 0·1 m and the line GS makes an angle of 60° with the X-axis as shown in the Fig. 2.03. A uniform magnetic field $\vec{B}$ parallel to GS exists in the region outside the electron gun. Find the minimum value of B needed to make the electron hit S.

(I.I.T. 1993)

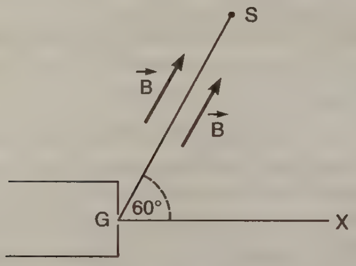

Fig. 2.03.

Sol. Suppose that v is the velocity, with which electrons are emitted from the gun.

Here, kinetic energy of electron,

$$\frac{1}{2} m v^2 = 2 \text{ keV} = 2 \times 10^3 \times 1{\cdot}6 \times 10^{-19}$$

$$= 3{\cdot}2 \times 10^{-16} \text{ J}$$

$$\therefore \quad v = \sqrt{\frac{2 \times 3{\cdot}2 \times 10^{-16}}{m}}$$

Since mass of electron, $m = 9{\cdot}1 \times 10^{-31}$ kg, we have

$$v = \sqrt{\frac{2 \times 3{\cdot}2 \times 10^{-16}}{9{\cdot}1 \times 10^{-31}}}$$

$$= 2{\cdot}65 \times 10^7 \text{ m s}^{-1}$$

The velocity v of the electron can be resolved into two components :

(*i*) $v \sin 60°$ *perpendicular to GS*. Under the effect of magnetic field, the velocity component $v \sin 60°$ will make the electron to move along circular path of radius, say r. Then,

$$\frac{m (v \sin 60°)^2}{r} = B e (v \sin 60°)$$

or $$r = \frac{m v \sin 60°}{B e}$$

The time period of circular motion,

$$T = \frac{2\pi r}{v \sin 60°} = \frac{2\pi m v \sin 60°}{B e \times v \sin 60°} = \frac{2\pi m}{B e}$$

(*ii*) $v \cos 60°$ *along GS*. The velocity component v cos 60° will drift the electron along GS and as such, it will move along helical path. The electron will hit S, if the time (t) taken by electron to cover the distance GS (= 0·1 m) is equal to the integral multiple of the period (T) of the circular path *i.e.* $t = n\,T$

or $$\frac{GS}{v \cos 60°} = n\left(\frac{2\pi m}{B e}\right)$$

or $$B = n\left(\frac{2\pi m v \cos 60°}{e \times GS}\right)$$

For B to be minimum, $n = 1$ *i.e.*

$$B_{min} = \frac{2\pi m v \cos 60°}{e \times GS}$$

$$= \frac{2\pi \times 9{\cdot}1 \times 10^{-31} \times 2{\cdot}65 \times 10^7 \times 0{\cdot}5}{1{\cdot}6 \times 10^{-19} \times 0{\cdot}1}$$

= **4·735 × 10^{-3} tesla**

Problem 2.04. A circular loop of radius R is bent along a diameter and given a shape as shown in Fig. 2.04. One of the semicircles (KNM) lies in the XZ-plane and the other one (KLM) in the YZ-plane with their centres at origin. Current I is flowing through each of the semicircles as shown in figure.

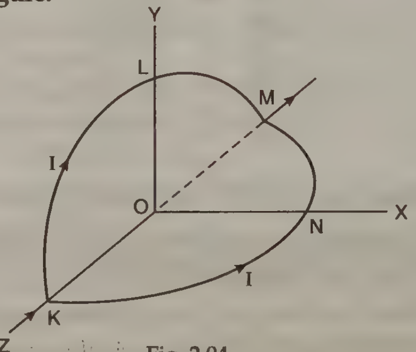

Fig. 2.04

(a) A particle of charge q is released at the origin with velocity $\vec{v} = -v_0\,\hat{i}$. Find the instantaneous force $\vec{F}$ on the article. Assume that space is gravity free.

(b) If an external uniform magnetic field $B_0\,\hat{j}$ is pplied, determine the force $\vec{F_1}$ and $\vec{F_2}$ on the semicircles LM and KNM due to the field and the net force $\vec{F}$ on the oop. *(I.I.T. 2000)*

Sol. Let $\vec{B_1}$ and $\vec{B_2}$ be respectively the magnetic fields roduced at point O due to current carrying semicircular arts KNM and KLM of the circular loop of radius R. Then,

$$\vec{B_1} = \frac{\mu_0}{4\pi}\cdot\frac{\pi I}{R}(\hat{j}) = \frac{\mu_0 I}{4R}\,\hat{j}$$

$$\text{and } \vec{B_2} = \frac{\mu_0}{4\pi}\cdot\frac{\pi I}{R}(-\hat{i}) = -\frac{\mu_0 I}{4R}\,\hat{i}$$

Therefore, total magnetic field produced by the two arts of the loop,

$$\vec{B} = \vec{B_1} + \vec{B_2} = \frac{\mu_0 I}{4R}\,\hat{j} + \left(-\frac{\mu_0 I}{4R}\,\hat{i}\right)$$

$$\text{or } \vec{B} = \frac{\mu_0 I}{4R}(-\hat{i} + \hat{j})$$

(*a*) Force on charge q due to magnetic field produced by urrent loop,

$$\vec{F} = q(\vec{v} \times \vec{B}) = q\left[(-v_0\,\hat{i}) \times \frac{\mu_0 I}{4R}(-\hat{i} + \hat{j})\right]$$

$$\text{or } \vec{F} = -\frac{\mu_0\, q\, v_0\, I}{4R}\,\hat{k}$$

(*b*) When a current carrying semicircular wire KLM or KNM (in general, of any shape) is placed in a magnetic field, then force on the wire is same as that on a current carrying straight conductor of length KM (*i.e.* length between the end points of the semicircular wire).

Therefore, force on current carrying semicircular part KNM of the loop,

$$\vec{F_1} = I(\overrightarrow{KM}) \times B_0\,\hat{j} = I[2R(-\hat{k})] \times B_0\,\hat{j} = 2B_0 I R\,\hat{i}$$

Similarly, force on current carrying semicircular part KLM of the loop,

$$\vec{F_2} = 2B_0 I R\,\hat{i}$$

Therefore, force on the whole loop,

$$\vec{F} = \vec{F_1} + \vec{F_2} = 2B_0 I R\,\hat{i} + 2B_0 I R\,\hat{i} = \mathbf{4B_0 I R}\,\hat{i}$$

Problem 2.05. A current of 10 A flows around a closed path in a circuit, which is in the horizontal plane as shown in Fig. 2.05. The circuit consists of eight alternating arcs of radii $r_1 = 0{\cdot}08$ m and $r_2 = 0{\cdot}12$ m. Each subtends the same angle at the centre.

(a) Find the magnetic field produced by this circuit at the centre.

(b) An infinitely long straight wire carrying a current of 10 A is passing through the centre of the above circuit vertically with the direction of the current being into the plane of the circuit. What is the force acting on the wire at the centre due to the current in the circuit? What is the force acting on the arc AC and the straight segment CD due to the current at the centre? *(I.I.T. 2001)*

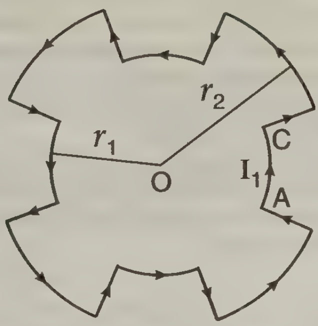

Fig. 2.05

Thought Process

1. *The four inner arcs are equivalent to a semi circular wire of radius r_1 and four outer arcs are equivalent to a semicircular wire of radius r_2. Both the sets of arcs produce magnetic fields perpendicular to plane of the paper and in outward direction.*
2. *Since direction of magnetic field produced due to the closed circuit is along the current carrying straight conductor through the centre, force on the straight conductor is zero.*
3. *Since magnetic field produced due to the straight conductor is tangential to all the arcs, no force will act on the current carrying arcs (such as AC) of the circuit.*
4. *Force will act on the straight parts (such as CD) of the circuit due to the straight conductor. It is because, magnetic field produced by the straight conductor through point O acts perpendicular to the straight part CD.*

Sol. Here, $r_1 = 0{\cdot}08$ m ; $r_2 = 0{\cdot}12$ m

Current through the circuit, $I_1 = 10$ A

Current through the straight conductor passing through centre O, $I_2 = 10$ A

(a) The four inner circular arcs constitute a semicircular wire of radius r_1. Therefore, magnetic field produced due to four inner acrs at centre O,

$$B_1 = \frac{\mu_0}{4\pi}\cdot\frac{\pi I_1}{r_1} = \frac{10^{-7} \times \pi \times 10}{0{\cdot}08}$$

$$= 3{\cdot}93 \times 10^{-5}\text{ T} \qquad \text{(outwards)}$$

Similarly, magnetic field produced due to four outer arcs at centre O,

$$B_2 = \frac{\mu_0}{4\pi}\cdot\frac{\pi I_1}{r_2} = \frac{10^{-7} \times \pi \times 10}{0{\cdot}12}$$

$$= 2{\cdot}62 \times 10^{-5}\text{ T} \qquad \text{(outwards)}$$

Therefore, net magnetic field produced by the circuit at centre O,

$$B = B_1 + B_2 = 33 \times 10^{-5} + 2{\cdot}62 \times 10^{-5}$$

$$= \mathbf{6{\cdot}55 \times 10^{-5}\ T\ (outwards)}$$

(b) ***Force on straight conductor through centre*:** When a current carrying conductor is placed in a magnetic field, force experienced by the conductor,

$$\vec{F} = I\,\vec{l} \times \vec{B}$$

Since direction of current through the straight conductor passing through centre and the direction of magnetic field produced by the circuit are along the length of the straight conductor (antiparallel), force on the conductor is **zero.**

Force on arc AC : The magnetic field produced by the straight conductor at the circular arc AC is along tangent to the arc. As explained above, force on arc AC due to the straight conductor is also **zero.**

Force on straight segment CD : Let PQ = dx be an elementary portion of the straight segment CD of the circuit at a distance x from the straight conductor passing through the centre O [Fig. 2.06].

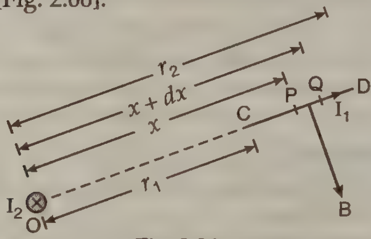

Fig. 2.06

Mganetic field B produced due to the straight conductor at point P acts normally to PQ and is given by

$$B = \frac{\mu_0}{4\pi} \cdot \frac{2 I_2}{x}$$

Since the straight segment carries current I_1, force on elementary portion PQ,

$$dF = B I_1 \, dx = \frac{\mu_0}{4\pi} \cdot \frac{2 I_2}{x} \times I_1 \times dx$$

$$= \frac{\mu_0}{4\pi} \cdot \frac{2 I_1 I_2}{x} dx \qquad \text{(inwards)}$$

Therefore, force on straight segment CD,

$$F = \int_{r_1}^{r_2} dF = \frac{\mu_0}{4\pi} \cdot 2 I_1 I_2 \int_{r_1}^{r_2} \frac{1}{x} dx = \frac{\mu_0}{4\pi} \cdot 2 I_1 I_2 \left| \log_e x \right|_{r_1}^{r_2}$$

$$= \frac{\mu_0}{4\pi} \cdot 2 I_1 I_2 \left| \log_e r_2 - \log_e r_1 \right| = \frac{\mu_0}{4\pi} \cdot 2 I_1 I_2 \cdot \log_e \frac{r_2}{r_1}$$

$$= 10^{-7} \times 2 \times 10 \times 10 \times \log_e \frac{0{\cdot}12}{0{\cdot}08}$$

$$= \mathbf{8{\cdot}11 \times 10^{-6} \ N} \qquad \textbf{(inwards)}$$

Problem 2.06. A straight segment OC (of length L metre) of a circuit containing a current I ampere is placed along the X-axis. Two infinitely long straight wires A and B each extending from $z = -a$ to $+a$ are fixed at $y = -a$ metre and $y = +a$ metre respectively as shown in the Fig. 2.07. If the wires A and B each carry a current I ampere into the plane of the paper, obtain the expression for the force acting on the segment OC. What will be the force on OC, if the current in the wire B is reversed ? (I.I.T. 1992)

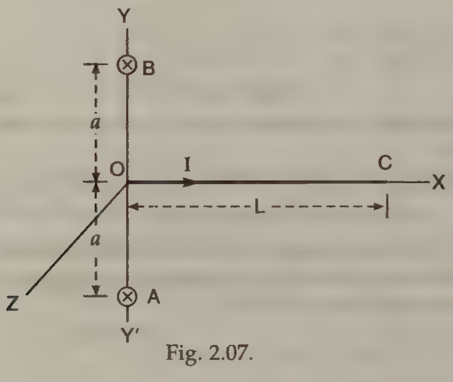

Fig. 2.07.

Thought Process

The resultant magnetic field due to the two wires is not uniform over the whole length of the straight segment OC. Therefore, force on segment OC is found by first finding force on an infinitesimally small length OC and then integrating over the whole length of the segment OC.

Sol. Consider an infinitesimally small portion PQ = dx of the segment located at distance x from the origin. The magnetic field $\vec{B}_1$ produced by the wire A will be along perpendicular to AP, while the magnetic field $\vec{B}_2$ due to the wire B will be along perpendicular to BP [Fig. 2.08].

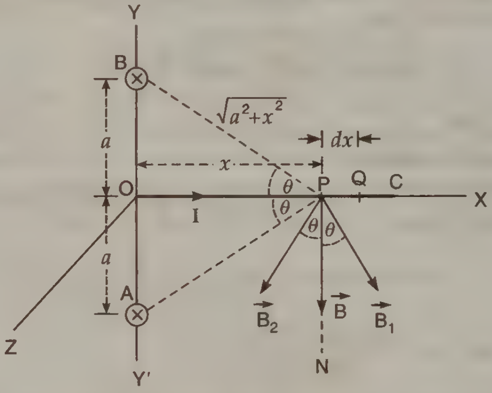

Fig. 2.08

Obviously, $AP = BP = \sqrt{a^2 + x^2}$

Now, $|\vec{B}_1| = \frac{\mu_0}{4\pi} \cdot \frac{2I}{AP} = \frac{\mu_0 I}{2\pi \sqrt{a^2 + x^2}}$

and $|\vec{B}_2| = \frac{\mu_0}{4\pi} \cdot \frac{2I}{BP} = \frac{\mu_0 I}{2\pi \sqrt{a^2 + x^2}}$

Draw PN perpendicular to OX. Suppose $\vec{B}_1$ and $\vec{B}_2$ make angle θ with PN. The components of $\vec{B}_1$ and $\vec{B}_2$ along OX are equal and opposite and hencecancel out ; while those along PN, add up. Therefore, net magnetic field at the elementary position PQ,

$$|\vec{B}| = \frac{\mu_0 I}{2\pi \sqrt{a^2 + x^2}} \cos\theta + \frac{\mu_0 I}{2\pi \sqrt{a^2 + x^2}} \cos\theta$$

$$= \frac{\mu_0 I}{\pi \sqrt{a^2 + x^2}} \cos\theta$$

Now, $\angle APO = \angle BPO = \theta$ and $\cos\theta = \frac{x}{\sqrt{a^2 + x^2}}$

Hence, $|\vec{B}| = \frac{\mu_0 I}{\pi (a^2 + x^2)} \cdot \frac{x}{\sqrt{a^2 + x^2}}$

$$= \frac{\mu_0 I x}{\pi (a^2 + x^2)} \quad \text{along PN}$$

or $$\vec{B} = \frac{\mu_0 I x}{\pi(a^2+x^2)}(-\hat{j}) = -\frac{\mu_0 I x}{\pi(a^2+x^2)}\hat{j}$$

Therefore, force on elementary portion PQ of the egment OC,

$$\vec{dF} = I\,\vec{dx} \times \vec{B}$$

Since $I\,\vec{dx} = I\,dx\,\hat{i}$, we have

$$\vec{dF} = I dx\,\hat{i} \times \left(-\frac{\mu_0 I x}{\pi(a^2+x^2)}\hat{j}\right) = -\frac{\mu_0 I^2}{\pi(a^2+x^2)}x\,dx\,\hat{k}$$

Force on the whole segment OC can be found by ntegrating the above between limits $x = 0$ to $x = L$ *i.e.*

$$\vec{F} = \int_0^L \vec{dF} = (-\hat{k})\frac{\mu_0 I^2}{\pi}\int_0^L \frac{x}{a^2+x^2}dx$$

Let $a^2 + x^2 = t$

$\therefore$ $0 + 2x\,dx = dt$ or $x\,dx = \frac{1}{2}dt$

The new limits of integration will be as obtained below :

When $x = 0,\ t = a^2 + 0^2 = a^2$;

and when $x = L,\ t = a^2 + L^2$

Hence, $$\vec{F} = -(\hat{k})\frac{\mu_0 I^2}{2\pi}\int_{a^2}^{(a^2+L^2)}\frac{1}{t}dt$$

$$= -(\hat{k})\frac{\mu_0 I^2}{2\pi}\Big|\log_e t\Big|_{a^2}^{(a^2+L^2)}$$

$$= -(\hat{k})\frac{\mu_0 I^2}{2\pi}\left[\log_e(a^2+L^2) - \log_e a^2\right]$$

$$= -\frac{\mu_0 I^2}{2\pi}\log_e\left(\frac{a^2+L^2}{a^2}\right)(\hat{k})$$

$$= \frac{\mu_0 I^2}{2\pi}\log_e\left(1+\frac{L^2}{a^2}\right)(-\hat{k})$$

i.e. $$\mathbf{F} = \frac{\mu_0 I^2}{2\pi}\log_e\left(1+\frac{L^2}{a^2}\right)$$ **(along negative Z-axis)**

Problem 2.07. A long horizontal wire AB which is free to move in a vertical plane and carries a steady current of 20 A is in equilibrium at a height of 0·01 m over another parallel long wire CD, which is fixed in a horizontal plane and carries a steady current of 30 A as shown in Fig. 2.09. Show that when AB is slightly depressed, it executes simple harmonic motion. Find the period of oscillations.

(I.I.T. 1994)

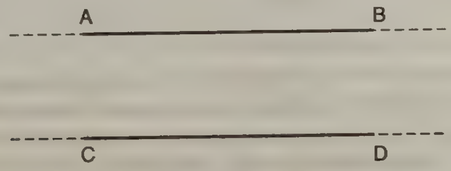

FIg. 2.09.

Sol. Force per unit length on wire AB due to the magnetic field produced by the wire CD

$$= \frac{\mu_0}{4\pi}\cdot\frac{2 I_1 I_2}{r}$$

where I_1 (= 20 A) and I_2 (= 30 A) are currents through the wires AB and CD respectively and r (= 0·1 m) is the height of wire AB above the wire CD.

If L is length of the wire AB, then force on the total length of the wire AB due to the wire CD,

$$F = \frac{\mu_0}{4\pi}\cdot\frac{2 I_1 I_2}{r}\times L = \frac{\mu_0 I_1 I_2}{2\pi r}\times L$$

The weight M g of the wire AB can balance the force F, only if F is in vertically upward direction. In other words, the wire AB can be in equilibrium, if the wire CD repels it *i.e.* currents I_1 and I_2 are in opposite direction. Therefore, in equilibrium

$$\frac{\mu_0 I_1 I_2}{2\pi r}\times L = M g \qquad ...(i)$$

Suppose that the wire AB is depressed through a small distance y. Since the distance between the two wires become $(r - y)$, the force on the wire AB increases to

$$F' = \frac{\mu_0 I_1 I_2}{2\pi(r-y)}\times L = \frac{\mu_0 I_1 I_2}{2\pi r}\left(1-\frac{y}{r}\right)^{-1}\times L$$

$$\approx \frac{\mu_0 I_1 I_2}{2\pi(r-y)}\left(1+\frac{y}{r}\right)^{-1}\times L$$

On releasing the wire AB, the wire moves under the effect of restoring force f given by

$$f = F' - F = \frac{\mu_0 I_1 I_2}{2\pi(r-y)}\left(1+\frac{y}{r}\right)^{-1}\times L - \frac{\mu_0 I_1 I_2}{2\pi(r-y)}\times L$$

$$= \frac{\mu_0 I_1 I_2}{2\pi(r-y)}\times L$$

The acceleration produced in the motion of wire AB is given by

$$a = \frac{f}{M} = \frac{\mu_0 I_1 I_2}{2\pi r^2 M}y\times L$$

or $a \propto y$

Hence, motion of the wire AB is simple harmonic in nature and its time period is given by

$$T = 2\pi\sqrt{\frac{y}{a}} = 2\pi\sqrt{\frac{2\pi r^2 M}{\mu_0 I_1 + I_2 L}}$$

From the equation (i), substituting the value of M, we have

$$T = 2\pi\sqrt{\frac{2\pi r^2}{\mu_0 I_1 I_2 L}\times\frac{\mu_0 I_1 + I_2 L}{2\pi r g}}$$

$$= 2\pi\sqrt{\frac{r}{g}} = 2\pi\sqrt{\frac{0{\cdot}01}{9{\cdot}8}} = 0{\cdot}2\text{ s}$$

Problem 2.08. A wire loop carrying a current I is placed in the XY-plane as shown in the Fig. 2.10. The extremities M and N of the current loop subtend an angle of 120° at the centre (P) of the circular part of the loop.

(a) If a particle with charge + Q and mass m is placed at the centre P and given a velocity $\vec{v}$ along NP, find its instantaneous acceleration.

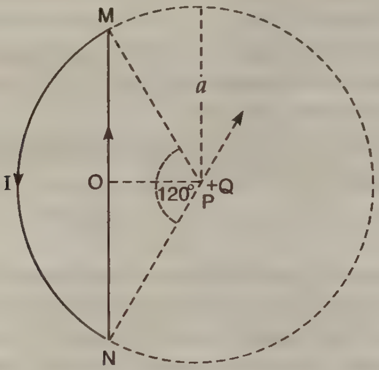

Fig. 2.10.

(b) If an external uniform magnetic induction field $\vec{B} = B\hat{i}$ is applied, find the force and the torque acting on the loop due this field. *(I.I.T. 1991)*

Thought Process

From point P, drop PO perpendicular to MN. Join PN and PM.

Obviously, $\angle NOP = \angle MPO = 60°$,

$OP = a \cos 60° = \dfrac{a}{2}$ *and* MN = 2

$OM = 2\,a \sin 60° = \sqrt{3}\,a$

Now, the magnetic field due to the wire loop may be considered as the combined effect of the magnetic field ($\vec{B}_1$) *produced by the circular arc (which is one third of a complete turn) and the magnetic field* ($\vec{B}_2$) *produced by the straight conductor MN, lying at distance OP and its two ends subtending angles* $\phi_1 = \phi_2 = \dfrac{1}{2}$ ($\angle$ MPN) = 60° *at the observation point P.*

Sol. (a) Here, the radius of the circular arc is a. For a circular loop of n turns,

$$B = \frac{\mu_0}{4\pi} \cdot \frac{2\pi n I}{a} = \frac{\mu_0 n I}{2a}$$

Therefore, magnetic field due to the portion of the circular loop of wire (one third of a complete turn),

$$B_1 = \frac{\mu_0 \left(\frac{1}{3}\right) I}{2a} = \frac{\mu_0 I}{6a}$$

or
$$\vec{B} = \frac{\mu_0 I}{6a}\hat{k}$$

Magnetic field due to the straight portion MN of the wire loop,

$$B_2 = \frac{\mu_0}{4\pi} \cdot \frac{I}{OP}(\sin\phi_1 + \sin\phi_2)$$

$$= \frac{\mu_0}{4\pi} \cdot \frac{I}{a/2}(\sin 60° + \sin 60°$$

$$= \frac{\sqrt{3}\,\mu_0 I}{2\pi a} \qquad \text{(along Z-axis)}$$

or
$$\vec{B}_2 = \frac{\sqrt{3}\,\mu_0 I}{2\pi a}(-\hat{k}) = -\frac{\sqrt{3}\,\mu_0 I}{2\pi a}\hat{k}$$

Therefore, net magnetic field due to the wire loop at point P,

$$\vec{B} = \vec{B}_1 + \vec{B}_2 = \frac{\mu_0 I}{6a}\hat{k} + \left(-\frac{\sqrt{3}\,\mu_0 I}{2\pi a}\hat{k}\right)$$

$$= -\frac{0{\cdot}109\,\mu_0 I}{a}\hat{k}$$

Since the charged particle moves with velocity $\vec{v}$ along NP *i.e.* making an angle of 60° with X-axis, we have

$$\vec{v} = (v\cos 60°)\,\hat{i} + (v\cos 60°)\,\hat{j} = v\left(\frac{1}{2}\hat{i} + \frac{\sqrt{3}}{2}\hat{j}\right)$$

Force on the charged particle due to the magnetic field produced by the wire loop,

$$\vec{F} = Q(\vec{v} \times \vec{B})$$

$$= Q\left\{v\left(\frac{1}{2}\hat{i} + \frac{\sqrt{3}}{2}\hat{j}\right)\right\} \times \left\{\frac{-0{\cdot}109\,\mu_0 I}{a}\hat{k}\right\}$$

$$= \frac{0{\cdot}109\,Q\,v\,\mu_0 I}{a}\left[-\frac{1}{2}(-\hat{j}) - \frac{\sqrt{3}}{2}\hat{i}\right]$$

$$= \frac{0{\cdot}109\,Q\,v\,\mu_0 I}{2a}(-\sqrt{3}\,\hat{i} + \hat{j})$$

If m is mass of the charged particle, then acceleration is given by

$$\vec{a} = \frac{\vec{F}}{m} = \frac{0{\cdot}109\,Q\,v\,\mu_0 I}{2ma}(-\sqrt{3}\,\hat{i} + \hat{j})$$

$$\therefore\ |\vec{a}| = \frac{0{\cdot}109\,Q\,v\,\mu_0 I}{2ma}\sqrt{(-\sqrt{3})^2 + (1)^2}$$

$$= \frac{0{\cdot}109\,Q\,v\,\mu_0 I}{2ma}$$

(b) Net force on the wire loop due to applied magnetic field is zero for obvious reasons.

Now, torque on the wire loop is given by

$$\vec{\tau} = I\vec{A} \times \vec{B}$$

Here, $\vec{B} = \hat{i}\,B$ and $\vec{A}$ = area vector representing the area of wire loop

Now, $|\vec{A}| = \dfrac{1}{3}$ (area of circle)

– area of Δ PMN $= \dfrac{1}{3}\pi a^2 - \dfrac{1}{2}\sqrt{3}\,a \cdot \dfrac{a}{2} = 0{\cdot}6136\,a^2$

As the wire loop lies in XY-plane, the area vector representing the area of the wire loop is given by

$$\vec{A} = 0{\cdot}6136\,a^2\,\hat{k}$$

Hence, $\vec{\tau} = I(0{\cdot}6136\,a^2\,\hat{k}) \times (B\,\hat{i}) = 0{\cdot}6136\,I\,B\,a^2\,\hat{j}$

$\therefore\ \tau = |\vec{\tau}| = 0{\cdot}6136\,I\,B\,a^2$

Problem 2.09. A galvanometer having 30 divisions has a current sensitivity of 20μA per division. It has a resistance of 25 Ω. How will you convert it into an ammeter measuring upto 1 A ? How will you now convert this ammeter into a voltmeter reading upto 1 V ? *(Roorkee ,1987)*

Sol. Here, current sensitivity of galvanometer

$$= 20\ \mu\text{A division}^{-1} = 20 \times 10^{-6}\ \text{A division}^{-1}$$

Since galvanometer has 30 divisions, current for full scale deflection,

$$I_g = 30 \times 20 \times 10^{-6} = 6 \times 10^{-4}\ \text{A}$$

Conversion of galvanometer into ammeter. If S is the resistance of required shunt that should be connected in parallel to the galvanometer, then

$$S = \frac{I_g}{I - I_g} G$$

Here, I = 1 A, G = 25 Ω

$$\therefore \quad S = \frac{6 \times 10^{-4}}{1 - 6 \times 10^{-4}} \times 25$$

$$= \mathbf{0.015\ \Omega\ (in\ parallel)}$$

Conversion of ammeter into voltmeter. If R is the resistance that should be connected in series to the ammeter, then

$$R = \frac{V}{I} - R_A$$

Here, I is current that can pass through the ammeter ; and R_A is the resistance of the ammeter and is given by

$$R_A = \frac{GS}{G+S} = \frac{25 \times 0.015}{25 + 0.015} = 0.015\ \Omega$$

Since V = 1 V and I = 1 A,

$$R = \frac{1}{1} - 0.015 = \mathbf{0.985\ \Omega} \qquad \textbf{(in series)}$$

Problem 2.10. A galvanometer having a coil resistance of 100 Ω gives a full scale deflection, when a current of 1 mA is passed through it. What is the value of the resistance, which can convert this galvanometer into a meter giving a full scale deflection for a current of 10 A ?

A resistance of the required value is available but it will get burnt, if the energy dissipated in it is greater than 1 W. Can it be used for the above described conversion of the galvanometer ? When this modified galvanometer is connected across the terminals of battery, it shows a current of 4 A . The current drops to 1 A , when a resistance of 1·5 Ω is connected in series with the modified galvanometer. Find the e.m.f. and the initial resistance of the battery.

(I.I.T. 1972)

Sol. Here, G = 100 Ω, $I_g = 1\ \text{mA} = 10^{-3}$ A and I = 10 A

If S is the required shunt resistance, then

$$S = \frac{I_g}{I - I_g} G = \frac{10^{-3}}{10 - 10^{-3}} \times 100 = \frac{\mathbf{100}}{\mathbf{9999}}\ \mathbf{\Omega}\ \textbf{(in parallel)}$$

The current that will pass through shunt is given by

$$I_s = I - I_g = 1 - 10^{-3} = 9.999\ \text{A}$$

Therefore, power dissipated in the shunt

$$= I_s^2 \times S = (9.999)^2 \times \frac{100}{9999} = 0.9999\ \text{W}$$

Since in the available shunt resistance, the power dissipated can be 1 W, it **can be safely used** for the conversion of galvanometer into the ammeter.

If R_A is resistance of the ammeter obtained, then

$$R_A = \frac{GS}{G+S} = \frac{100 \times \frac{100}{9999}}{100 + \frac{100}{9999}} = 0.01\ \Omega$$

Let E be e.m.f. of the battery and r be its internal resistance. When modified galvanometer is connected to the battery, then

$$I = \frac{E}{R_A + r}$$

Here, I = 4 A

$$\therefore \quad 4 = \frac{E}{0.01 + r}$$

or $\quad E = 0.04 + 4r \qquad$ ...(*i*)

When a resistance of 1·5 Ω is connected in series, then

$$I' = \frac{E}{R_A + r + 1.5}$$

Here, I′ = 1 A

$$\therefore \quad 1 = \frac{E}{0.01 + r + 1.5}$$

or $\quad E = 0.01 + r + 1.5 \qquad$ ...(*ii*)

Solving the equations (*i*) and (*ii*), we obtain

E = 2 V and **r = 0·49 Ω**

Problem 2.11. Two resistors 400 Ω and 800 Ω are connected in series with 6 V battery. It is desired to measure the current in the circuit. An ammeter of 10 Ω resistance is used for this purpose. What will be the reading in the ammeter ? Similarly, if a voltmeter of 10,000 Ω resistance is used to measure the potential difference across the 400 Ω resistor, what will be the reading in voltmeter ?

(M.N.R. 1990 ; I.I.T. 1982)

Sol. When ammeter is connected in circuit, its resistance R_A also comes in series with the resistances R_1 and R_2 [Fig. 2.11].

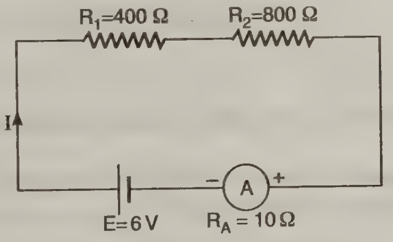

Fig. 2.11.

If R is total resistance of the circuit, then

$$R = R_1 + R_2 + R_A = 400 + 800 + 10 = 1210\ \Omega$$

If I is current in the circuit, then

$$I = \frac{E}{R} = \frac{6}{1210} = \mathbf{4.96 \times 10^{-3}\ A}$$

Therefore, reading of the ammeter = 4.96×10^{-3} A

When voltmeter is connected across the resistance R_1 [Fig. 2.12], then the resistances R_V and R_1 are in parallel and the combination is in series with R_2.

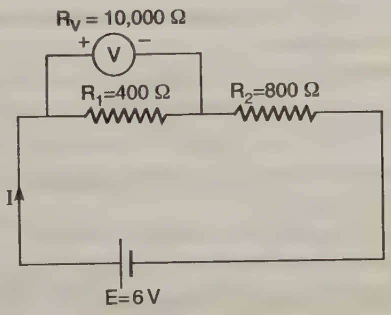

Fig. 2.12.

If R′ is effective resistance of R_1 and R_V, then

$$R' = \frac{R' \times R_V}{R_1 + R_V} = \frac{400 \times 10000}{400 + 10000} = 384 \cdot 6\ \Omega$$

The equivalent resistance of the circuit is given by

$$R = R' + R_2 = 384{\cdot}6 + 800 = 1184{\cdot}6\ \Omega$$

Therefore, current in the circuit,

$$I = \frac{E}{R} = \frac{6}{1184 \cdot 6} = 5 \cdot 065 \times 10^{-3}\ A$$

Hence, reading of the voltmeter,

$$I R' = 5{\cdot}06 \times 10^{-3} \times 384{\cdot}6 = \mathbf{1{\cdot}948\ V}$$

Chapter 3. Magnetic dipole

Problem 3.01. A small magnet of magnetic moment M is placed at broad-side on position of a magnet of magnetic moment M′, length 2 l′ in such a way that the axis of former coincides with the perpendicular bisector of the latter. The separation between their centres is *d*. Calculate the nature of interactions (force or torque) among them. What is its limiting value, when *d* becomes very large ?

(Roorkee, 1986)

Sol. The small magnet NS of magnetic moment M and pole strength *m* is placed at broad-side on position of magnet N′ S′ of magnetic moment M′ and length 2 l′ as shown in Fig. 3.01.

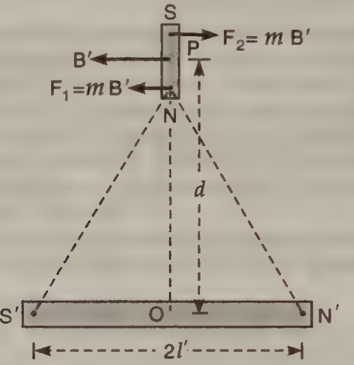

Fig. 3.01.

The distance between the centres of two magnets *i.e.* OP = *d*.

The magnetic field B′ due to the magnet N′ S′ at point P (a point on equitorial line of N′ S′),

$$B' = \frac{\mu_0}{4\pi} \cdot \frac{M'}{(d^2 + l^2)^{3/2}}$$

Let F_1 and F_2 be the forces experienced by north and south-pole of the small magnet NS due to the magnetic field B′. As the magnet NS is small, force on the two poles will be same in magnitude, say F. Therefore,

$$F = F_1 = F_2 = m\,B'$$

The forces on the two poles of the magnet NS are equal in magnitude but opposite in direction. Therefore, magnet NS is acted upon by a torque given by

$$\tau = F \times NS = m\,B' \times NS$$

Since $m \times NS = M$, the magnetic moment of magnet NS ;

$$\tau = M\,B'$$

Substituting for B′, we have

$$\tau = \frac{\mu_0}{4\pi} \cdot \frac{M M'}{(d^2 + l^2)^{3/2}}$$

Therefore, between the two magnets, the nature of interaction is **torque.**

When *d* becomes very large *i.e.* if $d >> l'$, then $d^2 + l^2 \approx d^2$.

The limiting value of torque, $\tau = \mathbf{\dfrac{\mu_0}{4\pi} \cdot \dfrac{M M'}{d^3}}$

Problem 3.02. A coil in the shape of an equilateral triangle of side 0·02 m is suspended from a vertex, such that it is hanging in a vertical plane between the pole pieces of a permanent magnet producing a horizontal magnetic field of 5×10^{-2} T [Fig. 3.02]. Find the couple acting on the coil, when a current of 0·1 A is passed through it and the magnetic field is parallel to its plane. *(Roorkee, 1991)*

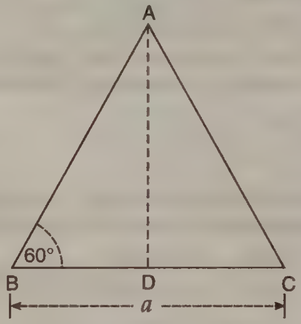

Fig. 3.02.

Sol. Here I = 0·1 A, $B = 5 \times 10^{-2}$ T

Angle between normal to the plane of the coil and the applied magnetic field, $\theta = 90°$

When a current I is passed through a coil having area A, then magnetic dipole moment of the coil is given by

$$M = I\,A$$

Since the coil of the shape of equilateral triangle has side,

$$a = 0{\cdot}02\ \text{m},$$

$$\text{area of coil, } A = \frac{1}{2}\text{base} \times \text{height} = \frac{1}{2}\, a \times a \sin 60°$$

$$= \frac{1}{2} \times 0 \cdot 02 \times 0 \cdot 02 \times \frac{\sqrt{3}}{2} = \sqrt{3} \times 10^{-4}\ \text{m}^2$$

Therefore, magnetic dipole moment of the coil,

$$M = 0 \cdot 1 \times \sqrt{3} \times 10^{-4} = \sqrt{3} \times 10^{-5}\ \text{A m}^2$$

The torque acting on the coil,

$$\tau = M\,B \sin\theta = \sqrt{3} \times 10^{-5} \times 5 \times 10^{-2} \times \sin 90°$$

$$= \mathbf{5\sqrt{3} \times 10^{-7}\ N\,m}$$

Problem 3.03. A rectangular loop PQRS made from a uniform wire has length *a*, width *b* and mass *m*. It is free to rotate about the arm PQ, which remains hinged along a horizontal line taken as the Y-axis [Fig. 3.03]. Take the vertically upward direction as the Z-axis. A uniform magnetic field $\vec{B} = (3\hat{i} + 4\hat{k})\,B_0$ exists in the region. The loop is held in the XY-plane and a current I is passed through it. The loop is now released and is found to stay in the horizontal position in equilibrium.

(*a*) What is the direction of the current I and PQ ?

(*b*) Find the magnetic force on the arm RS.

(*c*) Find the expression for I in terms of B_0, *a*, *b* and *m*.

(I.I.T. 2002)

Thought Process

The loop will stay horizontal, when the torque on loop due to magnetic field is equal and opposite to the torque of weight of the loop about PQ.

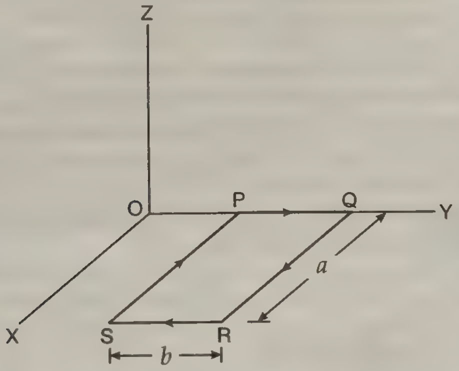

Fig. 3.03

Sol. (*a*) Here $\vec{B} = (3\,\hat{i} + 4\,\hat{k})\,B_0$;

$PQ = RS = b$, $PS = QR = a$ and mass of loop $= m$

Weight of the loop, $m\vec{g} = m\,g(-\hat{k}) = -m\,g\,\hat{k}$

The centre of gravity of loop lies at a distance $a/2$ along OX.

$$\therefore \qquad \vec{r} = \frac{a}{2}\,\hat{i}$$

Hence, torque of weight of the loop about PQ,

$$\vec{\tau}_1 = \vec{r} \times m\,\vec{g} = \left(\frac{a}{2}\,\hat{i}\right) \times (-m\,g\,\hat{k}) = \frac{1}{2}\,m\,g\,a\,\hat{j}$$

The direction of current through the loop should be such that torque $\vec{\tau}_2$ on the loop due to magnetic field acts opposite to $\vec{\tau}_1$.

Suppose that current I is passed through the loop in the direction PQRS. Then, area vector $\vec{A}$ of the loop is given by

$$\vec{A} = a\,b\,(-\hat{k}) = -a\,b\,\hat{k}$$

and magnetic moment of the current loop,

$$\vec{M} = I\,\vec{A} = -a\,b\,I\,\hat{k}$$

Hence, torque on the current loop due to magnetic field,

$$\vec{\tau}_2 = \vec{M} \times \vec{B} = (-a\,b\,I\,\hat{k}) \times (3\,\hat{i} + 4\,\hat{k})\,B_0 = -3\,a\,b\,I\,B_0\,\hat{j}$$

Thus, $\vec{\tau}_1$ and $\vec{\tau}_2$ act in opposite direction, if current is passed through the loop in the direction PQRS *i.e.* from **point P to Q in arm PQ.**

(*b*) Magnetic force on arm RS,

$$\vec{F} = I\,(\overrightarrow{RS}) \times \vec{B} = I\,(-b\,\hat{j}) \times (3\,\hat{i} + 4\,\hat{k})\,B_0$$

$$= \mathbf{b\,I\,B_0\,(3\,\hat{i} - 4\,\hat{k})}$$

(*c*) Since loop is in equilibrium,

$$|\vec{\tau}_1| = |\vec{\tau}_2|$$

$$\text{or} \qquad \frac{1}{2}\,m\,g\,a = 3\,a\,b\,I\,B_0$$

$$\text{or} \qquad I = \frac{m\,g}{6\,b\,B_0}$$

Problem 3.04. A magnet is suspended in the magnetic meridian with a untwisted wire. The upper end of wire is rotated through 180° to deflect the magnet by 30° from magnetic meridian. Now this magnet is replaced by another magnet and the upper end of the wire is rotated through 270° to deflect the magnet 30° from magnetic meridian. Compare the magnetic moments of magnets.

(*M.N.R. 1985*)

Thought Process

When wire is twisted through angle ϕ, the magnet gets deflected through angle θ. Therefore, the net twist produced in the wire will be $(\phi - \theta)$. If k is restoring torque per unit twist of the wire, then in equilibrium.

$$k\ (\phi - \theta) = M\,B \sin\theta$$

Sol. ***For First magnet :***

$$\phi - \theta = 180° - 30° = 150° = \frac{150 \times \pi}{180}\ \text{rad}$$

If M_1 is magnetic moment of the first magnet, then

$$k \times \frac{150\,\pi}{180} = M_1\,B \sin 30° \qquad \ldots(i)$$

For Second magnet :

$$\phi - \theta = 270° - 30° = 240° = \frac{240 \times \pi}{180}\ \text{rad}$$

If M_2 is magnetic moment of the second magnet, then

$$k \times \frac{240\,\pi}{180} = M_2\,B \sin 30° \qquad \ldots(ii)$$

Dividing equation (*i*) by (*ii*), we have

$$\frac{M_1\ B \sin 30°}{M_2\ B \sin 30°} = \left(k = \frac{150\,\pi}{180}\right) \bigg/ \left(\frac{k \times 240\,\pi}{180}\right)$$

$$\text{or} \qquad \frac{M_1}{M_2} = \frac{5}{8}$$

Problem 3.05. A magnet of magnetic moment M is freely suspended in a constant uniform magnetic field B. Calculate the work done in deflecting the magnet through an angle θ from the direction of B. (*Roorkee, 1990*)

Hint. Work done in rotating a magnet inside the magnetic field,

$$W = M\,B\,(\cos\theta_1 - \cos\theta_2) \qquad \ldots(i)$$

As the magnet is to be rotated from the direction of B,

$$\theta_1 = 0° \text{ and } \theta_2 = \theta$$

Therefore, equation (*i*) becomes

$$W = M\,B\,(\cos 0° - \cos\theta)$$

$$= \mathbf{M\,B\,(1 - \cos\theta)}$$

Chapter 4. Earth's Magnetism

Problem 4.01. A circular coil of radius 0·157 m has 50 turns. It is placed, such that its axis is in magnetic meridian. A dip needle is supported at the centre of the coil with its axis of rotation horizontal and in the plane of the coil. The angle of dip is 30°, when a current flows through the coil. The angle of dip becomes 60° on reversing the current. Find

the current in the coil assuming that the magnetic field due to the coil is smaller than the horizontal component of earth's magnetic field (Horizontal component of earth's field = 3 × 10^{-5} T). *(Roorkee, 1994)*

Thought Process

The horizontal component of earth's magnetic field B_H *is aided by the magnetic field B′ produced by the coil, when current is passed in one direction and is opposed by the magnetic field B′ on reversing the direction of the current. It follows that*

$$\textit{when } \delta = 30°, \tan\delta = \frac{B_V}{B_H - B'}$$

$$\textit{and when } d = 60°, \tan\delta = \frac{B_V}{B_H - B'} \qquad (B' < B_H)$$

Sol. Here, $BH = 3 \times 10^{-5}$ T

In first case, $\delta = 30°$

$$\therefore \quad \tan 30° = \frac{B_V}{B_H + B'}$$

$$\text{or} \quad \frac{B_V}{B_H + B'} = \frac{1}{\sqrt{3}} \qquad ...(i)$$

On reversing the current, $\delta = 60°$

$$\therefore \quad \tan 60° = \frac{B_V}{B_H - B'}$$

$$\text{or} \quad \frac{B_V}{B_H - B'} = \sqrt{3} \qquad ...(ii)$$

Dividing equation (*ii*) by (*i*), we have

$$\frac{B_V}{B_H - B'} \times \frac{B_H + B'}{B_V} = \sqrt{3} \times \frac{\sqrt{3}}{1}$$

$$\text{or} \quad \frac{B_H + B'}{B_H - B'} = 3$$

$$\text{or} \quad B' = \frac{1}{2} B_H = \frac{1}{2} \times 3 \times 10^{-5} = 1{\cdot}5 \times 10^{-5} \text{ T}$$

But magnetic field at the centre of a circular coil,

$$B' = \frac{\mu_0}{4\pi} \cdot \frac{2\pi n I}{a}$$

$$\therefore \quad \frac{\mu_0}{4\pi} \cdot \frac{2\pi n I}{a} = 1{\cdot}5 \times 10^{-5}$$

Here, $n = 50$, $a = 0{\cdot}157$ m

$$10^{-7} \times \frac{2\pi \times 50 \times I}{0{\cdot}157} = 1{\cdot}5 \times 10^{-5}$$

$$\text{or} \quad I = \frac{1{\cdot}5 \times 10^{-5} \times 0{\cdot}157}{10^{-7} \times 2 \times 3{\cdot}14 \times 50} = \mathbf{0{\cdot}075\ A}$$

Problem 4.02. A small magnet of magnetic moment $\pi = 10^{-10}$ is placed on the Y- axis at a distance of 0·1 m from the origin with its axis parallel to the X-axis. A coil having 169 turns and radius 0·05 m is placed on the X-axis at a distance of 0·12 m from the origin with the axis of the coil coinciding with X-axis. Find the magnitude and direction of the current in the coil for a compass needle placed at the origin to point in the north-south direction. *(Roorkee, 1993)*

Thought Process

A compass needle placed at the origin will point in the north-south direction, if the magnetic field produced at the origin by the magnet and the coil are equal in magnitude and opposite in direction. Accordingly, as seen from origin, the direction of flow of current through the coil is in anticlockwise direction.

Sol. Let B be the magnetic field produced by the small magnet NS at the origin and B′ be the magnetic field produced by the coil on passing current through it. Since magnetic field B due to the magnet is along OX, the magnetic field B′ due to the coil would be along OX′. It will be so, if on looking from the origin O, the direction of flow of current through the coil is in anticlockwise direction [Fig. 4.01].

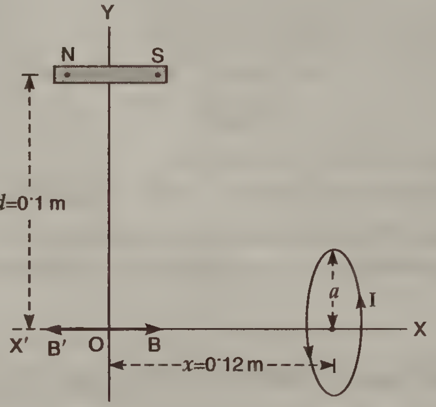

Fig. 4.01.

The magnetic field due to small magnet at point O,

$$B = \frac{\mu_0}{4\pi} \cdot \frac{M}{r^3}$$

Here, $M = \pi \times 10^{-10}$ A m^2 ; $r = 0{\cdot}1$ m

$$\therefore \quad B = 10^{-7} \times \frac{\pi \times 10^{-10}}{(0{\cdot}1)^3} = \pi \times 10^{-14} \text{ T}$$

The magnetic field due to circular coil at point O,

$$B' = \frac{\mu_0}{4\pi} \cdot \frac{2\pi I a^2}{(a^2 + x^2)^{3/2}}$$

Here, $n = 169$; $a = 0{\cdot}65$ m ; $x = 0{\cdot}12$ m

$$\therefore \quad B' = 10^{-7} \times \frac{2\pi \times 169 \times I \times (0{\cdot}05)^2}{[(0{\cdot}05)^2 + (0{\cdot}12)^2]^{3/2}}$$

$$= 10^{-7} \times \frac{2\pi \times 169 \times I \times (0{\cdot}05)^2}{(0{\cdot}13)^2} = 3{\cdot}846\,\pi \times 10^{-5}\, I$$

For compass needle to point in the north-south direction,

$3{\cdot}846\,\pi \times 10^{-5}\, I = \pi \times 10^{-14}$

or **$I = 2{\cdot}6 \times 10^{-10}$ A**

(in anticlockwise direction, when seen from the origin)

Problem 4.03. A vibration magnetometer consists of two identical bar magnets placed one over the other, such that they are mutually perpendicular and bisect each other. The time period of oscillation in a horizontal magnetic field is 4 s. If one of the magnets is taken away, find the period of the other in the same field. *(Roorkee, 1992)*

Thought Process

When two magnets, each of magnetic moment M and moment of inertia I are placed perpendicular to each other, the moment of inertia of the combination becomes

$$I' = 2I$$

and the magnetic moment of the combination is given by

$$M' = \sqrt{M^2 + M^2 + 2\,M\,M\cos 90^\circ} = \sqrt{2}\,M$$

Sol. Let T′ be the time period of the combination and T, the time period of a magnet when the other is taken away.

For combination : $T' = 2\pi\sqrt{\dfrac{I'}{M'B}}$

$$\therefore \qquad 4 = 2\pi\sqrt{\frac{2I}{\sqrt{2}\,MB}} \qquad \text{...(i)}$$

When one magnet is taken away : $T = 2\pi\sqrt{\dfrac{I}{MB}}$ ...(ii)

Dividing equation (ii) by (i), we have

$$T = 2\pi\sqrt{\frac{I}{MB}} \Big/ 2\pi\sqrt{\frac{2I}{\sqrt{2}\,MB}} = (2)^{1/4}$$

or $\qquad T = 4 \times (2)^{1/4} = 4 \times 1{\cdot}189 =$ **4·76 s**

Chapter 5. Classification of Magnetic materials

Problem 5.01. An iron rod of volume 10^{-4} m^3 and relative permeability 1000 is placed inside a long solenoid wound with 5 turns cm^{-1}. If a current of 0·5 A is passed through the solenoid, find the magnetic moment of the rod.

Sol. Here, $\mu_r = 1000$; $n = 5$ turns cm^{-1} = 500 turns m^{-1}

volume of the rod, $V = 10^{-4}$ m^3 ;

current through the solenoid, $i = 0{\cdot}5$ A

The magnetic field produced by solenoid,

$$B = \mu_0\mu_r\,n\,i = 4\pi \times 10^{-7} \times 1000 \times 500 \times 0{\cdot}5 = \frac{\pi}{10}\text{ tesla}$$

Now, $\qquad B = \mu_0\,(H + I)$

$$\text{or} \qquad I = \frac{B}{\mu_0} - H = \frac{B}{\mu_0} - \frac{B}{\mu} \qquad \left(\because H = \frac{B}{\mu}\right)$$

$$\text{or} \qquad \frac{B}{\mu_0}\left(1 - \frac{\mu_0}{\mu}\right) = \frac{B}{\mu_0}\left(1 - \frac{1}{\mu_r}\right)$$

$$\text{or} \qquad I = \frac{B}{\mu_0\,\mu_r}(\mu_r - 1) = \frac{\pi/10}{4\pi \times 10^{-7} \times 1000}(1000 - 1)$$

$$= 2{\cdot}5 \times 10^5 \text{ A m}^{-1}$$

Now, $I = \dfrac{M}{V}$,

where M is magnetic moment and V is volume of the rod.

$$\therefore \qquad M = I \times V = 2{\cdot}5 \times 10^5 \times 10^{-4} = \mathbf{25\ A\ m^2}$$

Problem 5.02. A bar magnet has coercivity 4×10^3 A m^{-1}. It is desired to demagnetise it by inserting it inside a solenoid 12 cm long and having 60 turns. What current should be sent through the solenoid ?

Sol. The coercivity of 4×10^3 A m^{-1} of the bar magnet implies that magnetic intensity $H = 4 \times 10^3$ A m^{-1} (in opposite direction) is required to demagnetise it.

Here, number of turns per unit length of the solenoid,

$$n = \frac{60}{12} = 5 \text{ turns cm}^{-1} = 500 \text{ turns m}^{-1}$$

Now, $\qquad B = \mu_0\,n\,I$

$$\text{or} \qquad I = \frac{B}{\mu_0\,n} = \frac{H}{n} = \frac{4 \times 10^3}{500} = 8\text{ A}$$

MULTIPLE CHOICE QUESTIONS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Magnetic Effect of Current

PART I. TEXT-BASED QUESTIONS

1. A current flows in a conductor from east to west. The direction of the magnetic field at a point above the conductor is
(A) towards north. (B) towards south.
(C) towards east. (D) towards west.
(Karnataka Entrance, 1992, 198 7)

2. The magnetic field at a point due to a current carrying conductor is directly proportional to
(A) resistance of the conductor.
(B) thickness of the conductor.
(C) current flowing through the conductor.
(D) distance from the conductor. *(C.E.T. 1999)*

3. In SI system, permeability has the units :
(A) weber metre^{-1} ampere^{-1}
(B) weber metre ampere^{-1}
(C) weber metre^{-1}ampere^{-2}
(D) weber metre ampere *(Pre-Medical/Dental ,1993)*

4. The magnetic field $\overrightarrow{dB}$ due to a small current element dl at a distance $\vec{r}$ and element carrying current I is
(A) $\overrightarrow{dB} = \frac{\mu_0}{4\pi} \times \frac{I\,\vec{dl} \times \vec{r}}{r}$ (B) $\overrightarrow{dB} = \frac{\mu_0}{4\pi} \times \frac{I\,\vec{dl} \times \vec{r}}{r^2}$
(C) $\overrightarrow{dB} = \frac{\mu_0}{4\pi} \times \frac{I\,\vec{dl} \times \vec{r}}{r^3}$ (D) $\overrightarrow{dB} = \frac{\mu_0}{4\pi} \times \frac{I\,\vec{dl} \times \vec{r}}{r^4}$
(C.B.S.E. 1996)

5. The magnetic field at a distance *r* from a long wire carrying current I is 0·4 tesla. The magnetic field at a distance 2 *r* is
(A) 0·1 tesla (B) 0·2 tesla
(C) 0·8 tesla (D) 1·6 tesla *(C.B.S.E. 1992)*

6. A straight wire of diameter 0·5 mm carrying a current of 1 A is replaced by another wire of 1 mm diameter carrying the same current. The strength of the magnetic field far away is
(A) twice the earlier value.
(B) one half of the earlier value.
(C) one quarter of the earlier value.
(D) same as the earlier value. *(C.B.S.E. 1999, 1997)*

7. A circular coil A has a radius *a* and the current flowing in it is I. Another circular coil B has a radius 2 *a* and if 2 I is the current flowing through it, then the magnetic fields at the centre of the circular coils are in the ratio of
(A) 1 : 1 (B) 2 : 1
(C) 3 : 1 (D) 4 : 1 *(C.B.S.E. 1993)*

8. Magnetic field intensity at the centre of coil of 50 turns, radius 0·5 m and carrying a current of 2 A is
(A) $0{\cdot}5 \times 10^{-5}$ T (B) $1{\cdot}26 \times 10^{-4}$ T
(C) 3×10^{-5} T (D) 4×10^{-5} T *(C.B.S.E. 1999)*

9. A helium nucleus makes a full rotation in a circle of radius 0·8 m in 2 s. The vlaue of the magnetic field B at the centre of circle will be
(A) $\frac{10^{-19}}{\mu_0}$ (B) $10^{-19}\,\mu_0$
(C) $2 \times 10^{-19}\,\mu_0$ (D) $\frac{2 \times 10^{-19}}{\mu_0}$ *(C.P.M.T. 1988)*

10. A particle carrying a charge equal to 100 times the charge on an electron is revolving per second in a circular path of radius 0·8 m. The magnetic field produced at the centre wil be :
(A) $10^{-7}/\mu_0$ (B) $10^{-17}\,\mu_0$
(C) $10^{-6}\,\mu_0$ (D) $10^{-7}\,\mu_0$

11. A positively charged particle moving due east enters region of uniform magnetic field directed verticall upwards. The particle will
(A) get deflected in vertically upward direction.
(B) move in circular path with an increased speed.
(C) move in circular path with a decreased speed.
(D) move in a circular path with a uniform speed.
(C.B.S.E. 1997

12. A charged particle moves with velocity $\vec{v}$ in a unifor magnetic field $\vec{B}$. The magnetic force experienced by th particle is
(A) always zero.
(B) never zero.
(C) zero, if $\vec{B}$ and $\vec{v}$ are perpendicular.
(D) zero, if $\vec{B}$ and $\vec{v}$ are parallel.
(Pre-Medical/Dental ,1990

13. A 2 MeV proton is moving perpendicular to a unifor magnetic field of 2·5 tesla. The force on the proton is
(A) $2{\cdot}5 \times 10^{-10}$ N (B) $7{\cdot}84 \times 10^{-11}$ N
(C) $2{\cdot}5 \times 10^{-11}$ N (D) $7{\cdot}84 \times 10^{-12}$ N
(C.P.M.T. 1989

14. Tesla is a unit of magnetic
(A) field (B) flux
(C) induction (D) moment. *(C.P.M.T. 1992*

15. Weber m^{-2} is equal to
(A) tesla (B) henry
(C) watt (D) dyne. *(A.F.M.C. 1997*

16. The unit of magnetic induction is
(A) A m^{-1} (B) A m
(C) weber (D) tesla *(Karnataka, 1993*

17. A power line lies along east-west direction and carries current of 10 ampere. The force per metre due to earth' magnetic field of 10^{-4} tesla is
(A) 10^{-2} N (B) 10^{-3} N
(C) 10^{-4} N (D) 10^{-5} N *(Roorkee, 1992*

18. The magnetic field of a U-shaped magnet is parallel to th surface of the paper, when the magnet is placed in the plan of paper with its north pole towards left. A conductor i placed in the field, so that it is perpendicular to the pape If the direction of flow of current through the conducto is outwards, it will tend to move :
(A) downwards. (B) upwards.
(C) to the right. (D) to the left.

19. Two parallel wires carrying currents in the same directio attract each other, because of
(A) potential difference between them.
(B) mutual inductance between them.
(C) electric forces between them.
(D) magnetic forces between them. *(N.C.E.R.T. 1983*

20. Two long straight wires carrying the same current I an separated by a distance *r* exert force F per unit length o each other. If the current is increased to 2 I and separatio is reduced to *r* / 2, then force will become :

(A) 8 F (B) 2 F
(C) F/2 (D) F/8

21. **Two thin long parallel wires are separated by a distance r and carry a current I each. The magnitude of the force per unit length experienced by one wire due to the other is :**

(A) $\frac{\mu_0 I^2}{r^2}$ (B) $\frac{\mu_0 I^2}{2\pi r}$
(C) $\frac{\mu_0 I}{2\pi r}$ (D) $\frac{\mu_0 I}{2\pi r^2}$ *(I.I.T. 1986)*

22. **Two long parallel wires are carrying currents of 5 A and 12 A respectively. If the force per unit length between these wires is 3×10^{-5} N m^{-1}, the distance between them should be**

(A) 400 m (B) 4 m
(C) 0·4 m (D) 0·04 m *(C.E.T. 1999)*

23. **Two long parallel wires are at a distance of 1 m. If both of them carry 1 A of current, then the force of attraction per unit length between the two wires is**

(A) 2×10^{-7} N m^{-1} (B) 2×10^{-8} N m^{-1}
(C) 5×10^{-8} N m^{-1} (D) 5×10^{-7} N m^{-1}
(C.B.S.E. 1998)

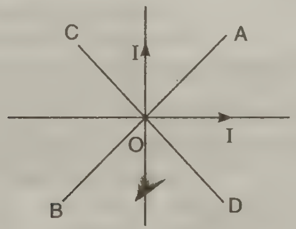
24. **Two parallel wires in free space are 10 cm apart and each carries a current of 10 A in the same direction. The force exerted by one wire on the other (per metre length) is**

(A) 2×10^{-4} N attractive.
(B) 2×10^{-7} N attractive.
(C) 2×10^{-4} N repulsive.
(D) 2×10^{-7} N repulsive. *(C.B.S.E. 1997)*

25. **A 15 cm radius ring has 3500 turns of wire wound on a ferromagnetic core of relative permeability 800. What is the magnetic field in the core for a magnetising current 1·2 A ?**

(A) 0·39 oersted (B) 5·76 oersted
(C) 5·76 tesla (D) 4·48 tesla
(Karnataka Entrance, 1991)

26. **Two equal electric currents are flowing perpendicular to each other as shown in the figure. AB and CD are perpendicular to each other and symmetrically placed w.r.t. the currents. Where do we expect the resultant magnetic field to be zero ?**



(A) on AB. (B) on CD.
(C) on both AB and CD. (D) on both OD and BO.
(C.B.S.E. 1996)

27. **A circular loop of radius 10 cm carrying a current of 1 A is placed in a uniform magnetic field of 0·1 T. If the magnetic field is perpendicular to the plane of the loop, the force experienced by the loop is**

(A) 0·001 N (B) 0·314 N
(C) 0·52 N (D) zero *(C.E.T. 1998)*

28. **A circular loop of radius R carrying a current I is placed in a uniform magnetic field with its plane perpendicular to B. The force on the loop is**

(A) $2\pi B I R$ (B) $2\pi B I^2 R$
(C) $4\pi B I R$ (D) zero *(C.P.M.T. 1993)*

29. **The torque on the loop in Q. 28. is**

(A) $\pi B R^2$ (B) $\pi B I^2 R^2$
(C) $\pi B^2 I R^2$ (D) zero *(C.P.M.T. 1993)*

30. **A current loop of area 0·01 m^2 and carrying a current of 10 ampere is held perpendicular to a magnetic field of intensity of 0·1 tesla. The torque (in N m) acting on the loop is**

(A) 0 (B) 0·001
(C) 0·01 (D) 1·1
(Pre-Medical/Dental, 1994)

31. **A current carrying loop is placed in a uniform magnetic field. The torque acting on it does not depend upon**

(A) shape of the loop.
(B) size of the loop.
(C) value of the current.
(D) magnetic field. *(C.E.T. 1998)*

32. **The basic instrument employed to detect current is**

(A) galvanometer (B) ammeter
(C) wattmeter (D) voltmeter.
(Karnataka, 1992 S)

33. **A galvanometer is said to be sensitive, if it gives a**

(A) small deflection for a small current.
(B) small deflection for a large current.
(C) large deflection for a large current.
(D) large deflection for a small current. *(C.E.T. 1999)*

34. **The sensitivity of a moving coil galvanometer can be increased by**

(A) increasing the number of turns.
(B) decreasing the number of turns.
(C) decreasing the area of the coil.
(D) none of the above. *(Karnataka Entrance, 1992, 1989)*

35. **To convert a galvanometer into an ammeter, we connect**

(A) low resistance in series.
(B) low resistance in parallel.
(C) high resistance in series.
(D) high resistance in parallel.
(C.B.S.E. 2002 ; A.F.M.C. 1995, 1993)

36. **A moving coil galvanometer has a resistance of 900 Ω. In order to send only 10% of the main current through this galvanometer, the resistance of the required shunt is**

(A) 0·9 Ω (B) 90 Ω
(C) 100 Ω (D) 900 Ω *(Roorkee ,1992)*

37. **A galvanometer having a resistance of 8 Ω is shunted by a wire of resistance 2 Ω. If the total current is 1 A, the part of it passing through the shunt will be**

(A) 1·2 A (B) 0·8 A
(C) 0·5 A (D) 0·3 A *(C.B.S.E. 1998)*

38. **The deflection in a moving coil galvanometer falls from 50 to 10 divisions, when a shunt of 12 Ω is connected across it. The resistance of the coil of the galvanometer is**

(A) 2·4 Ω (B) 12 Ω
(C) 48 Ω (D) 60 Ω.

39. **To increase the range of an ammeter,**

(A) a small resistance is connected in series.
(B) a small resistance is connected as shunt.
(C) a large resistance is connected in series.
(D) a large resistance is connected as shunt.
(Karnataka Entrance, 1988)

40. **To convert a galvanometer into a voltmeter,**

(A) a high resistance is connected in parallel.
(B) a low resistance is connected in series.
(C) a low resistance is connected in parallel.
(D) a high resistance is connected in series.
(C.E.T. 1999 ; Karnataka Entrance, 1993)

41. **A galvanometer can measure a current up to 20 milliampere. When it is connected in series with a**

resistance of 2970 ohm, it can read up to 60 volt. The galvanometer has a resistance (in ohm)

(A) 130
(B) 30
(C) 230
(D) 60 *(Karnataka Entrance, 1987)*

42. **The e.m.f. of generator is 6 V and its internal resistance is 0·5 kΩ. The reading of a voltmeter having an internal resistance of 2·5 kΩ is**

(A) 10^{-3} V
(B) 1 V
(C) 5 V
(D) 10 V *(C.E.T. 1991)*

43. **A voltmeter has a resistance of 20 kΩ. When it is connected in series with a resistance R across a 230 V supply, it reads 160 V. The value of R is**

(A) 3·75 kΩ
(B) 4·75 kΩ
(C) 6·75 kΩ
(D) 8·75 kΩ *(C.E.T. 1999)*

PART II. THOUGHT-BASED QUESTIONS

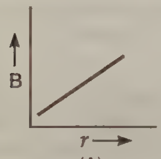
44. **If a long hollow copper pipe carries a current, the magnetic field produced will be**

(A) inside the pipe only.
(B) outside the pipe only.
(C) neither inside nor outside the pipe.
(D) both inside and outside the pipe. *(C.B.S.E. 1999)*

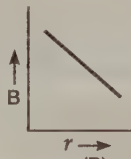
45. **A current I flows along the length of an infinitely long, straight and thin walled pipe. Then, the magnetic field**

(A) at all points inside the pipe is the same, but not zero.
(B) at any point inside the pipe is zero.
(C) is zero only on the axis of the pipe.
(D) is different at different points inside the pipe. *(I.I.T. 1993)*

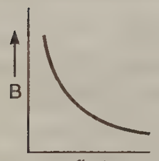
46. **A constant current is flowing through a straight conductor. The variation of magnetic induction B with distance r of the observation point will be as shown :**



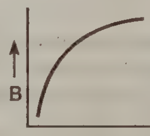
(A)



(B)



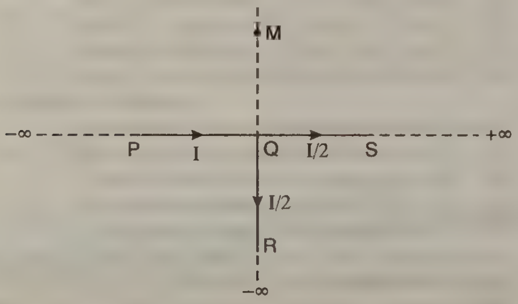
(C)



(D)

(A.F.M.C. 1997)

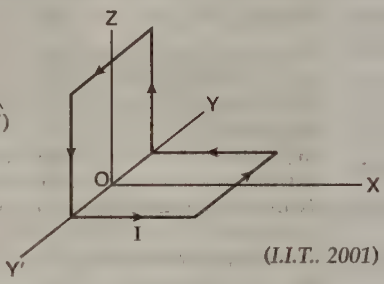
47. **An infinitely long conductor PQR is bent to form a right angle as shown. A current I flows through PQR. The magnetic field due to this current at the point M is B_1. Now, another infinitely long straight conductor QS is connected at Q, so that the current is I/2 in QR as well as QS, the current in PQ remaining unchanged. The magnetic field at M is now B_2. The ratio B_1/B_2 is given by**



(A) 1/2
(B) 1
(C) 2/3
(D) 2 *(I.I.T. 2000)*

48. **A non-polar loop of conducting wire carrying a current I is placed as shown in the figure. Each of the straight sections of the loop is of length 2 *a*. The magnetic field due to this loop at the point P (*a*, 0, *a*) points in the direction**

(A) $\frac{1}{\sqrt{2}}(-\hat{j}+\hat{k})$
(B) $\frac{1}{\sqrt{3}}(-\hat{j}+\hat{k}+\hat{i})$
(C) $\frac{1}{\sqrt{3}}(\hat{i}+\hat{j}+\hat{k})$
(D) $\frac{1}{\sqrt{2}}(\hat{i}+\hat{k})$



(I.I.T.. 2001)

49. **A long straight along the Z-axis carries a current I in the negative Z-direction. The magnetic field vector $\vec{B}$ at a point having coordinate (*x*, *y*) on the *z* = 0 plane is**

(A) $\frac{\mu_0}{2\pi}\cdot\frac{I(y\hat{i}-x\hat{j})}{(x^2+y^2)}$
(B) $\frac{\mu_0}{2\pi}\cdot\frac{I(y\hat{i}+x\hat{j})}{(x^2+y^2)}$
(C) $\frac{\mu_0}{2\pi}\cdot\frac{I(x\hat{j}-y\hat{i})}{(x^2+y^2)}$
(D) $\frac{\mu_0}{2\pi}\cdot\frac{I(x\hat{i}-y\hat{j})}{(x^2+y^2)}$ *(I.I.T. 2002)*

50. **Two wires are held perpendicular to the plane of paper at 5 m apart. They carry currents of 2·5 A and 5 A in same direction. Then the magnetic field strength (B) at a point midway between the wires will be :**

(A) $\frac{\mu_0}{4\pi}$ T
(B) $\frac{\mu_0}{2\pi}$ T
(C) $\frac{3\mu_0}{2\pi}$ T
(D) $\frac{3\mu_0}{4\pi}$ T *(C.B.S.E. 2001)*

51. **The magnetic field of a given length of wire carrying a current for a single turn circular coil at centre is B. Then its value for the same wire, when same current passing through it, is**

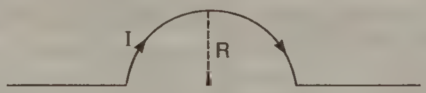
(A) B/4
(B) B/2
(C) 2 B
(D) 4 B *(C.B.S.E. 2002)*

52. **A wire of certain length is bent to form a circular coil of a single turn. If the same wire is bent into a coil of smaller radius so as to have two turns, then magnetic field produced at the centre by the same value of current is :**

(A) one quarter of its value in first case.
(B) one half of its value in first case.
(C) two times its value in first case.
(D) four times its value in first case.

(C.B.S.E. 1998 ; Karnataka Entrance, 1991, 1988 ; A.I.I.M.S. 1990)

53. **A portion of a conducting wire is bent in the form of a semicircle of radius R as shown in figure. At the centre of the semicircle, the magnetic induction will be :**



(A) $\frac{\mu_0 I}{2R}$
(B) $\frac{\mu_0 I}{4R}$
(C) $\frac{\mu_0 I}{2\pi R}$
(D) $\frac{\mu_0 I}{4\pi R}$

54. The current that flows through a conductor of length 1 cm bent into the form of an arc of a circle of radius 2 cm to produce a magnetic field of 0·1 oersted at its centre is

(A) 1 ampere (B) 4 ampere
(C) 0·5 ampere (D) 0·1 ampere

55. A coil having n turns is wound tightly in the form of a spiral with inner and outer radii a and b respectively. When a current I passes through the coil, the magnetic field at the centre is

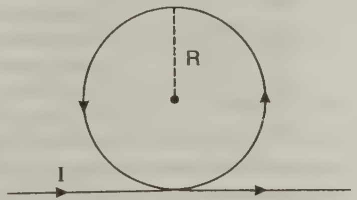
(A) $\frac{\mu_0 n I}{b}$ (B) $\frac{2 \mu_0 n I}{a}$

(C) $\frac{\mu_0 n I}{2(a-b)} \log_e \frac{b}{a}$ (D) $\frac{\mu_0 I^n}{2(b-a)} \log_e \frac{b}{a}$ (*I.I.T. 2001*)

56. Two coils are placed, such that their planes are at right angles to each other and have common centre. If each coil carries the same current and produces same magnetic field B, then the resultant field will be :

(A) 2 B (B) $\sqrt{2}$ B
(C) B / $\sqrt{2}$ (D) zero

57. An infinitely long straight conductor is bent into the shape as shown. If it carries a current I and the radius of the circular loop is R, then magnetic induction at the centre of the circular part is :



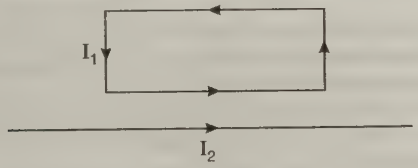
(A) $\frac{\mu_0}{4\pi} \cdot \frac{2\pi I}{R}$

(B) $\frac{\mu_0}{4\pi} \cdot \frac{2I}{R}(\pi + 1)$

(C) $\frac{\mu_0}{4\pi} \cdot \frac{2I}{R}(\pi - 1)$

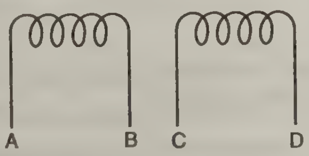
(D) cannot be found.

58. A rectangular loop carries a current I_1 and is placed near a long straight wire. If the wire carries a current I_2 and it is parallel to one of the sides of the loop, then the loop will



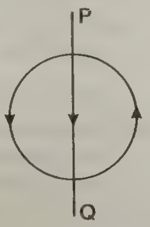
(A) move towards the wire.
(B) move away from the wire.
(C) rotate about some axis parallel to the wire.
(D) remain stationary.

59. Two current carrying coils are held as shown in the figure. If the two coils attract each other, then direction of flow of electrons must be same at the ends



(A) A and B.
(B) A and C.
(C) A and D.
(D) C and D.

60. In the diagram, PQ is a long current carrying wire, which is placed near a current carrying circular coil. The direction of the force acting on PQ is



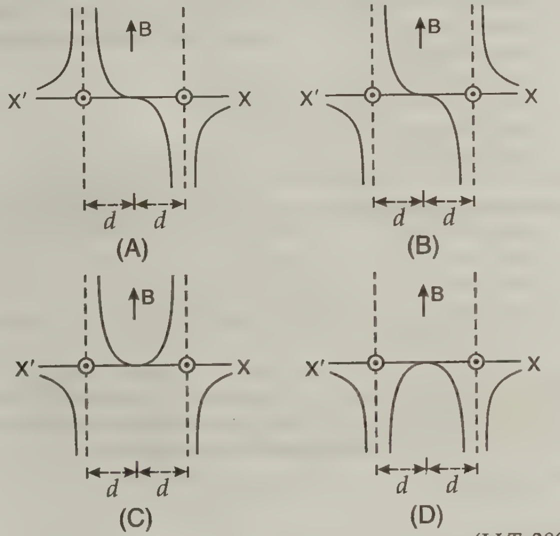
(A) parallel to PQ towards Q.
(B) parallel to PQ towards P.
(C) perpendicular to PQ towards right.
(D) perpendicular to PQ towards left.

61. Two very long, straight and parallel wires carry steady currents I and – I respectively. The distance between the wires is r. At a certain instant of time, a point charge q is at a point equidistant from the two wires, in the plane of the wires. Its instantaneous velocity v is perpendicular to this plane. The magnitude of the force due to the magnetic field acting on the charge at this instant is

(A) $\frac{\mu_0 I q v}{2\pi r}$ (B) $\frac{\mu_0 I q v}{\pi r}$

(C) $\frac{2 \mu_0 I q v}{\pi r}$ (D) 0 (*I.I.T. 1998*)

62. Two long parallel wires are at a distance 2 d apart. They carry steady equal currents flowing out of the plane of the paper as shown. The variation of the magnetic field B along the line XX′ is given by



(A) (B) (C) (D)

(*I.I.T. 2000*)

63. Current I is flowing in a coil of area A and number of turns n. The magnetic moment of the coil is

(A) n I A (B) n^2 I A

(C) $\frac{nI}{A}$ (D) $\frac{nI}{\sqrt{A}}$ (*C.B.S.E. 2001*)

64. The resistance of an ideal ammeter is

(A) very low. (B) very high.
(C) infinity. (D) can have any value.

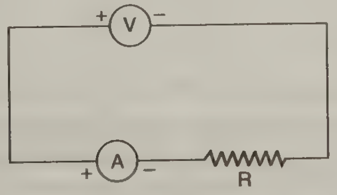
(*C.E.T. 1999 ; Karnataka Entrance, 1993*)

65. The resistance of an ideal voltmeter is

(A) very high. (B) nearly zero.
(C) very low. (D) none of the above.

(*Karnataka Entrance, 1984*)

66. A candidate connects a moving coil voltmeter V and a moving coil ammeter A and resistance R as shown in figure. If the voltmeter reads 20 V and the ammeter reads 4 A, then R is



(A) equal to 5 Ω. (B) greater than 5 Ω.
(C) less than 5 Ω.
(D) greater or less than 5 Ω depending upon its material.

(*A.F.M.C. 1998*)

Chapter 2. Motion of Charged Particle

PART I. TEXT-BASED QUESTIONS

1. **The mass of a proton is about 2,000 times the mass of an electron. An electron and a proton are injected into a uniform electric field at right angles to the direction of the field with the same initial kinetic energy. Then,**
   (A) the electron trajectory will be less curved than that of the proton.
   (B) the proton trajectory will be less curved than that of the electron.
   (C) both the trajectories will be equally curved.
   (D) both the trajectories will be straight.
   (Karnataka Entrance, 1988)

2. **A deuterium nucleus consists of one proton and one neutron. If a deuterium nucleus and a helium nucleus are both placed in the same electric field, the acceleration of deuterium is**
   (A) equal to that of the helium.
   (B) greater than that of helium.
   (C) less than that of helium.
   (D) not related in a fixed way to that of helium.
   (Karnataka Entrance, 1986, 1985)

3. **A charged particle is moving through magnetic field. Then, magnetic field :**
   (A) always exerts a force on the particle.
   (B) never exerts a force on the particle.
   (C) exerts a force, if the particle is moving at right angles to the field.
   (D) exerts a force, if the particle is moving along the field.

4. **An electric charge e moves with a constant velocity v parallel to the lines of force of a uniform magnetic field B, the force experienced by the charge is :**
   (A) Bev (B) $\frac{ev}{B}$
   (C) zero (D) $\frac{e}{Bv}$

5. **A uniform magnetic field acts at right angles to the direction of motion of electrons. As a result, the electron moves in a circular path of radius 2 cm. If the speed of the electrons is doubled, then the radius of the circular path will be**
   (A) 2·0 cm (B) 0·5 cm
   (C) 4·0 cm (D) 1·0 cm *(C.B.S.E., 1991)*

6. **An electron moves with a velocity of $10^3\ \text{m s}^{-1}$ in a magnetic field of induction 0·3 T at an angle 30°. If e/m of electron is $1{\cdot}76 \times 10^{11}\ \text{C kg}^{-1}$, the radius of the path is nearly**
   (A) 10^{-8} m (B) 2×10^{-8} m
   (C) 10^{-6} m (D) 10^{-10} m *(C.B.S.E. 2000)*

7. **A charged particle of charge q and mass m enters perpendicularly in a magnetic field $\vec{B}$. Kinetic energy of the particle is E. Then frequency of rotation is**
   (A) $\frac{qB}{\pi m}$ (B) $\frac{qB}{2\pi m}$
   (C) $\frac{qBE}{2\pi m}$ (D) $\frac{qB}{2\pi E}$ *(C.B.S.E. 2001)*

8. **A proton having charge e enters a magnetic field of strength B with a velocity v in a direction making angle θ with the direction of the field. The force on proton is :**
   (A) Bev (B) zero
   (C) $Bev\cos\theta$ (D) $Bev\sin\theta$

9. **Two particles X and Y having equal charges, after being accelerated through the same potential difference enter a region of uniform magnetic field and describe circular paths of radii r_1 and r_2 respectively. The ratio of the mass of X to that of Y is**
   (A) $\left(\frac{r_1}{r_2}\right)^{1/2}$ (B) $\left(\frac{r_2}{r_1}\right)$
   (C) $\left(\frac{r_1}{r_2}\right)^2$ (D) $\left(\frac{r_1}{r_2}\right)$
   (C.P.M.T. 1991 ; I.I.T. 1988)

10. **A proton is projected in a direction perpendicular to a uniform magnetic field and an electron is projected along the direction of the field. Then, the path followed by**
    (A) electron will be circular, while that of proton will be straight.
    (B) proton will be circular, while that of the electron will be straight.
    (C) both of them will be parabolic.
    (D) both of them will be straight.

11. **The radius of curvature of the paths of a charged particle in uniform magnetic field is directly proportional to :**
    (A) the charge on the particle.
    (B) the energy of the particle.
    (C) the momentum of the particle.
    (D) the intensity of the field.

12. **A deutron of kinetic energy 50 keV is describing a circular orbit of radius 0·5 m in a plane perpendicular to magnetic field $\vec{B}$. The kinetic energy of the proton that describes a circular orbit of radius 0·5 m in the same plane with the same $\vec{B}$ is**
    (A) 25 keV (B) 50 keV
    (C) 200 keV (D) 100 keV
    (Pre-Medical/Dental, 1991)

13. **A proton and an alpha particle enter in a uniform magnetic field with the same velocity. The time period of rotation of the alpha particle will be**
    (A) four times that of the proton.
    (B) two times that of the proton.
    (C) three times that of the proton.
    (D) same as that of the proton. *(Pre-Medical/Dental 1990)*

14. **A charge q moves in a regin, where electric field $\vec{E}$ and magneic field $\vec{B}$ both exist. Then the force on it is :**
    (A) $q(\vec{v} \times \vec{B})$ (B) $q\vec{E} + q(\vec{v} \times \vec{B})$
    (C) $q\vec{E} + q(\vec{B} \times \vec{v})$ (D) $q\vec{B} + q(\vec{E} \times \vec{v})$
    (C.B.S.E. 2002)

15. **In a certain region of space, electric field $\vec{E}$ and magnetic field $\vec{B}$ are perpendicular to each other and an electron enters in region perpendicular to the direction of $\vec{B}$ and $\vec{E}$ both and moves undeflected. Then velocity of electron is**
    (A) $\frac{|\vec{E}|}{|\vec{B}|}$ (B) $\frac{|\vec{B}|}{|\vec{E}|}$
    (C) $\vec{E} \times \vec{B}$ (D) $\vec{E} \cdot \vec{B}$ *(C.B.S.E. 2001)*

16. **Cyclotron is a device to**
    (A) measure charge. (B) measure voltage.
    (C) accelerate protons. (D) accelerate electrons.
    (A.F.M.C. 1997)

17. **The phenomenon of production of e.m.f. in a current carrying metallic strip on applying a magnetic field along a direction perpendicular to the direction of flow of current is known as**
(A) Half effect (B) Joule effect
(C) Seebeck effect (D) Peltier effect
(A.F.M.C. 1996)

PART II. THOUGHT-BASED QUESTIONS

18. **An electron is projected into a magnetic field with components of velocity parallel and normal to the field. The path followed by electron will be :**
(A) straight. (B) parabolic.
(C) helical. (D) elliptical.

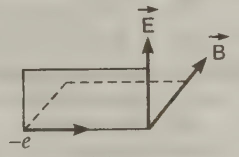
19. **An electron describes half a revolution in a circle of radius r inside a magnetic field of strength B. The energy acquired by the electron is :**
(A) $\frac{1}{2} m v^2$ (B) $m v^2$
(C) $\pi r \times B e v$ (D) zero.

20. **A proton and alpha particles are projected with the same kinetic energy at right angles to a uniform magnetic field. Then**
(A) the alpha-particle will move along a circular path of smaller radius than the proton.
(B) the alpha-particle will move along a circular path of greater radius than the proton.
(C) both will move along circular paths of same radius.
(D) both will follow a straight path.

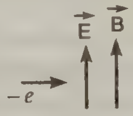
21. **After being accelerated through a potential difference of V (volt), an electron passes through a transverse magnetic field and experiences a force F. If the electron is accelerated through a potential difference of 2 V (in volt), then force on electron will be :**
(A) $\frac{F}{\sqrt{2}}$ (B) $\frac{F}{2}$
(C) $\sqrt{2}\,F$ (D) 2 F

22. **A charged particle passes through a region of space without change in its velocity. If E and B represent the electric and magnetic fields respectively, then for this region of space, which alternative may not be possible ?**
(A) $E = 0, B = 0$ (B) $E \neq 0, B \neq 0$
(C) $E = 0, B \neq 0$ (D) $E \neq 0, B = 0$

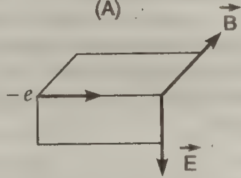
23. **An electron passes a region of space in which electric ($\vec{E}$) and magnetic field ($\vec{B}$) act over the same region. The electron may emerge undeflected, if the fields are oriented as shown :**



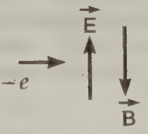
(A)



(B)



(C)



(D)

24. **An electron and a proton both having same linear momentum are projected at right angles to a uniform magnetic field. Then trajectory of**
(A) both will be equally curved.
(B) both will be straight.
(C) electron will be less curved than that of proton.
(D) proton will be less curved than that of electron.

25. **A particle of mass m and charge q moves with a consant velocity v along the positive X-direction. It enters a region containing a uniform magnetic field B directed along the negative Z-direction, extending from $x = a$ to $x = b$. The minimum value of v required so that the particle can just enter the region $x > b$ is**
(A) $\frac{q b B}{m}$ (B) $\frac{q (b - a) B}{m}$
(C) $\frac{q a B}{m}$ (D) $\frac{q (b + a) B}{2 m}$ *(I.I.T. 2002)*

Chapter 3. Magnetic dipole

PART I. TEXT-BASED QUESTIONS

1. **Which one of the following statement is correct ? The field strength of a bar magnet :**
(A) is same throughout the entire length of the bar magnet.
(B) is greater at the centre of the bar magnet.
(C) is the greatest at the poles.
(D) increases as the magnet ages.

2. **When a bar magent is immersed in a heap of iron filings and is then taken out, it is observed that iron filings stick to the surface of the bar magnet. A close exmination would reveal that iron filings**
(A) stick uniformly throughout the surface of bar magent.
(B) stick randomly on the surface of bar magnet.
(C) have maximum concentration at the mid portion of bar magnet.
(D) have maximum concentration at the two ends of the bar magent. *(C.E.T. 1998)*

3. **The magnetic field lines :**
(A) intersect at the neutral point.
(B) intersect near north and south poles.
(C) cannot intersect at all.
(D) depend upon the position of the magnet.
(M.N.R. 1987)

4. **A uniform magnetic field is obtained in :**
(A) a bar magnet.
(B) a horseshoe magnet.
(C) a circular coil carrying a current.
(D) a cylindrical coil carrying a current.
(Karnataka Entrance, 1992)

5. **The strength of magnetic field at a distance r (in metre) from an isolated magnetic pole of strength m (in SI units) in air is :**
(A) $\frac{\mu_0}{4\pi} \cdot \frac{m}{r}$ (B) $\frac{\mu_0}{4\pi} \cdot \frac{m}{r^2}$
(C) $\frac{\mu_0}{4\pi} m r$ (D) $\frac{\mu_0}{4\pi} m r^2$ *(M.N.R. 1987)*

6. **The magnetic field due to a small magnetic dipole of magnetic moment M at a point on the axis of the dipole and at a distance r from it is given by**
(A) $\frac{\mu_0}{4\pi} \cdot \frac{M}{r^3}$ (B) $\frac{\mu_0}{4\pi} \cdot \frac{M}{r^2}$
(C) $\frac{\mu_0}{4\pi} \cdot \frac{2M}{r^3}$ (D) $\frac{\mu_0}{4\pi} \cdot \frac{2M}{r^2}$ *(A.F.M.C. 1998)*

7. The magnetic field at a distance d from a short bar magnet in longitudinal and transverse positions are in the ratio :
(A) 1 : 1 (B) 1 : 2
(C) 2 : 1 (D) 3 : 1 *(C.E.T. 1999)*

8. A bar magnet of magnetic moment $\vec{M}$ is placed in a magnetic field of induction $\vec{B}$. The torque exerted on it is
(A) $\vec{M} . \vec{B}$ (B) $-\vec{M} . \vec{B}$
(C) $\vec{M} \times \vec{B}$ (D) $-\vec{M} \times \vec{B}$ *(C.B.S.E. 1999)*

9. The work done in turning a magnet of magnetic moment M through an angle θ from the meridian is :
(A) $M B (1 - \cos \theta)$ (B) $M B \cos \theta$
(C) $m B$ (D) $M B \sin \theta$
(A.F.M.C. 1997 ; M.N.R. 1992)

10. The work done in turning a magnet of magnetic moment M by an angle of 90° from the meridian is n times the corresponding work done to turn it through an angle of 60°. The value of n is given by
(A) 2 (B) 1
(C) 0·5 (D) 0·25 *(C.B.S.E. 1995)*

PART II. THOUGHT-BASED QUESTIONS

11. A bar magnet of magnetic moment M is cut into two parts of equal lengths. The magnetic moment and pole strength of either part is :
(A) $\frac{M}{2}, \frac{m}{2}$ (B) $M, \frac{m}{2}$
(C) $\frac{M}{2}, m$ (D) M, m
(C.B.S.E. 1997 ; N.C.E.R.T. 1983)

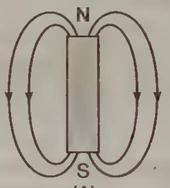
12. A bar magnet has been cut equally lengthwise and breadthwise to give four equal pieces. The pole strength of each piece as compared to the pole strength of original bar magnet is :
(A) same (B) 1/8
(C) 1/4 (D) 1/2

13. A large magnet is broken into two pieces, so that their lengths are in the ratio 2 : 1. The pole strengths of the two pieces will be :
(A) in the ratio 4 : 1 (B) in the ratio 2 : 1
(C) in the ratio 1 : 2 (D) equal.

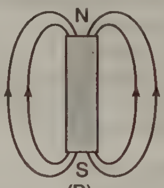
14. A steel wire of length L has a magnetic moment M. It is then bent into a semicircular arc. The new magnetic moment is :
(A) M (B) M/L
(C) $2 M/\pi$ (D) M L *(C.P.M.T. 1984)*

15. The direction of magnetic field lines of a bar magnet is
(A) from south pole to north pole.
(B) from north pole to south pole.
(C) across the bar magnet.
(D) from south pole to north pole inside the magnet and from north pole to south pole outside the magnet.
(A.F.M.C. 1995)

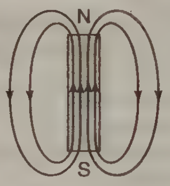
16. The magnetic field lines due to a bar magnet are correctly shown in *(I.I.T. 2002)*



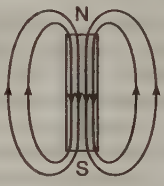
(A)



(B)



(C)



(D)

17. Two small magnets each of magnetic moment 10 A m^2 are placed in end-on position 0·1 m apart from their centres. The force acting between them is :
(A) $0{\cdot}6 \times 10^7$ N (B) $0{\cdot}06 \times 10^7$ N
(C) 0·6 N (D) 0·06 N *(M.N.R. 1994)*

18. A bar magnet is placed inside a non-uniform magnetic field. It experiences :
(A) a force and a torque.
(B) a force but not a torque.
(C) a torque but not a force.
(D) neither a force nor a torque. *(I.I.T. 1982)*

19. The absence of magnetic monopole is explained by :
(A) Coulomb's law. (B) Lorentz's law.
(C) Gauss's law. (D) Fleming's law.
(Karnataka Entrance, 1991)

Chapter 4. Earth's magnetism

PART I. TEXT-BASED QUESTIONS

1. The line joining the points of horizontal component of earth's magnetic field is called :
(A) magnetic axis. (B) magnetic line.
(C) magnetic meridian. (D) magnetic equator.
(M.N.R. 1987)

2. The angle between the earth's magnetic axis and earth's geographic axis is :
(A) 0° (B) 17°
(C) 23° (D) none of the above.
(M.N.R. 1977)

3. Earth's magnetic field always has a horizontal component except at :
(A) equator (B) poles
(C) both at equator and poles
(D) none of the above.

4. Which of the following relation is correct in magnetism ?
(A) $B = \sqrt{B_V^2 + B_H^2}$ (B) $B = B_V + B_H$
(C) $B_V = \sqrt{B^2 + B_H^2}$ (D) $B_H = \sqrt{B^2 + B_V^2}$
(A.F.M.C. 1996)

5. At magnetic poles, the angle of dip is :
(A) 45° (B) 30°
(C) 0° (D) 90° *(C.P.M.T. 1991)*

6. At a certain place, the angle of dip is 30° and the horizontal component of earth's magnetic field is 0·50 oersted. The earth's total magnetic field is :
(A) $\sqrt{3}$ (B) 1
(C) $1/\sqrt{3}$ (D) 1/2 *(C.P.M.T. 1990)*

7. The angle of dip at the magnetic equator is :
(A) 0° (B) 45°
(C) 90° (D) 30°

8. The angle of dip is θ at a place, where the horizontal and vertical components of earth's magnetic fields are equal. The value of θ is :
(A) 0° (B) 30°
(C) 45° (D) 90°

9. At a place, where $B_H = 0{\cdot}32$ oersted ; a tangent galvanometer with a coil of 20 turns carrying a current of 0·64 ampere produces a deflection of 45°, provided the radius of the coil in cm is ($\pi = 22/7$) :
(A) 25 (B) 37·5
(C) 2·25 (D) 1·75
(Karnataka Entrance, 1987)

10. The sensitivity of a tangent galvanometer is increased, if
(A) number of turns decreases.
(B) field increases.
(C) number of turns increases.
(D) field decreases. *(A.F.M.C. 1995)*

11. The period of oscillation of a magnet in a vibration magnetometer is 2 s. The period of oscillation of a magnet of same size but having magnetic moment four times will be :
(A) 1 s (B) 4 s
(C) 8 s (D) 0·05 s *(C.P.M.T. 1990)*

12. A magnet suspended in earth's field can vibrate in horizontal plane. A second magnet is so placed that the field becomes less than the horizontal component of earth's field. In this situation, the time period will :
(A) increase (B) decrease
(C) remain unchanged (D) cannot be predicted.

13. The time period of oscillation of a freely suspended magnet does not depend upon :
(A) the length of the magnet.
(B) the pole strength of the magnet.
(C) the horizontal component of the earth's magnetic field.
(D) the length and nature of the material of the suspension.
(C.P.M.T. 1980)

14. Two bar magnets having same geometry with magnetic moments M and 2 M are firstly placed in such a way that their similar poles are on the same side ; then its period of oscillation is T_1. Now the polarity of one of the magnets is reversed. The time period of oscillations will be :
(A) $T_1 < T_2$ (B) $T_1 > T_2$
(C) $T_1 = T_2$ (D) $T_2 = \infty$ (C.B.S.E. 2002)

PART II. THOUGHT-BASED QUESTIONS

15. Isogonic lines on magnetic map represent lines of :
(A) zero declination. (B) equal declination.
(C) equal dip. (D) equal horizontal field.
(C.P.M.T. 1992)

16. Due to earth's magnetic field, the charged cosmic rays particles
(A) require greater kinetic energy to reach the equator than pole.
(B) require less kinetic energy to reach the equator than pole.
(C) can never reach the pole.
(D) can never reach the equator. *(C.B.S.E. 1997)*

17. A circular loop is carrying current and is said to be equivalent to a magnetic dipole. Then, a point on the axis of the loop lies in its
(A) end-on position.
(B) broad side-on position.
(C) both end-on and broad side-on positions.
(D) none of the above.

18. A circular loop is carrying current and is said to be equivalent to a magnetic dipole. Then, a point on the loop lies in its
(A) end-on position.
(B) broad side-on position.
(C) both end-on and broad-side on positions.
(D) none of the above

19. A dip circle is at right angle to the magnetic meridian. What will be its apparent dip ?
(A) 0° (B) 30°
(C) 60° (D) 90° *(A.F.M.C. 1995)*

20. If a magnet is suspended at an angle 30° to the magnetic meridian, the dip needle makes an angle of 45° with the horizontal. The actual angle of dip is :
(A) $\tan^{-1}\frac{3}{2}$ (B) $\tan^{-1}\sqrt{3}$
(C) $\tan^{-1}\frac{2}{\sqrt{3}}$ (D) $\tan^{-1}\frac{\sqrt{3}}{2}$

21. A magnet is placed vertically on a paper. Then, the neutral point obtained on the paper is :
(A) one only (B) two only
(C) three only (D) zero. *(C.P.M.T. 1985)*

22. A magnet was found to vibrate at a place with a period of T. A piece of brass of same length, breadth and mass was placed over the magnet. The new time period will be :
(A) 2 T (B) $T/\sqrt{2}$
(C) T/2 (D) $\sqrt{2}$ T

23. A bar magnet is oscillating in earth's magnetic field with a period T. What happens to its period and motion, if its mass is quadrupled ?
(A) T/2 (B) 2 T
(C) 4 T (D) unchanged.
(Pre-Medical/Dental ,1994)

24. A thin rectangular magnet suspended freely has a period of oscillation of 4 s. If it is broken into two halves (each having half the original length) and one of the pieces is suspended similarly, the period of its oscillation will be :
(A) 4 s (B) 2 s
(C) 0·5 s (D) 0·25 s *(N.C.E.R.T. 1984)*

Chapter 5. Classification of Magnetic materials

PART I. TEXT-BASED QUESTIONS

1. Tesla is the unit of
(A) electric flux (B) magnetic flux
(C) electric field (D) magnetic induction
(C.B.S.E. 1997)

2. Chose the correct answer :
(A) All electrons possess magnetic moment.
(B) All protons possess magnetic moment.
(C) All nuclei possess magnetic moment.
(D) All atoms possess magnetic moment.

3. Which of the following is ferromagnetic ?
(A) Aluminium (B) Quartz
(C) Nickel (D) Bismuth
(Karnataka Entrance, 1993)

4. An example of a ferromagnetic substance is :
(A) aluminium (B) nickel
(C) gold (D) copper *(Karnataka, 1993)*

5. Which of the following is paramagnetic ?
(A) Antimony (B) Silver
(C) Marble (D) Alnico

6. If the permanent magnetic moment of the atoms of a substance is zero, then substance is called :

(A) diamagnetic (B) paramagnetic
(C) ferromagnetic (D) antiferromagnetic
(C.P.M.T. 1993)

7. **In which type of material the mgnetic susceptibility does nto depend on temperature ?**
(A) Diamagnetic (B) Paramagnetic
(C) Ferromagnetic (D) Ferrite *(C.B.S.E. 2001)*

Here, μ_B is Bohr magneton.

8. **The susceptibility of a diamagnetic substance :**
(A) decreases with temperature.
(B) does not vary with temperature.
(C) first decreases and then increases with increase of temperature.
(D) increases with temperature.
(Karnataka Entrance, 1994)

9. **The magnetic permeability is maximum for :**
(A) paramagnetic (B) ferromagnetic
(C) diamagnetic (D) non-magnetic.

10. **Susceptibility is positive and small for a :**
(A) paramagnetic (B) ferromagnetic
(C) non-magnetic (D) diamagnetic.
(C.P.M.T. 1990)

11. **Susceptibility is positive and large for a**
(A) paramagnetic (B) ferromagnetic
(C) non-magnetic (D) diamagnetic.
(C.P.M.T. 1990, 1982)

12. **If a diamagnetic substance is brought near north or south pole of a bar magnet, it is**
(A) attracted by the poles.
(B) repelled by the poles.
(C) repelled by the north pole and attracted by the south pole.
(D) attracted by the north pole and repelled by the south pole. *(C.B.S.E 1999)*

13. **The relative permeability of a diamagnetic material is**
(A) zero. (B) equal to unity.
(C) less than unity. (D) more than unity.
(A.F.M.C. 1998)

14. **A diamagnetic solution is poured into a U- tube and one arm of this U-tube is placed between the poles of a strong magnet with the meniscus in a line with the field. Then the level of the solution will :**
(A) rise (B) fall
(C) oscillate slowly (D) remain as such.
(M.N.R. 1993)

15. **The meniscus of a liquid contained in one of the limbs of a narrow U-tube is held in an electromagnet with the meniscus in line with the field. The liquid is seen to rise. This indicates that the liquid is :**
(A) ferromagnetic (B) paramagnetic
(C) diamagnetic (D) non-magnetic.
(M.N.R. 1992)

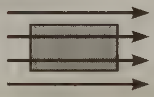
16. **Choose the correct answer :**
(A) Diamagnetism occurs in all materials.
(B) Diamagnetism is the result of partial alignment of permanent magnetic moment.
(C) The magnetic field due to induced magneitc moment is opposite to the applied field.
(D) The magnetising field intensity is always zero in free space.

17. **Which of following is not a unit of intensity of magnetisation ?**
(A) $A\ m^{-1}$ (B) $J\ T^{-1}\ m^{-3}$
(C) $N\ T^{-1}\ m^{-2}$ (D) $A\ T^{-1}\ m^{-2}$

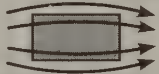
18. **Which of the following is not unit of magnetic induction ?**
(A) T (B) $Wb\ m^{-2}$
(C) $J\ A^{-1}\ m^{-2}$ (D) $N\ A^{-1}\ m^{-1}$

19. **Which of the following relation is not correct ?**
(A) $B = \mu_0 (I + H)$ (B) $B = \mu_0 (1 + \chi_m)H$
(C) $I = \dfrac{B - \mu_0 H}{\mu_0}$ (D) $\chi_m = \mu - 1$

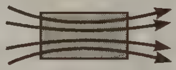
20. **A uniform magnetic field (parallel to the plane of the paper) existed in space initially directed from left to right. When a bar of soft iron is placed in the field parallel to it, the lines of force passing through it, will be represented by :**



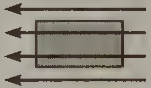
(A)



(B)



(C)



(D)

(C.P.M.T. 1988)

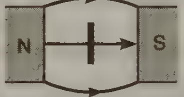
21. **At currie point, a ferromagnetic material becomes :**
(A) non-magnetic (B) diamagnetic
(C) paramagnetic (D) strongly ferromagnetic.
(N.C.E.R.T. 1990)

22. **Above curie temperature, ferromagnetic specimen :**
(A) remains ferromagnetic.
(B) becomes ferromagnetic.
(C) becomes paramagnetic.
(D) becomes diamagnetic. *(Karnataka, 1995, 1992)*

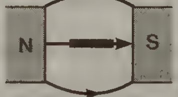
23. **Which of the following relation is not correct ?**
(A) $\chi_m = \dfrac{I}{H}$ (B) $\mu_0 = \mu_0 (1 + \chi_m)\ H$
(C) $\mu_0 = \mu\ (1 + \chi_m)$ (D) $\mu_r = 1 + \chi_m$

24. **For a paramagnetic material, the dependence of the magnetic susceptibility χ_m on the absolute temperature T is given by :**
(A) $\chi_m \propto T$ (B) $\chi_m \propto \dfrac{1}{T}$
(C) $\chi_m = e^{kT}$ (D) χ_m = constant

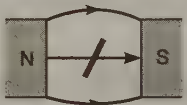
25. **A rod of a paramagnetic substance, such as platinum is placed in a non-uniform strong magnetic field. How will it align itself in the field ?**



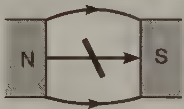
(A)



(B)



(C)



(D)

26. **A rod of a diamagnetic substance, such as bismuth is placed in a non-uniform magnetic field. How will it align itself in the field ? Refer the four orientations as shown in last question.**

27. **The hysteresis curve of a magnetic material is generally studied for :**
(A) diamagnetic materials.
(B) ferromagnetic materials.
(C) paramagnetic materials.
(D) dielectric materials. *(Karnataka Entrance, 1991)*

28. Which of the following is most suitable for the core of the electromagnets ?
(A) Air (B) Soft iron
(C) Steel (D) Cu – Ni alloy
(A.I.I.M.S. 1980)

29. Electromagnets are made of soft iron, because soft iron has :
(A) low susceptibility and low retentivity.
(B) high susceptibility and low retentivity.
(C) high susceptibility and high retentivity.
(D) low permeability and high retentivity. *(M.N.R. 1988)*

30. An electromagnet uses :
(A) soft iron core (B) steel core
(C) nickel core (D) copper core *(A.F.M.C. 1988)*

31. Soft iron is used to manufacture electromagnets, because their :
(A) magnetic saturation limit is high and retentivity and coercivity are small.
(B) retentivity is high. (C) coercivity is high.
(D) area of hysteresis loop is large. *(N.C.E.R.T. 1980)*

32. Soft iron is used in many parts of electrical machines for :
(A) low hysteresis loss and low permeability.
(B) low hysteresis loss and high permeability.
(C) high hysteresis loss and low permeability.
(D) high hysteresis loss and high permeability.

33. A magnetic needle suspended by a silk thread is vibrating in the earth's magnetic field. If the temperature of the needle is increased by 500 °C, then :
(A) the time period decreases.
(B) the time period remains unchanged.
(C) the time period increases.
(D) the needle stops vibrating. *(M.N.R. 1994)*

PART II. THOUGHT-BASED QUESTIONS

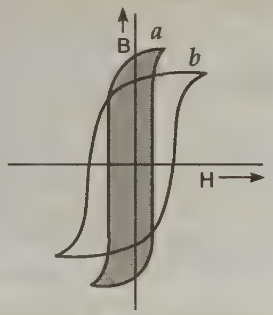
34. Two particles, each of mass m and charge q, are attached to the two ends of a light rigid rod of length 2 R. The rod is rotated at constant angular speed about a perpendicular axis passing through its centre. The ratio of the magnitudes of the magnetic moment of the system and its angular momentum about the centre of the rod is
(A) $\frac{q}{2m}$ (B) $\frac{q}{m}$
(C) $\frac{2q}{m}$ (D) $\frac{q}{\pi m}$ *(I.I.T. 1998)*

35. A particle of charge q and mass m moves in a circular orbit of radius r with angular speed ω. The ratio of the magnitude of its magnetic moment to that of its angular momentum depends on
(A) ω and q (B) ω, q and m
(C) q and m (D) ω and m *(I.I.T. 2000)*

36. The magnetic moment of atomic neon is equal to :
(A) zero (B) μ_B
(C) $\mu_B/2$ (D) $3\,\mu_B/2$ *(N.C.E.R.T. 1984)*
Here, μ_B is Bohr magneton.

37. The hysteresis cycle for the material of permanent magnet is :
(A) short and wide. (B) tall and narrow.
(C) tall and wide. (D) short and narrow.

38. The B-H curves (*a*) and (*b*) in the figure are associated with
(A) a diamagnetic and paramagnetic substance respectively.
(B) a paramagnetic and a ferromagnetic substance respectively.
(C) soft iron and steel respectively.
(D) steel and soft iron respectively.
(C.P.M.T. 1989)



39. The area of the B-H hysteresis loop is an indication of :
(A) the permeability of the medium.
(B) the susceptibility of the substance.
(C) the retentivity of the material.
(D) the energy dissipated per unit volume of the substance per cycle. *(Karnataka Entrance, 1994, 1993)*

40. Area contained within the hysteresis loop represents :
(A) magnetic energy of the specimen.
(B) loss of energy of the specimen.
(C) loss of energy per unit volume per cycle.
(D) none of the above. *(Karnataka, 1995)*

41. The material of a permanent magnet has :
(A) high retentivity, low coercivity.
(B) low retentivity, high coercivity.
(C) low retentivity, low coercivity.
(D) high retentivity, high coercivity.
(Karnataka Entrance, 1994, 1988)

42. Ferromagnetic substance used in a transformer must have :
(A) high susceptibility and high hysteresis loss.
(B) high permeability and low hysteresis loss.
(C) low permeability and high hysteresis loss.
(D) low permeability and low hysteresis loss.
(Karnataka, 1992 S)

43. For protecting a sensitive equipment from external magnetic field, it should be :
(A) placed inside an iron can.
(B) wrapped with insulated wire, through which current is passed.
(C) surrounded with fine copper gauge.
(D) placed inside an aluminium can.
(C.B.S.E. 1998 ; Karnataka Entrance, 1992)

44. In cassette tapes, the sound is recorded in the form of :
(A) variable electrical resistance on the tape.
(B) sound wave on the tape.
(C) electrical energy.
(D) magnetic field on the tape.
(Karnataka Entrance, 1989)

ANSWERS TO MULTIPLE CHOICE QUESTIONS

Chapter 1. Magnetic Effect of Current

1. (A)	2. (C & D)	3. (A)	4. (C)	5. (B)	6. (D)	7. (A)	8. (B)	9. (B)	10. (B)
11. (D)	12. (D)	13. (D)	14. (C)	15. (A)	16. (D)	17. (B)	18. (B)	19. (D)	20. (A)

CHAPTER
1

Electromagnetic Induction

1.01. ELECTROMAGNETIC INDUCTION

As said earlier ; in 1820, Oersted discovered the magnetic effect of electric current *i.e.* when a steady current flows through a conductor, a magnetic field is produced around it. In 1831, Michael Faraday discovered the effect, called ***electromagnetic induction,*** just converse to the magnetic effect of electric current.

When a coil made of copper wire is placed inside a magnetic field, magnetic flux is linked with the coil. Faraday found that when the magnetic flux linked with the coil is changed*, an electric current starts flowing in the coil, provided the coil is a closed one. In case the coil is open, an e.m.f. is set up across the two ends of the coil. The current and the e.m.f. so produced are called ***induced current*** and ***induced e.m.f.*** respectively. The induced current and the e.m.f. in the coil last only so long as the magnetic flux linked with the coil keeps on changing.

Thus, *electromagnetic induction is the phenomenon of production of electric current (or e.m.f.) in a coil, when the magnetic flux linked with the coil is changed.*

1.02. MAGNETIC FLUX

The magnetic flux linked with a surface held in a magnetic field is defined as the number of magnetic field lines crossing the surface normally and is measured as the product of component of the magnetic field normal to the surface and the surface area.

It is a scalar quantity and is denoted by ϕ.

Mathematically, magnetic flux linked with a surface area ΔS held inside a magnetic field B is given by

$$\phi = B_n \Delta S, \quad ...(1.01)$$

where B_n is component of magnetic field B along normal to the surface area ΔS.

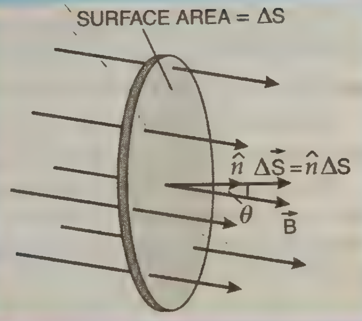

Fig. 1.01

Consider that a surface area ΔS is held inside the magnetic field $\vec{B}$, such that direction of magnetic field makes an angle θ with normal to the surface area ΔS [Fig. 1.01]. Thus, component of magnetic field along normal to the surface area,

$$B_n = B\cos\theta$$

Hence, magnetic flux linked with the surface area is given by

$$\phi = B_n \Delta S = (B\cos\theta)\,\Delta S$$

or

$$\phi = B\,\Delta S\cos\theta \quad ...(1.02)$$

If $\Delta\vec{S}$ is the area vector representing the surface area ΔS, then equation (1.01) or (1.02) can be expressed as

$$\phi = \vec{B}\cdot\Delta\vec{S} \quad ...(1.03)$$

The direction of area vector $\Delta\vec{S}$ is always along the surface area it represents. If $\hat{n}$ is unit vector along normal to the surface area, then equation (1.03) may be written as

$$\phi = \vec{B}\cdot(\hat{n}\,\Delta S) \quad ...(1.04)$$

Here, $\vec{B}\cdot\hat{n} = B_n$ gives the component of magnetic field along normal to the surface area ΔS.

Let us find the magnetic flux linked with a surface area, when held inside the magnetic field in the following cases :

1. When magnetic field is perpendicular to the surface area. Fig. 1.02 shows a surface area ΔS held inside the magnetic field B, such that the direction of magnetic field is perpendicular to the surface area. Since $\vec{B}$ and $\Delta\vec{S}$ are parallel, $\theta = 0°$.

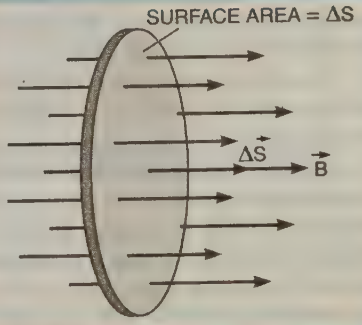

Fig. 1.02

---

* The change in magnetic flux linked with a coil may be caused by varying the strength of the magnetic field or by the relative motion between the source of magnetic flux and the coil.

From equation (1.02), we have

$$\phi = B\,\Delta S \cos 0° = B\,\Delta S$$

It follows that magnetic flux linked with a surface is maximum, when the direction of magnetic field is perpendicular to the surface area.

2. When magnetic field is parallel to the surface area. Fig. 1.03 shows a surface area ΔS held inside the magnetic field B, such that the direction of magnetic field is parallel to the surface area. Since $\vec{B}$ and $\vec{\Delta S}$ are perpendicular, $\theta = 90°$.

From equation (1.02), we have

$$\phi = B\,\Delta S \cos 90° = 0$$

Unit of magnetic flux. In SI, the unit of magnetic flux is **weber (Wb).**

$$\mathbf{1\ weber\ (Wb) = 1\ tesla\ (T) \times 1\ m^2}$$

One weber is the magnetic flux linked with a surface area of 1 metre^2, when held normally inside a uniform magnetic field of 1 tesla.

In cgs system, the unit of magnetic flux is **maxwell (Mx).**

$$\mathbf{1\ maxwell\ (Mx) = 1\ gauss\ (G) \times 1\ cm^2}$$

One maxwell is the magnetic flux linked with a surface area of 1 cm^2, when held normally inside a uniform magnetic field of 1 gauss.

$$1\ \text{Wb} = 1\ \text{T} \times 1\ \text{m}^2 = (10^4\ \text{G}) \times 10^4\ \text{cm}^2$$

or

$$\mathbf{1\ Wb = 10^8\ maxwell}$$

Dimensional formula of magnetic flux. From equation (1.02), we have

$$\phi = B\,\Delta S \cos\theta = \frac{F}{q\,v} \times \Delta S \cos\theta \qquad (\because F = B\,q\,v)$$

Therefore, dimensional formula of ϕ,

$$[\phi] = \left[\frac{F}{q\,v}\,\Delta S\cos\theta\right] = \frac{[M\,L\,T^{-2}]}{[A\,T][L\,T^{-1}]} \times [L^2]$$

or

$$[\phi] = [M\,L^2\,T^{-2}\,A^{-1}]$$

Note. Here, A stands for ampere and [A T] is dimensional formula of electric charge (coulomb).

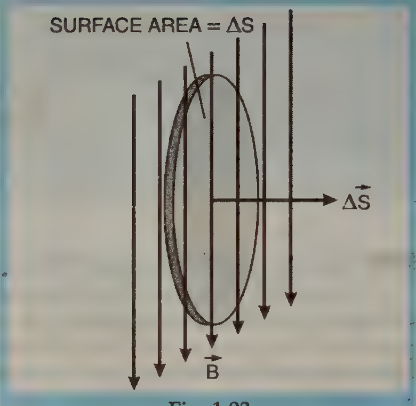

Fig. 1.03

Key point

When a surface is placed in magnetic field, the magnetic flux linked with it is maximum, when it is oriented perpendicular to the direction of magnetic field and becomes zero, when it is parallel to the direction of magnetic field.

1.03. FARADAY'S EXPERIMENT

The following experiments performed by Faraday led to the discovery of the phenomenon of electromagnetic induction :

Experiment 1. When the strength of magnetic field is varied. Consider two coils P and S wound on an iron rod. A battery and a tapping key K are connected to the coil P, while a sensitive galvanometer is connected to the coil S [Fig. 1.04]. Faraday observed that deflection is produced in the galvanometer, when the tapping key K is pressed. When the tapping key is released, deflection is again produced but the direction of deflection is opposite. The galvanometer does not show any deflection, when the tapping key is kept pressed.

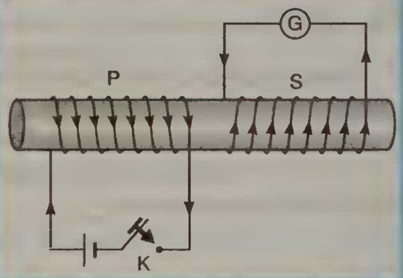

Fig. 1.04

Explanation. When current flows through the coil P, magnetic field is produced along the axis of the coil. Since the coil S is wound on the same rod, magnetic flux gets linked with this coil also.

When the tapping key is just pressed, the current through coil P starts growing and it leads to a growing magnetic field through the coil S. As the magnetic flux linked with the coil S is changing, induced current is produced. On the other hand, when the key is released, the current through the coil P starts decaying. It results in decaying magnetic field through the coil S *i.e.* the magnetic flux linked with the coil S again starts changing. Due to this, induced current is produced in the coil. Since the induced current is produced due to decaying magnetic field (earlier, the magnetic field was growing), the flow of current and hence the deflection in the galvanometer is in the opposite direction.

When the tapping key is kept pressed, the current in coil P becomes steady and hence magnetic flux linked with the coil S also becomes steady. Since induced current is produced only when the magnetic flux linked with the coil changes, the galvanometer does not show any deflection when the tapping key is kept pressed.

Experiment 2. When the source of magnetic field is moved towards or away rom a stationary coil. Consider a coil P wound on an iron rod and connected to battery. A steady current flowing through the coil will produce a steady magnetic eld along its axis. Another coil S has a galvanometer in its circuit [Fig. 1.05]. araday observed that deflection is produced in the galvanometer, when the coil is moved towards the coil S. If the coil P is moved away, the galvanometer shows deflection again, but this time, the deflection is in opposite direction. The eflection is produced in the galvanometer, only when the coil P is moved towards r away from the coil S.

Explanation. When a steady current is passed through the coil P wound on an on rod, the iron rod becomes an electromagnet. Since magnetic field lines crowd ear the poles of the magnet, the magnetic flux linked with the coil S grows when e coil P is moved towards the coil S ; and decays when it is moved away. Since ue to motion of the coil P towards or away from the coil S, the magnetic flux linked ith coil S changes, the galvanometer shows deflection due to the flow of induced urrent in the coil S. In case the coil P is kept stationary, the magnetic flux linked ith the coil S remains same and hence galvanometer does not show any deflection.

The same effects will be observed, if the electromagnet (the current carrying il P wound on the iron rod) is replaced by a bar magnet NS [Fig. 1.06].

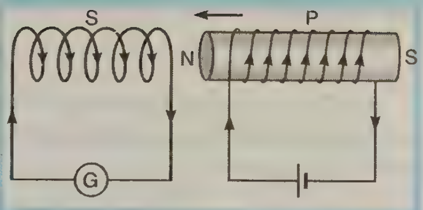

Fig. 1.05

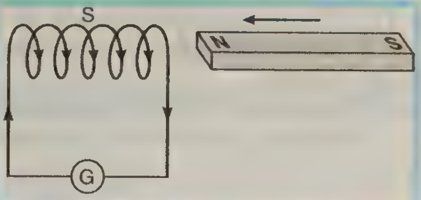

Fig. 1.06

Key point

1. Induced e.m.f. is produced in a coil, when there is relative motion between magnet and the coil.

2. No induced e.m.f. is produced, when magnet is rotated about its own axis. However, induced e.m.f. is produced, if magnet is rotated about an axis perpendicular to its length.

Experiment 3. When a coil is moved in a stationary magnetic field. Consider at a coil ABCD having a galvanometer G in its circuit is placed inside a uniform agnetic field, which is confined to the region PQRS only. The cross-marks dicate that the magnetic field is directed perpendicularly *into* the plane of the aper. When the coil is moved so that it remains entirely inside the magnetic field ig. 1.07], the galvanometer does not show any deflection. On the other hand, hen the coil is pulled out of the magnetic field (moved so that a part of the coil inside the magnetic field and a part outside) as shown in Fig. 1.08, the galvano-eter shows deflection.

Explanation. When the coil is moved entirely inside the magnetic field [Fig. 07], the magnetic flux linked with its area ABCD does not change. Due to this, no duced current is produced in the coil and the galvanometer does not show any eflection.

However, when the coil is moved as shown in Fig. 1.08, the area of the coil inside e magnetic field goes on decreasing *i.e.* the magnetic flux linked with the coil goes decreasing. As a result, the induced current flows through the coil and the lvanometer shows deflection. The e.m.f. so produced in the coil is called *motional n.f.* It is a consequence of Lorentz magnetic force on the electrons inside the wire, which the coil is made of. However, the expression for motional e.m.f. can be tained both by finding Lorentz magnetic force on the electrons inside the wire rming the coil and by applying Faraday's law of electromagnetic induction.

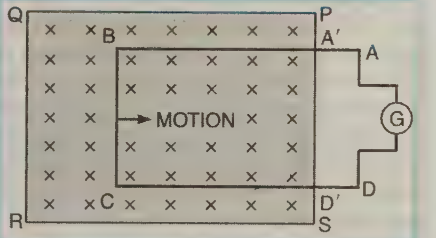

Fig. 1.07

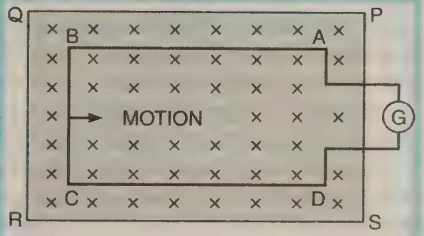

Fig. 1.08

1.04. FARADAY'S LAWS OF ELECTROMAGNETIC INDUCTION

The results of Faraday's experiments on electromagnetic induction are known *Faraday's laws of electromagnetic induction.* These laws are stated as below :

1. *Whenever magnetic flux linked with a circuit (a loop of wire or a coil or an electric circuit in general) changes, induced e.m.f. is produced.*
2. *The induced e.m.f. lasts as long as the change in the magnetic flux continues.*
3. *The magnitude of the induced e.m.f. is directly proportional to the rate of change of the magnetic flux linked with the circuit.*

Let ϕ_1 and ϕ_2 be the values of magnetic flux linked with the coil initially $t = 0$) and at time t respectively. Then,

$$\text{rate of change of magnetic flux} = \frac{\phi_2 - \phi_1}{t}$$

If e is the induced e.m.f. produced, then

$$e \propto \frac{\phi_2 - \phi_1}{t}$$

or

$$e = -k\,\frac{\phi_2 - \phi_1}{t}$$

Here, k is the constant of proportionality and the negative sign indicates that e induced e.m.f. has got opposing nature *i.e.* direction of flow of current due to the induced e.m.f. is such that it opposes the change in magnetic flux. In SI, the constant of proportionality* is 1. Hence,

$$e = -\frac{\phi_2 - \phi_1}{t} \qquad \text{...(1.05)}$$

In SI, e is measured in **volt,** ϕ in **weber** and t in **second.**

If $d\phi$ is small change in magnetic flux in a small time dt, then the equation (1.05) may be expressed as

$$e = -\frac{d\phi}{dt} \qquad \text{...(1.06)}$$

The equation (1.05) or (1.06) can be used to find the induced e.m.f. produced in a coil due to change in magnetic flux linked with the coil.

Key point

The negative sign in equation (1.06) i accounted for by Lenz's law.

If the coil consists of N turns, then magnetic flux ϕ is linked with each turn of the coil. Hence,

the total magnetic flux linked with the coil = N ϕ

Therefore, induced e.m.f. produced in the coil,

$$e = -\frac{d}{dt}(\mathrm{N}\,\phi)$$

or

$$e = -\mathrm{N}\frac{d\phi}{dt} \qquad \text{...(1.07)}$$

The equation (1.06) or (1.07) is commonly known as **Faraday-Lenz's law.**

1.05. LENZ'S RULE

Lenz's rule is a convenient method to determine the direction of induced current produced in a circuit. It is related to the principle of conservation of energy and it accounts for the negative sign appearing in equation (1.06) or (1.07).

Lenz's law states that *the induced current produced in a circuit always flows in such a direction that it opposes the change or the cause that produces it.*

Let us now apply Lenz's rule to find the direction of flow of induced current in the experiments described in section 1.03.

Experiment 1. Refer to Fig. 1.04. On pressing the key, the current in the coil P flows in clockwise direction, when seen from left and the magnetic field lines so produced will be directed from left to right. As the current grows through the coil P, the magnetic flux will also grow through the coil S. The direction of flow of induced current in coil S should be such that it opposes the growth of magnetic flux through it. The growing magnetic flux will be opposed, if the induced current in the coil S produces magnetic field lines from right to left. Consequently, the induced current in the coil S should flow in anticlockwise direction, when seen from left.

Experiment 2. Refer to Fig. 1.05 or 1.06. When the current carrying coil P wound on an iron rod, with its left end behaving as N-pole (or the bar magnet with its N-pole), is moved towards the coil S, the induced current produced in coil S should oppose the motion of coil P (or of the bar magnet). It will happen so; if the induced current in the coil S produces magnetic field lines from left to right *i.e.* if the induced current flows through the coil S in clockwise direction, when seen from left.

Similarly, when the coil P (or the bar magnet) is moved away from the coil S, the induced current will flow in anticlockwise direction, when seen from left.

Experiment 3. Refer to Fig. 1.08. When the coil ABCD is pulled towards right, the magnetic flux linked with the coil goes on decreasing. It is because of the reason that the area of the coil inside the magnetic field goes on decreasing. According to Lenz's law, the induced current should flow in such a direction, so that the motion of the coil is opposed *i.e.* on arm BC, force acts towards left. From Fleming's left hand rule, it follows that force on arm BC will act towards left, if the induced current in the arm BC flows from point C to B or in the direction DCBA in the coil.

1.06. LENZ'S LAW AND PRINCIPLE OF CONSERVATION OF ENERGY

Lenz's law is in accordance with the principle of conservation of energy. In electromagnetic induction, the electrical energy (in the form of induced current or induced e.m.f.) is produced at the expense of mechanical energy.

---

*The constant of proportionality depends upon the units in which e, ϕ and t are measured. In c.g.s. electromagnetic system, the constant of proportionality is $1/c$, where c is the speed of light in vacuum. In this system, e is measured in e.m.u. of e.m.f. ϕ in maxwell and t in second.

1 e.m.u. of e.m.f. = 10^8 V and 1 maxwell = 10^{-8} weber

Explanation. Consider a solenoid connected to an electric lamp (or a sensitive alvanometer) as shown in Fig. 1.09. Suppose that a magnet with its north pole facing he solenoid is moved towards the solenoid. The induced current is produced in he solenoid in clockwise direction, when seen from left. Due to the flow of current, he lamp glows and it radiates light energy. According to energy conservation rinciple, work equivalent to the electric energy (which makes the lamp glow) must e done by the agent in pushing the magnet towards the solenoid. In fact, it is exactly o. The induced current produced in the solenoid in clockwise direction (when seen rom left) produces magnetic field from left towards right. When the magnet (with s north pole towards the solenoid) is moved towards the solenoid, it experiences n opposing force due to the magnetic field and hence mechanical work has to be lone in moving the magnet. The work done in moving the magnet against this force esults in the form of electric energy (or induced e.m.f.) in the circuit. Hence, Lenz's aw is in accordance with the law of conservation of energy.

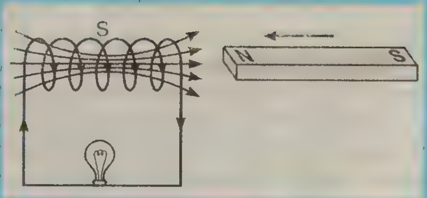

Fig. 1.09

It may be pointed out that when the magnet with its north pole facing the olenoid is moved towards the solenoid, the current cannot flow in the clockwise irection (when seen from right) *i.e.* in a direction opposite to that warranted by enz's law. It is because, if it was so, the magnetic field lines would be produced from ight to left and then the magnet would be attracted towards the solenoid and it vould gain kinetic energy. In other words, if the current were to flow in the direction pposite to that determined by Lenz's law, then the lamp would radiate energy and t the same time, the magnet would gain kinetic energy at the expense of nothing. uch a situation is against the principle of conservation of energy. Hence, the induced urrent cannot flow in a direction other than that determined by Lenz's law *i.e.* it ows in a direction so as to oppose the cause or the change that produced it.

1.07. EXPRESSION FOR MOTIONAL E.M.F.

Consider that a uniform magnetic field $\vec{B}$ is confined to the region PQRS and coil ABCD is placed inside the magnetic field. The direction of the magnetic field s perpendicular to the plane of the coil and in inward direction [Fig. 1.10]. When ne coil is moved with velocity $\vec{v}$ towards right, each electron inside the wire naking the coil) experiences magnetic Lorentz force

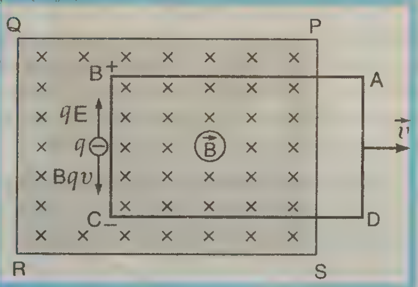

Fig. 1.10

$$\vec{f}_m = -q\,(\vec{v} \times \vec{B}), \qquad \text{...(1.08)}$$

here – q is the charge on an electron*. Since $\vec{v}$ and $\vec{B}$ are perpendicular to each other, ne magnitude of force on an electron is equal to

$$f_m = B\,q\,v$$

nd it acts from top to bottom in the plane of paper. The magnetic Lorentz force auses the electrons in the arm BC of the coil to move from its end B to C. As the lectrons accumulate at the end C, it will become negatively charged and the end will become positively charged. Due to this, an electric field is set up between the vo ends of wire BC in a direction from the end B to C. The electric field so produced xerts force on electrons in a direction from the end C to B and it opposes the agnetic Lorentz force. The force on an electron due to the electric field increases, s more and more electrons accumulate at the end C. A stage comes, when the lectrons which accumulate at the end C produce electric field just strong enough o that the force on an electron due to electric field becomes equal to magnetic orentz force on it. As the two forces are in opposite directions, they just cancel out nd there is no more motion of electrons. If E is strength of the electric field at that age, then force on electron due to electric field

$$f_e = q\,E$$

In equilibrium, $f_e = f_m$ or $q\,E = B\,q\,v$

or

$$E = B\,v \qquad \text{...(1.09)}$$

If e is the potential difference between the ends B and C and l is the length of ne arm BC, then

$$E = \frac{e}{l} \qquad \text{...(1.10)}$$

---

*Since induced e.m.f. has been denoted by e, for the sake of distinction, the charge on ectron has been denoted by $-q$ in this chapter.

From the equations (1.09) and (1.10), we have

$$\frac{e}{l} = \text{B}\, v$$

or $$e = \text{B}\, l\, v \qquad \text{...(1.11)}$$

It is the expression for ***motional e.m.f.*** produced in the coil ABCD due to its motion inside the magnetic field. The current in the coil flows from the positive end B to the negative end C along the path BADC.

Aliter. The expression for motional e.m.f. can also be obtained from Faraday's law of electromagnetic induction as explained below :

Consider that at any time t, the part BA′ = CD′ = x (say) of the coil is inside the magnetic field [Fig. 1.11]. If l is the length of the arm BC of the coil, then area of the coil inside the magnetic field at any time t,

$$\Delta\text{S} = \text{BC} \times \text{CD}' = l\, x$$

Therefore, magnetic flux linked with the coil at time t,

$$\phi = \text{B}\, \Delta\text{S} = \text{B}\, l\, x$$

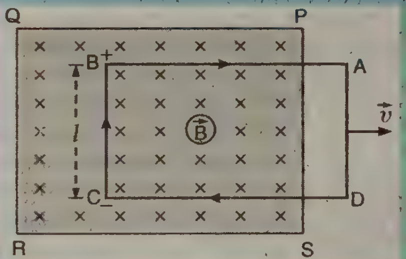

Fig. 1.11

Suppose that the coil is pulled out of the magnetic field with velocity v. As the coil is pulled out, the area of the coil inside the magnetic field and hence magnetic flux linked with the coil changes. The time rate of change of magnetic flux linked with the coil is given by

$$\frac{d\phi}{dt} = \frac{d}{dt}(\text{B}\, l\, x) = \text{B}\, l\, \frac{dx}{dt} = \text{B}\, l\, v$$

If e is the induced e.m.f. produced, then

$$e = -\frac{d\phi}{dt}$$

or $$e = -\text{B}\, l\, v$$

The negative sign shows that the induced e.m.f. opposes the coil from being pulled out of the magnetic field. It is the same expression as obtained from the concept of magnetic Lorentz force experienced by the electrons. The application of Lenz's law tells that as the coil is pulled out of the magnetic field, the induced current will flow in the coil, so as to exert force on the arm BC towards left. Fleming's left hand rule tells that the current due to induced e.m.f. will flow from the end C to B *i.e.* along the path DCBA in the coil.

Key point

No induced e.m.f is produced in a coil, when it moves by remaining wholly inside the magnetic field.

Note. Refer to Fig. 1.07. Let us investigate, why no current flows through the coil, when it remains wholly inside the magnetic field during its motion. When the coil ABCD is entirely inside the magnetic field the ends B and A of the coil become positive, while the ends C and D become negative. Thus, the potential difference between the ends B and C will be the same as that between the ends A and D. The situation will look like as if two cells of equal e.m.f. have been connected across the arms BC and AD as shown in Fig. 1.12. Obviously, no net e.m.f. exists in the coil and hence no current flows through the coil ABCD.

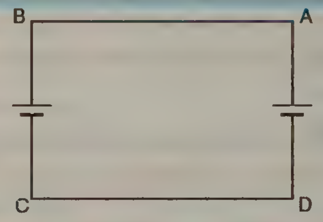

Fig. 1.12

1.08. EDDY CURRENTS

When magnetic flux linked with a coil changes, induced e.m.f. is produced in it and the induced current flows through the wire forming the coil.

Foçault found that when magnetic flux linked with a metallic conductor changes, induced currents are set up in the conductor in the form of closed loops. These currents look like *'eddies'* or *'whirl pools'* and likewise are known as *eddy currents*. **They are also known as *Focault's currents.***

Thus, *eddy currents are the currents induced in a conductor, when placed in a changing magnetic field.*

Following experiments explain the origin of eddy currents :

Experiment 1. Introduce a soft iron core inside a solenoid and connect it to a source of alternating e.m.f. Place a metallic disc over the cross-sectional face of the soft iron core as shown in Fig. 1.13. As the circuit is switched on, the metallic disc is thrown up into the air.

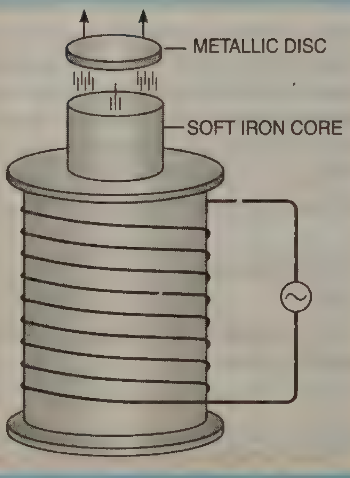

Fig. 1.13

Explanation. When the circuit is switched on, the current starts growing through the solenoid. As the current grows, the magnetic field lines along the axis of the solenoid and hence the magnetic flux through the disc also increases from zero to some finite value. Due to this, induced currents are produced in the disc and the disc is converted into a small magnet. If the upper face of the soft iron core acquires N-polarity initially, then the lower face of the disc also acquires N-polarity in accordance with Lenz's law. Due to repulsive force between the upper face of the soft iron core and the lower face of the disc, the latter is thrown up.

Experiment 2. Suspend a flat metallic plate between the two poles of an electromagnet [Fig. 1.14]. Initially, when the magnetic field is off, it is found that the metallic plate oscillates freely and its oscillatory motion can continue for a reasonably long time. However, when the magnetic field is switched on, the metallic plate comes to rest quite soon.

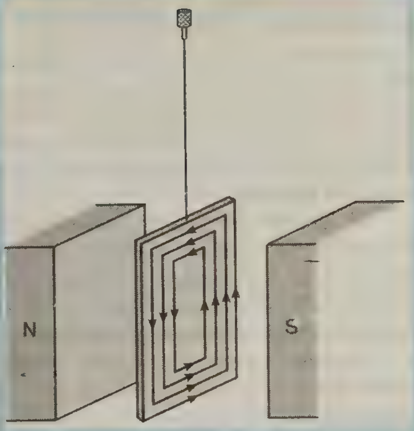

Fig. 1.14

Explanation. The damping effect on the oscillatory motion of the metallic plate can be explained by applying Lenz's law. When metallic plate is in its equilibrium position, the magnetic flux linked with the plate is maximum. As the plate starts moving towards its extreme position, its area between the two poles goes on decreasing and hence the magnetic flux linked with the plate also goes on decreasing. It results in the production of induced currents in the plate in the form of closed loops. According to Lenz's law, the induced currents oppose the plate from moving towards its extreme position. Similarly, when the metallic plate returns from its extreme position and starts entering the magnetic field, the induced currents are set up, which again oppose the motion of the metallic plate. In fact, the eddy currents produced are very large and the electric energy so produced is dissipated in the form of heat energy. The large value of eddy currents is due to the fact that the metallic plate has low resistance and even a small induced e.m.f. causes large eddy currents in it.

It may be pointed out that the production of eddy currents in the metallic plate oscillating inside the magnetic field produces damping effect. It is called *electromagnetic damping* and is made use of in a number of practical situations.

Experiment 3. Fig. 1.15 shows a metallic plate having narrow slots and suspended between the poles of a magnet. When such a metallic plate is made to oscillate, it is found that the metallic plate swings much more freely than in the case, when it did not have slots in it.

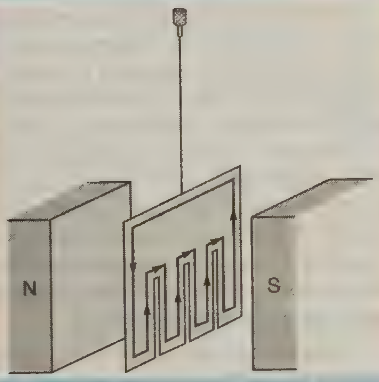

Fig. 1.15

Explanation. It is because, the magnitude of eddy currents produced in this case is much less. The reason is that for a closed loop of same area, the electrons have to cover a much larger path in this case. In traversing the path of larger length, the electrons experience more resistance ; with the result that the eddy currents produced are smaller. Therefore, it can be used as one of the methods to reduce eddy currents.

1.09. APPLICATIONS OF EDDY CURRENTS

Some of the important applications of eddy currents are as given below :

1. ***Dead beat galvanometers.*** The oscillations of a moving coil galvanometer generally take a long time to die out. But by winding its coil on a metallic frame made of copper or aluminium, the galvanometer can be made dead beat. It is because, due to the production of eddy currents in the metallic frame, the coil of the galvanometer comes to rest very soon.

It may be pointed out that the working of ballistic galvanometer requires that the damping should be minimum. It is achieved by winding the coil on a frame made of non-conducting material, such as bamboo or paper.

2. ***Electromagnetic damping.*** The oscillations of the coil of a galvanometer can also be stopped by short circuiting the two ends of the coil through a tapping key. When the key is pressed, the coil circuit is closed and the eddy currents are produced due to the motion of the coil in the magnetic field of the magnet of the galvanometer. Due to Lenz's law, the direction of eddy currents is such that it opposes the oscillations of the coil.

3. ***Induction motors.*** A rotating magnetic field is produced by means of two single phase currents. A metallic rotor placed inside the rotating magnetic field starts rotating due to large eddy currents produced in it. These motors are commonly used in fans.

4. ***Induction furnace.*** In an induction furnace, very high temperature can be produced by producing large eddy currents. The high frequency eddy currents are preferred because of the reason that the heating effect of current is proportional to the square of the frequency of the current.

5. ***Diathermy.*** Eddy currents have been used for deep heat treatment called *diathermy*.

6. *Speedometer.* In the speedometer of an automobile, a small magnet is geared to the main shaft of the vehicle and it rotates according to the speed of the vehicle. The magnet is mounted in an aluminium cylinder with the help of hair springs. When the magnet rotates, it produces eddy currents in the drum. Due to the effect of eddy currents, the drum tries to oppose the motion of the rotating magnet. In turn, the drum experiences a torque and gets deflected through certain angle. A pointer attached to the drum moves over a calibrated scale, which directly indicates the speed of the vehicle.

7. ***Energy meters.*** In energy meters, the armature coil carries a metallic aluminium disc which rotates between the poles of a pair of permanent horse shoe magnets. As the armature rotates, the current induced in the disc tends to oppose the motion of the armature coil. Due to this braking effect, the deflection is proportional to the energy consumed.

8. *Electric brake.* A metallic drum is coupled to the wheels of the train ; so that when the train runs, the drum also rotates. In order to stop the train, a strong magnetic field is applied to the rotating drum. The large eddy currents produced oppose the motion of the drum. Since the drum is connected to the wheels of the train, the latter comes to a halt.

These days, electric brakes are provided in the trains in addition to usual vacuum brakes.

Undesirable effects of eddy currents. Since the resistance of a metallic conductor is quite low, the magnitude of eddy currents produced is quite large. As such, considerable amount of heat is produced in the conductor due to Joule's heating effect. If the large eddy currents are allowed to produce in the core of a choke coil, transformer, dynamo, etc, it may produce undesirable effects.

The eddy currents produced in the core of a transformer are reduced by making use of a laminated core. The thick core of a transformer is formed by joining identical iron strips together, after insulating them from each other by coating them with varnish. Since the resistance of an iron strip will be much larger than the resistance of the thick core, only very feeble eddy currents are produced in the iron strips and the transformer is saved from getting heated.

1.10. SELF INDUCTION

Consider a coil connected to a battery and a tapping key [Fig. 1.16]. When the key K is pressed, the current starts growing through the coil and as a result, the magnetic field lines also start growing through it. This, in turn, produces induced e.m.f. in the coil. The direction of the induced e.m.f. is such that it opposes the growth of current in the circuit.

On the other hand, when the key is released, the current in the circuit starts decaying. As a result of this, the magnetic field lines linked with the coil also start decreasing. The e.m.f. is produced in the coil so that it opposes the decay of current in the circuit. Thus, during both growth and decay of current in the coil, an opposing induced e.m.f. is produced in the coil.

The phenomenon, according to which an opposing induced e.m.f. is produced in a coil as a result of change in current or magnetic flux linked with the coil, is called self-induction.

Since self-induction opposes both the growth (when the circuit is switched on) and decay (when the circuit is switched off) of the current in a coil, it is also called *back e.m.f.*

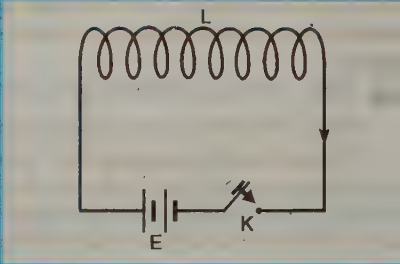

Fig. 1.16

Key point

The self-inductance of a straight conductor is zero.

1.11. COEFFICIENT OF SELF-INDUCTION

Suppose that after the key is pressed [Fig. 1.16], a current I flows through the coil at any instant. It is found that magnetic flux ϕ linked with the coil at any instant is directly proportional to the current passing through it at that instant *i.e.*

$$\phi \propto \mathrm{I}$$

or $$\phi = \mathrm{L\,I}, \qquad \text{...(1.12)}$$

where L is called *coefficient of self-induction* or simply *self-inductance* of the coil. It depends upon the number of turns, cross sectional area and permeability of the material of the core (if any), on which the coil is wound.

If $\mathrm{I} = 1$, then $\phi = \mathrm{L} \times 1$ or $\mathrm{L} = \phi$

Thus, *self-inductance of a coil is numerically equal to the magnetic flux linked with the coil, when a unit current flows through it.*

If e is the induced e.m.f. produced in the coil due to its self-inductance at the instant, when the rate of change of magnetic flux in the coil is $\frac{d\phi}{dt}$, then

$$e = -\frac{d\phi}{dt} = -\frac{d}{dt}(\mathrm{L\,I})$$

or $$e = -\mathrm{L}\frac{d\mathrm{I}}{dt} \qquad \text{...(1.13)}$$

Here, $\frac{d\mathrm{I}}{dt}$ is the rate of change of current in the coil at that instant. The negative gn shows the opposing nature of the induced e.m.f. Considering magnitude only, om equation (1.13), we have

$$e = \mathrm{L}\frac{d\mathrm{I}}{dt}$$

If $\frac{d\mathrm{I}}{dt} = 1$, then $e = \mathrm{L} \times 1$ or $\mathrm{L} = e$

Hence, *self-inductance of a coil is numerically equal to the induced e.m.f. produced the coil, when the rate of change of current in the coil is unity.*

In SI, the unit of self-inductance is **henry (H)**.

Again, $$\mathrm{L} = \frac{e}{d\mathrm{I}/dt} \qquad \text{...(1.14)}$$

If $e = 1$ volt and $\frac{d\mathrm{I}}{dt} = 1$ ampere second^{-1}, then

$$\mathrm{L} = \frac{1 \text{ volt}}{1 \text{ ampere second}^{-1}} = 1 \text{ henry}$$

Thus, *self-inductance of a coil is said to be one henry, if a rate of change of current of ampere per second induces an e.m.f. of 1 volt in it.*

1.12. SELF INDUCTION – INERTIA OF ELECTRICITY

When a source of e.m.f. tends to send current in an electric circuit having a coil, e self inductance of the inductor (coil) behaves the same way as the mass of a body oes, when a force tends to a cause a change in its state. We know that more the ass of the body, more is the opposition it offers to the change in the state of the ody. Likewise, mass of a body gives the measure of its inertia. In the same way, ore the self-inductance of a coil, more is the opposition it offers to the change in urrent through the coil. Hence, self induction is called ***inertia of electricity***.

1.13. SELF-INDUCTANCE OF A LONG SOLENOID

Consider a long solenoid of length l, area of cross-section A and number of turns er unit length n. Suppose that a current I is passed through the solenoid. Then, agnetic field inside the solenoid is given by

$$\mathrm{B} = \mu_0\, n\, \mathrm{I}$$

In case of a long solenoid (length very large as compared to its radius), the agnetic field produced well within the solenoid is practically constant. Therefore, the magnetic flux passing through each turn of the solenoid

$$= \mathrm{B} \times \text{area of each turn} = \mu_0\, n\, \mathrm{I\,A}$$

total magnetic flux linked with the solenoid,

$$\phi = \text{magnetic flux linked with one turn} \times \text{total number of turns}$$

Now, total number of turns in the solenoid = $n\,l$

$$\therefore \quad \phi = \mu_0\, n\, \mathrm{I\,A} \times n\,l$$

or $$\phi = \mu_0\, n^2\, l\, \mathrm{A\,I} \qquad \text{...(1.15)}$$

If L is the self-inductance of the solenoid, then

$$\phi = \mathrm{L\,I} \qquad \text{...(1.16)}$$

From equations (1.15) and (1.16), we have

$$\mathrm{L} = \mu_0\, n^2\, l\, \mathrm{A} \qquad \text{...(1.17)}$$

It gives the self-inductance of a long solenoid of length l, area of cross-section A and having number of turns per unit length equal to n.

1.14. MUTUAL INDUCTION

Let us consider two coils P and S placed close* to each other. A battery and a apping key K are connected to the P-coil, while a galvanometer is connected across he S-coil [Fig. 1.17]. The coils P and S are respectively known as *primary* and *econdary coils.*

---

*If the coils are placed close to each other, then the magnetic flux linked with one coil gets linked with the other coil.

As soon as the key K is pressed, the current in the P-coil starts growing. As the current grows, the magnetic flux starts building up with the coil P and due to self-induction, an induced e.m.f. is produced in it. The induced e.m.f. opposes the growth of current in the P-coil. Since the S-coil is placed close to the P-coil, the magnetic flux also starts building up with the S-coil and hence an induced e.m.f. is produced in the S-coil also. This induced e.m.f. in the S-coil also opposes the growth of current in the P-coil.

Similarly, when the key is released, the induced e.m.f. is produced in the primary as well as the secondary coil. The sign of the induced e.m.f. produced in this case will be opposite to that produced when the key is pressed.

Thus, during both growth and decay of the current in the primary coil, an opposing induced e.m.f. is produced in the secondary coil.

The phenomenon according to which an opposing e.m.f. is produced in a coil as a result of change in current or magnetic flux linked with a neighbouring coil is called mutual induction.

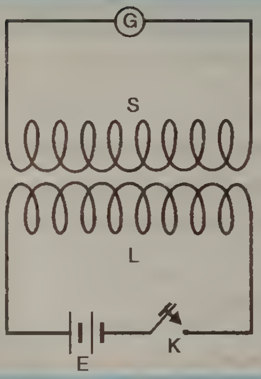

Fig. 1.17

Key point

When two coils are inductively couplec in addition to induced e.m.f. produced du to mutual induction, induced e.m.f. i produced in each of the two coils due t self-induction also.

1.15. COEFFICIENT OF MUTUAL INDUCTION

Consider two coils P and S as shown in Fig. 1.17. Suppose that a current I is flowing through the P-coil at any instant. It is found that the magnetic flux ϕ linked with the S-coil at any instant is directly proportional to the current passing through P-coil at that instant *i.e.*

$$\phi \propto \mathrm{I}$$

or
$$\phi = \mathrm{M\,I}, \qquad \text{...(1.19)}$$

where M is called ***coefficient of mutual induction*** or simply ***mutual inductance*** of the two coils.

If $\mathrm{I} = 1$, then $\phi = \mathrm{M} \times 1$ or $\mathrm{M} = \phi$

Thus, *mutual inductance of the two coils is numerically equal to the magnetic flux linked with one coil, when a unit current flows through the neighbouring coil.*

If e is the induced e.m.f. produced in the S-coil due to mutual inductance at the instant when the rate of change of magnetic flux in the coil is $\frac{d\phi}{dt}$, then

$$e = -\frac{d\phi}{dt} = -\frac{d}{dt}(\mathrm{M\,I})$$

or
$$e = -\mathrm{M}\frac{d\mathrm{I}}{dt} \qquad \text{...(1.20)}$$

Here, $\frac{d\mathrm{I}}{dt}$ is the rate of change of current in the P-coil at that instant. The negative sign shows the opposing nature of the induced e.m.f. considering magnitude only ; from equation (1.20), we have

$$e = \mathrm{M}\frac{d\mathrm{I}}{dt}$$

If $\frac{d\mathrm{I}}{dt} = 1$, then $e = \mathrm{M} \times 1$ or $\mathrm{M} = e$

Hence, *mutual inductance of two coils is numerically equal to the induced e.m.f. produced in one coil, when the rate of change of current is unity in the other coil.*

In SI, the unit of mutual inductance is **henry (H).**

Again,
$$\mathrm{M} = \frac{e}{d\mathrm{I}/dt} \qquad \text{...(1.21)}$$

If $e = 1$ volt and $\frac{d\mathrm{I}}{dt} = 1$ ampere second^{-1}, then

$$\mathrm{M} = \frac{1 \text{ volt}}{1 \text{ ampere second}^{-1}} = 1 \text{ henry}$$

Thus, *the mutual inductance of two coils is said to be one henry, if a rate of change of current of 1 ampere per second in one coil induces an e.m.f. of 1 volt in the neighbouring coil.*

1.16. FACTORS AFFECTING MUTUAL INDUCTION BETWEEN TWO COILS

The mutual induction between two coils depends upon the shape and size of the two coils, separation between them and the permeability of the material of the core (if any), on which the two coils are wound. Apart from these factors, the mutual induction between the two coils depends upon the manner in which the two coils are oriented relative to each other. The manner in which the two coils are oriented determines the ***coefficient of coupling*** between them, which is given by

$$K = \sqrt{\frac{M}{L_1 L_2}} \qquad ...(1.18)$$

Here, L_1 and L_2 are self-inductances of the two coils and M is mutual inductance between them.

When the two coils P and S are wound on each other [Fig. 1.18], the coefficient of coupling is maximum and hence mutual induction between the coils is maximum. It, further increases, when the two coils are wound on a soft iron core. It is because, the magnetic permeability of soft iron is very large. For this reason, a transformer is wound on a core of soft iron. Mutual induction will be still greater, if the coil S is wound over the middle part of the coil P.

When the two coils are placed so as to have a common axis [Fig. 1.19], the coefficient of coupling between the two coils is still very large but less than that for the arrangement shown in Fig. 1.18. Hence, mutual induction between the two coils is lesser, when they are placed along a common axis than when they are wound on each other.

Fig. 1.20 shows the two coils placed such that their axes are perpendicular to each other. The coefficient of coupling is minimum in this case. Hence, mutual induction between two coils is minimum, when they are placed with their axes perpendicular to each other.

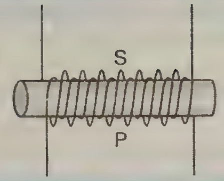

Fig. 1.18

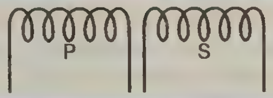

Fig. 1.19

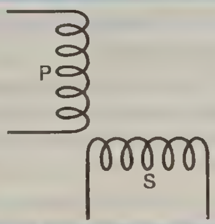

Fig. 1.20

1.17. MUTUAL INDUCTANCE OFTWO LONG SOLENOIDS

Consider two long solenoids S_1 and S_2 of same length l, such that the solenoid S_2 surrounds the solenoid S_1 completely as shown in Fig. 1.21. Let n_1 and n_2 be the number of turns per unit length of the solenoids S_1 and S_2 respectively. Suppose that current I_1 is passed through the solenoid S_1. Then, due to flow of current through the solenoid S_1, magnetic field will be produced inside it and magnetic flux will be linked with coil S_2. The magnetic flux (ϕ_{21}) linked with the solenoid S_2 is directly proportional to the current I_1 passing through the solenoid S_1 *i.e.*

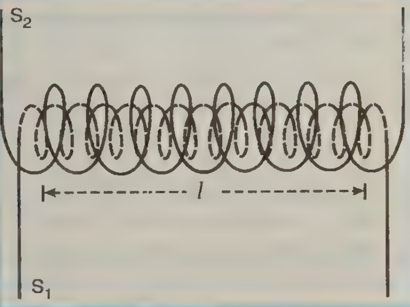

Fig. 1.21

$$\phi_{21} \propto I_1$$

or $$\phi_{21} = M_{21} I_1, \qquad ...(1.22)$$

where M_{21} is the coefficient of mutual induction of the two solenoids, when current is passed through solenoid S_1 and induced e.m.f. is produced in solenoid S_2.

Now, magnetic field produced inside the solenoid S_1 on passing current through it,

$$B_1 = \mu_0 n_1 I_1$$

When current is passed through a solenoid, the magnetic field lines are confined to the space within the solenoid only. Therefore, when the current is passed through the solenoid S_1, then in the annular region between the cross-sections of the two solenoids, the field is zero. Therefore, magnetic flux linked with each turn of the solenoid S_2 will be equal to B_1 times the area of cross-section of the solenoid S_1. If A is the area of cross-section of the solenoid S_1, then

magnetic flux linked with each turn of the solenoid $S_2 = B_1 A$

Therefore, total magnetic flux linked with the solenoid S_2,

$$\phi_{21} = B_1 A \times n_2 l = \mu_0 n_1 I_1 \times A \times n_2 l$$

or $$\phi_{21} = \mu_0 n_1 n_2 A l I_1 \qquad ...(1.23)$$

From equations (1.22) and (1.23), we have

$$M_{21} = \mu_0 n_1 n_2 A l \qquad ...(1.24)$$

Now, let us find the mutual inductance between the two solenoids, when current is passed through solenoid S_2 and induced e.m.f. is produced in solenoid S_1. If a current L_2 is passed through the solenoid S_2 and magnetic flux ϕ_{12} is linked with solenoid S_1, then

$$\phi_{12} \propto I_2$$

or $$\phi_{12} = M_{12} I_2, \qquad ...(1.25)$$

where M_{12} is coefficient of mutual inductance of the two solenoids in this case.

Now, magnetic field produced inside the solenoid S_2 on passing current through it,

$$B_2 = \mu_0 n_2 I_2$$

The magnetic flux linked with each turn of the solenoid $S_1 = B_2 A$

Key point

The coefficient of mutual inductance between two coils wound over each other does not depend upon the area of cross-section of the outer coil. It does not matter, whether current is passed through the inner or outer coil. It is because, when current is passed through the inner coil, magnetic field in the annular region between the cross-sections of the two coils is zero. On the other hand, when current is passed through the outer coil, magnetic flux is intercepted by the cross-section of inner coil only.

Therefore, total magnetic flux linked with the solenoid S_1,

$$\phi_{12} = B_2 A \times n_1 l = \mu_0 n_2 I_2 \times A \times n_1 l$$

or

$$\phi_{12} = \mu_0 n_1 n_2 A l I_2 \qquad ...(1.26)$$

From equations (1.25) and (1.26), we have

$$M_{12} = \mu_0 n_1 n_2 A l \qquad ...(1.27)$$

From equations (1.24) and (1.27), it follows that in case of two long solenoids, the coefficient of mutual induction remains the same, irrespective of whether the current is passed through the inner solenoid or the outer solenoid. Therefore,

$$M_{21} = M_{12} = M \text{ (say)}$$

Hence, coefficient of mutual induction between two long solenoids,

$$M = \mu_0 n_1 n_2 A l \qquad ...(1.28)$$

It may be pointed out that in the above expression, A represents the area of cross-section of the inner solenoid.

Key point

1. When two coils having self inductances L_1 and L_2 are connected in series keeping them far apart (so that mutual inductance between them is negligible), the equivalent inductance of the combination is given by

$$L = L_1 + L_2$$

2. When two coils are connected in parallel, the equivalent inductance is given by

$$\frac{1}{L} = \frac{1}{L_1} + \frac{1}{L_2}$$

SOLVED NUMERICAL PROBLEMS

Type A. On Faraday's law of Electromagnetic Induction

Problem 1.01. The magnetic flux through a coil perpendicular to its plane is varying according to the relation $\phi = (5t^3 + 4t^2 + 2t - 5)$ weber. Calculate the induced current through the coil at $t = 2$ s, if the resistance of the coil is 5 ohm. *(P.S.S.C.E. 1998 S)*

Sol. Here, resistance of the coil, $R = 5\ \Omega$

Instantaneous magnetic flux linked with the coil,

$$\phi = (5t^3 + 4t^2 + 2t - 5) \text{ wb}$$

If e is instantaneous value of induced e.m.f. produced in coil, then

$$e = -\frac{d\phi}{dt} = -\frac{d}{dt}(5t^3 + 4t^2 + 2t - 5)$$

$$= -[15(3t^2) + 4(2t) + 2(1) - 0]$$

or

$$e = (-15t^2 - 8t - 2) \text{ volt}$$

Therefore, induced e.m.f. produced in the coil at $t = 2$ s,

$$e = -15(2)^2 - 8(2) - 2 = -60 - 16 - 2 = -78 \text{ V}$$

Hence, magnitude of induced current in the coil at $t = 2$ s,

$$I = \frac{e}{R} = \frac{78}{5} = 15{\cdot}6 \text{ A}$$

Problem 1.02. A wire 40 cm long, bent into rectangular loop 15 cm × 5 cm, is placed perpendicular to the magnetic field, whose flux density is 0·08 Wb m^{-2}. Within 0·5 second, the loop is changed into 10 cm square and flux density increases to 1·4 Wb m^{-2}. Calculate the value of induced e.m.f.

Sol. Initial area of the loop,

$$S_1 = 15 \times 5 = 75 \text{ cm}^2 = 75 \times 10^{-4} \text{ m}^2$$

Initial flux density, $B_1 = 0{\cdot}8 \text{ Wb m}^{-2}$

Therefore, initial magnetic flux linked with the loop,

$$\phi = B_1 S_1 = 0{\cdot}8 \times 75 \times 10^{-4} = 60 \times 10^{-4} \text{ Wb}$$

Final area of the loop,

$$S_2 = 10 \times 10 = 100 \text{ cm}^2 = 100 \times 10^{-4} \text{ m}^2$$

Final flux density, $B_2 = 1{\cdot}4 \text{ Wb m}^{-2}$

Therefore, final magnetic flux linked with the loop,

$$\phi_2 = B_2 S_2 = 1{\cdot}4 \times 100 \times 10^{-4} = 140 \times 10^{-4} \text{ Wb}$$

Change in magnetic flux,

$$d\phi = \phi_2 - \phi_1 = 140 \times 10^{-4} - 60 \times 10^{-4}$$

$$= 80 \times 10^{-4} \text{ Wb}$$

Time during which the change in magnetic flux takes place,

$$dt = 0{\cdot}05 \text{ s}$$

Therefore, induced e.m.f.,

$$e = -\frac{d\phi}{dt} = -\frac{80 \times 10^{-4}}{0{\cdot}5} = -0{\cdot}016 \text{ volt}$$

Problem 1.03. A 10 ohm resistance coil has 1000 turns and at a certain time, $5{\cdot}5 \times 10^{-4}$ Wb of flux passes through it. If the flux falls to $0{\cdot}5 \times 10^{-4}$ Wb in 0·1 second ; find the e.m.f. generated in volt and charge flowing through the coil in coulomb.

Sol. Initial magnetic flux linked with the coil,

$$\phi_1 = 5{\cdot}5 \times 10^{-4} \text{ Wb}$$

Final magnetic flux linked with the coil,

$$\phi_2 = 0{\cdot}5 \times 10^{-4} \text{ Wb}$$

Change in magnetic flux,

$$\phi_2 - \phi_1 = 0{\cdot}5 \times 10^{-4} - 5{\cdot}5 \times 10^{-4} = -5 \times 10^{-4} \text{ Wb}$$

Number of turns in the coil, N = 1000

Total effective change in magnetic flux,

$$d\phi = N(\phi_2 - \phi_1) = 1000 \times (-5 \times 10^{-4}) = -0{\cdot}5 \text{ Wb}$$

Time in which the change in magnetic flux takes place,

$$dt = 0{\cdot}1 \text{ s}$$

Therefore, induced e.m.f. produced,

$$e = -\frac{d\phi}{dt} = -\frac{(0{\cdot}05)}{0{\cdot}1} = \frac{5}{10} = 5 \text{ V}$$

Current through 10 ohm resistance

$$= \frac{e}{\text{resistance}} = \frac{5}{10} = 0{\cdot}5 \text{ A}$$

Charge flowing through the coil in 0·1 s

$$= 0{\cdot}5 \times 0{\cdot}1 = 0{\cdot}05 \text{ C}$$

Problem 1.04. A copper rod of length l rotates with an angular velocity ω in a uniform magnetic field B. Find the e.m.f. developed between the two ends of rod. The field is normal to the plane of rotation. *(H.S.S.C.E. 2001)*

Sol. When the copper rod rotates inside the uniform magnetic field, it intercepts magnetic field over a circular area, whose radius is equal to length (l) of the rod.

Therefore, area intercepted by the copper rod in one rotation,

$$\Delta S = \pi l^2$$

Therefore, change in magnetic flux through the copper rod in one rotation,

$$d\phi = B\,\Delta S = B \times \pi l^2$$

Since the rod rotates with angular velocity ω, time taken by it to complete one rotation,

$$dt = \frac{2\pi}{\omega}$$

If e is the induced e.m.f. produced between the two ends of the rod, then

$$e = -\frac{d\phi}{dt} = -\frac{B \times \pi l^2}{2\pi/\omega}$$

or $e = -\frac{1}{2} B l^2 \omega$

Note. If ν is frequency of rotation of the copper rod, then

$\omega = 2\pi\nu$

∴ $e = -\frac{1}{2} B l^2 \times 2\pi\nu$

or $e = -B \times \pi l^2 \times \nu$

Problem 1.05. A metal rod of length 1 m is rotated about ne of its ends in a plane at right angles to a uniform magetic field of $2{\cdot}5 \times 10^{-3}$ Wb m^{-2}. If it makes 30 r.p.s., calculate he induced e.m.f. between its ends. (*H.S.S.C.E. 2002*)

Sol. Here, $B = 2{\cdot}5 \times 10^{-3}$ Wb^{-2}, $l = 1$ m and $\nu = 30$ r.p.s.

When the metal rod rotates inside the magnetic field, it ntercepts the magnetic field over a circular area of radius qual to its length. Then, as obtained in solved problem 1.04, he induced e.m.f. produced between the two ends of the netal rod is given by

$$e = -B \times \pi l^2 \times \nu$$
$$= -2{\cdot}5 \times 10^{-3} \times \pi \times (1)^2 \times 30 = \mathbf{-0{\cdot}023\ V}$$

Problem 1.06. When a wheel with metal spokes 1·2 m ong rotates in a magnetic field of flux density 5×10^{-5} tesla ormal to the plane of the wheel, an e.m.f. of 10^{-2} volt is nduced between the rim and the axle. Find the rate of otation of the wheel.

Sol. Here, length of spoke, $l = 1{\cdot}2$ m ;

e.m.f. induced ; $e = 10^{-2}$ volt ;

magnetic flux density, $B = 5 \times 10^{-5}$ tesla

Suppose that the wheel makes ν rotations per second. Due to rotation of the wheel inside the magnetic field, the netal spoke sweeps a circular area of radius equal to its ength. As a result of change in magnetic flux, the induced .m.f. is produced across the two ends of the metal spoke. As btained in solved problem 1.04, the induced e.m.f. produced cross the two ends of the spoke is given by

$$e = B \times \pi l^2 \times \nu \qquad \text{(in magnitude)}$$

∴ $$\nu = \frac{e}{B \times \pi l^2} = \frac{10^{-2}}{5 \times 10^{-5} \times \pi\,(1{\cdot}2)^2}$$
$$= \mathbf{44{\cdot}2\ rotations\ s^{-1}}$$

Problem 1.07. A wheel with 10 metallic spokes each ·50 m long is rotated with the speed of 120 r.p.m. in a plane normal to the earth's magnetic field at the place. If the magnitude of the field is 0·40 G, what is the induced e.m.f. between the axle and the rim of the wheel ? (*Text Problem*)

Sol. Here, number of spokes = 10 ;

length of spoke, $l = 0{\cdot}50$ m ; $B = 0{\cdot}40$ G $= 0{\cdot}40 \times 10^{-4}$ T

frequency of rotation, $\nu = 120$ r.p.m. $= 2$ r.p.s.

Due to rotation of the wheel inside the magnetic field, nduced e.m.f. will be produced across the two ends of each spoke. As all the ten spokes are connected with their one end at the axle and the other end at the rim, the net e.m.f. produced will be the same as that produced across a single spoke. As obtained in solved problem 1.04, the induced e.m.f. produced across the two ends of a spoke is given by

$$e = -B \times \pi l^2 \times \nu$$
$$= -0{\cdot}40 \times 10^{-4} \times \pi \times (0{\cdot}50)^2 \times 2 = \mathbf{-6{\cdot}283 \times 10^{-5}\ V}$$

Problem 1.08. A circular copper disc 10 cm in radius rotates at 20 π rad s^{-1} about an axis through its centre and perpendicular to the disc. A uniform magnetic field of 0·2 T acts perpendicular to the disc. (*a*) Calculate the potential difference developed between the axis of the disc and the rim. (*b*) What is the induced current, if the resistance of the disc is 2 Ω ? (*C.B.S.E. 2001*)

Sol. Here, $B = 0{\cdot}2$ T ;

radius of the circular disc, $r = 10$ cm $= 0{\cdot}1$ m

resistance of the disc, $R = 2\ \Omega$

angular speed of rotation of the disc, $\omega = 20\,\pi$ rad s^{-1}

Therefore, frequency of rotation of the disc,

$$\nu = \frac{\omega}{2\pi} = \frac{20\,\pi}{2\pi} = 10 \text{ r.p.s.}$$

(*a*) If e is the induced e.m.f. produced between the axis of the disc and its rim, then

$$e = -B \times \pi r^2 \times \nu$$
$$= -0{\cdot}2 \times \pi \times (0{\cdot}1)^2 \times 10 = \mathbf{-0{\cdot}0628\ V}$$

(*b*) Induced current, $I = \frac{e}{R} = \frac{0{\cdot}0628}{2} = \mathbf{0{\cdot}0314\ A}$

Note. The circular disc can be considered as a wheel having infinite number of spokes between its centre and the rim. As discussed in solved problem 1.07, the e.m.f. developed will be the same as that produced across a single spoke.

Type B. On Motional e.m.f.

Problem 1.09. A train is moving in the north-south direction with a speed of 108 km h^{-1}. Find the amount of e.m.f. generated between two wheels, if the length of axle is 2 m. Assume that the vertical component of earth's field is $8{\cdot}0 \times 10^{-5}$ Wb m^{-2}.

Sol. Here, $B_V = 8{\cdot}0 \times 10^{-5}$ Wb m^{-2} ; $l = 2$ m

$$v = 108 \text{ km h}^{-1} = 108 \times (1000 \text{ m}) \times (60 \times 60 \text{ s})^{-1}$$
$$= 30 \text{ m s}^{-1}$$

Now, $e = B_V\, l\, v = 8{\cdot}0 \times 10^{-5} \times 2 \times 30 = \mathbf{4{\cdot}8 \times 10^{-3}\ V}$

Problem 1.10. A horizontal straight wire 10 m long is extending along east and west and is falling with a speed of 5·0 m s^{-1} at right angles to the horizontal component of the earth's magnetic field of strength $0{\cdot}30 \times 10^{-4}$ wb m^{-2}. What is the instantaneous value of the e.m.f. induced in the wire ?

Sol. Here, length of the wire, $l = 10$ m ;

velocity of the wire, $v = 5{\cdot}0$ m s^{-1}

Horizontal component of earth's magnetic field,

$$B_H = 0{\cdot}30 \times 10^{-4} \text{ wb m}^{-2}$$

Now, $e = B_H\, l\, v = 0{\cdot}30 \times 10^{-4} \times 10 \times 5{\cdot}0 = \mathbf{1{\cdot}5 \times 10^{-3}\ V}$

Problem 1.11. A rectangular loop of sides 8 cm and 2 cm with a small cut is moving out of a region of uniform magnetic field of magnitude 0·3 T directed normal to the loop. What is the voltage developed across the cut, if the velocity of the loop is 1 cm s^{-1} in a direction normal to the (*i*) longer side, (*ii*) shorter side of the loop ? For how long does the induced voltage last in each case ? (*Text Problem*)

Sol. Here, $B = 0{\cdot}3$ T ; $v = 1$ cm s$^{-1} = 10^{-2}$ m s^{-1}

Now, $e = B\, l\, v$

In the above expression, l is the length of the arm, which is perpendicular to the direction of motion.

(*i*) *Direction of motion normal to longer side* : Length of longer side, $l = 8$ cm $= 8 \times 10^{-2}$ m

∴ $$e = B\, l\, v = 0{\cdot}3 \times 10^{-2} \times 8 \times 10^{-2} = 0{\cdot}24 \times 10^{-3} \text{ V}$$
$$= \mathbf{0{\cdot}24\ mV}$$

The e.m.f. will last in the loop, till it does not get out of the magnetic field *i.e.* for the time the loop takes to travel a distance equal to the length of the shorter arm. If t is the time for which the e.m.f. lasts in the loop, then

$$t = \frac{\text{length of the shorter arm}}{v} = \frac{2}{1} = \mathbf{2\ s}$$

(ii) Direction of motion normal to the shorter side : Length of the shorter side, $l = 2\ \text{cm} = 2 \times 10^{-2}$ m

$$\therefore \quad e = B\,l\,v = 0{\cdot}3 \times 10^{-2} \times 2 \times 10^{-2} = \mathbf{0{\cdot}06\ mV}$$

The time for which the e.m.f. lasts in the loop,

$$t = \frac{\text{length of the longer arm}}{v} = \frac{8}{1} = \mathbf{8\ s}$$

Problem 1.12. Fig. 1.22 shows a conducting rod PQ in contact with metal rails RP and SQ, which are 25 cm apart in a uniform field of flux density 0·4 T acting perpendicular to the plane of the paper. Ends R and S are connected through a 5 Ω resistance. What is the e.m.f., when the rod moves to the right with a velocity of 5 m s^{-1} ? What is the magnitude and the direction of the current through the 5 Ω resistor ? If the rod PQ moves towards the left with the same speed, what will be the new current and its direction ? *(I.S.C.E. 1995)*

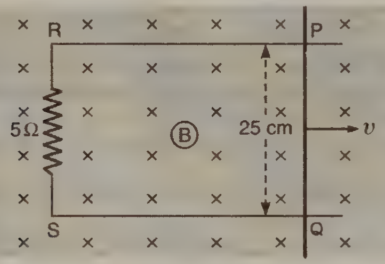

Fig. 1.22

Sol. Here $B = 0{\cdot}4$ T ; $v = 5\ \text{m s}^{-1}$;

$l = 25\ \text{cm} = 0{\cdot}25$ m

Induced e.m.f. produced,

$$e = B\,l\,v = 0{\cdot}4 \times 0{\cdot}25 \times 5 = \mathbf{0{\cdot}5\ V}$$

Current through the 5 Ω resistance,

$$I = \frac{e}{R} = \frac{0{\cdot}5}{5} = \mathbf{0{\cdot}1\ A}$$

According to Lenz's law, when the rod PQ moves towards right, the induced current should flow in a direction so that the rod PQ experiences force towards left. According to Fleming's left hand rule, then the current through the rod PQ will flow from the end Q to P *i.e.* **from the end R to S** through the resistance of 5 Ω.

If the rod PQ moves towards left with the same speed, the current of **0·1 A** will flow through 5 Ω resistance **from the end S to R.**

Problem 1.13. A jet plane is travelling west at the speed of 1800 km h^{-1}. What is the voltage difference developed between the ends of the wing 25 m long, if the earth's magnetic field at the location has a magnitude of 5·0 × 10^{-4} T and the dip angle is 30° ? *(Text Problem)*

Sol. Here, $v = 1800\ \text{km h}^{-1}$

$= 1800 \times (1000\ \text{m}) \times (60 \times 60\ \text{s})^{-1} = 500\ \text{m s}^{-1}$

Earth's magnetic field, $B = 5{\cdot}0 \times 10^{-4}\ t$;

angle of dip, $\delta = 30°$; length of the wing = 25 m

Now, $\quad B_V = B \sin \delta = 5{\cdot}0 \times 10^{-4} \sin 30° = 2{\cdot}5 \times 10^{-4}$ T

The vertical component (B_V) of the earth's field is norma to both the wings and the direction of motion.

Therefore, induced e.m.f. produced,

$$e = B_V\,l\,v = 2{\cdot}5 \times 10^{-4} \times 25 \times 500 = \mathbf{3{\cdot}125\ V}$$

Type C. On Self Induction

Problem 1.14. The self-inductance of a coil having 20 turns is 10 millihenry. Compute the total flux linked wit the coil. Also determine the magnetic flux through th cross-section of the coil corresponding to current of 4 milliampere.

Sol. Here, self-inductance of coil, L = 10 millihenry

$= 10 \times 10^{-3}$ henry ;

current through the coil, I = 4 milliampere

$= 4 \times 10^{-3}$ ampere

Total magnetic flux linked with the coil,

$$\phi = L\,I = 10 \times 10^{-3} \times 4 \times 10^{-3} = \mathbf{4 \times 10^{-5}}\ \textbf{webe}$$

Number of turns in the coil, N = 200

Therefore, magnetic flux through the cross-section of th coil (flux linked with each turn),

$$\frac{\phi}{N} = \frac{4 \times 10^{-5}}{200} = \mathbf{2 \times 10^{-7}\ weber}$$

Problem 1.15. Current in a 10 millihenry coil increase uniformly from zero to one ampere in 0·01 second. Find th direction and value of self-induced e.m.f.

Sol. Here, $L = 10$ millihenry $= 10 \times 10^{-3} = 10^{-2}$ henry

Initial current in the coil = 0 ;

final current in the coil = 1 ampere

Therefore, change in current, $dI = 1 - 0 = 1$ ampere

Time in which the current changes, $dt = 0{\cdot}01$ second

Now, induced e.m.f.,

$$e = -L\frac{dI}{dt} = -10^{-2} \times \frac{1}{0{\cdot}01} = \mathbf{-1\ V}$$

The self-induced e.m.f. will act so as to ***oppose th growth of current.***

Problem 1.16. A long solenoid with 15 turns per cm ha a small loop of area 2·0 cm^2 placed inside, normal to the axi of the solenoid. If the current carried by the solenoi changes steadily from 2 A to 4 A in 0·1 s, find the induce e.m.f. in the loop while the current is changing. *(Text Problem*

Sol. The magnetic field produced inside the solenoid,

$$B = \mu_0\,n\,I$$

If A is the area of the loop placed inside the solenoid, the magnetic flux linked with the loop,

$$\phi = B\,A = \mu_0\,n\,I\,A$$

If e is the induced e.m.f. produced due to change i current through the solenoid, then

$$e = -\frac{d\phi}{dt} = -\frac{d}{dt}(\mu_0\,n\,I\,A)$$

or $\quad e = -\mu_0\,n\,A\,\dfrac{dI}{dt}$

Here, number of turns per unit length of the solenoid,

$$n = 15\ \text{turns cm}^{-1} = 1500\ \text{turns m}^{-1}$$

$$A = 2{\cdot}0\ \text{cm}^2 = 2{\cdot}0 \times 10^{-4}\ \text{m}^2 ; \frac{dI}{dt} = \frac{4{\cdot}0}{0{\cdot}1} = 20\ \text{A s}^{-1}$$

$$\therefore \quad e = -4\,\pi \times 10^{-7} \times 1500 \times 2{\cdot}0 \times 10^{-4} \times 20$$

$$= \mathbf{-7{\cdot}54 \times 10^{-6}\ V}$$

ype D. On Mutual Induction

Problem 1.17. Calculate the mutual inductance bet-veen two coils, when a current of 4·0 A changes to 8·0 A in ·5 s and induces an e.m.f. of 50 mV in the secondary coil. *(P.S.S.C.E. 1997 S)*

Sol. Here, induced e.m.f. produced,

$$e = 50 \text{ mV} = 50 \times 10^{-3} \text{ V}$$

Change in current in the primary coil,

$$dI = 8{\cdot}0 - 4{\cdot}0 = 4{\cdot}0 \text{ A}$$

Time in which change in current takes place, $dt = 0{\cdot}5$ s

If M is the mutual inductance between the two coils, then

$$e = -M\frac{dI}{dt}$$

or $$M = \frac{e}{dI/dt} \quad \text{(in magnitude)}$$

$$= \frac{50 \times 10^{-3}}{4{\cdot}0 - 0{\cdot}5} = \frac{0{\cdot}5 \times 50 \times 10^{-3}}{4{\cdot}0} = \mathbf{6{\cdot}25 \times 10^{-3}\ H}$$

Problem 1.18. A solenoidal coil has 50 turns per cm along its length and a cross-sectional area of 4 cm^2. 200 turns of another wire is wound round the first solenoid coaxially. The two coils are electrically insulated from each other. Calculate the mutual inductance between the two coils. Given, $\mu_0 = 4\pi \times 10^{-7}$ N A^{-2}. *(I.S.C.E. 1998)*

Sol. Refer to Fig 1.21 ;

Here, number of turns per unit length of solenoid S_1,

$$n_1 = 50 \text{ turns cm}^{-1} = 5000 \text{ turns m}^{-1}$$

area of cross-section of solenoid S_1,

$$A = 4 \text{ cm}^2 = 4 \times 10^{-4} \text{ m}^2$$

total number of turns of solenoid S_2,

$$n_2 l = 200$$

Also, $\mu_0 = 4\pi \times 10^{-7}$ N A^{-2}

Therefore, mutual inductance of two coils,

$$M = \mu_0 n_1 n_2 A l = \mu_0 n_1 (n_2 l) A$$

$$= 4\pi \times 10^{-7} \times 5000 \times 200 \times 4 \times 10^{-4}$$

$$= \mathbf{5{\cdot}027 \times 10^{-4}\ H}$$

Problem 1.19. (*a*) A toroidal solenoid with an air core has an average radius of 15 cm, area of cross-section 12 cm^2 and 1200 turns. Obtain the self-inductance of the toroid. Ignore field variation across the cross-section of the toroid.

(*b*) A second coil of 300 turns is wound closely on the toroid above. If the current in the primary coil is increased from zero to 2·0 A in 0·05 s, obtain the induced e.m.f. in the second coil. *(Text Problem)*

Sol. (*a*) Total number of turns, N = 1200 ;

area of cross-section of the solenoid,

$$A = 12 \text{ cm}^2 = 12 \times 10^{-4} \text{ m}^2$$

and average radius of toroidal solenoid,

$$r = 15 \text{ cm} = 15 \times 10^{-2} \text{ m}$$

Therefore, the number of turns per unit length,

$$n = \frac{N}{2\pi r} = \frac{1200}{2\pi \times 15 \times 10^{-2}} = \frac{4000}{\pi} \text{ m}^{-1}$$

Suppose that a current I is passed through the solenoid. Magnetic field produced along the axis of the solenoid,

$$B = \mu_0 n I = 4\pi \times 10^{-7} \times \frac{4000}{\pi} \times I = I \times 1{\cdot}6 \times 10^{-3} \text{ T}$$

Magnetic flux linked with the solenoid itself,

$$\phi = B \times \text{area of cross-section} \times \text{total number of turns}$$

$$= I \times 1{\cdot}6 \times 10^{-3} \times 12 \times 10^{-4} \times 1200$$

$$= I \times 2{\cdot}304 \times 10^{-3} \text{ Wb}$$

Now, $$L = \frac{\phi}{I} = \frac{I \times 2{\cdot}304 \times 10^{-3}}{I} = \mathbf{2{\cdot}304 \times 10^{-3}\ H}$$

(*b*) Magnetic flux linked with the second coil,

$$\phi_2 = B \times A \times N_2,$$

where N_2 is total number of turns of the second coil.

$$\therefore \quad \phi = I \times 1{\cdot}6 \times 10^{-3} \times 12 \times 10^{-4} \times 300$$

$$= 5{\cdot}76 \times 10^{-4} \times I \text{ Wb}$$

Now, initial magnetic flux linked with the second coil,

$$\phi_i = 5{\cdot}76 \times 10^{-4} \times \text{initial current}$$

$$= 5{\cdot}76 \times 10^{-4} \times 0 = 0$$

Final magnetic flux linked with the second coil,

$$\phi_f = 5{\cdot}76 \times 10^{-4} \times \text{final current}$$

$$= 5{\cdot}76 \times 10^{-4} \times 2{\cdot}0 = 1{\cdot}152 \times 10^{-3} \text{ Wb}$$

Therefore, total change in flux, $d\phi = \phi_f - \phi_i$

$$= 1{\cdot}152 \times 10^{-3} - 0 = 1{\cdot}152 \times 10^{-3} \text{ Wb}$$

Time taken, $dt = 0{\cdot}05$ s

Now, $$e = -\frac{d\phi}{dt} = -\frac{1{\cdot}152 \times 10^{-3}}{0{\cdot}05} = \mathbf{-\,0{\cdot}023\ V}$$

TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 1.20. An air-cored solenoid with length 30 cm, area of cross-section 25 cm^2 and number of turns 500 carries a current of 2·5 A. The current is suddenly switched off in a brief time of 10^{-3} s. How much is the average back e.m.f. induced across the ends of the open switch in the circuit ? Ignore the variation in magnetic field near the ends of the solenoid. *(Text Problem)*

Sol. Here, area of cross-section of the solenoid,

$$A = 25 \text{ cm}^2 = 25 \times 10^{-4} \text{ m}^2$$

total number of turns, N = 500 ; $l = 30$ cm $\times 10^{-2}$ m ;

Therefore, number of turns per unit length,

$$n = \frac{N}{l} = \frac{500}{30 \times 10^{-2}}$$

Current passed through the solenoid, I = 2·5 A

Magnetic field inside the solenoid,

$$B = \mu_0 n I = 4\pi \times 10^{-7} \times \frac{500}{30 \times 10^{-2}} \times 2{\cdot}5 = 52{\cdot}36 \times 10^{-4} \text{ T}$$

Magnetic flux linked with the solenoid initially,

$$\phi_i = B \times A \times N = 52{\cdot}36 \times 10^{-4} \times 25 \times 10^{-4} \times 500$$

$$= 65{\cdot}45 \times 10^{-4} \text{ Wb}$$

Magnetic flux linked with the solenoid finally, $\phi_f = 0$

$$\therefore\ d\phi = \phi_f - \phi_i = 0 - 65{\cdot}45 \times 10^{-4} = -\,65{\cdot}45 \times 10^{-4} \text{ Wb}$$

Now, time taken, $dt = 10^{-3}$ s

Therefore, average induced e.m.f. produced,

$$e = -\frac{d\phi}{dt} = -\frac{-\,65{\cdot}45 \times 10^{-4}}{10^{-3}} = \mathbf{6{\cdot}545\ V}$$

Problem 1.21. It is desired to measure the magnitude of field between the poles of a powerful loudspeaker magnet. A small flat search coil of area 2·0 cm^2 with 25 closely wound turns is positioned normal to the field direction and then quickly snatched out of the field region. The total charge flown in the coil (measured by a ballistic galvanometer connected to the coil) is 7·5 mC. The resistance

of the coil of the galvanometer is 0·50 Ω. Estimate the field strength of the magnet. *(Text Problem)*

Sol. Here, number of turns, N = 25 ;
area of coil, $A = 2{\cdot}0 \text{ cm}^2 = 2{\cdot}0 \times 10^{-4} \text{ m}^2$
charge flown in the coil, $q = 7{\cdot}5 \text{ mC} = 7{\cdot}5 \times 10^{-3}$ C ;
resistance of coil, R = 0·50 Ω

Let B be the strength of the magnetic field. Then, magnetic flux linked with the search coil initially,

$$\phi_i = BA$$

When the search coil is brought out of the magnetic field, the magnetic flux linked with the coil finally, $\phi_f = 0$

Now, $e = -N\dfrac{d\phi}{dt}$,

where N is the number of turns in the coil.

or $$IR = -N\frac{d\phi}{dt}$$

or $$R\frac{dq}{dt} = -N\frac{d\phi}{dt}$$

or $$R\,dq = -N\,d\phi$$

Integrating both sides, we have

$$R\int_0^q dq = -N\int_{\phi_i}^{\phi_f} d\phi$$

or $$R(q-0) = -N(\phi_f - \phi i)$$

or $$Rq = -N(0 - BA) = NBA$$

or $$B = \frac{Rq}{NA} = \frac{0\cdot 50 \times 7\cdot 5 \times 10^{-3}}{25 \times 2\cdot 0 \times 10^{-4}} = 0\cdot 75 \text{ T}$$

Problem 1.22. Fig 1.23. shows a metal rod PQ resting on the rails AB and positioned between the poles of a permanent magnet. The rails, the rod and the magnetic field are in three mutually perpendicular directions. A galvanometer G connects the rails through a switch K. Length of the rod = 15 cm, B = 0·50 T, resistance of the closed loop containing the rod = 9·0 m Ω.

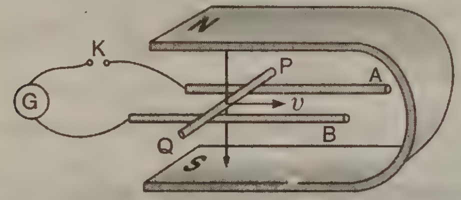

Fig. 1.23

(*a*) Suppose K is open and the rod moves with a speed of 12 cm s^{-1} in the direction shown. Give the polarity and magnitude of the induced e.m.f.

(*b*) Is there an excess charge built up at the ends of the rods, when K is open ? What, if K is closed ?

(*c*) With K open and the rod moving uniformly, there is no net force on the electrons in the rod PQ even though they do experience magnetic force due to the motion of the rod. Explain, why.

(*d*) What is the retarding force on the rod, when K is closed ?

(*e*) How much power is required (by an external agent) to keep the rod moving at the same speed (= 12 cm s^{-1}), when K is closed ? How much power is required, when K is open ?

(*f*) How much power is dissipated as heat in the closed circuit ? What is the source of this power ?

(*g*) What is the induced e.m.f. in the moving rod, when the permanent magnet is rotated to a vertical position so that the field is parallel to the rails ? *(Text Problem)*

Sol. Here, B = 0·50 T ; $l = 15 \text{ cm} = 15 \times 10^{-2}$ m ;

$$R = 9{\cdot}0 \text{ m}\Omega = 9{\cdot}0 \times 10^{-3}\ \Omega$$

(*a*) Now, $e = B\,v\,l$

Here, $v = 12 \text{ cm s}^{-1} = 12 \times 10^{-2} \text{ m s}^{-1}$

∴ $$e = 0{\cdot}50 \times 12 \times 10^{-2} \times 15 \times 10^{-2} = \mathbf{9 \times 10^{-3}\ V}$$

If $-q$ is charge on an electron, then the electrons in the rod will experience magnetic Lorentz force $-q(\vec{v} \times \vec{B})$ along PQ. Hence, the end P of the rod will become positive and the end Q will become negative.

(*b*) On closing the switch K, electrons collect at the end Q. Therefore, excess charge is built up at the end Q. However, it does not happen, when the switch K is open.

(*c*) The magnetic Lorentz force on electron is cancelled by the electric force acting on it due to the electric field set up across the two ends due to accumulation of positive and negative charges at the ends P and Q respectively.

(*d*) Retarding force, $F = BIl = 0\cdot 50 \times \dfrac{e}{R} \times 15 \times 10^{-2}$

$$= 0\cdot 50 \times \frac{9 \times 10^{-3}}{9 \times 10^{-3}} \times 15 \times 10^{-2} = \mathbf{7{\cdot}5 \times 10^{-2}\ N}$$

(*e*) When K is closed, power required by external agent against the retarding force, $P = F\,v$

Here, speed with which the rod is moved,

$$v = 12 \text{ cm s}^{-1} = 12 \times 10^{-2} \text{ m s}^{-1}$$

∴ $$P = 7{\cdot}5 \times 10^{-2} \times 12 \times 10^{-2} = \mathbf{9 \times 10^{-3}\ W}$$

(*f*) Power dissipated as heat,

$$\frac{e^2}{R} = \frac{(9 \times 10^{-3})^2}{9 \times 10^{-3}} = \mathbf{9 \times 10^{-3}\ W}$$

The source of this power is the power of external agent.

(*g*) The motion of rod does not cut field lines, hence **no induced e.m.f.** is produced.

Problem 1.23. A circular loop of radius 0·3 cm lies parallel to a much bigger circular loop of radius 20 cm. The centre of the small loop is on the axis of the bigger loop. The distance between their centres is 15 cm [Fig. 1.24].

(*a*) What is the flux linking the bigger loop, if a current of 2·0 A flows through the smaller loop ?

(*b*) Obtain the mutual inductance of the two loops. *(Text Problem)*

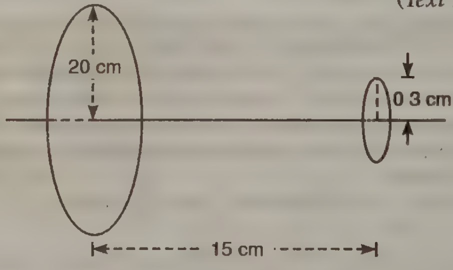

Fig. 1.24

Sol. Due to symmetry, flux linking the bigger loop due to current of 2·0 A flowing through smaller loop will be same as the flux linking the smaller loop due to current of 2·0 A flowing through bigger loop.

Bigger loop	***Smaller loop***
$a_1 = 20 \text{ cm} = 20 \times 10^{-2}$ m	$a_2 = 0{\cdot}3 \text{ cm} = 0{\cdot}3 \times 10^{-2}$ m

Distance of smaller loop from the bigger loop,

$x = 15 \text{ cm} = 15 \times 10^{-2} \text{ m}$

and current through the either loop, $I = 2{\cdot}0$ A

Magnetic field at the centre of smaller loop due to current flowing through the bigger loop is given by

$$B_1 = \frac{\mu_0}{4\pi} \cdot \frac{2\pi I a_1^2}{(a_1^2 + x^2)^{3/2}}$$

$$= \frac{10^{-7} \times 2\pi \times 2{\cdot}0 \times (20 \times 10^{-2})^2}{\left\{(20\ 10^{-2})^2 + (15 \times 10^{-2})^2\right\}^{3/2}}$$

$$= \frac{10^{-7} \times 2\pi \times 2{\cdot}0 \times (20 \times 10^{-2})^2}{(625 \times 10^{-4})^{3/2}}$$

$$= \frac{10^{-7} \times 2\pi \times 2{\cdot}0 \times (20 \times 10^{-2})^2}{(25 \times 10^{-2})^3} = 3{\cdot}127 \times 10^{-6} \text{ T}$$

(*a*) Flux linked with smaller coil,

$$\phi = B_1 \times A_2 = B_1 \pi a_2^2$$

$$= 3{\cdot}127 \times 10^{-6} \times \pi \times (0{\cdot}3 \times 10^{-2})^2$$

$$= \mathbf{9{\cdot}096 \times 10^{-11}\ Wb}$$

(*b*) Now, $M = \frac{\phi}{I} = \frac{9{\cdot}096 \times 10^{-11}}{2{\cdot}0} = \mathbf{4{\cdot}548 \times 10^{-11}\ H}$

Problem 1.24. (*a*) A circuit contains two inductors in series with self-inductances L_1 and L_2 and mutual inductance M. Obtain a formula for the equivalent inductance in the circuit.

(*b*) Two inductors of self-inductances L_1 and L_2 are connected in parallel. The inductors are so far apart that their mutual inductance is negligible. What is the equivalent inductance of the combination ? (*Text Problem*)

Sol. (*a*) Let L_1 and L_2 be the self-inductances of two inductors and M, the mutual inductance between them. Further, let e_1 and e_2 be induced e.m.fs. produced in two inductors and *e* be the total e.m.f. produced. Then,

$$e = e_1 + e_2 \qquad ...(i)$$

If $\frac{dI}{dt}$ is the rate of change of current through the two inductors in series, then

$$e_1 = -L_1 \frac{dI}{dt} - M\frac{dI}{dt} \quad \text{and} \quad e_2 = -L_2 \frac{dI}{dt} - M\frac{dI}{dt}$$

If L is the self-inductance of the two inductors in series, then

$$e = -L\frac{dI}{dt}$$

Therefore, equation (*i*) becomes

$$-L\frac{dI}{dt} = \left(-L_1\frac{dI}{dt} - M\frac{dI}{dt}\right) + \left(-L_2\frac{dI}{dt} - M\frac{dI}{dt}\right)$$

or $\quad \mathbf{L = L_1 + L_2 + 2\,M}$

(*b*) As the two inductors are connected in parallel, induced e.m.f. produced across either of the inductors will be same. If $\frac{dI_1}{dt}$ and $\frac{dI_2}{dt}$ are the rates of change of current through the inductors L_1 and L_2 respectively, then

$$e = -L_1\frac{dI_1}{dt} \quad \text{and} \quad e = -L_2\frac{dI_2}{dt}$$

If L is the effective inductance of the two inductors in parallel, then

$$e = -L\left(\frac{dI_1}{dt} + \frac{dI_2}{dt}\right)$$

Substituting for $\frac{dI_1}{dt}$ and $\frac{dI_2}{dt}$, we get

$$e = -L\left(-\frac{e}{L_1} - \frac{e}{L_2}\right)$$

or $\quad \frac{1}{L} = \frac{1}{L_1} + \frac{1}{L_2} \quad$ or $\quad L = \frac{L_1 L_2}{L_1 + L_2}$

Problem 1.25. Fig 1.25 shows a short solenoid of length 4 cm, radius 2·0 cm and number of turns 100, lying inside on the axis of a long solenoid, 80 cm long and number of turns 1500.

What is the flux through the long solenoid, if a current of 5·0 A flows through the short solenoid ? Also obtain the mutual inductance of the two solenoids. (*Text Problem*)

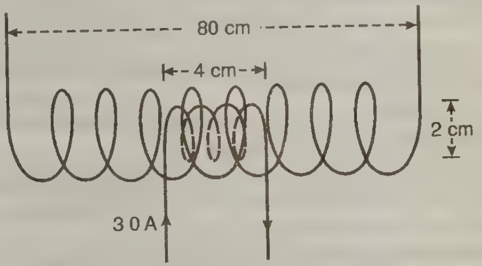

Fig. 1.25

Sol. *Long solenoid* :

Total number of turns, $N_1 = 1500$;

length, $l_1 = 80 \text{ cm} = 80 \times 10^{-2}$ m

Short solenoid :

Total number of turns, $N_2 = 100$;

length $l_2 = 4 \text{ cm} = 4 \times 10^{-2}$ m ;

radius, $r_2 = 2 \text{ cm} = 2 \times 10^{-2}$ m ;

Therefore, area of cross-section of the short solenoid,

$$A_2 = \pi r_2^2 = \pi \times (2 \times 10^{-2})^2 = 4\pi \times 10^{-4} \text{ m}^2$$

Current through the short solenoid, $I = 3{\cdot}0$ A

It is difficult to calculate magnetic flux through the long solenoid and hence the mutual inductance of the two solenoids as such. It is because, the short solenoid produces a complicated field. In section 1.17, it was proved that

$$M_{12} = M_{21}$$

Also, when same current is passed through the inner (short) or the outer (long) solenoid,

$$\phi_{21} = \phi_{12}$$

Therefore, we may assume that the current of 3 A, which actually flows through the short solenoid, is flowing through the long solenoid. Now, the magnetic flux through the long solenoid and mutual induction between the two solenoids can be easily calculated.

Magnetic flux linked with the short solenoid,

$$\phi = B_1 \times A_2 \times N_2,$$

where B_1 is field due to the long solenoid, A_2 and N_2 are area of cross-section and total number of turns of the short solenoid respectively.

$$\therefore \quad \phi = \mu_0 n_1 I \times A_2 \times N_2$$

Now, $\quad n_1 = \frac{N_1}{l_1} = \frac{1500}{80 \times 10^{-2}}$

$$\therefore \quad \phi = 4\pi \times 10^{-7} \times \frac{1500}{80 \times 10^{-2}} \times 3{\cdot}0 \times 4\pi \times 10^{-4} \times 100$$
$$= \mathbf{8{\cdot}883 \times 10^{-4}\ Wb}$$

Also, $$M = \frac{\phi}{I} = \frac{8{\cdot}883 \times 10^{-4}}{3}$$
$$= 2{\cdot}96 \times 10^{-4}\ \text{H}$$

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. What is meant by magnetic flux ? State its SI unit. *(P.S.S.C.E. 2000, 1999 S)*

Ans. The magnetic flux linked with a surface is defined as the number of magnetic field lines passing normally through that surface. Its SI unit is weber.

Q. 1.02. Weber is the unit of which physical quantity ? *(C.B.S.E. 1986)*

Ans. It is the unit of magnetic flux.

Q. 1.03. What are the SI units of (*i*) magnetic flux and (*ii*) magnetic field strength ? *(C.B.S.E. 1990)*

Ans. (*i*) Weber (*ii*) Tesla.

Q. 1.04. What is the basic cause of induced e.m.f. ? *(P.S.S.C.E. 2001 ; H.P.S.S.C.E. 1997)*

Ans. Whenever magnetic flux linked with a coil changes, induced e.m.f. is produced.

Q. 1.05. What factors govern the magnitude of the e.m.f. induced in an electric circuit ?

Ans. The magnitude of induced e.m.f. in an electric circuit is directly proportional to the rate of change of magnetic flux linked with the circuit.

Q. 1.06. What is the magnitude of the induced current in the circular loop KLMN of radius *r* [Fig. 1.26], if the straight wire PQ carries a steady current of magntude I ampere ? *(C.B.S.E. 2002)*

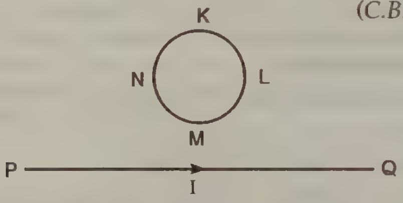

Fig. 1.26

Ans. No induced e.m.f. will be produced in the circular loop. It is because, the magnetic flux linked with the loop remains unchanged due to steady current through the wire PQ.

Q. 1.07. A conducting loop is held stationary normal to the field between the NS poles of a fixed permanent magnet. By choosing a magnet sufficiently strong, can we hope to generate current in the loop ? *(Text Question)*

Ans. No current will be induced in the loop, how so strong a magnet be chosen. It is because, there is no relative motion between the loop and the magnet. The induced current is produced only, if the magnetic flux linked with the loop changes.

Q. 1.08. Explain, whether an induced current will be developed in a conductor, if it is moved in a direction parallel to magnetic field. *(C.B.S.E. Sample Q. Paper)*

Ans. Induced current will not be developed in a conductor, if it is moved in a direction parallel to the magnetic field. It is because, in such a case, Lorentz force on free electrons in the conductor is zero and consequently no potential difference is created across the two ends of the conductor.

Q. 1.09. A closed conducting loop moves normal to the electric field between the plates of a large capacitor. Is a current induced in the loop, when it is (*i*) wholly inside the capacitor, (*ii*) partially outside the plates of the capacitor ? The electric field is normal to the plane of the loop. *(Text Question)*

Ans. The current is induced, if magnetic flux linked with the loop changes. No current is induced in either case, when the loop is wholly inside or partially inside the electric field.

Q. 1.10. Two identical loops, one of copper and another of aluminium are rotated with the same speed in the same magnetic field. In which case, the induced (*a*) e.m.f. (*b*) current will be more and why ? *(Text Question)*

Ans. The induced e.m.f. will be same in both but the induced current will be more in the copper loop as its resistance will be lesser as compared to that of the aluminium loop.

Q. 1.11. A straight conductor 1 m long moves at right angles to both its length and a uniform magnetic field. If the speed of the conductor is 2·0 m s^{-1} and the strength of the magnetic field is 10^4 gauss, find the value of induced e.m.f. in volt. *(P.S.S.C.E. 1996)*

Ans. Here, $l = 1$ m ; $v = 2{\cdot}0$ m s^{-1} ; $B = 10^4$ gauss $= 1$ tesla

Now, $e = B\ v l = 1 \times 2{\cdot}0 \times 1 = \mathbf{2{\cdot}0\ V}$

Q. 1.12. A metallic wire 1 m in length is moving normally across a field of 0·1 T with a speed of 5 m s^{-1}. Find the e.m.f. between the ends of the wire. *(I.S.C.E. 1997 ; similar H.P.S.S.C.E. 1995)*

Ans. Induced e.m.f., $e = B\,v\,l = 0{\cdot}1 \times 5 \times 1 = \mathbf{0{\cdot}5\ V}$

Q. 1.13. A wire cuts across a flux of 0·2 × 10^{-2} weber in 0·12 second. What is the e.m.f. induced in the wire ? *(I.S.C.E. 1995)*

Ans. Induced e.m.f., $$e = -\frac{d\phi}{dt} = -\frac{0{\cdot}2 \times 10^{-2}}{0{\cdot}12}$$
$$= \mathbf{-\,0{\cdot}0167\ V}$$

Q. 1.14. State Lenz's law of electromagnetic induction. *(C.B.S.E. 2002 ; P.S.S.C.E. 2002, 2001, 2000, 1999, 1998 S ; H.S.S.C.E. 2001, 1999 S, 1995 ; I.S.C.E. 1995)*

Ans. It states that the induced e.m.f. (or current) produced in a circuit always acts so that it opposes the change or the cause that produces it.

Q. 1.15. What factors govern the direction of e.m.f. ?

Ans. The direction of induced e.m.f. is always so that it opposes the change which produces it.

Q. 1.16. The induced e.m.f. is also called back e.m.f. Why ?

Ans. It is because, the induced e.m.f. opposes the applied voltage.

Q. 1.17. When current flowing in an inductive circuit is switched off, will the induced current be in the direction of main current or in the opposite direction ?

Ans. When the current is switched off, the current is in he direction of main current.

Q. 1.18. What are eddy currents ? How are they pro-luced ? *(H.S.S.C.E. 1997)*

Or

What are eddy currents ? *(H.S.S.C.E. 2001)*

Ans. The eddy currents are caused in a metallic onductor, when the magnetic flux linked with the conductor hanges.

Q. 1.19. Why the oscillations of a copper disc in a mag-etic field are lightly damped ? *(H.P.S.S.C.E. 1995)*

Ans. The eddy currents produced in the copper disc due to its motion in magnetic field) always oppose its scillatory motion and as such, the motion is damped.

Q. 1.20. Define the SI unit of self inductance.

(P.S.S.C.E. 2001, 2000, 1998 S ; H.S.S.C.E. 1998 S)

Ans. Refer to section 1.11.

Q. 1.21. If a rate of change of current of 4 A s^{-1} induces n e.m.f. of 20 mV in a solenoid, what is the self-inductance f the solenoid ? *(C.B.S.E. 1996)*

Ans. Here, $\frac{dI}{dt} = 4\text{ A s}^{-1}$; $e = 20\text{ m V} = 20 \times 10^{-3}\text{ V}$

Now, $e = L\frac{dI}{dt}$ (magnitude)

$$\therefore \quad L = \frac{e}{dI/dt} = \frac{20 \times 10^{-3}}{4} = \mathbf{5 \times 10^{-3}\ H}$$

$(\because \phi = LI)$

Q. 1.22. Magnetic flux of 5 microweber is linked with a oil, when a current of 1 mA flows through it. What is the self-nductance of the coil ? *(H.S.S.C.E. 1999 ; C.B.S.E. 1993)*

Ans. Here, $\phi = 5\,\mu\text{ Wb} = 5 \times 10^{-6}\text{ Wb}$; $I = 1\text{ mA} = 10^{-3}\text{ A}$

Now, $L = \frac{\phi}{I} = \frac{5 \times 10^{-6}}{10^{-3}} = \mathbf{5 \times 10^{-3}\ H}$

Q. 1.23. The magnetic flux threading a coil changes rom 12×10^{-3} Wb to 6×10^{-3} Wb in 0·01 s. Calculate the nduced e.m.f. *(C.B.S.E. 1990)*

Ans.
$$e = -\frac{d\phi}{dt} = -\frac{6 \times 10^{-3} - 12 \times 10^{-3}}{0{\cdot}01}$$
$$= \frac{6 \times 10^{-3}}{0{\cdot}01} = \mathbf{0{\cdot}6}$$

Q. 1.24. Explain, why the inductance coils are made of opper.

Ans. The inductance coils made of copper will have ery small ohmic resistance. Due to change in magnetic flux, large induced current will be produced in such an nductance, which will offer appreciable opposition to the low of current due to the applied e.m.f.

Q. 1.25. A coil is wound on an iron core and looped back on itself so that the core has two sets of closely wound wires in series carrying current in the opposite senses. What do you expect about its self-inductance ? Will it be large or small ? *(Text Question)*

Ans. The self-inductance will be small due to cancellation of inductive effects. It is because, currents in two sets of wires flow in opposite directions and produce flux in opposite directions.

Q. 1.26. Coils in the resistance boxes are made from doubled up insulated wire. Why ?

Ans. It is done so as to cancel the effect of self-induced e.m.f. in the coil. In the coil made of doubled up wire, the inductive effect in the two wires will be opposite to each other.

Q. 1.27. A lamp connected in parallel with a large inductor glows brilliantly before going off, when the switch is put off. Why ?

Ans. As the switch is put off, a large e.m.f. is set up in the inductor due to break in the current through the inductor. The large e.m.f. makes the bulb glow brilliantly.

Q. 1.28. Why is spark produced in the switch of a fan, when it is switched off ?

(H.S.S.C.E. 1998 S ; H.P.S.S.C.E. 1996)

Ans. Due to the sudden break, a large induced e.m.f. is set up across the gap in the switch. Due to this, sparking takes place in the switch.

Q. 1.29. If the self-inductance of an air core inductor increases from 0·01 mH to 10 mH on introducing an iron core into it, what is the relative permeability of the core used ? *(C.B.S.E. 2002)*

Ans. Relative permeability, $\mu_r = \frac{10}{0{\cdot}01} = \mathbf{1000}$

Q. 1.30. What is meant by mutual induction ?

(H.P.S.S.C.E. 1998)

Ans. The phenomenon according to which induced e.m.f. is produced in a coil due to change in magnetic flux linked with a neighbouring coil is called mutual induction.

Q. 1.31. Define coefficient of mutual inductance for a pair of coils. *(I.S.C.E. 1998)*

Ans. Refer to section 1.15.

Q. 1.32. What is the unit of mutual inductance ?

(I.S.C.E. 1996)

Ans. Henry. For definition, refer to section 1.15.

Q. 1.33. Refer to Figs. 1.18, 1.19 and 1.20. In which case will the mutual inductance of two coils be maximum, if the number of turns remains the same in each case ?

(C.B.S.E. 1999 S)

Ans. In the arrangement shown in Fig. 1.18, the mutual inductance of the two coils will be maximum.

For details, refer to section 1.14.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. What are the dimensions of magnetic flux ?

(P.S.S.C.E. 1999 S)

Ans. The magnetic flux linked with a surface,

$$\phi = B\,A\cos\theta$$

Since $F = q\,v$, we have

$$\phi = \frac{F}{q\,v}A\cos\theta$$

$$\therefore \quad [\phi] = \frac{[M\,L\,T^{-2}] \times [L^2]}{[A\,T][L\,T^{-1}]} = \mathbf{[M\,L^2\,T^{-2}\,A^{-1}]}$$

$(\because$ charge = current × time$)$

Q. 1.02. State Faraday's laws of electromagnetic induc-tion. *(P.S.S.C.E. 2002, 1999 S ; H.S.S.C.E. 2001, 1998 S ; I.S.C.E. 1995)*

Ans. Refer to section 1.04.

Q. 1.03. State Lenz's law. Show that it is in accordance with the law of conservation of energy. *(H.P.S.S.C.E. 2002 ; C.B.S.E. 1997)*

Or

Briefly explain, how Lenz's law supports the law of conservation of energy. *(C.B.S.E. 1999)*

Or

State Lenz's law. Does it violate law of conservation of energy ? *(P.S.S.C.E. 1993)*

Ans. Refer to sections 1.05 and 1.06.

Q. 1.04. Show that Lenz's law is a direct consequence of the law of conservation of energy. *(H.P.S.S.C.E. 1996)*

Or

Show that Lenz's law obeys the law of conservation of energy. *(P.S.S.C.E. 1998 S ; C.B.S.E. 1996)*

Or

Briefly explain, how Lenz's law supports the law of conservation of energy. *(C.B.S.E. 1999 S)*

Ans. Refer to section 1.06.

Q. 1.05. The electric current in a wire in the direction from B to A is decreasing. What is the direction of induced current in the metallic loop kept above the wire as shown in Fig. 1.27 ? *(C.B.S.E. 1997 ; I.I.T. 1979)*

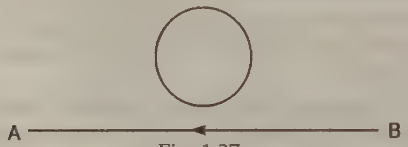

Fig. 1.27

Ans. When the increasing current flows through the wire in the direction from point B to A, the increasing magnetic field is produced ; which is directed perpendicular to the plane of the loop (or the plane of paper) and in inward direction. Due to this, induced e.m.f. is produced in the loop which opposes the magnetic field produced due to the current flowing through the wire *i.e.* induced current in the loop should flow in a direction so that it produces magnetic field perpendicular to the plane of the loop and in outward direction. Maxwell's cork screw rule tells that induced current in the loop will flow in anticlockwise direction.

Q. 1.06. A magnet is moved in the direction indicated by an arrow between two coils AB and CD as shown in Fig. 1.28. Suggest the direction of current in each coil. *(C.B.S.E. 2001 S)*

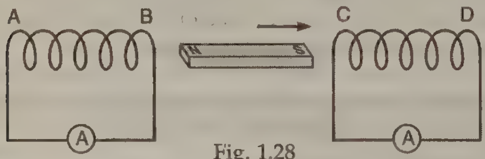

Fig. 1.28

Ans. For coil AB. N-pole of the magnet is moving away from the coil AB, the end A of the coil will behave as S-pole so as to oppose from motion of the magnet. Therefore, looking from the end A, the current in the coil AB will be in anticlockwise direction.

For coil CD. In this case, the end C of the coil CD should behave as S-pole so as to repel the approaching magnet. Looking from the end D, the direction of current in coil CD will be anticlockwise.

Q. 1.07. A cylindrical bar magnet is kept along the axis of a circular coil and near it as shown in Fig. 1.29. Will there be any induced e.m.f. at the terminals of the coil, when the magnet is rotated (*a*) about its own axis and (*b*) about an axis perpendicular to the length of the magnet ? *(C.B.S.E. 2001 S)*

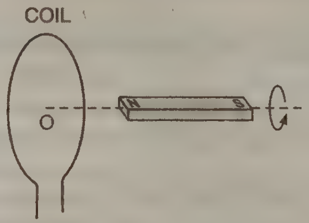

Fig. 1.29 (*a*)

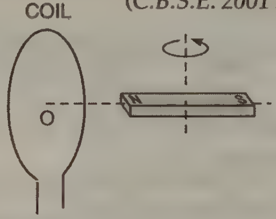

Fig. 1.29 (*b*)

Ans. Fig. 1.29. (*a*). When the magnet is rotated about its own axis, there is no change in the magnetic flux liked with the coil. Hence, no induced e.m.f. is produced in the coil.

Fig. 1.29. (*b*). When the magnet is rotated about an axis perpendicular to its length, the orientation of the magnetic field due to the magnet will change continuously. Due to this, the magnetic flux linked with the coil will also change continuously and it will result in the production of induced e.m.f. in the coil.

Q. 1.08. Figs. 1.30 (*a*) and (*b*) below show planar loops of different shapes moving out or into a region of magnetic field, which is directed normal to the plane of the loop and away from the readeı. Determine the direction of induced current. *(Text Question)*

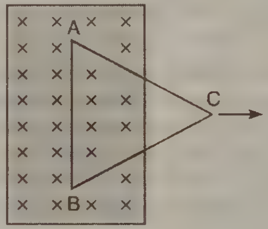

Fig. 1.30 (*a*)

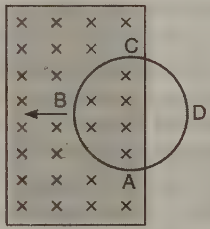

Fig. 1.30 (*b*)

Ans. ***In Fig. 1.30* (*a*) :** As the planar loop moves towards right, the magnetic flux linked with the loop decreases. The induced current will flow in a direction, so that the magnetic flux tends to increase through the loop *i.e.* the loop tends to move back into the magnetic field. For this, current in the arm AB (inside the magnetic field) should flow in such a direction so that the force on it acts towards left. It will happen so, if the induced current flows through the loop in the direction CBAC.

***In Fig. 1.30* (*b*) :** The application of Lenz's law tells that current in the part ABC (inside the magnetic field) should flow in such a direction that force on this part acts downwards. It will happen so, if the current through the part ABC flows along CBA i.e. the current through the loop flows in the direction CBADC.

Q. 1.09. Figs. 1.31 (*a*) and (*b*) below show planar loops of different shapes moving out of or into a region of magnetic

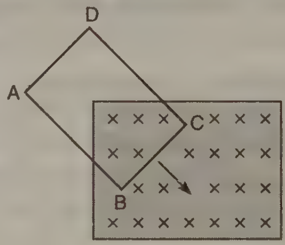

Fig. 1.31 (*a*)

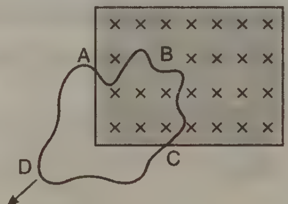

Fig. 1.31 (*b*)

ld, which is directed normal to the plane of the loops and ay from the reader. Determine the direction of induced rrent in each loop using Lenz's law. (*Text Question*)

Ans. *In Fig. 1.31 (a)* : Due to motion of loop ABCD in the ection shown, the flux linked with the loop increases. cording to Lenz's law, force on the arm BC (inside the gnetic field) should act opposite to its direction of motion. r this, current should flow through the loop in the direction DAB.

In Fig. 1.31 (b) : According to Lenz's law, the direction current in the part ABC (inside the magnetic field) should along ABC, so that it experiences force in a direction posite to the direction, in which it is moved. Hence, the ection of the current through the loop should be along CDA.

Q. 1.10. An irregular shaped wire PQRS (as shown in 1.32) placed in a uniform magnetic field perpendicular the plane of the paper changes into a circular shape. ow with reason the direction of the induced current in loop. (*C.B.S.E. 1998 S*)

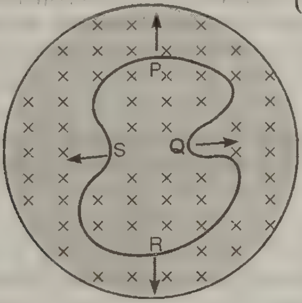

Fig. 1.32

Ans. When an irregular shaped wire PQRS changes to cular loop, the magnetic flux linked with the wire increases e to increase in area of the loop. The induced e.m.f. will use current to flow in the direction, so that the wire is pulled ward from all sides. According to Fleming's left hand rule, rce on wire PQRS will act inward from all sides, if the rrent flows in the direction PSRQ.

Note. When the wire loop changes to a circular loop, its ea increases. It is because, for a given perimeter, of all the ometrical shapes, a circle has the maximum area.

Q. 1.11. Use Lenz's law to determine the direction induced current in the situations described by the gs. 1.33 (*a*) and (*b*) given below :

In Fig. 1.33 (*a*) a wire of irregular shape turning into a rcular shape and in Fig. 1.33 (*b*), a circular loop being formed into a narrow straight wire. The cross (×) indi- tes magnetic field into the paper, and the dot (.) indicates agnetic field out of the paper. (*Text Question*)

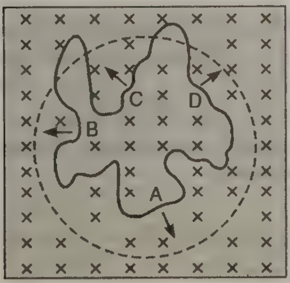

Fig. 1.33 (*a*)

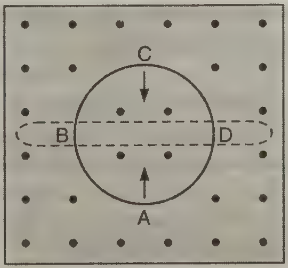

Fig. 1.33 (*b*)

Ans. *In Fig. 1.33 (a)* : When a wire of irregular shape turns into a circular loop, the magnetic flux linked with the loop increases due to increase in area (The circular loop has greater area than the loop of irregular shape). The induced e.m.f. will cause current to flow in such a direction, so that the wire forming the loop is pulled inward from all sides. It requires that current should flow in the direction ADCBA.

In Fig. 1.33 (b) : By appling Lenz's law, it follows that the current will flow in the direction ADCBA.

Q. 1.12. The closed loop PQRS is moving into a uniform magnetic field acting at right angles to the plane of the paper as shown in Fig. 1.34. State the direction in which the induced current flows in the loop. (*C.B.S.E. 2002*)

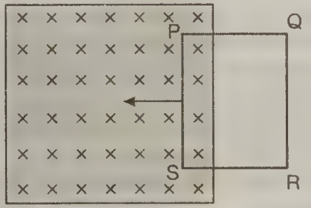

Fig. 1.34

Ans. As the closed loop PQRS moves into the uniform magnetic field, magnetic flux linked with the loop will increase. According to Lenz's law, induced e.m.f. produced in the loop should act so that the coil is opposed from moving into the magnetic field. For this to occur, force on the arm PS of the coil should act towards left. It requires that curernt through the arm PS should be from the end P to S *i.e.* current in the coil should be in the direction of SRQP.

Q. 1.13. Twelve wires of equal lengths are connected in the form of a skeleton-cube which is moving with a velocity $\vec{v}$ in the direction of a magnetic field $\vec{B}$ [Fig. 1.35]. Find the e.m.f. in each arm of the cube.

(*C.B.S.E. 2001 S*)

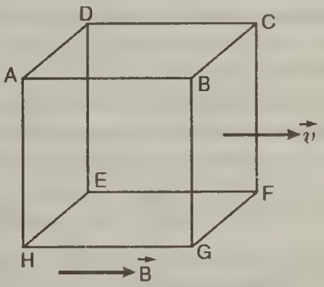

Fig. 1.35

Ans. Force on a charged particle moving inside magnetic field is given by

$$\vec{F} = q(\vec{v} \times \vec{B})$$

Since $\vec{v}$ and $\vec{B}$ are parallel, the force on electrons in any arm of the skeleton cube will be zero. As such, there cannot be drift of electrons in any arm from its one end to the other. Hence, no induced e.m.f. will be produced in any arm of the skeleton-cube.

Q. 1.14. A copper ring is held horizontally and a bar magnet is dropped through the ring with its length along the axis of the ring [Fig. 1.36]. Will the acceleration of the falling magnet be equal to, greater than or less than that due to gravity ? (*P.S.S.C.E. 1995*)

Or

Why does acceleration of a magnet falling through a long solenoid decrease ? (*C.B.S.E. 1999*)

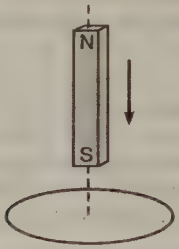

Fig. 1.36

Ans. When the magnet falls, the magnetic flux through the copper ring increases and it results in induced e.m.f. in the ring. The induced e.m.f. so produced, opposes the falling magnet. Therefore, the acceleration of the falling magnet will be less than that due to gravity.

Q. 1.15. An induced current has no direction of its own. Explain, why. (*P.S.S.C.E. 2001 ; H.S.S.C.E. 1995*)

Ans. The induced current always flows in a direction so that it opposes the cause or the change which produces it. For example, as shown in Fig. 1.36, when the magnet is dropped through the copper ring, the induced current flows in the ring in clockwise direction (when seen from above), till the magnet does not come out of the ring from the other side. But as soon as the magnet leaves the ring, the direction of the current will become anticlockwise in accordance with Lenz's law. It shows that an induced current has no direction of its own.

Q. 1.16. A magnetic field of flux density 10 T acts normal to a coil of 50 turns having 100 cm^2 area. Find e.m.f. induced, if the coil is removed from the magnetic field of 0·1 s. (*H.S.S.C.E. 1997*)

Ans. Here, $n = 50$; $A = 100\text{ cm}^2 = 10^{-2}\text{ m}^2$;

$B = 10\text{ T}$ and $dt = 0{\cdot}1\text{ s}$

Magnetic flux linked with the coil initially,

$$\phi_1 = n\,B\,A = 50 \times 10 \times 10^{-2} = 5\text{ Wb}$$

Magnetic flux linked with the coil finally *i.e.* on being removed from the magnetic field, $\phi_2 = 0$

Change in magnetic flux through the coil,

$$d\phi = \phi_2 - \phi_1 = 0 - 5 = -5\text{ Wb}$$

$$\text{Induced e.m.f., } e = -\frac{d\phi}{dt} = -\left(\frac{-5}{0{\cdot}1}\right) = \mathbf{50\ V}$$

Q. 1.17. How are eddy currents produced ? Give two applications of eddy currents.

(*P.S.S.C.E. 2000, 1999 S ; C.B.S.E. 1993, 1992*)

Or

What are eddy currents ? Name any two of its applications. (*H.P.S.S.C.E. 1997, 1995*)

Ans. Eddy currents are produced in a metallic conductor, when magnetic flux linked with the conductor changes.

Applications : 1. In energy meters **2.** In dead beat galvanometers.

Q. 1.18. How can eddy currents be reduced ?

(*H.S.S.C.E. 1997 S*)

Ans. Refer to section 1.09.

Q. 1.19. Why is the coil of a dead beat galvanometer wound on a metal frame ? (*C.B.S.E. 1991*)

Ans. On switching off the current in a galvanometer, the coil of the galvanometer does not come to rest immediately. It oscillates about its equilibrium position. But the coil of a dead beat galvanometer comes to rest immediately. It is du to the reason that the eddy currents are setup in the metalli frame, over which the coil is wound and the eddy current oppose the oscillatory motion of the coil.

Q. 1.20. Why are the to and fro oscillations completel absent in better designed galvanometer ?

Ans. Refer to section 1.09.

Q. 1.21. An iron bar falling vertically through th hollow region of a thick cylindrical shell made of coppe experiences a retarding force. What can you conclud about the iron bar ? (*Text Question*

Ans. The iron bar must be a magnet. When the ba magnet falls through the copper shell, it produces a chang in magnetic flux through it. Due to this, eddy currents ar produced in the shell. The eddy currents so produced oppos the fall of the magnet (Lenz's law) and hence bar magne experiences retarding force.

Q. 1.22. A coil A is connected to a volmeter V and th other coil B to an alternating current source [Fig. 1.37]. If large copper sheet C is placed between the two coils, hov does the induced e.m.f. in the coil A change due to curren in coil B ? (*C.B.S.E. 2001 S*

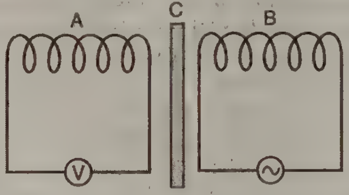

Fig. 1.37

Ans. In the absence of copper sheet, induced e.m.f. wi be produced in the coil A due to mutual induction betwee coils A and B. As a result, voltmeter will show deflectio depending on the magnitude of induced e.m.f.

When the copper sheet is placed between the two coil eddy currents will be set up in the coil. Since the eddy current have opposing effect, the magnetic flux linked with the co A due to eddy currents will always be opposite to that du to alternating current through the coil B. Hence, induce e.m.f. will get reduced.

Q. 1.23. Define the term `self-induction'. Write its S unit. Write two factors on which the self-inductance of a coi depends. (*C.B.S.E. 1999, 1995, 1993 ; H.S.S.C.E. 1995*

Ans. For definition of self-induction, refer to section 1.1 Its SI unit is henry.

The self-inductance of a coil depends upon its area o cross-section, the number of turns and the permeability of th material of the core.

Q. 1.24. How does the self inductance of a coil change when : (*i*) the number of turns in the coil is decreased (*ii*) a iron rod is introduced into it ? Justify you answer in each case

(*C.B.S.E. 1998*

Ans. Self inductance of a coil, $L = \mu_0\, n^2\, l\, A$

(*i*) When the number of turns is decreased, the sel inductance will decrease. It is because,

$$L \propto n^2$$

(*ii*) On introducing the iron rod into the coil, the sel inductance will become

$$L' = \mu_0\, \mu_r\, n^2\, l\, A,$$

where μ_r is the relative premeability of iron. Since, $\mu_r > 1$, sel induction will increase.

Q. 1.25. Define self-inductance. Write down the xpression for the self-inductance of a long solenoid of ngth *l* having N turns.

Ans. For definition of self-inductance, refer to section 11.

Self-inductance of a long solenoid, $L = \mu_0 n^2 l A$, here the letters have their usual meanings.

Q. 1.26. Self-induction is called the inertia of electricity. xplain, why. (*P.S.S.C.E. 2001*)

Ans. Self-induction of a coil is its property by virtue of hich the coil opposes any change in the current flowing rough it. It is because, the induced e.m.f. produced opposes e change in current. For this reason, self-induction is called nertia of electricity.

Q. 1.27. Define the term mutual inductance. Write its I units. Give two factors on which the coefficient of mutual nductance between a pair of coil depends. (*C.B.S.E. 1999, 1995*)

Ans. For definition of mutual inductance, refer to section .15. The SI unit of mutual inductance is henry.

The mutual inductance between two coils depends upon he number of turns of the two coils, their relative orientations nd the permeability of the material of the core.

Q. 1.28. How does the mutual inductance of a pair of oils change, when (*i*) the distance between the coils is inreased ? (*ii*) the number of turns in each coil is decreased ? Justify your answer in each case. (*C.B.S.E. 1998*)

Ans. (*i*) On increasing distance between the coil, the nagnetic flux linked with secondary coil due to current lowing through primary coil will decrease. Hence, mutual nductance of the two coils will decrease.

(*ii*) Mutual inductance of two coils, $M = \mu_0 n_1 n_2 A l$

Obviously, the mutual inductance of the two coils will decrease on decreasing the number of turns in each coil.

Q. 1.29. Making or breaking of current in a coil produces a momentary current in the neighbouring coil of another circuit. Why ?

Ans. Before making current in a coil, the current is zero and before breaking, the current is maximum. In other words, it is constant in both the cases. Obviously, on making or breaking the current in a circuit, the current starts changing. The changing current produces changing magnetic field, which in turn produces induced current in the neighbouring circuit.

Q. 1.30. Define self-inductance and mutual inductance. State their units in SI.

(*H.S.S.C.E. 1994, 1992 ; H.P.S.S.C.E. 1993 ; C.B.S.E. 1991*)

Ans. For definition of self-inductance and mutual inductance, refer to sections 1.11 and 1.15.

The SI unit of both self-inductance and mutual inductance is henry.

Q. 1.31. Distinguish between self induction and mutual induction. (*C.B.S.E. 1997*)

Ans. Refer to sections 1.10 and 1.14.

Q. 1.32. What is non-inductive wiring of coils ?

Ans. To make non-inductive coils, they are made of doubled up insulated wires. In such a coil, the direction of the current in the two wires will be opposite to each other. Due to this, the two wires will produce equal and opposite magnetic fields. Therefore, the net magnetic field linked with the coil is always zero and hence no inductive effect takes place.

abc TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 1.01. Two circular conductors are perpendicular to each other as shown in Fig. 1.38. Will a current be induced in the conductor A, if the current is changed in the conductor B ?

Ans. When the current passes through the circular conductor B, the magnetic field produced is parallel to the plane of the circular conductor A. As such, the magnetic flux linked with circular conductor A due to the magnetic field produced due to the flow of current through conductor B is zero.

When the current through conductor B is changed, the magnetic flux linked with conductor will remain zero. Hence, no current will be induced in conductor A, when current through conductor B is changed.

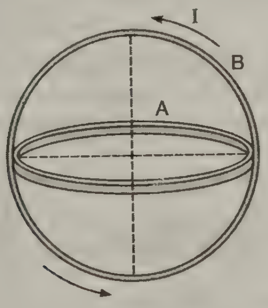

Fig. 1.38

Q. 1.02. A rectangular loop and a circular loop are moving out of a uniform magnetic field region to a field free region with a constant velocity. In which loop do you except the induced e.m.f. to be constant during the passage out of the field region ? The field is normal to the loops. (*Text Question*)

Ans. In case of a rectangular loop, induced e.m.f. will be constant. It is because, when such a loop is moved, the rate of change of its area is uniform. But when a circular loop is moved out of the magnetic field, its rate of change of area is not constant and hence the induced e.m.f. produced will not be constant.

Q. 1.03. A thin semicircular conducting ring of radius R is falling with its plane vertical in a horizontal magnetic induction $\vec{B}$ [Fig. 1.39]. At the position MNQ, the speed of the ring is v. What is the potential difference developed across the ring at the position MNQ ?

(*I.I.T. 1996*)

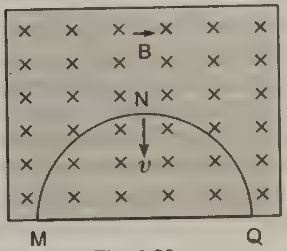

Fig. 1.39

Ans. Suppose that the semiconductor ring falls through an infinitesimally small distance dx from its initial position MNQ to M′Q′N′ in time dt [Fig. 1.40]. Then,

decrease in area of the ring inside the magnetic field,

$$dA = -\text{MQQ'M'} = -\text{M'Q'} \times \text{QQ'} = -2\,\text{R}\,dx$$

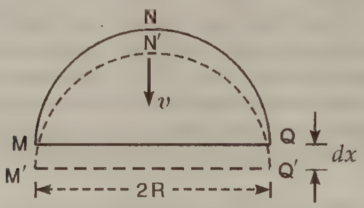

Fig. 1.40

Therefore, change in magnetic flux linked with the ring,

$$d\phi = \text{B} \times dA = \text{B} \times (-2\,\text{R}\,dx) = -2\,\text{B}\,\text{R}\,dx$$

The potential difference developed across the ring,

$$e = -\frac{d\phi}{dt} = -\left(-2\,\text{B}\,\text{R}\,\frac{dx}{dt}\right) = \mathbf{2\,B\,R}\,v$$

Here, $v = \frac{dx}{dt}$ is the speed with which the ring is falling.

Q. 1.04. An aircraft flies along the meridian. Will the potentials of the ends of its wings be the same ? Will the potential difference change, if the aircraft flies in any other direction with the same velocity ?

Ans. As the aircraft flies, magnetic flux changes through its wings due to the vertical component of the earth's magnetic field. Due to this, induced e.m.f. is produced across the wings of the aircraft. Therefore, the wings of the aircraft will not be at the same potential.

If the aircraft flies in any other direction, the value of the potential difference (induced e.m.f.) will not change. It is because, the value of potential difference depends only on the vertical component of the earth's magnetic field and the velocity of the aircraft.

Q. 1.05. (*a*) Will the earth's magnetic field induce current in an artificial satellite with a metal surface that is in orbit around the equator ? Around the poles ?

(*a*) If so how would these currents affect the motion of the satellite ?

Ans. (*a*) There will be no induced currents in the metal of the satellite, which is orbiting in equitorial plane. It is because, the magnetic flux does not change through the metal of the satellite in such a orbit. In other orbits (including orbit around the poles), the value of the magnetic field will change both in magnitude and direction. Due to this, the magnetic flux through the satellite will change and hence induced currents will be produced in the metal of the satellite.

(*b*) The induced currents in the metal of the satellite will produce magnetic field and therefore the satellite will itself act like a magnet. It will experience a small magnetic interaction with the earth so that the force on the satellite will not be purely gravitational. Therefore, there will be deflection from the gravitational path, the satellite would take if it moved in the gravitatonal field alone. Part of the effect of interaction would cause the satellite to lose energy, dissipated in the form of heat. Paradoxially, if it loses energy, it will speed up.

Q. 1.06. A copper coil L wound on a soft iron core and a 15 W-110 V lamp are connected to a 30 V battery through a tapping key as shown in Fig. 1.41. When the ke is closed, the lamp glows dimly. But when the key i suddenly opened, the lamp flashes for an instant to muc greater brightness. Explain, why.

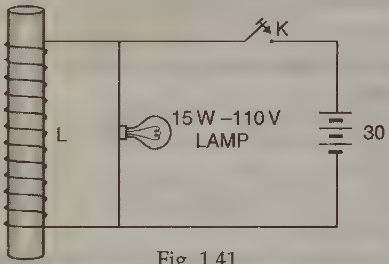

Fig. 1.41

Ans. On closing the key, the lamp glows dimly, becaus across a 110 V-lamp, the voltage applied is only 30 V. Whil the key is closed, some current also flows through the coil As the resistance of copper coil is very low, the current in th coil is much greater than the current through the lamp.

When the key is opened, the current through the lam stops and the current circulating through the coil L tends t decrease. But this tendency is opposed by the induced e.m. produced in the coil due to self induction. As the induce e.m.f. opposes the change, it tends to maintain the curren and makes it to flow through the lamp. This current can b significantly larger than would be produced in the lamp b the 30 V battery ; in fact it might be much larger tha would be produced by a 110 V battery. The large curren (driven by the induced e.m.f.) causes the lamp to flash brigh and may even burn it out.

Q. 1.07. A small square loop of wire of side l is place inside a large square loop of wire of side L (L > > l The loops are coplanar and their centres coincide [Fig. 1.42 Find the mutual inductance of the system. (*I.I.T. 1998*)

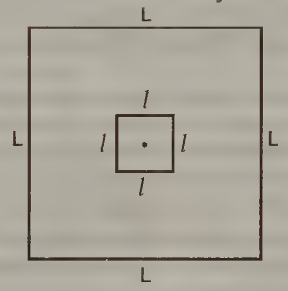

Fig. 1.42

Sol. Suppose that a current I passes through the squar loop of side L [Fig. 1.43].

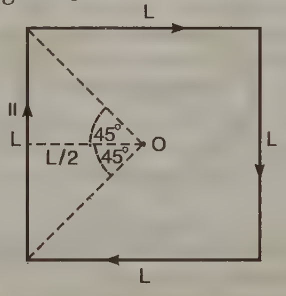

Fig. 1.43

Then, magnetic field at the centre O of the loop,

$$B = 4 \times B',$$

where B′ is magnetic field at the centre of loop due to one side of the square loop.

Now, $B' = \frac{\mu_0}{4\pi} \cdot \frac{I}{a}(\sin\phi_1 + \sin\phi_2)$

Here, $a = \frac{L}{2}; \phi_1 = \phi_2 = 45°$

$$\therefore \quad B' = \frac{\mu_0}{4\pi} \cdot \frac{I}{L/2}(\sin 45° + \sin 45°)$$

$$= \frac{\mu_0}{2\pi L}\left(\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}}\right) = \frac{\mu_0}{\sqrt{2}\,\pi L}$$

Hence, $B = 4 \times \frac{\mu_0 I}{\sqrt{2}\,\pi L} = \frac{2\sqrt{2}\,\mu_0 I}{\pi L}$

Magnetic flux linked with the small square loop,

$$\phi = B \times l^2 = \frac{2\sqrt{2}\,\mu_0 I l^2}{\pi L} \quad ...(i)$$

If M is coefficient of mutual induction between the two loops, then

$$\phi = MI \quad ...(ii)$$

From equations (*i*) and (*ii*), we have

$$M = \frac{2\sqrt{2}\,\mu_0 l^2}{\pi L}$$

Q. 1.08. A small resistor (say, a lamp) is usually put in parallel to the current carrying coil of an electromagnet [Fig. 1.44]. What purpose does it serve ?

(Text Question ; Pre-degree Kerala, 1991)

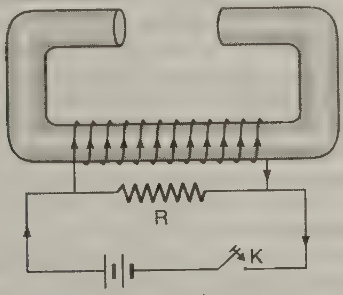

Fig. 1.44

Ans. When the current in the coil of an electromagnet is switched off, the induced e.m.f. produced at break is very large (particularly in large electromagnets). Due to this, spark is produced at the open switch. However, if a lamp (or a resistor) is connected across the coil of the magnet, the induced e.m.f. sends current through it and sparks are avoided.

Q. 1.09. A rectangular wire frame ABCD rotates with a constant velocity around one of its sides parallel to a nearby current carrying straight conductor [Fig. 1.45]. Indicate the positions, in which the minimum and maximum e.m.f.s will be induced in the frame.

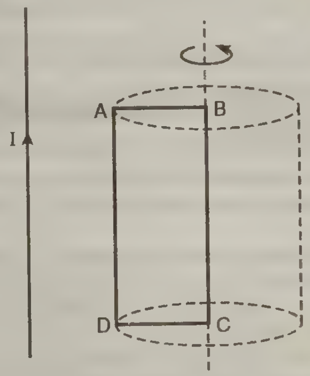

Fig. 1.45

Ans. The lines of force of the magnetic field produced by the current carrying straight conductor are circular in shape and have their centres on the straight conductor.

When the frame lies in the plane passing through the straight conductor, the magnetic field lines pass normally through it. When the magnetic field lines pass normally through the plane of the rotating rectangular frame ABCD, the magnetic flux linked with the frame is maximum but the rate of change of magnetic flux is minimum and likewise induced e.m.f. produced is also minimum. Hence, the induced e.m.f. produced is minimum, when the frame lies in the plane passing through the straight conductor.

On the other hand, when the frame is perpendicular to the plane passing through the straight conductor, the magnetic flux linked with the frame is minimum ; the rate of change of magnetic flux is maximum and likewise induced e.m.f. produced is also maximum.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Explain the concept of magnetic flux linked with a surface. Give its units and obtain its dimensional formula.
2. State and explain Faraday's laws of electromagnetic induction. *(H.P.S.S.C.E. 2000, 1999 ; H.S.S.C.E. 1996)*
3. State Faraday's laws of electromagnetic induction and Lenz's law. *(H.S.S.C.E. 2002)*
4. State Lenz's law of electromagnetic induction and show that it is in accordance with law of conservation of energy. *(H.S.S.C.E. 1998)*
5. State Lenz's law. Prove that the charge induced is independent of time. *(P.S.S.C.E. 1995)*
6. A straight conducting rod of length l is moved with a velocity v in a transverse magnetic field. Deduce the magnitude and direction of induced e.m.f. developed. If the ends of the rod are joined with a wire, indicate the direction of flow of induced current.
7. By calculating magnetic Lorentz force on a conductor moved in a transverse magnetic field, deduce Faraday flux law

$$e = -\frac{d\phi}{dt}$$

8. Derive an expression for the induced e.m.f. produced by changing the area of a rectangular coil placed perpendicular to a uniform magnetic field. *(C.B.S.E. 1992)*
9. A rectangular coil of N turns and area of cross-section A is held in a time-varying field given by $B = B_V \sin \omega t$, with the plane of the coil normal to the magnetic field. Deduce an expression for the e.m.f. induced in the coil. *(C.B.S.E. 2000)*

10. What are eddy currents ? Give experiments to explain their origin. *(H.P.S.S.C.E. 1997, 1996 ; P.S.S.C.E. 1996)*
11. What are eddy currents ? Discuss the effects of eddy currents in electrical appliances, where iron is used.
12. What are eddy currents and electromagnetic damping ? How are these used in a speedometer, an electric brake and a dead beat galvanometer ? *(P.S.S.C.E. 1999, 1996)*
13. What are eddy currents ? How they can be minimised ? *(H.S.S.C.E. 2002, 1997 ; H.P.S.S.C.E. 2001;)*
14. What are eddy currents ? Give their merits and demerits. *(H.S.S.C.E. 1999 S)*
15. Explain, what do you mean by 'self-induction' and 'self-inductance' of a coil. Define S.I. unit of self-inductance.
16. Explain self induction of a coil and give its unit. *(H.S.S.C.E. 2002)*
17. Explain the phenomenon of self induction. Define coefficient of self-induction. What are its units ? *(H.S.S.C.E. 1994 ; C.B.S.E. 1990)*
18. Define an expression for the self-inductance of a long solenoid. *(C.B.S.E. 2001 ; H.S.S.C.E. 2001)*
19. Calculate the coefficient of self-induction for a long air cored solenoid. *(P.S.S.C.E. 1999 S)*
20. Explain the phenomenon of mutual induction. Define coefficient of mutual induction. Give its S.I. units. *(H.S.S.C.E. 1993 ; C.B.S.E. 1990)*
21. Explain mutual inductance and define its SI unit. *(H.S.S.C.E. 2002)*
22. Define coefficient of mutual inductance of two coils. A secondary coil of n_2 turns is wound on a long solenoid of area of cross-section A, having a primary coil of n_1 turns per unit length. What is the mutual inductance of the two coils ? *(C.B.S.E. 1990)*

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. Explain Faraday's and Lenz's law of electromagnetic induction by describing suitable experiments. *(P.S.S.C.E. 1998, 1997 S)*
2. State Faraday's laws of electromagnetic induction and explain three methods of producing induced e.m.f. *(P.S.S.C.E. 2002, 2000, 1997 ; H.S.S.C.E. 1996)*
3. What is meant by self-induction and coefficient of self-induction ? Explain. Derive an expression for the coefficient of self-induction for a long air-cored solenoid. *(P.S.S.C.E. 2001)*
4. Explain the phenomenon of mutual induction. Define coefficient of mutual induction and state its unit. Also derive an expression for coefficient of mutual induction between two long solenoids. *(P.S.S.C.E. 2002, 2000)*
5. Explain what is meant by mutual induction and mutual inductance. Give the practical unit of mutual inductance. How it can be defined in terms of induced e.m.f. and rate of growth of current ? Derive expression for mutual inductance between two solenoids.

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Faraday law of Electromagnetic Induction

1. The magnetic flux through a coil perpendicular to its plane is varying according to the relation
$$\phi = (4\,t^3 + 5\,t^2 + 8\,t + 5) \text{ weber}$$
Calculate the induced current through the coil at $t = 2$ s, if the resistance of the coil is 3·1 ohm. *(P.S.S.C.E. 1999)* [**Ans.** 24·5 A]
2. A small piece of metal wire is dragged across the gap between the pole pieces of a magnet in 0·5 s. The magnetic flux between the pole pieces is known to be 8×10^{-4} Wb. Estimate the e.m.f. induced in the wire. *(Text Problem)* [**Ans.** $1{\cdot}6 \times 10^{-3}$ V]
3. A magnetic field of flux density 1·0 Wb m^{-2} acts normal to a 80 turn coil of 0·01 m^2 area. Find the e.m.f. induced in it, if this coil is removed from the field in 0·1 second. *(H.S.S.C.E. 2002)* [**Ans.** 8 V]
4. A magnetic field of flux density 10 T acts normal to a coil of 50 turns having 100 cm^2 area. Find e.m.f. induced, if the coil is removed form magnetic field in 0·1 s. *(H.S.S.C.E. 1998)* [**Ans.** 50 V]
5. Find the magnitude of e.m.f. induced in a 200 turn coil with cross-sectional area of 0·16 m^2, if the magnetic field through the coil changes from 0·10 Wb m^{-2} to 0·30 Wb m^{-2} at a uniform rate over a period of 0·05 s. *(H.S.S.C.E. 2002)* [**Ans.** 128 V]
6. Find the e.m.f. induced in a coil of 200 turns and cross-sectional area 0·2 m^2, when a magnetic field perpendicular to the plane of the coil changes from 0·1 Wb m^{-2} to 0·5 Wb m^{-2} at a uniform rate over a period of 0·05 s. *(P.S.S.C.E. 1992)* [**Ans.** 320 V]
7. A wire 88 cm long bent into a circular loop is placed perpendicular to the magnetic field of flux density 2·5 Wb m^{-2}. Within 0·5 s, the loop is changed into a square of each side 22 cm and flux density is increased to 3·0 Wb m^{-2}. Calculate the value of e.m.f. induced. *(H.P.S.S.C.E. 1990)* [**Ans.** 0·018 V]
8. A square copper coil of each side 8 cm consists of 100 turns. The coil is initially in vertical plane, such that the plane of coil is normal to uniform magnetic field of induction 0·4 weber m^{-2}. The coil is turned through 180° about a horizontal axis in 0·2 s. Find the induced e.m.f. *(P.S.S.C.E. 1999 S)* [**Ans.** 2·56 volt]
9. A conducting rod 1 m in length moves with a frequency of 50 r.p.s. with one end at the centre and the other end at the circumference of a circular metallic ring of radius 1 m about an axis passing through the centre of the coil and perpendicular to the plane of the coil. A constant magnetic field parallel to the axis is present everywhere. What is the e.m.f. developed between the centre and the metallic ring ?($B = 1{\cdot}0$ Wb m^{-2}). [**Ans.** 157·08 V]
10. A 1 m long conducting rod rotates with an angular speed 400 rad s^{-1} about an axis normal to the rod and passing through its one end. The other end of the rod is in contact with a circular metallic ring. A constant magnetic field of 0·5 T parallel to the axis exists everywhere. Calculate the e.m.f. developed between the centre and the ring. *(Text Problem)* [**Ans.** 100 V]
11. A copper disc of radius 10 cm placed with its plane normal to a uniform magnetic field completes 1200 rotations per minute. If induced e.m.f. between the centre and edge of the disc in 6·284 mV, find the intensity of the magnetic field. Take $\pi = 3{\cdot}142$. [**Ans.** 10^{-2} T]
12. A metal disc of radius 200 cm is rotated at a constant angular speed of 60 rad s^{-1} in a plane at right angles to an external field of magnetic induction 0·05 Wb m^{-1}. Find the

e.m.f. induced between the centre and a point on the rim. *(P.S.S.C.E. 1991)* **[Ans.** 6 V]

ype B. On Motional e.m.f.

13. If a 10 m long metallic bar moves in a direction at right angle to the magnetic field with a speed of $5{\cdot}0 \text{ m s}^{-1}$, 25 V e.m.f. is induced in it. Find the value of magnetic field intensity. *(P.S.S.C.E. 1999)* **[Ans.** 0·5 T]

14. A conductor 2 m long moves in a magnetic field of flux density $0{\cdot}5 \times 10^{-4}$ tesla with a speed of 36 km per hour. Calculate the e.m.f. induced in it, if it is perpendicular to both its length and field. **[Ans.** 10^{-3} volt]

15. A straight wire of length 2 m moves at a speed of 500 cm s^{-1} in a direction at right angles to a uniform field of induction 1000 gauss. Find the e.m.f. generated in volt. **[Ans.** 1 volt]

16. A metre gauge train is running due north with a constant speed of 90 km h^{-1} on a horizontal track. If the vertical component of earth's magnetic field is $3 \times 10^{-5} \text{ W b m}^{-2}$, calculate the e.m.f. induced across the axle of the train of length 1·25 m. *(H.S.S.C.E. 2002)* **[Ans.** $9{\cdot}375 \times 10^{-4}$ V]

17. Calculate the e.m.f. induced between the ends of an axle 1·8 m long of a railway carriage travelling at the rate of 50 km h^{-1}. The vertical component of the earth's magnetic field is $0{\cdot}5 \times 10^{-4}$ weber m^{-2}. **[Ans.** $1{\cdot}25 \times 10^{-3}$ V]

18. An aircraft with a wing span of 40 m flies with a speed of 1080 km h^{-1} in the eastward direction at a constant altitude in the northern hemisphere, where the vertical component of earth's magnetic field is $1{\cdot}75 \times 10^{-5}$ T. Find the e.m.f. that develops between the tips of the wings. *(Text Problem)* **[Ans.** 0·21 V]

19. A satellite with a 40 cm long copper wire on its bottom is revolving around the earth at 7·8 km per second, such that the wire is perpendicular to the vertical component of earth's magnetic field. Determine the e.m.f. induced across this wire, if the magnitude of the vertical component of magnetic field is 0·2 gauss. **[Ans.** 0·0624 V]

20. A railway track running north-south has two parallel rails 1·0 m apart. Calculate the value of induced e.m.f. between the rails, when a train passes at a speed of 90 km h^{-1}. Horizontal component of earth's field at that place is $0{\cdot}3 \times 10^{-4} \text{ Wb m}^{-2}$ and angle of dip is 60°. *(H.S.S.C.E. 2001)* **[Ans.** $1{\cdot}3 \times 10^{-3}$ V]

ype C. On Self Induction

21. Magnetic flux of 5μWb is linked with a coil, when a current of 1 mA flows through it. What is the self inductance of the coil ? *(H.S.S.C.E. 1999)* **[Ans.** 5 mH]

22. The self inductance of an inductor having 100 turns is 20 mH. Calculate the total magnetic flux linked with the coil and the magnetic flux through the cross-section of the inductor corresponding to a current of 4 mA. **[Ans.** 8×10^{-3} Wb, 8×10^{-5} Wb]

23. A coil has an inductance of $1{\cdot}5 \times 10^{-2}$ H. Calculate the e.m.f. induced, when current in the coil changes at the rate 200 ampere per second. **[Ans.** 3 V]

24. The current passing through a 20 H inductor changes from 9 A to 8 A in 20×10^{-3} s. What will be the value of self induced e.m.f. ? **[Ans.** 10^3 V]

25. A 5 henry inductor carries a steady current of 2 ampere. How can a 50 volt self induced e.m.f. be made to appear in the inductor ? *(P.S.S.C.E. 2001)* **[Ans.** By decreasing current from 2 A to zero in 0·2 s]

26. A coil has a self inductance of 10 mH. What is the maximum magnitude of the induced e.m.f. in the inductor, when a curent $I = 0{\cdot}1 \sin 200\, t$ ampere is sent through it ? **[Ans.** 0·2 V]

27. A long solenoid of 10 turns cm^{-1} has a small loop of area 1 cm^2 placed inside with the normal of the loop parallel to the axis. Calculate the voltage across the small loop, if the current in the solenoid is changed at a steady rate from 1 A to 2 A in 0·1 s during the duration of the change. **[Ans.** $1{\cdot}257 \mu$V]

Type D. On Mutual Induction

28. What is the mutual inductance of a pair of coils, if a current of 3 ampere in one coil causes the flux in the second coil of 1000 turns to change by 10^{-4} Wb in each turn ? **[Ans.** $3{\cdot}33 \times 10^{-2}$ H]

29. If the coefficient of mutual induction of primary and secondary of an induction coil is 6 henry and a current of 5 ampere is cut off in 2×10^{-4} s, find the induced e.m.f. in the secondary coil. **[Ans.** $1{\cdot}5 \times 10^5$ V]

30. An e.m.f. of 50 millivolt is induced in a coil, when the current in the neighbouring coil changes from 10 ampere to 5 ampere in 0·1 s. What is the mutual inductance of the coils ? **[Ans.** 10^{-3} H]

31. An e.m.f. 0·5 V is developed in the secondary coil, when current in the primary coil changes from 5·0 A to 2·0 A in 300 millisecond. Calculate the mutual inductace of the two coils. *(I.S.C.E. 1993)* **[Ans.** 0·05 H]

32. A conducting wire of 100 turns is wound over 1 cm near the centre of a solenoid of 100 cm length and 2 cm radius having 1000 turns. Calculate coefficient of mutual inductance of the two solenoids. *(H.S.S.C.E. 1994)* **[Ans.** $1{\cdot}58 \times 10^{-4}$ H]

33. An air-cored solenoid is of length 0·3 m, area of cross-section $1{\cdot}2 \times 10^{-3} \text{ m}^2$ and has 2500 turns. Around its central section, a coil of 350 turns is wound. The solenoid and the coil are electrically insulated from each other. Calculate the e.m.f. induced in the coil, if the initial current of 3 A in the solenoid is reversed in 0·25 s. *(P.S.S.C.E. 2001)* **[Ans.** 0·1056 V]

MISCELLANEOUS PROBLEMS

34. A metallic wire bent in the form of a semicircle of radius 0·1 m is moved into magnetic field of 20 mT in a direction parallel to its plane, but perpendicular to the magnetic field with a velocity of 10 m s^{-1}. Find the e.m.f. induced in the wire. **[Ans.** 0·04 V]

35. The network shown in Fig. 1.46 is a part of complete circuit. What is the potential difference $V_B - V_A$, when the current I is 5 A and is decreasing at a rate of 10^3 A s^{-1} ? **[Ans.** – 15 V]

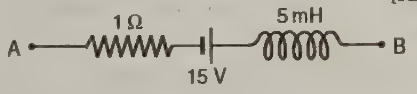

Fig. 1.46

36. A coil of wire of certain radius has 600 turns and a self inductance of 108 mH. What will be self inductance of a similar coil, which has 500 turns ? **[Ans.** 75 mH]

37. Three inductances are connected as shown in Fig. 1.47. Find the resultant inductance. *(P.S.S.C.E. 1993)* **[Ans.** 1 H]

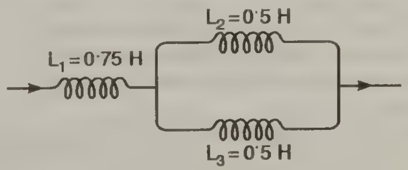

Fig. 1.47

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. Proceed as in solved problem no. 1.01.

2. $e = \frac{d\phi}{dt} = \frac{8\times10^{-4}}{0\cdot5} = \mathbf{1\cdot6 \times 10^{-3}\ V}$

3. $d\phi = n\,A\,(B_2 - B_1) = 80 \times 0\cdot01\ (0 - 1\cdot0)$

   $= 0\cdot8$ Wb (in magnitude)

   Now, $e = \frac{d\phi}{dt} = \frac{0\cdot8}{0\cdot1} = \mathbf{8\ V}$

4. Proceed as in problem no. 3.

5. $d\phi = \phi_2 - \phi_1 = n\,B_2\,A - n\,B_1\,A = n\,A\,(B_2 - B_1)$

   $= 200 \times 0\cdot16\ (0\cdot30 - 0\cdot10) = 6\cdot4$ Wb

   Now, $e = \frac{d\phi}{dt} = \frac{6\cdot4}{0\cdot05} = \mathbf{128\ V}$

6. Proceed as in problem no. 5.

7. Proceed as in solved problem no. 1.02.

8. If θ is angle between the direction of magnetic field and normal to the plane of coil, then

   $$\phi = n\,B\,A\cos\theta$$

   Initial magnetic flux, $\phi_1 = n\,B\,A\cos 0° = n\,B\,A$

   and final magnetic flux, $\phi_2 = n\,B\,A\cos 180° = -\,n\,B\,A$

   Therefore, change in magnetic flux,

   $$d\phi = \phi_2 - \phi_1 = (-\,n\,BA) - n\,BA = -\,2\,n\,BA$$

   or $d\phi = 2\,n\,BA$ (in magnitude)

   $$= 2 \times 100 \times 0\cdot4 \times (8 \times 8 \times 10^{-4}) = 0\cdot512 \text{ Wb}$$

   $\therefore\quad e = \frac{d\phi}{dt} = \frac{0\cdot512}{0\cdot2} = \mathbf{2\cdot56\ V}$

9. As obtained in solved problem no. 1.04,

   $$e = B \times \pi\,l^2 \times v = 1\cdot0 \times \pi \times (1)^2 \times 50 = \mathbf{157\cdot08\ V}$$

10. As obtained in solved problem no. 1.04,

    $$e = \frac{1}{2}B\,l^2\,\omega = \frac{1}{2} \times 0\cdot5 \times (1)^2 \times 400 = \mathbf{100\ V}$$

11. As explained in solved problem no. 1.08, induced e.m.f. between the centre and edge of the disc is given by

    $$e = B \times \pi\,r^2 \times v \quad \text{(in magnitude)}$$

    Here, $v = 120$ r.p.m. $= \frac{120}{60} = 20$ r.p.s. ;

    $$e = 6\cdot284 \text{ mV} = 6\cdot284 \times 10^{-3} \text{ V}$$

    $$\therefore\quad B = \frac{e}{\pi\,r^2 \times v} = \frac{6\cdot284 \times 10^{-3}}{3\cdot142 \times (0\cdot1)^2 \times 20} = \mathbf{10^{-2}\ T}$$

12. As obtained in solved problem no. 1.04,

    $$e = \frac{1}{2}B\,r^2\,\omega$$

    Here, $r = 200$ cm $= 2$ m ; $B = 0\cdot05$ Wb m^{-2}

    and $\omega = 60$ rad s^{-1}

    $$\therefore\quad e = \frac{1}{2} \times 0\cdot05 \times (2)^2 \times 60 = \mathbf{6\ V}$$

13. Now, $e = B\,l\,v$

    or $B = \frac{e}{l\,v} = \frac{25}{10 \times 5\cdot0} = \mathbf{0\cdot5\ T}$

14. Proceed as in problem no. 13.

15. Proceed as in problem no. 13.

16. Proceed as in solved problem no. 1.09.

17. Proceed as in solved problem no. 1.09.

18. Proceed as in solved problem no. 1.09.

19. Proceed as in solved problem no. 1.09.

20. $e = B_V\,l\,v$

    Now, $B_V = B_H \tan\delta = 0\cdot3 \times 10^{-4} \times \tan 60° = 0\cdot52 \times 10^{-4}$ T

    $$\therefore\quad e = 0\cdot52 \times 10^{-4} \times 1\cdot0 \times \left(\frac{90 \times 1000}{60 \times 60}\right)$$

    $$= \mathbf{1\cdot3 \times 10^{-3}\ V}$$

21. Here, $\phi = 5\ \mu$Wb $= 5 \times 10^{-6}$ Wb and I $= 1$ mA $= 10^{-3}$ A

    Now, $\phi = L\,I$

    or $L = \frac{\phi}{I} = \frac{5 \times 10^{-6}}{10^{-3}} = 5 \times 10^{-3}$ H $= \mathbf{5\ mH}$

22. Proceed as in solved problem no. 1.14.

23. $e = L\frac{dI}{dt} = 1\cdot5 \times 10^{-2} \times 200 = \mathbf{3\ V}$

24. Proceed as in solved problem no. 1.15.

25. Suppose that current is decreased from 2 A to zero in tim *dt*. Then,

    $$dI = 2 - 0 = 2 \text{ A}$$

    Now, $e = L\frac{dI}{dt}$ or $50 = 5 \times \frac{2}{dt}$ or $dt = \mathbf{0\cdot2\ s}$

26. Here, L $= 10$ m H $= 10 \times 10^{-3}$ H and I $= 0\cdot1 \sin 200\,t$

    $$\therefore\quad \frac{dI}{dt} = \frac{d}{dt}(0\cdot1 \sin 200\,t) = (0\cdot1 \cos 200\,t) \times 200$$

    $$= 20 \cos 200\,t$$

    Now, $\left(\frac{dI}{dt}\right)_{max} = 20 \times 1 = 20$ A s^{-1}

    $$\therefore\ e_{max} = L\left(\frac{dI}{dt}\right)_{max} = 10 \times 10^{-3} \times 20 = \mathbf{0\cdot2\ V}$$

27. Proceed as in solved problem no. 1.16.

28. Total magnetic flux linked with the second coil,

    $$\phi = 1000 \times 10^{-4} = 0\cdot1 \text{ Wb}$$

    Now, $\phi = M\,I$ or $M = \frac{\phi}{I} = \frac{0\cdot1}{3} = \mathbf{3\cdot33 \times 10^{-2}\ H}$

29. Here, $dI = 5$ A ; $dt = 2 \times 10^{-4}$ s, M $= 6$ H

    Now, $e = M\frac{dI}{dt} = 6 \times \frac{5}{2 \times 10^{-4}} = \mathbf{1\cdot5 \times 10^5\ V}$

30. Proceed as in problem no. 29.

31. Proceed as in problem no. 29.

32. Here, length of the primary solenoid $= 100$ cm $= 1$ m

    Total number of turns in the primary solenoid, $N_1 = 100$

    Therefore, number of turns per unit length of the primar solenoid,

    $$n_1 = \frac{1000}{1} = 1000 \text{ m}^{-1}$$

    Radius of primary solenoid, $r = 2$ cm $= 0\cdot02$ m

    Therefore, area of cross-section of primary solenoid,

    $$A = \pi\,r^2 = \pi \times (0\cdot02)^2 = 4\,\pi \times 10^{-4} \text{ m}^2$$

    Length of the secondary solenoid, $l = 1$ cm $= 0\cdot01$ m

    Total number of turns in the secondary solenoid, $N_2 = 10$

    Therefore, number of turns per unit length of th secondary solenoid,

    $$n_2 = \frac{100}{0\cdot01} = 10^4 \text{ m}^{-1}$$

    Now, $M = \mu_0\,n_1\,n_2\,A\,l$

    $$= 4\,\pi \times 10^{-7} \times 1000 \times 10^4 \times 4\,\pi \times 10^{-4} \times 0\cdot01$$

    $$= \mathbf{1\cdot58 \times 10^{-4}\ V}$$

    Aliter. $M = \mu_0\,n_1\,n_2\,A\,l = \mu_0\,n_1\,N_2\,A$,

    where $N_2 = n_2\,l$ is total number of turns in the secondar solenoid.

    $$\therefore\quad M = 4\,\pi \times 10^{-7} \times 1000 \times 100 \times 4\,\pi \times 10^{-4}$$

    $$= \mathbf{1\cdot58 \times 10^{-4}\ V}$$

33. Here, $n_1 = \frac{2500}{0\cdot 3}\ \text{m}^{-1}$; $A = 1\cdot 2 \times 10^{-3}\ \text{m}^2$, $N_2 = 350$

$$\therefore \quad M = \mu_0\, n_1\, N_2\, A$$

$$= 4\pi \times 10^{-7} \times \frac{2500}{0\cdot 3} \times 350 \times 1\cdot 2 \times 10^{-3}$$

$$= 4\cdot 4 \times 10^{-3}\ \text{H}$$

Now, $dI = 3 - (-3) = 6$ A and $dt = 0\cdot 25$ s

$$\therefore \quad e = M\frac{dI}{dt} = 4\cdot 4 \times 10^{-3} \times \frac{6}{0\cdot 25} = \mathbf{0\cdot 1056\ V}$$

34. Refer to conceptual SAQ 1.03. It can be obtained that when a semicircular metallic wire of radius R enters into a magnetic field B with velocity v, induced e.m.f. produced

$$e = \frac{1}{2}\, B\, R\, v$$

$$\therefore \quad e = \frac{1}{2} \times (20 \times 10^{-3}) \times 0\cdot 1 \times 10 = \mathbf{0\cdot 04\ V}$$

35. It follows that

$$V_A = I\,R + (-E) + \left(-L\frac{dI}{dt}\right) = V_B$$

$$\text{or } V_A - V_B = I\,R - E - L\frac{dI}{dt}$$

$$= 5 \times 1 - 15 - 5 \times 10^{-3} \times 10^3$$

$$= 5 - 15 - 5 = \mathbf{-15\ V}$$

36. The self inductance of a coil is given by

$$L = \mu_0\, n^2\, l\, A = \frac{\mu_0\, N^2\, A}{l}$$

$$\therefore \quad \frac{L_1}{L_2} = \frac{N_1^2}{N_2^2}$$

$$\text{or} \quad L_2 = L_1 \times \frac{N_2^2}{N_1^2} = \frac{108 \times (500)^2}{(600)^2}$$

$$= \mathbf{75\ mH}$$

37. Refer to keynote on page 508 :
The resultant inductance is given by

$$L = L_1 + \frac{L_2 \times L_3}{L_2 + L_3} = 0\cdot 75 + \frac{0\cdot 5 \times 0\cdot 5}{0\cdot 5 + 0\cdot 5}$$

$$= 0\cdot 75 + 0\cdot 25 = \mathbf{1\ H}$$

CHAPTER

2

Transient Current

2.01. TRANSIENT CURRENT

When a battery is connected to a resistor, the electric current reaches its maximum value in practically zero time. However, when the circuit contains an inductor (or a capacitor) also, the current takes some finite time to attain its maximum value. It is because, the growth of current is opposed by the induced e.m.f. produced due to the varying current. Similarly, when such an electric circuit is switched off, the current takes some finite time to decay from maximum to zero value.

The electric currents, whose magnitude vary for a small time, while growing to maximum or decaying to zero, are called transient currents.

It may be pointed out that the transient currents do not vary in direction* with time.

2.02. GROWTH AND DECAY OF CURRENT IN LR-CIRCUIT

Consider a battery of e.m.f. E connected to a series combination of an inductance L and resistance R through a two-way key as shown in Fig. 2.01.

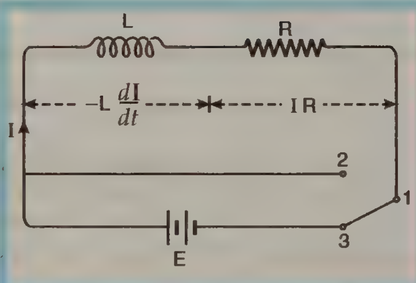

Fig. 2.01

(a) Growth of current. Initially ($t = 0$), the current in the circuit is zero. When the plug is inserted in the gap between 1 and 3 of the two-way key, the battery comes in circuit with the series combination of L and R. Due to the phenomenon of self-induction, an induced e.m.f. is set up in the circuit, which opposes the growth of current in it. If I is the current and $\frac{dI}{dt}$ is the rate of change of current in the inductance at any time t, then

potential difference across the resistance = I R

induced e.m.f. produced in the inductance $= -L\frac{dI}{dt}$

During growth of current in LR-circuit, the potential difference across the resistance will be equal to the sum of E (e.m.f. of the source) and $-L\frac{dI}{dt}$ (induced e.m.f. produced in the inductance). Thus,

$$E + \left(-L\frac{dI}{dt}\right) = IR$$

or

$$E = IR + L\frac{dI}{dt} \qquad ...(2.01)$$

Key point

When the LR-circuit is just switched on, the rate of change of current in the circuit,

$$\frac{dI}{dt} = \frac{E}{L}$$

It follows that when the current in the circuit will attain maximum value (I_0), the rate of growth of current $\left(\frac{dI}{dt}\right)$ will become zero *i.e.*

when $I = I_0$, $\quad \frac{dI}{dt} = 0$

Setting the above condition in equation (2.01), we obtain

$$E = I_0 R + L\,(0) = I_0 R$$

Setting $E = I_0 R$ in equation (2.01), we have

$$I_0 R = IR + L\frac{dI}{dt} \quad \text{or} \quad L\frac{dI}{dt} = R\,(I_0 - I)$$

or

$$\frac{dI}{I_0 - I} = \frac{R}{L}\,dt$$

Integrating both sides, we have

$$\int \frac{dI}{I_0 - I} = \frac{R}{L}\int dt$$

---

*The currents, which vary both in magnitude and direction with time, are called alternating currents.

or $$-\log_e (I_0 - I) = \frac{R}{L}t + k, \qquad ...(2.02)$$

vhere k is the constant of integration. In order to find k, we apply the boundary ondition *i.e.*

when $t = 0,\ I = 0$

Setting the above condition in equation (2.02), we have

$$-\log_e (I_0 - 0) = \frac{R}{L}(0) + k$$

or $$k = -\log_e I_0$$

Substituting for k in equation (2.02), we have

$$-\log_e (I_0 - I) = \frac{R}{L}t - \log_e I_0 \quad \text{or} \quad \log_e (I_0 - I) - \log_e I_0 = -\frac{R}{L}t$$

or $$\log_e = \frac{(I_0 - I)}{I_0} = -\frac{R}{L}t \quad \text{or} \quad \frac{(I_0 - I)}{I_0} = e^{-\frac{R}{L}t}$$

or $$I = I_0\left(1 - e^{-\frac{R}{L}\cdot t}\right) \qquad ...(2.03)$$

Key point

When the current in LR-circuit becomes steady, inductive effect of the inductor ceases.

The equation (2.03) gives the value of current at any time t during growth of current in LR-circuit.

Time constant. From equation (2.03), it follows that $\frac{L}{R}$ has got dimensions of time and is called *inductive time constant* of the LR-circuit.

When L is in *henry* and R in *ohm,* $\frac{L}{R}$ is in *seconds.*

Setting $t = \frac{L}{R}$ in equation (2.03), we obtain

$$I = I_0\left(1 - e^{-\frac{R}{L}\cdot\frac{L}{R}}\right) = I_0\,(I - e^{-1}) = I_0\,\{1 - (2{\cdot}718)^{-1}\} = I_0\,(1 - 0{\cdot}368) = 0{\cdot}632\,I_0$$

Thus, *the inductive time constant of an LR-circuit may be defined as the time in which the current grows from zero to $0{\cdot}632$ (or $63{\cdot}2\%$) of its maximum value.*

It can be calculated that when $t = \frac{2L}{R}, \frac{3L}{R}, \frac{4L}{R}$ and $\frac{5L}{R}$; the current will attain values* $0{\cdot}865\,I_0$, $0{\cdot}950\,I_0$, $0{\cdot}982\,I_0$ and $0{\cdot}993\,I_0$ respectively. Finally, when $t = \infty$,

$$I = I_0\left(1 - e^{-\frac{R}{L}\cdot\infty}\right) = I_0\,(I - e^{-\infty}) = I_0\,(1 - 0)$$

or $$I = I_0$$

i.e. in LR-circuit, current will take infinite time to grow to the maximum value. However, practically the current attains maximum value after a time equal to five time constants $\left(5\frac{L}{R}\right)$ of the LR-circuit. Fig. 2.02 shows the growth of current with time in LR-circuit.

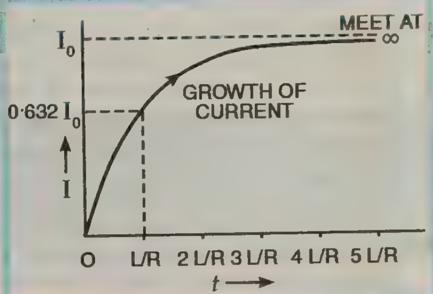

Fig. 2.02

***(b)* Decay of current.** Initially ($t = 0$), the current in the circuit is maximum (I_0). Now, as we take out plug from the gap between 1 and 3 of the two-way key and insert it in the gap between 1 and 2, the battery gets out of the circuit and the current in the circuit starts decaying [Fig. 2.03]. The decaying current produces induced e.m.f. in the circuit and it opposes the decay of the current.

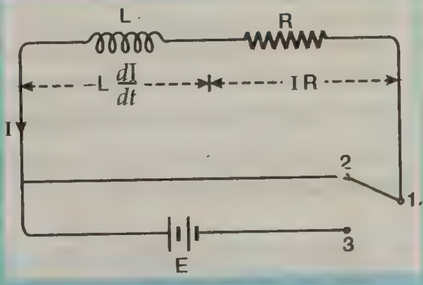

Fig. 2.03

Let I be the value of current in the circuit and $\frac{dI}{dt}$, the rate of decay of current at any time t. As battery is not present in the circuit,

$$0 + \left(-L\frac{dI}{dt}\right) = IR$$

---

*$e^{-2} = (2{\cdot}718)^{-2} = 0{\cdot}135$, $e^{-3} = (2{\cdot}718)^{-3} = 0{\cdot}050$, $e^{-4} = (2{\cdot}718)^{-4} = 0{\cdot}018$ and $e^{-5} = (2{\cdot}718)^{-5} = 0{\cdot}007$

or $$L\frac{dI}{dt} = -IR \quad \text{or} \quad \frac{dI}{I} = -\frac{R}{L}dt$$

Integrating both sides, we have

$$\int \frac{dI}{I} = -\frac{R}{L}\int dt$$

or $$\log_e I = -\frac{R}{L}t + k, \qquad ...(2.04)$$

where k is the constant of integration. In order to find k, we apply the boundary condition *i.e.*.

when $t = 0$, $I = I_0$

Setting this condition in equation (2.04), we have

$$\log_e I_0 = -\frac{R}{L}(0) + k$$

or $$k = \log_e I_0$$

Substituting for k in equation (2.04), we have

$$\log_e I = -\frac{R}{L}t + \log_e I_0 \quad \text{or} \quad \log_e I - \log_e I_0 = -\frac{R}{L}t$$

or $$\log_e \frac{I}{I_0} = -\frac{R}{L}t \quad \text{or} \quad \frac{I}{I_0} = e^{-\frac{R}{L}\cdot t}$$

or $$I = I_0\, e^{-\frac{R}{L}\cdot t} \qquad ...(2.05)$$

The equation (2.05) gives the value of current at any time t during decay of current in LR-circuit.

Again, from equation (2.05), $\frac{L}{R}$ has got dimensions of time and the ***inductive time constant*** of the LR-circuit can also be defined by using equation (2.05).

Setting $t = \frac{L}{R}$ in equation (2.05), we get

$$I = I_0\, e^{-\frac{R}{L}\cdot\frac{L}{R}} = I_0\, e^{-1} = I_0\,(0\cdot368) = 0\cdot368\, I_0$$

Therefore, *the inductive time constant of an LR-circuit may also be defined as the time in which the current decays from maximum to 0·368 (or 36·8%) of its maximum value.*

It can be calculated that at $t = \frac{2L}{R}, \frac{3L}{R}, \frac{4L}{R}$ and $\frac{5L}{R}$, the current will fall to the values $0\cdot135\, I_0$, $0\cdot050\, I_0$, $0\cdot018\, I_0$ and $0\cdot007\, I_0$ respectively. Using the equation (2.05), it can be proved that the current will become zero after infinite time. Graphically, the current will decay with time in LR-circuit as shown in Fig. 2.04.

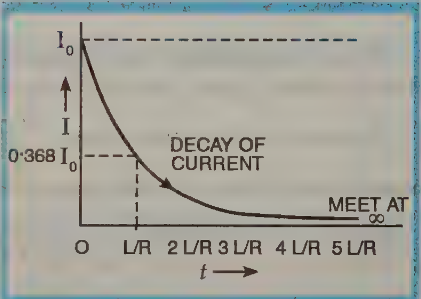

Fig. 2.04

Note. In section 2.04, we shall study that when the current in LR-circuit attains maximum value, the energy stored in the inductor is given by

$$U = \frac{1}{2}LI_0^2$$

2.03. GROWTH AND DECAY OF CHARGE IN A CR-CIRCUIT

Consider a battery of e.m.f. E connected to a series combination of a capacitor C and resistance R through a two-way key as shown in Fig. 2.05.

(a) Growth of charge. Initially ($t = 0$), the charge on the capacitor is zero. When the plug is inserted in the gap between 1 and 3 of the two-way key, the battery in the circuit starts charging the capacitor. Let q be the charge on the capacitor and I, the value of current in the circuit at any time t. Then,

potential difference across the resistance $= IR$

potential difference across the plates of capacitor $= \frac{q}{C}$

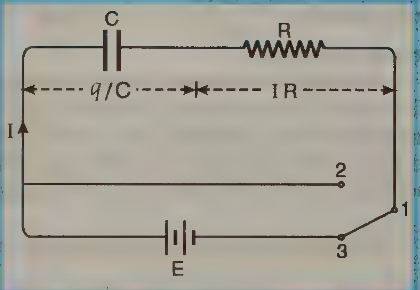

Fig. 2.05

At any time, the e.m.f. of battery must be equal to the sum of the potential differences across R and C *i.e.*

$$E = IR + \frac{q}{C} \qquad ...(2.06)$$

When the capacitor gets fully charged (q_0), the current in the circuit becomes zero *i.e.*

when $q = q_0$, $I = 0$

Setting the above condition in equation (2.06), we have

$$E = (0)\,R + \frac{q_0}{C}$$

or $$E = \frac{q_0}{C}$$

Key point

When a CR-circuit is just switched on,
$q = 0$ and $I =$ maximum
and when steady state is reached,
$q =$ maximum and $I = 0$

Substituting for E in equation (2.06), we have

$$\frac{q_0}{C} = I\,R + \frac{q}{c} \qquad \text{or} \qquad \frac{q_0 - q}{C} = I\,R$$

By definition, $$I = \frac{dq}{dt}$$

Therefore, $$\frac{q_0 - q}{C} = \left(\frac{dq}{dt}\right) R \qquad \text{or} \qquad \frac{dq}{q_0 - q} = \frac{1}{CR}\, dt$$

Integrating both sides, we have

$$\int \frac{dq}{q_0 - q} = \frac{1}{CR} \int dt$$

or $$-\log_e q_0 - q = \frac{1}{CR} t + k, \qquad \text{...(2.07)}$$

ere k is the constant of integration. In order to kind k, we apply the boundary ndition *i.e.*

when $t = 0, q = 0$

Substituting for k in equation (2.07), we have

$$-\log_e (q_0 - q) = \frac{1}{CR} t - \log_e q_0$$

$$\text{or } \log_e (q_0 - q) - \log_e q_0 = \frac{1}{CR} t \qquad \text{or} \qquad \log_e \frac{q_0 - q}{q_0} = -\frac{1}{CR} t$$

$$\text{or} \qquad \frac{q_0 - q}{q_0} = e^{-\frac{1}{CR} \cdot t} \qquad \text{or} \qquad 1 - \frac{q}{q_0} = e^{-\frac{1}{CR} \cdot t}$$

or $$q = q_0 \left(1 - e^{-\frac{1}{CR} \cdot t}\right) \qquad \text{...(2.08)}$$

The equation (2.08) gives the value of charge on the capacitor at any time t uring charging through the resistance in CR-circuit.

From equation (2.08), it follows that CR has got dimensions of time and is called *pacitive time constant* of the circuit.

When C is in *farad* and R is in *ohm*, CR is in *seconds*.

Setting $t = CR$ in equation (2.08), we have

$$q = q_0 \left(1 - e^{-\frac{1}{CR} \cdot CR}\right) = q_0 = (1 - e^{-1})$$

$$= q_0 \{1 - (2{\cdot}718)^{-1}\} = q_0 \{1 - 0{\cdot}368\} = 0{\cdot}632\, q_0$$

Thus, *the capacitive time constant of a CR-circuit may be defined as the time in which e charge on the capacitor grows from zero to 0·632 (or 63·2%) of its maximum value.*

It can be proved that when $t = 2$ CR, 3 CR, 4 CR and 5 CR, the charge on the apacitor will be $0{\cdot}865\, q_0$, $0{\cdot}950\, q_0$, $0{\cdot}982\, q_0$ and $0{\cdot}993\, q_0$ respectively.

Finally, when $t = \infty$,

$$q = q_0 \left(1 - e^{-\frac{1}{CR} \cdot \infty}\right)$$

$$= q_0 (1 - e^{-\infty}) = q_0 (1 - 0) = q_0$$

e. in a CR-circuit, the capacitor will take infinite time to charge to its maximum alue. Fig. 2.06 shows the growth of charge with time in CR-circuit. The graph is xponential in nature as suggested by equation (2.08).

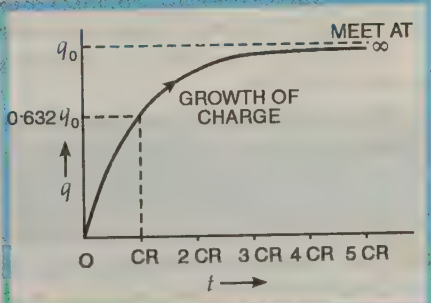

Fig. 2.06

***(b)* Decay of charge.** Consider a battery of e.m.f. E connected to a series ombination of a capacitor C and a resistance R through a two way. When key is kept pressed for some time ($t > 5\,\mathrm{C\,R}$), the charge on the capacitor attains its value q_0. Thus, initially ($t = 0$), charge on the capacitor is maximum.

As we take out plug from the gap between 1 and 3 of the two-way key and insert it in the gap between 1 and 2 [Fig. 2.07], the battery gets out of the circuit and the charged capacitor starts discharging through the resistance. Let I be the value of current in the circuit and q be the charge on the capacitor at any time t. As battery is not present in the circuit,

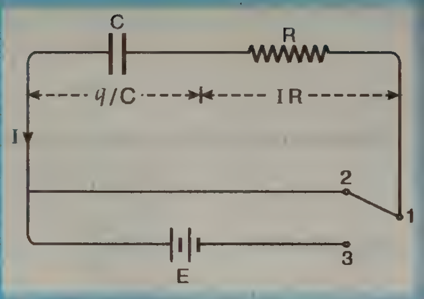

Fig. 2.07

$$0 = \mathrm{I\,R} + \frac{q}{\mathrm{C}} \qquad \text{...(2.09)}$$

By definition, $\mathrm{I} = \dfrac{dq}{dt}$

Substituting for I in equation (2.09), we have

$$\left(\frac{dq}{dt}\right)\mathrm{R} + \frac{q}{\mathrm{C}} = 0 \quad \text{or} \quad \frac{dq}{q} = -\frac{1}{\mathrm{CR}}\,dt$$

Integrating both sides, we have

$$\int \frac{dq}{q} = -\frac{1}{\mathrm{CR}} \int dt$$

or

$$\log_e q = -\frac{1}{\mathrm{CR}}\,t + k, \qquad \text{...(2.10)}$$

where k is the constant of integration. In order to find k, we apply the boundary condition *i.e.*

when $t = 0,\ q = q_0$

Setting this condition in equation (2.10), we have

$$\log_e q = -\frac{1}{\mathrm{CR}}(0) + k$$

or

$$k = \log_e q_0$$

Substituting for k in equation (2.10), we have

$$\log_e q = -\frac{1}{\mathrm{CR}}\,t + \log_e q_0$$

or

$$\log_e \frac{q}{q_0} = -\frac{1}{\mathrm{CR}}\cdot t \quad \text{or} \quad \frac{q}{q_0} = e^{-\frac{1}{\mathrm{CR}}\cdot t}$$

or

$$q = q_0\, e^{-\frac{1}{\mathrm{CR}}\cdot t} \qquad \text{...(2.11)}$$

The equation (2.11) gives the value of charge on the capacitor at any time t during discharge of the capacitor through the resistance in a CR-circuit.

Setting $t = \mathrm{CR}$ in equation (2.11), we get

$$q = q_0\, e^{-\frac{1}{\mathrm{CR}}\cdot \mathrm{CR}} = q_0\, e^{-1} = 0\cdot 368\, q_0$$

Therefore, *capacitive time constant of a CR-circuit may also be defined as the time during which the charge on the capacitor decays from maximum to 0·368 (or 36·8%) of its maximum value.*

It can be easily shown that :

(*i*) at $t = 2$ CR, 3 CR, 4 CR and 5 CR, the charge on capacitor in a CR-circuit falls to the values 0·135 q_0, 0·050 q_0, 0·018 q_0 and 0·007 q_0 respectively and

(*ii*) the charge will become zero after infinite time.

Graphically, the charge on capacitor will decay with time in a CR-circuit as shown in Fig. 2.08.

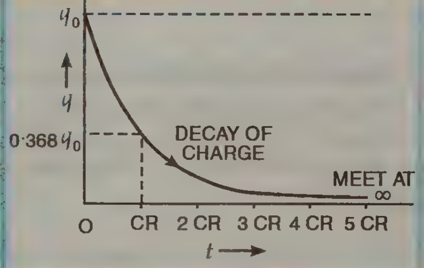

Fig. 2.08

Note. In section 2.05, we shall study that when the capacitor is charged to the maximum value q_0, the energy stored in the capacitor is given by

$$\mathrm{U} = \frac{1}{2}\frac{q_0^2}{\mathrm{C}}$$

2.04. ENERGY STORED IN AN INDUCTOR

Consider that a source of e.m.f. is connected to an inductor L. As the current starts growing, an induced e.m.f. is set up in the inductor and the induced e.m.f., then, opposes the growth of current through it. The source of e.m.f. has to spend energy in sending current through the circuit against the induced e.m.f. The energy spent by the source of e.m.f. is stored in the inductor in the form of magnetic field.

Initially ($t = 0$), the current in the inductor is zero. Consider that at any instant, e current in the inductor is I and the rate of growth of current at that time is equal $\frac{dI}{dt}$. Then,

induced e.m.f. produced in the inductor, $e = L\frac{dI}{dt}$ (in magnitude)

If the source of e.m.f. sends a constant current I through the inductor for a small ne dt, then small amount of work done by the source is given by

$$dW = e\,I\,dt = \left(L\frac{dI}{dt}\right)I\,dt = L\,I\,dI$$

The total amount of work done by the source of e.m.f., till the current increases m its initial value $I = 0$ to its final value I_0 is given as

$$W = \int_0^{I_0} L\,I\,dI = L\int_0^{I_0} I\,dI = L\left|\frac{I^2}{2}\right|_0^{I_0} = \frac{1}{2}L\,I_0^2$$

Key point

Energy stored in an inductor resides inside it in the form of magnetic field.

This work done by the source of e.m.f. in building up current from zero to I_0 stored inside the inductor in the form of energy. Therefore, energy stored in the ductor,

$$U = \frac{1}{2}L\,I_0^2 \qquad ...(2.12)$$

The energy is stored in the inductor at the expense of the energy of the source e.m.f. and it resides in the inductance in the form of magnetic field.

It may be pointed out that :

(*i*) The energy is stored in the inductor at the expense of the energy of the source of e.m.f.

(*ii*) The energy resides in the inductor in the form of magnetic field.

(*iii*) In case of an alternating source of e.m.f., during one half cycle energy is stored in the inductor from the source and during the next half cycle, the same amount of energy is returned to the source. It is for this reason that average electric power of an inductor is zero.

2.05. ENERGY STORED IN A CAPACITOR

Consider that a source of e.m.f. E is connected to a capacitor of capacitance C. s the charging of the capacitor takes place, the potential difference across the plates the capacitor increases. The source of e.m.f. has to spend energy in charging the pacitor against the potential difference across the plates of the capacitor. The work ne by the source of e.m.f. gets stored in the capacitor in the form of its energy.

Initially ($t = 0$), the charge on the capacitor is zero. Consider that at any instant, e charge on the capacitor is q and the potential difference across the plates of the pacitor at that time is V.

Then, $V = \frac{q}{C}$

Suppose that the source of e.m.f. delivers infinitesimally small amount of charge to the plates of the capacitor without producing any change in the potential fference across its plates. Then, small amount of work done by the source of e.m.f. given by

$$dW = V\,dq = \frac{q}{C}\,dq$$

Key point

Energy stored in a capacitor resides inside it in the form of electric field.

The total amount of work done by the source of e.m.f. so as to increase charge n the plates from the initial value $q = 0$ to the final value q_0 is given by

$$W = \int_0^{q_0}\frac{q}{C}\,dq = \frac{1}{C}\int_0^{q_0} q\,dq = \frac{1}{C}\left|\frac{q^2}{2}\right|_0^{q_0} \quad \frac{1}{2}\frac{q_0^{\,2}}{C}$$

This work done by the source of e.m.f. in charging the capacitor from zero to is stored inside the capacitor in the form of its energy. Therefore, energy stored side the capacitor,

$$U = \frac{1}{2}\frac{q_0^{\,2}}{C} \qquad ...(2.13)$$

When the capacitor acquires charge q_0, the potential difference across the plates of the capacitor will become equal to E, the e.m.f. of the source of e.m.f.

$$\therefore \quad q_0 = \text{C E}$$

Substituting for q_0 (= C E) in equation (2.13), we have

$$U = \frac{1}{2}\text{C E}^2 \qquad \text{...(2.14)}$$

Substituting for $C\left(= \frac{q_0}{E}\right)$ in equation (2.13), we have

$$U = \frac{1}{2}q_0 \, E \qquad \text{...(2.15)}$$

The equations (2.13), (2.14) and (2.15) give the energy stored in a charged capacitor. The energy is stored in the capacitor at the expense of the energy of the source of e.m.f. and it resides in the capacitor in the form of electric field.

It may be pointed out that :

(i) The energy is stored in the capacitor at the expense of the energy of the source of *e.m.f.*

(ii) The energy resides in the capacitor in the form of electric field.

(iii) In case of alternating source of e.m.f., during one half cycle energy will be stored in the capacitor from the source and during the next half cycle, the same amount of energy is returned to the source. It is for this reason that average electric power of a capacitor is zero.

2.06. LC-OSCILLATIONS

Consider a charged capacitor of capacitance C. The energy is stored in the capacitor in the form of electric field between its two plates. If the charged capacitor is connected to an inductor L as shown in Fig. 2.09 (*a*), LC-oscillations are produced as explained below :

As soon as the capacitor is connected to inductor, it sends a current, thereby producing growing magnetic field inside the inductor. In turn, it produces induced e.m.f., which opposes the growth of current and hence the capacitor takes some finite time to discharge completely. When it discharges completely, the energy which was stored inside the capacitor in the form of electric field, now appears in the form of magnetic field inside the inductor [Fig. 2.09 (*b*)].

As soon as the discharge is complete, the current ceases to flow and the magnetic field lines linked with the inductor also start winding up. Owing to this, induced e.m.f. is produced in the inductor. The induced e.m.f. starts charging the capacitor but with opposite polarity. Now, the energy stored in the inductor in the form of magnetic field appears in the form of electric field between the plates of the capacitor as shown in Fig. 2.09 (*c*). In case the circuit does not possess any ohmic resistance, the capacitor will charge to the same initial value.

On getting fully charged, the capacitor will again discharge sending current through the inductor in opposite direction (as plates have opposite polarities) and therefore causing magnetic flux to link with inductor in the opposite direction as shown in Fig. 2.09 (*d*).

As before, on the complete discharge of capacitor, the magnetic flux linked with the inductor starts winding up. As a result, the induced e.m.f. so produced charges the capacitor, such that polarity of the plates is opposite to that in the previous case *i.e.* the same as it was in the beginning [Fig. 2.09 (*e*)].

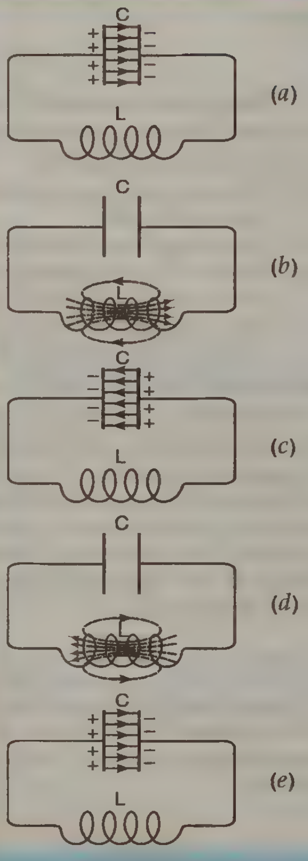

Fig. 2.09

The process, then, repeats itself indefinitely and the electromagnetic oscillations are produced as shown in Fig. 2.10. The oscillations are produced due to continuous conversion of energy in the form of electric field between the plates of the capacitor into magnetic field inside the inductor and vice versa. If the circuit does not have any resistance, no dissipation of energy will take place and the amplitude of oscillations produced will remain constant. Such oscillations are called ***undamped oscillations***. However, due to finite resistance of the circuit, the amplitude of oscillations goes on decreasing. It is because, a small amount of electric energy is dissipated in the form of heat energy during each oscillation. In other words, in practice, the ***damped oscillations*** are produced.

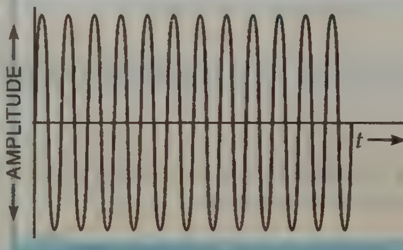

Fig. 2.10

The frequency of the LC-oscillations produced is given by

$$f = \frac{1}{2\pi\sqrt{\text{LC}}}$$

Mathematical treatment. Consider that a capacitor of capacitance C and itially charged to value q_0 is connected to an inductor of inductance L [Fig. 2.11]. nus,

$$\text{at } t = 0, \qquad q = q_0 \text{ and } \qquad I = 0.$$

As the capacitor is connected to inductor, it will start discharging through the ductor. Due to the varying current flowing through the inductor, induced e.m.f. ill be produced in it. Suppose that at any time t during the discharge of capacitor, arge left on capacitor is q, current in the circuit is I and the rate of change of rrent is $\frac{dI}{dt}$.

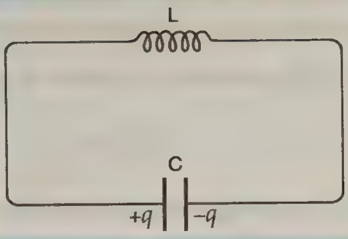

Fig. 2.11

Now, the induced e.m.f. across the inductor at any instant

$$= -L\frac{dI}{dt}$$

and the potential difference across the capacitor at that instant $= \frac{q}{C}$

Therefore, in the LC-circuit, at any instant

$$-L\frac{dI}{dt} = \frac{q}{C}$$

or $$L\frac{dI}{dt} + \frac{q}{C} = 0 \qquad \text{...(2.16)}$$

Key point

A varying magnetic field produces a varying electric field and in turn a varying electric field produces a varying magnetic field.

Now, $I = \frac{dq}{dt}$ so that $\frac{dI}{dt} = \frac{d^2q}{dt^2}$

Therefore, equation (2.16) becomes

$$L\frac{d^2q}{dt^2} + \frac{q}{C} = 0$$

or $$\frac{d^2q}{dt^2} + \frac{1}{LC}q = 0 \qquad \text{...(2.17)}$$

Let us substitute $\frac{1}{LC} = \omega^2$ ...(2.18)

Then, equation (2.17) becomes

$$\frac{d^2q}{dt^2} + \omega^2 q = 0 \qquad \text{...(2.19)}$$

The general solution of the differential equation (2.19) is of the form

$$q = A\cos\omega t = B\sin\omega t \qquad \text{...(2.20)}$$

To find A and B : The values of constants A and B are found by applying ne following boundary conditions :

(*i*) When $t = 0,\ q = q_0$

Setting this condition in equation (2.20), we have

$$q_0 = A\cos\omega\,(0) + B\sin\omega\,(0)$$

or $$A = q_0$$

(*ii*) The instantaneous value of current in the circuit is given by

$$I = \frac{dq}{dt} = \frac{d}{dt}(A\cos\omega t + B\,\omega\cos\omega t)$$

or $$I = -A\,\omega\sin\omega t + B\,\omega\cos\omega t \qquad \text{...(2.21)}$$

Now, when $t = 0, I = 0$

Setting this condition in equation (2.21), we have

$$0 = -A\,\omega\sin\omega\,(0) + B\,\omega\cos\omega\,(0)$$

or $$B = 0$$

Substituting for A and B in equation (2.20), we get

$$q = q_0\cos\omega t \qquad \text{...(2.22)}$$

Therefore, charge on the capacitor at any time is a harmonic function of time nd hence it keeps on oscillating. If f is the frequency of oscillation, then

$$\omega = 2\pi f \qquad \text{or} \qquad f = \frac{\omega}{2\pi}$$

Using equation (2.18), we have

$$f = \frac{1}{2\pi\sqrt{LC}} \qquad \text{...(2.23)}$$

Just as in a harmonic oscillator, sum of kinetic and potential energies is constant ; in the LC-circuit, the sum of the energy stored in capacitor and the inductor at any instant is also constant *i.e.* the total energy of the LC-circuit does not depend on time. It can be shown as below :

Energy stored in capacitor at any instant $= \frac{1}{2}\frac{q^2}{C}$

$$= \frac{q_0^2}{2C}\cos^2 \omega t \qquad (\because q = q_0 \cos \omega t)$$

Also, energy stored in inductor at any instant $= \frac{1}{2} L I^2$

$$= \frac{1}{2} L \left(\frac{dq}{dt}\right)^2 = \frac{1}{2} L \left[\frac{d}{dt}(q_0 \cos \omega t)\right]^2$$

$$= \frac{q_0^2 L \omega^2 \sin^2 \omega t}{2} = \frac{q_0^2 L}{2}\left(\frac{1}{LC}\right)\sin^2 \omega t \qquad \left(\because \omega^2 = \frac{1}{LC}\right)$$

$$= \frac{q_0^2}{2C}\sin^2 \omega t$$

Therefore, total energy of the LC-circuit at any instant,

$$U = \frac{q_0^2}{2C}\cos^2 \omega t + \frac{q_0^2}{2C}\sin^2 \omega t = \frac{q_0^2}{2C} \quad \text{(constant)}$$

Note. The equation (2.22) can be used to find instantaneous and maximum value of current in the circuit. It follows that

$$I = \frac{dq}{dt} = q_0\, \omega \sin \omega t = I_0 \sin \omega t$$

Thus, maximum current, $I_0 = q_0\, \omega$

SOLVED NUMERICAL PROBLEMS

Type A. On Growth and Decay of Current in LR-circuit

Problem 2.01. An inductance of 2·5 henry is Connected to a battery of e.m.f. 3 volt through a resistance of 50 ohm. Calculate (*i*) time constant of circuit (*ii*) rate of change of current at the instant, the current begins to flow and (*iii*) the maximum value of the current.

Sol. Here, E = 3 volt ; L = 2·5 henry ; R = 50 ohm

(*i*) Time constant, $\frac{L}{R} = \frac{2 \cdot 5}{50} = 0 \cdot 05 \text{ s}$

(*ii*) For LR-circuit, $E - L\frac{dI}{dt} = IR$

$$\therefore \qquad \frac{dI}{dt} = \frac{E - IR}{L}$$

At the instant, when current begins to flow, I = 0. Therefore, rate of change of current at the instant the current begins to flow is given by

$$\therefore \qquad \frac{dI}{dt} = \frac{E-(0)R}{L} = \frac{E}{L} = \frac{3}{2 \cdot 5} = 1 \cdot 2 \text{ A s}^{-1}$$

(*iii*) Maximum current, $I_0 = \frac{E}{R} = \frac{3}{50} = 0 \cdot 06 \text{ A}$

Problem 2.02. A potential difference of 1 volt is applied to a coil of resistance 1 ohm and inductance 1 henry. (*i*) What is the current after 1 s ? (*ii*) How long does it take the current to reach half its final value ?

Sol. (*i*) Here, E = 1 volt ; R = 1 ohm ; L = 1 henry ; *t* = 1 s

Maximum value of current, $I_0 = \frac{E}{R} = \frac{1}{1} = 1 \text{ A}$

Let I be the value of current after 1 s.

Now, $I = I_0\left(1 - e^{-\frac{R}{L}t}\right)$

$$\therefore \qquad I = 1\left(1 - e^{-\frac{1}{1}\times 1}\right) = (1 - e^{-1}) = (1 - 0 \cdot 368)$$

$$= 0 \cdot 632 \text{ A}$$

(*ii*) Here, $I = \frac{I_0}{2}$

We know, $I = I_0 = \left(1 - e^{-\frac{R}{L}t}\right)$

$$\therefore \qquad \frac{I_0}{2} = I_0\left(1 - e^{-\frac{1}{1}t}\right)$$

or $\frac{1}{2} = \left(1 - e^{-t}\right)$ or $e^{-t} = \frac{1}{2}$ or $e^{t} = 2$

or $t = \log_e 2 = 2 \cdot 3036 \times \log_{10} 2 = 2 \cdot 3026 \times 0 \cdot 3010$

$= 0 \cdot 693 \text{ s}$

Problem 2.03. A steady current is flowing through a coil of resistance 20 ohm and inductance 0·1 henry. Find the time taken by the current to fall to 30% of its maximum value. What is the rate of change of current at this instant, if steady value of current through the coil is 2 ampere ?

Sol. Here, I_0 = 2 ampere ; L = 0·1 henry ; R = 20 ohm

Let *t* be the time, after which the current falls to 30% of its maximum value, *i.e.* it becomes

$$I = \frac{30}{1000} I_0 = 0 \cdot 3\, I_0$$

During decay, the value of current at time t is given by

$$I = I_0\, e^{-\frac{R}{L}t}$$

$$\therefore \quad 0 \cdot 3\, I_0 = I_0\, e^{-\frac{20}{0 \cdot 1}t} = I_0\, e^{-200\,t}$$

or $$e^{200\,t} = \frac{1}{0 \cdot 3} = 3 \cdot 3333$$

or $$200\,t = \log_e 3 \cdot 3333 = 2 \cdot 3026 \log_{10} 3 \cdot 3333$$

or $$t = \frac{2 \cdot 3026 \log_{10} 3 \cdot 3333}{200} = \frac{2 \cdot 3026 \times 0 \cdot 5229}{200}$$

$$= 6 \cdot 02 \times 10^{-3}\ \text{s}$$

When the current decays in a circuit (battery is not in ircuit),

$$IR = -L\frac{dI}{dt}$$

Therefore, the rate of decrease of current in the circuit is iven by

$$-\frac{dI}{dt} = \frac{R}{L}I = \frac{R}{L} \times 0 \cdot 3\, I_0 = \frac{20}{0 \cdot 1} \times 0 \cdot 3 \times 2$$

$$= 120\ \text{A s}^{-1}$$

Type B. On Growth and Decay of Charge in CR-circuit

Problem 2.04. If a circuit having a resistor of 2 megaohm n series with a capacitor of one microfarad is placed in eries with a cell of e.m.f. 2 volt, find the time after which he charge reaches 84·47% of its maximum.

Sol. Here, $R = 2$ megaohm $= 2 \times 10^6$ ohm ;

$C = 1$ microfarad $= 10^{-6}$ farad

Suppose that t is the time after which the charge reaches 84·47% of its maximum value *i.e.* the charge becomes

$$q = \frac{84 \cdot 47}{100} q_0 \quad \text{or} \quad \frac{q}{q_0} = \frac{86 \cdot 47}{100} = 0 \cdot 8647$$

We know, $$q = q_0\left(1 - e^{\frac{-t}{CR}}\right) \quad \text{or} \quad \frac{q}{q_0} = \left(1 - e^{\frac{-t}{CR}}\right)$$

$$\therefore \quad 0 \cdot 8647 = \left(1 - e^{-\frac{t}{2 \times 10^6 \times 10^{-6}}}\right) = \left(1 - e^{-t/2}\right)$$

or $$e^{-\frac{t}{2}} = 1 - 0 \cdot 8647 = 0 \cdot 1353$$

or $$-\frac{t}{2} = \log_e (0 \cdot 1353) = 2 \cdot 3026 \log_{10} (0 \cdot 1353)$$

$$= 2 \cdot 3026 \times (\bar{1} \cdot 1313)$$

or $$t = 2 \times 2 \cdot 3026 \times 0 \cdot 8687 = 4\ \text{s}$$

Problem 2.05. A capacitor of 1·443 μF capacitance after being charged, is shunted by a high resistance. If half of the charge leaks away in one minute, find the value of the resistance.

Sol. Here, $C = 1 \cdot 443\ \mu\text{F} = 1 \cdot 443 \times 10^{-6}$ F ;

$t = 1$ minute $= 60$ s

Charge on capacitor after 1 minute *i.e.* 60 s $= \dfrac{q_0}{2}$

We know, $$q = q_0\, e^{-\frac{t}{CR}}$$

or $$\frac{q_0}{2} = q_0\, e^{-\frac{60}{1 \cdot 443 \times 10^{-6} \times R}}$$

or $$\frac{1}{2} = e^{-\frac{60}{1 \cdot 443 \times 10^{-6} \times R}} \quad \text{or} \quad e^{\frac{60}{1 \cdot 443 \times 10^{-6} \times R}} = 2$$

or $$\frac{60}{R \times 1 \cdot 443 \times 10^{-6}} = \log_e 2 = 2 \cdot 303 \log_{10} (2)$$

$$= 2 \cdot 303 \times 0 \cdot 3010 = 0 \cdot 6931$$

or $$R = \frac{60}{1 \cdot 443 \times 10^{-6} \times 0 \cdot 6931} = 60 \times 10^6\ \Omega$$

Type C. On LC-oscillations

Problem 2.06. A radio can tune over the frequency range of a portion of MW broadcast band 800 kHz to 1200 kHz. If its LC-circuit has an effective inductance of 200 μH, what must be range of its variable capacitor ? *(Text Problem)*

Sol. Here, $L = 200\ \mu\text{H} = 200 \times 10^{-6}$ H

Frequency range of MW broadcast

$= 800$ kHz to 1200 kHz

$= 8 \times 10^5$ Hz to 12×10^{-5} Hz

For tuning the radio, the natural frequency of the LC-circuit should be equal to the frequency of the signal.

Now, $$f = \frac{1}{2\pi\sqrt{LC}}$$

or $$C = \frac{1}{4\pi^2 f^2 L}$$

Value of capacitor corresponding to lower limit of MW band *i.e.* $f = 8 \times 10^5$ Hz,

$$C_1 = \frac{1}{4\pi^2 (8 \times 10^5)^2 \times 200 \times 10^{-6}}$$

$$= 197 \cdot 9 \times 10^{-12}\ \text{F} \approx 98\ \text{pF}$$

Value of capacitor corresponding to upper limit of MW band *i.e.* $f = 12 \times 10^5$ Hz,

$$C_1 = \frac{1}{4\pi^2 (12 \times 10^5)^2 \times 200 \times 10^{-6}}$$

$$= 87 \cdot 95 \times 10^{-12}\ \text{F} \approx 88\ \text{pF}$$

Therefore, variable capacitor should be of range 88 pF to 198 pF.

TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 2.01. Two circuits (A) and (B) connected to identical d.c. sources (e.m.f. = 10 V) differ greatly in their self-inductance. Circuit A has large self-inductance equal to 10 H, while the self-inductance of B is much smaller, equal to 0·05 H. The total external resistance in each circuit (which includes the resistance of the inductor itself) is 40 Ω.

(*a*) Are the steady current values in each circuit equal ? If so, what is the value ?

(*b*) Compare the times required for the currents in the two circuits to reach [1–(1 / *e*)] of their steady value.

(*c*) Which circuit requires greater energy consumption of the source to build up its current to the steady value ?

(d) After the steady state is reached, do the circuits dissipate the same power in the form of heat ? (*Text Problem*)

Ans. *Circuit A* *Circuit B*

$E = 10\,V; L = 10\,H; R = 40\,\Omega$ $E = 10\,V; L = 0{\cdot}05\,H; R = 40\,\Omega$

(*a*) Steady current, $I_0 = \dfrac{E}{R}$

Since the value of steady current is independent of the value of inductance (L) in the circuit, the steady current in each circuit is *same* and is equal to

$$I_0 = \frac{10}{40} = 0{\cdot}25\ \text{A}$$

(*b*) During growth : $I = I_0\left(1 - e^{-\frac{R}{L}t}\right)$

Thus, time *t* required for current to reach the value $I_0(1 - 1/e)$ is given by

$$I_0\left(1 - \frac{1}{e}\right) = I_0\left(1 - e^{-\frac{R}{L}t}\right) \quad \text{or} \quad e^{-\frac{R}{L}t} = \frac{1}{e} = e^{-1}$$

$$\text{or} \quad \frac{R}{L}t = 1 \quad \text{or} \quad t = \frac{L}{R}$$

$$\therefore \quad \frac{t_A}{t_B} = \frac{10/40}{0{\cdot}05/40} = 200$$

(*c*) Energy required to build up current I_0 in an inductor,

$$W = \frac{1}{2}LI_0^2$$

Therefore, $W_A = \dfrac{1}{2} \times 10 \times (0{\cdot}25)^2 = 312{\cdot}5 \times 10^{-3}\ \text{J}$

and $W_B = \dfrac{1}{2} \times 0{\cdot}05 \times (0{\cdot}25)^2 = 1{\cdot}5625 \times 10^{-3}\ \text{J}$

Hence, ***circuit A requires greater energy*** to build up current equal to I_0.

(*d*) Power dissipated on reaching the steady state $= I_0^2 R$

Since I_0 and R are same for both circuits, the two circuits will dissipate the *same power.*

Power dissipated in each circuit $= (0{\cdot}25)^2 \times 40 = \mathbf{2{\cdot}5\ W}$

Problem 2.02. Two capacitors 4 μF and 6 μF (in series), are connected through a resistance of 10 kΩ to a 18 V battery of negligible internal resistance [Fig. 2.12]. After a time of about 10 s, the battery is disconnected and the capacitors are allowed to discharge through the resistance. Determine the voltage across each capacitor after a time lapse of 48 milliseconds. (*Text Problem*)

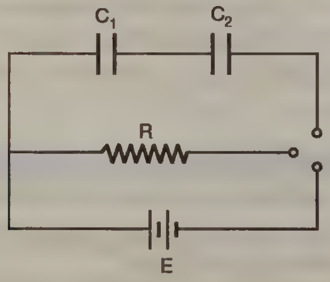

Fig. 2.12

Sol. Here, $C_1 = 4\,\mu F; C_2 = 6\,\mu F$

Therefore, total capacitance in series is given by

$$\frac{1}{C} = \frac{1}{C_1} + \frac{1}{C_2} = \frac{1}{4} + \frac{1}{6} = \frac{10}{24}$$

$$\text{or} \quad C = \frac{24}{10} = 2{\cdot}4\,\mu F = 2{\cdot}4 \times 10^{-6}\ \text{F}$$

Also, $R = 10\ \text{k}\Omega = 10^4\ \Omega$

Time constant of CR-circuit,

$$CR = 2{\cdot}4 \times 10^{-6} \times 10^4 = 2{\cdot}4 \times 10^{-2}\ \text{s}$$

As battery is connected to CR-circuit for 10 s, *i.e.* for a time very large as compared to time constant of the circuit ($CR = 2{\cdot}4 \times 10^{-2}$ s), the capacitor will get charged to the maximum value q_0 and voltage across its plates will become equal to 18 V *i.e.* equal to e.m.f. (E) of the battery.

Now, $q_0 = CE = 2{\cdot}4 \times 10^{-6} \times 18 = 4{\cdot}32 \times 10^{-5}$ C

During discharge, charge on the capacitor after time *t* is given by

$$q = q_0\, e^{-\frac{1}{CR}t}$$

Here, $t = 48$ millisecond $= 48 \times 10^{-3}$ s

$$\therefore \quad q = 4{\cdot}32 \times 10^{-5}\, e^{-\frac{1}{2{\cdot}4 \times 10^{-2}} \times 48 \times 10^{-3}}$$

$$= 4{\cdot}32 \times 10^{-5}\, e^{-2} = 4{\cdot}32 \times 10^{-5} \times 0{\cdot}135$$

$$= 5{\cdot}832 \times 10^{-6}\ \text{C}$$

Since capacitors are connected in series, each capacitor has the same charge *i.e.*

$$q = 5{\cdot}838 \times 10^{-6}$$

Therefore, voltage across C_1, $V_1 = \dfrac{q}{C_1} = \dfrac{5{\cdot}832 \times 10^{-6}}{4 \times 10^{-6}}$

$$= 1{\cdot}458\ \text{V}$$

and voltage across C_2, $V_2 = \dfrac{q}{C_2} = \dfrac{5{\cdot}832 \times 10^{-6}}{6 \times 10^{-6}}$

$$= 0{\cdot}972\ \text{V}$$

Problem 2.03. A 3 henry inductor is placed in series with a 10 ohm resistor. An e.m.f. of 30 volt is suddenly supplied to the combination. At 0·3 s (which is one inductive time constant) after start, find at which rate energy is stored in the magnetic field.

Sol. Here, $E = 30$ volt ; $L = 3$ henry ; $R = 10$ ohm ; $t = 0{\cdot}3$ s

Maximum current, $I_0 = \dfrac{30}{10} = 3$ ampere

From definition, after one inductive time constant *i.e.* at 0·3 s, $I = 0{\cdot}632\, I_0 = 0{\cdot}632 \times 3 = 1{\cdot}896$ A

Now, rate at which energy is stored in magnetic field,

$$\frac{dW}{dt} = \frac{d}{dt}\left(\frac{1}{2}LI^2\right) = LI\frac{dI}{dt}$$

But rate of increase of current during growth,

$$\frac{dI}{dt} = \frac{E - IR}{L}$$

Since at $t = 0{\cdot}3$ s, $I = 1{\cdot}896$ A, the rate of increase of current at 0·3 s,

$$\frac{dI}{dt} = \frac{30 - 1{\cdot}896 \times 10}{3} = \frac{30 - 18{\cdot}96}{3}$$

$$= \frac{11{\cdot}04}{3} = 3{\cdot}68\ \text{A s}^{-1}$$

$$\therefore \quad \frac{dW}{dt} = 3 \times 1{\cdot}896 \times 3{\cdot}68 = \mathbf{20{\cdot}93\ W}$$

Problem 2.04. An LC-circuit contains a 20 mH inductor and a 50 μF capacitor with an initial charge of 10 mC.

e resistance of the circuit is negligible. Let the instant at ich circuit is closed be $t = 0$.

(a) What is the total energy stored initially ? Is it con- ved during the LC oscillations ?

(b) What is the natural frequency of the circuit ?

(c) At what times is the energy stored : (i) completely ectrical (i.e. stored in the capacitor) ? (ii) completely gnetic (i.e. stored in the inductor) ?

(d) At what times is the total energy shared equally tween the inductor and the capacitor ?

(e) If a resistor is inserted in the circuit, how much ergy is eventually dissipated as heat ? *(Text Problem)*

Sol. Here, $L = 20 \text{ mH} = 20 \times 10^{-3}$ H ;

$C = 50 \ \mu\text{F} = 50 \times 10^{-6}$ F ;

Charge on the capacitor initially, $q_0 = 10 \text{ mC} = 10 \times 10^{-3}$ C

(a) Energy stored in the capacitor initially

$$= \frac{q_0^2}{2C} = \frac{(10 \times 10^{-3})^2}{2 \times 50 \times 10^{-6}} = 1 \text{ J}$$

Since the LC-circuit has negligible resistance, the energy conserved in LC-oscillations.

(b) Natural frequency,

$$f = \frac{1}{2\pi\sqrt{LC}} = \frac{1}{2\pi\sqrt{20 \times 10^{-3} \times 50 \times 10^{-6}}} = 159{\cdot}15 \text{ Hz}$$

(c) Time period of LC oscillations,

$$T = \frac{1}{f} = \frac{1}{159{\cdot}15} = 6{\cdot}28 \times 10^{-3} \text{ s}$$

(i) Energy stored is completely electrical at

$t = 0, T, T/2, 3T/2, \ldots$, where $T = 6{\cdot}28 \times 10^{-3}$ s

(ii) Energy stored is completely magnetic at

$t = T/4, 3T/4, 5T/4, \ldots$, where $T = 6{\cdot}28 \times 10^{-3}$ s

(d) The energy stored in the capacitor will become half that stored initially, if $q = \pm \dfrac{q_0}{\sqrt{2}}$

It is because, $W = \dfrac{q_0^2}{2C}$

i.e. $W \propto q_0^2$

During LC-oscillations, the charge on capacitor at any instant,

$$q = q_0 \cos \omega t$$

$$\therefore \quad \pm \frac{q_0}{\sqrt{2}} = q_0 \cos \omega t \quad \text{or} \quad \cos \omega t = \pm \frac{1}{\sqrt{2}}$$

Therefore, $\omega t = \pi/4, 3\pi/4, 5\pi/4, \ldots$

or $t = T/8, 3T/8, 5T/8, \ldots$, where $T = 6{\cdot}28 \times 10^{-3}$ s

(e) When resistance is introduced, whole of the energy will be dissipated in the form of heat. The introduction of resistance produces damped oscillations.

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 2.01. What is a transient current ?

Ans. The current which varies for a small finite time, hile growing to maximum or decaying to zero value, is alled transient current.

Q. 2.02. What is difference between a steady current nd d.c. ?

Ans. A steady current is that whose magnitude remains onstant. On the other hand, the current which always flows n one direction is called d.c. It does not reverse its direction vith time as a.c. does.

Q. 2.03. What are the dimensions of R/L ?

Ans. Reciprocal of time.

Q. 2.04. Write down the expression for the rate of rowth of current in an LR-circuit.

Ans. Refer to section 2.02. From equation (2.01), it ollows that

the rate of growth of current, $\dfrac{dI}{dt} = \dfrac{E - IR}{L}$

Q. 2.05. How does an inductor behave in the d.c. circuit after the steady state has been reached ?

Ans. After the steady state is reached, the inductor behaves just as a conducting wire.

Q. 2.06. A battery is connected to a series combination of an inductance (L) and a resistance R. On what factors does the value of maximum current depend in LR-circuit ?

Ans. The maximum value of current is given by

$$I_0 = \frac{E}{R}$$

It may be noted that it does not depend upon the value of inductance.

Q. 2.07. What are the dimensions of C R ?

Ans. Time.

Q. 2.08. Does the value of maximum charge on the capacitor in a CR-circuit depend on the values of both C and R ?

Ans. No, the value of maximum charge on the capacitor depends on the value of C. It is independent of the value of R.

Q. 2.09. Define time constant of an electrical circuit. *(I.S.C.E. 1998)*

Ans. The time constant of an electrical circuit is the time in which the current (in LR-circuit) or charge (in CR-circuit) grows to 1/eth of its maximum value.

Q. 2.10. Does the time constant of a CR-circuit or an LR-circuit depend on e.m.f. of the source ?

Ans. No, it does not depend on e.m.f. of the source. The time constant of a CR-circuit is CR and that of an LR-circuit is L/R.

Q. 2.11. Where does the energy reside in an inductor through which current has attained its maximum value ?

Ans. It resides inside the inductor in the form of magnetic field.

Q. 2.12. What are the dimensions of $\sqrt{LC}$?

Ans. Time.

Q. 2.13. What role does the resistance of inductor play in LC-circuit ?

Ans. Due to the resistance of the inductor, the LC-oscillations produced are damped one. It is because, during each oscillation, a part of electric energy is dissipated in the form of heat energy.

FAQ FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 2.01. Define time constant in LR-circuit. How can it be increased ? *(H.S.S.C.E. 1994)*

Ans. For definition of time constant of LR-circuit, refer to section 2.02. The time constant of LR-circuit *i.e.* $\frac{L}{R}$ can be increased by increasing the value of L and decreasing the value of R.

Q. 2.02. Verify that L/R has the dimensions of time.

Ans. The instantaneous current in LR-circuit during growth is given by

$$I = I_0\left(1 - e^{-\frac{R}{L}t}\right)$$

It follows that the factor $\frac{R}{L}t$ should be dimensionless *i.e.*

$$\frac{R}{L}t = \text{dimensionless}$$

Therefore, $\left[\frac{L}{R}\right] = \text{time}$

Q. 2.03. What factors determine the growth of current in LR-circuit ? Is it L or R or both ? Explain. *(H.S.S.C.E. 1994)*

Ans. The growth of current in LR-circuit is determined by both L and R. Practically, the current attains the maximum value in a time equal to $5\frac{L}{R}$. Therefore, lesser the value of L and greater the value of R, earlier the current will attain its maximum value.

Q. 2.04. Prove that total energy stored in an inductor is $\frac{1}{2}L I_{max}^2$, where I_{max} is the maximum current through the inductor. *(C.B.S.E. 1993)*

Ans. Refer to section 2.04.

Q. 2.05. Verify that CR has the dimensions of time.

Ans. The instantaneous charge on capacitor in CR-circuit during growth is given by

$$q = q_0\left(1 - e^{-\frac{1}{CR}t}\right)$$

It follows that the factor $\frac{1}{CR}t$ is dimensionless *i.e.*

$$\frac{1}{CR}t = \text{dimensionless}$$

Therefore, [C R] = time

Q. 2.06. Why does an LC-circuit produce oscillations ?

Ans. When a charged capacitor in an LC-circuit discharges through the inductor, the electric energy stored between the plates of capacitor appears as the magnetic energy inside the inductor. When the capacitor has discharged, the magnetic field linked with the inductor starts collapsing. Due to this, induced e.m.f. is produced in the inductor and the capacitor starts charging and ultimately the magnetic energy appears as the electric energy across the capacitor. This process repeats again and again, giving rise to LC-oscillations.

Q. 2.07. Calculate the wavelength of radio waves radiated out by a circuit consisting of 0·02 μF capacitor and 8 μH inductor in series. *(H.S.S.C.E. 1992)*

Ans. Here, $C = 0{\cdot}02\ \mu F = 0{\cdot}02 \times 10^{-6}\ F$;

$$L = 8\ \mu F = 8 \times 10^{-6}\ H$$

Now,
$$f = \frac{1}{2\pi\sqrt{LC}} = \frac{1}{2\pi\sqrt{0{\cdot}02 \times 10^{-6} \times 8 \times 10^{-6}}}$$
$$= 3{\cdot}98 \times 10^{-5}\ Hz$$

Therefore, wavelength of the radio waves emitted,

$$\lambda = \frac{c}{f} = \frac{3 \times 10^8}{3{\cdot}98 \times 10^5} = \mathbf{7{\cdot}54 \times 10^2\ m}$$

Q. 2.08. Why does an LC-circuit usually produce damped oscillations ?

Ans. An inductor possesses a small resistance also. Therefore, each time electric energy converts into magnetic energy during LC-oscillations, a small part of energy is dissipated as heat energy across the resistance of the inductor. As a result, the oscillations produced are damped in nature.

abc TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 2.01. Fig. 2.13 shows an inductor L and a resistance R connected in parallel to a battery through a switch. The resistance of R is the same as that of the coil that makes L. Two identical bulbs are put in each arm of the circuit.

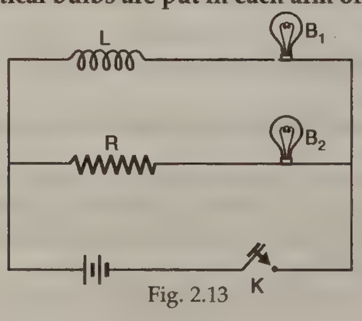

Fig. 2.13

(*i*) Which of the bulbs lights up earlier, when S is closed ? *(C.B.S.E. 1999 S, 1998)*

(*ii*) Will the bulbs be equally bright after some time ?

Ans. (*i*) The bulb B_2 will light up earlier. The reason is that current through bulb B_2 grows to maximum value instantaneously, while the current through bulb B_1 will take up some finite time $\left(\text{practically equal to } \frac{5L}{R}\right)$ to reach the maximum value.

(*ii*) After the steady state is reached, self-inductance will have no effect. Therefore, after some time, when steady state has been reached, the two bulbs will become equally bright.

Q. 2.02. An ideal inductor of 1 H is connected across a resistance of 100 Ω as shown in the Fig. 2.14.

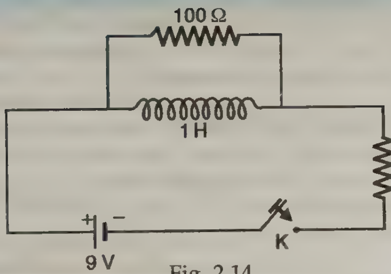

Fig. 2.14

(*i*) What is the current through the inductor as soon as ey K is closed ?

(*ii*) What is the potential difference across the 100 Ω resistance, when the current has attained a steady value ? (*I.S.C.E. 1994*)

Ans. **(*i*)** At the instant, the key K is closed, the current in the circuit begins to grow and the induced e.m.f. produced in the inductor opposes the flow of current through it. Thus, as soon as the key K is closed, **no current** flows through the inductor.

(*ii*) When the current attains steady value in the circuit, the inductive effect of the inductor ceases and it will short circuit the 100 Ω resistance. Since no current flows through the 100 Ω resistance, the potential difference across 100 Ω resistance will also be **zero.**

FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Show that the current rises exponentially in a circuit containing inductance and resistance, when a steady e.m.f. is applied to it.
2. A certain LR-circuit has a time constant equal to L/R. Show that the time T that must elapse for the current to achieve half its final steady state value is

$$T = \frac{L}{R} \log_e 2$$

3. Derive the equation for decay of current in an LR-circuit connected to a source of constant e.m.f. What is meant by time constant ?
4. Show that during charging and discharging of capacitor through a resistance, the current always decreases from maximum to zero.
5. Derive an expression for the energy stored in an inductor. (*H.S.S.C.E. 1999 S*)
6. Show that the energy stored in an inductor L, when a current I is established through it, is $\frac{1}{2} L I^2$. (*H.S.S.C.E. 2002, 2001 ; C.B.S.E. 1990*)
7. Show that in an electric circuit consisting of inductance, the coefficient of self induction is numerically equal to twice the work done in establishing the magnetic flux associated with unit current in the circuit.
8. How is energy stored in an inductor and where does this energy reside ? Obtain an expression for this energy and give an example, where this energy is made use of.
9. Derive an expression for the energy stored in a charged capacitor C. Where does this energy reside ?
10. Prove that the potential energy of a charged capacitor is equal to half of the product of charge on it and potential difference between its plates. In what form does this energy reside ?
11. What happens, when a charged capacitor is discharged through a coil of inductance L and of negligible resistance ?
12. What do you understand by LC oscillations ? Discuss qualitatively, how these oscillations are produced.
13. A charged capacitor is connected to an inductor. Show that the discharge of capacitor through the inductor is oscillatory. Obtain the frequency of oscillations.

FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. Explain the meaning of transient current. Discuss the growth and decay of current in LR-circuit. (*C.B.S.E. 1990*)
2. (*a*) Derive an expression for the growth of current in a circuit containing L and R. Give the graph between time and rising current.
   (*b*) Draw a sketch to show the variation of current with time. How would the curve look like, if
   (*i*) R was replaced with R′ (R′ > R) ? (*ii*) E was replaced with E′ (E′ > E) ?
3. Discuss the charging and discharging of a capacitor in a CR-circuit. When will the time constant be 1 second ?
4. (*a*) Derive the equations for growth and decay of charge in CR-circuit connected to a constant e.m.f. What is meant by time constant ?
   (*b*) How does the current vary with time in such a circuit ?
   (*c*) If the resistance could be made negligibly small, which of the following will be correct ?
   (*i*) The capacitor gets charged almost instantaneously.
   (*ii*) The charging rate becomes gradual. (*iii*) There is no charging at all.

FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Growth and Decay of current in LR-circuit

1. What resistance must be connected in series with an inductor of 5 mH, so that the circuit has a time constant of 2×10^{-3} s ? [**Ans.** 2·5 Ω]
2. A cell of 1·5 V is connected across an inductor of 2 mH in series with a 2 Ω resistor. What is the rate of growth of current immediately after the circuit is switched on ? [**Ans.** 750 A s^{-1}]
3. A coil of resistance 20 ohm and inductance of 0·5 henry is applied d.c. of 200 volt. Calculate the rate of increase of current (*i*) at the instant of closing the switch (*ii*) at *t* = L/R s after the switch is closed. [**Ans.** (*i*) 400 A s^{-1} ; (*ii*) 147·2 A s^{-1}]
4. A coil of resistance 20 ohm and inductance 0·5 henry is connected to 100 volt d.c. battery. Calculate
   (*a*) the steady current
   (*b*) the rate of increase of current (*i*) at the instant of closing the switch (*ii*) at *t*= L/R s after the switch is closed.
   [**Ans.** (*a*) 5 A ; (*b*) (*i*) 200 A s^{-1}, (*ii*) 73·6 A s^{-1}]

5. A 2 volt battery of negligible internal resistance is applied to a coil of inductance 1 henry and resistance 10 ohm. Calculate the time required by current to attain a value half that of the steady current. **[Ans.** 0·0693 s**]**

6. A coil of inductance 8·4 mH and resistance 6 Ω is connected to a 12 V battery. Find the time, when the current in the coil will grow to 1·0 A. *(I.I.T. 1999)* **[Ans.** $9{\cdot}7 \times 10^{-4}$ s**]**

7. When a current of 10 A is flowing through a resistance of 20 Ω and inductance of 10 H, the battery is switched off. Find (*a*) current after 0·4 s, (*b*) the time this current takes to fall to 60% of its initial value. **[Ans.** (*a*) 4·5 A (*b*) 0·255 s**]**

Type B. On Growth and Decay of charge in CR-circuit

18. Find the natural frequency of a circuit containing inductance of 100 μH and a capacity of 0·01 μF. To which wavelength, its response will be maximum ? For how long the oscillations will continue ? **[Ans.** 159·15 kHz, 1884·96 m ; ∞ **]**

19. A capacitor of 10 microfarad is connected in series with a resistance of $2{\cdot}2 \times 10^5$ ohm. Determine the time constant for the circuit. Can we think of oscillations in this circuit, such that the frequency is equal to the inverse of the time constant ? Justify your answer with proper explanation. **[Ans.** 2·2 s, No**]**

MISCELLANEOUS PROBLEMS

20. Two resistances, one of 100 Ω and another of 200 Ω and an inductance of 10 H are connected to 3 V battery through a key K as shown in Fig. 2.15. On closing the key, what is the initial potential drop across the inductance ? *(H.S.S.C.E. 2001)* **[Ans.** 1 V**]**

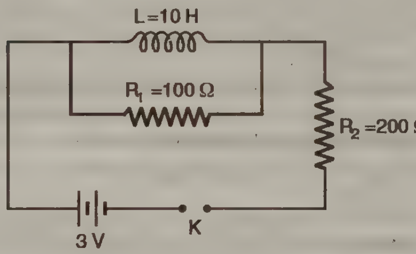

Fig. 2.15

21. A solenoid has an inductance of 10 henry and a resistance of 2 ohm. It is connected to a 10 volt battery. How long will it take for the magnetic energy to reach 1/4th of its maximum value ? *(I.I.T. 1996)* **[Ans.** 3·47 s**]**

22. A 20 μF capacitor is charged to 30 V of potential. The battery is then disconnected and a 200 mH of coil is connected across it, so that LC oscillations are set up. Calculate the frequency of the oscillations set up and the maximum current in the coil. **[Ans.** 79·6 Hz, 0·3 A**]**

23. An inductor of inductance 2·0 mH is connected across a charged capacitor of capacitance 5·0 μF and the resulting LC-circuit is set oscillating at its natural frequency. Let *q* denote the instantaneous charge on the capacitor and I the current in the circuit. It is found that maximum value of charge on the capacitor is 200 μC.

(*a*) When *q* = 100 μC, what is the value of $\left|\dfrac{dI}{dt}\right|$?

(*b*) When *q* = 200 μC, what is the value of I ?

(*c*) Find the maximum value of I.

(*d*) When I is equal to one half its maximum value, what is the value of | *q* | ? *(I.I.T. 1998)*

[Ans. (*a*) 10^4 A s^{-1} ; (*b*) 0 ; (*c*) 2·0 A ; (*d*) 173·2 μC**]**

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. Time constant $= \dfrac{L}{R}$ or $2 \times 10^{-3} = \dfrac{5 \times 10^{-3}}{R}$

or $R = \dfrac{5 \times 10^{-3}}{2 \times 10^{-3}} = \mathbf{2{\cdot}5\ \Omega}$

2. Now, $\dfrac{dI}{dt} = \dfrac{E - IR}{L}$

When the circuit is just switched on, I = 0.

$$\therefore \quad \frac{dI}{dt} = \frac{E}{L} = \frac{1{\cdot}5}{2 \times 10^{-3}} = \mathbf{750\ A\ s^{-1}}$$

3. (*i*) Rate of increase of current at the instant of closing the switch,

$$\frac{dI}{dt} = \frac{E}{L} = \frac{200}{0{\cdot}5} = \mathbf{400\ A\ s^{-1}}$$

(*ii*) Now, $I = I_0\left(1 - e^{-\frac{R}{L}t}\right)$

Therefore, at $t = \dfrac{L}{R}$,

$$I = I_0\left(1 - e^{\frac{-R}{L} \times \frac{L}{R}}\right) = I_0\,(1 - e^{-1}) = 0{\cdot}632\, I_0$$

$$= 0{\cdot}632\,\frac{E}{R} = \frac{0{\cdot}632\times 200}{20} = 6{\cdot}32\text{ A}$$

Therefore, rate of increase of current at $t = \frac{L}{R}$,

$$\frac{dI}{dt} = \frac{E - IR}{L} = \frac{200 - 6{\cdot}32\times 20}{0{\cdot}5} = \mathbf{147{\cdot}2\ A\ s^{-1}}$$

4. **(a)** Now, $I_0 = \frac{E}{R} = \frac{100}{20} = \mathbf{5\ A}$

(b) Proceed as in problem no. 3.

5. Proceed as in solved problem 2.02 (*ii*)

6. Now, $I = I_0\left(1 - e^{-\frac{R}{L}t}\right)$ or $I = \frac{E}{R}\left(1 - e^{-\frac{R}{L}t}\right)$

or $1{\cdot}0 = \frac{12}{6}\left(1 - e^{-\frac{6}{8{\cdot}4\times 10^{-3}}t}\right)$ or $e^{-\frac{6\times 10^3}{8{\cdot}4}t} = 0{\cdot}5$

or $e^{\frac{6\times 10^3}{8{\cdot}4}t} = 2$ or $\frac{6\times 10^3}{8{\cdot}4}t = \log_e 2$

or $t = \frac{8{\cdot}4}{6\times 10^3}\times 2{\cdot}3026\log_{10} 2 = \frac{8{\cdot}4\times 2{\cdot}3026\times 0{\cdot}3010}{6\times 10^3}$

$= \mathbf{9{\cdot}7\times 10^{-4}\ s}$

7. **(a)** Now, $I = I_0\, e^{-\frac{R}{L}t}$ or $I = 10\, e^{-\frac{20}{10}\times 0{\cdot}4}$

or $I = 10\times e^{-0{\cdot}8}$ or $I = 10\times 0{\cdot}45 = \mathbf{4{\cdot}5\ A}$

(b) Now, $I_0\times\frac{60}{100} = I_0\, e^{-\frac{20}{10}t}$ or $e^{2t} = 1{\cdot}667$

or $2t = \log_e 1{\cdot}667$ or $t = \frac{1}{2}\times 2{\cdot}3026\log_{10} 1{\cdot}667$

or $t = \frac{1}{2}\times 2{\cdot}3026\times 0{\cdot}2219 = \mathbf{0{\cdot}255\ s}$

8. Time constant $= CR = 40\times 10^{-6}\times 50 = 2\times 10^{-3}\text{ s} = \mathbf{2\ ms}$

9. Now, $q = q_0\left(1 - e^{-\frac{1}{CR}t}\right)$

∴ $\frac{q_0\times 63{\cdot}2}{100} = q_0\left(1 - e^{-\frac{1}{2\times 10^{-6}\times 10^6}t}\right)$

or $0{\cdot}632 = 1 - e^{-\frac{t}{2}}$ or $e^{-\frac{t}{2}} = 1 - 0{\cdot}632 = 0{\cdot}368$

or $e^{\frac{t}{2}} = \frac{1}{0{\cdot}368} = 2{\cdot}717$ or $\frac{t}{2} = \log_e 2{\cdot}717$

or $t = 2\times 2{\cdot}3026\log_{10} 2{\cdot}717 = 2\times 2{\cdot}3026\times 0{\cdot}434 = \mathbf{2\ s}$

Also, maximum charge on capacitor,

$q_0 = CE = \mathbf{4\times 10^{-5}\ C}$

Aliter. The capacitor will charge to 63·2% of its final value in a time equal to CR *i.e.* $2\times 10^{-6}\times 10^{6} = \mathbf{2\ s}$

10. Now, $q = q_0\, e^{-\frac{1}{CR}t}$ or $\frac{q_0}{4} = q_0\, e^{-\frac{1}{0{\cdot}18\times 10^{-6}\times R}\times 0{\cdot}5}$

or $e^{\frac{2{\cdot}78\times 10^6}{R}} = 4$ or $\frac{2{\cdot}78\times 10^6}{R} = \log_e 4$

or $R = \frac{2{\cdot}78\times 10^6}{\log_e 4} = \frac{2{\cdot}78\times 10^6}{1{\cdot}386} = \mathbf{2\times 10^6\ \Omega}$

11. Proceed as in problem no. 10.

12. Now, $q = q_0\, e^{-\frac{1}{CR}t}$ or $\frac{q}{C} = \frac{q_0}{C}\, e^{-\frac{1}{CR}t}$

or $V = E\, e^{-\frac{1}{CR}t}$

Proceed as in problem no. 10 to find *t* by taking $V = \frac{E}{2}$.

13. Now, $V = E\, e^{-\frac{1}{CR}t}$ or $5 = 10\, e^{-\frac{1}{CR}\times 1}$

or $e^{-\frac{1}{CR}} = 0{\cdot}5$

Voltage after 2 s is given by

$$V = 10\, e^{-\frac{1}{CR}\times 2} = 10\times\left(e^{-\frac{1}{CR}}\right)^2 = 10\times(0{\cdot}5)^2 = \mathbf{2{\cdot}5\ V}$$

14. Now, $U = \frac{q_0^2}{2C} = \frac{(0{\cdot}01)^2}{2\times 10^{-6}} = \mathbf{50\ J}$

15. Now, $\frac{1}{C_s} = \frac{1}{C_1} + \frac{1}{C_2} + \frac{1}{C_3} = \frac{1}{2{\cdot}0} + \frac{1}{3{\cdot}0} + \frac{1}{6{\cdot}0} = 1$

or $C_s = 1\ \mu F = 10^{-6}\text{ F}$

∴ $U = \frac{1}{2}C_s E^2 = \frac{1}{2}\times 10^{-6}\times(60)^2 = \mathbf{1{\cdot}8\times 10^{-3}\ J}$

16. Now, $I_0 = \frac{E}{R} = \frac{100}{20} = 5\text{ A}$

∴ $U = \frac{1}{2}L I_0^2 = \frac{1}{2}\times 5\times(5)^2 = \mathbf{62{\cdot}5\ J}$

17. Here, $L = 0{\cdot}4\text{ mH} = 0{\cdot}4\times 10^{-3}\text{ H}$;

$C = 400\text{ pF} = 400\times 10^{-12}\text{ F}$

Now, $f = \frac{1}{2\pi\sqrt{LC}}$

$$= \frac{1}{2\pi\sqrt{0{\cdot}4\times 10^{-3}\times 4000\times 10^{-12}}}$$

$$= \frac{1}{2\pi\times 40\times 10^{-8}} = 3{\cdot}98\times 10^5\text{ Hz}$$

∴ $\lambda = \frac{c}{f} = \frac{3\times 10^8}{3{\cdot}98\times 10^5} = \mathbf{753{\cdot}77\ m}$

18. Proceed as in problem no. 17.
The oscillations will continue for infinitely long time, provided the circuit is non-resistive.

19. Time constant $= CR = 10\times 10^{-6}\times 2{\cdot}2\times 10^5 = \mathbf{2{\cdot}2\ s}$
A CR-circuit can not produce oscillations.

20. On closing the key, initially no current flows through inductor. Therefore, current will flow through the series combination of R_1 and R_2 and is given by

$$I = \frac{E}{R_1 + R_2} = \frac{3}{100 + 200} = 0{\cdot}01\text{ A}$$

Potential drop across L = potential drop across R_1
$= IR_1 = 0{\cdot}01\times 100 = \mathbf{1\ V}$

21. Here, $L = 10\text{ H}$; $R = 2\ \Omega$ and $E = 10\text{ V}$

∴ $I_0 = \frac{E}{R} = \frac{10}{2} = 5\text{ A}$

Maximum energy stored in the capacitor, $U_{max} = \frac{1}{2}L I_0^2$

Let I be the current, when energy stored in the capacitor will become $\frac{1}{4}$th of its maximum value *i.e.*

$\frac{1}{2}LI^2 = \frac{1}{4}\left(\frac{1}{2}L I_0^2\right)$ or $I = \frac{I_0}{2} = \frac{5}{2} = 2{\cdot}5\text{ A}$

$$\text{Now, } I = I_0\left(1-e^{-\frac{R}{L}t}\right) \quad \text{or} \quad 2\cdot5 = 5\left(1-e^{-\frac{2}{10}t}\right)$$

$$\text{or } (1-e^{-0\cdot2\,t}) = 0\cdot5 \quad \text{or} \quad e^{-0\cdot2\,t} = 0\cdot5$$

$$\text{or } e^{0\cdot2\,t} = 2 \quad \text{or} \quad 0\cdot2\,t = \log_e 2$$

$$\text{or } t = \frac{\log_e 2}{0\cdot2} = \frac{2\cdot3026\times\log_{10}2}{0\cdot2} = \frac{2\cdot3026\times0\cdot3010}{0\cdot2}$$

$= \mathbf{3\cdot47\ s}$

22. To find frequency of oscillations, proceed as in problem no. 17. It can be obtained that

$f = \mathbf{79\cdot6\ Hz}$

During LC-oscillations, charge on capacitor at any instant,

$$q = q_0 \cos \omega t$$

$$\text{Now, } I = \frac{dq}{dt} = \frac{d}{dt}(q_0 \cos \omega t) = q_0(-\sin \omega t)\,\omega$$

$$= -q_0\,\omega \sin \omega t$$

Therefore, maximum value of current,

$I_0 = q_0\,\omega = C\,E \times 2\pi f = 20 \times 10^{-6} \times 30 \times 2\pi \times 79\cdot6 = \mathbf{0\cdot3\ A}$

23. Here, $L = 2\cdot0\ mH = 2 \times 10^{-3}\ H$; $C = 5\cdot0\ \mu F = 5 \times 10^{-6}\ F$

$$\text{Now, } \omega = 2\pi f = \frac{1}{\sqrt{LC}}$$

$$= \frac{1}{\sqrt{2\times10^{-3}\times5\times10^{-6}}} = 10^4\ \text{rad s}^{-1}$$

Now, charge on capacitor at any instant during LC-oscillations,

$$q = q_0 \cos \omega t \quad \text{...(i)}$$

$$\therefore \quad I = \frac{dq}{dt} = -q_0\,\omega \sin \omega t \quad \text{...(ii)}$$

$$\text{and} \quad \frac{dI}{dt} = -q_0\,\omega^2 \cos \omega t \quad \text{...(iii)}$$

(a) To find $\frac{dI}{dt}$, when q = 100 μC :

Setting $q = 100\,\mu C$ and $q_0 = 200\,\mu C$ in equation (*i*), we hav

$$100 = 200 \cos \omega t \quad \text{or} \quad \cos \omega t = 0\cdot5$$

$$\text{Now, } \frac{dI}{dt} = q_0\,\omega^2 \cos \omega t \quad \text{(in magnitude)}$$

Here, $q_0 = 200\ \mu C = 200 \times 10^{-6}\ C$, $\omega = 10^4\ \text{rad s}^{-1}$ and $\cos \omega t = 0\cdot5$

$$\therefore \quad \frac{dI}{dt} = 200\times10^{-6}\times(10^4)^2\times0\cdot5 = \mathbf{10^4\ A\ s^{-1}}$$

(b) To find I, when q = 200 μC :

Setting $q = 200\,\mu C$ and $q_0 = 200\,\mu C$ in equation (*i*), we hav

$$200 = 200 \cos \omega t \quad \text{or} \quad \cos \omega t = 1 \quad \text{or} \quad \omega t = 0°$$

Now, $I = q_0\,\omega \sin \omega t$ (in magnitude)

$\therefore$ $I = 200 \times 10^{-6} \times 10^4 \sin 0° = \mathbf{0}$

(c) To find maximum value of I :

From equation (*ii*), maximum value of I is given by

$I_0 = q_0\,\omega$ (in magnitude)

$= 200 \times 10^{-6} \times 10^4 = \mathbf{2\ A}$

(d) To find q, when I = I₀/2 :

Now, $I = q_0\,\omega \sin \omega t$ (in magnitude)

$$\text{Setting } I = \frac{I_0}{2} \text{ or } I = \frac{q_0\,\omega}{2}, \text{ we have}$$

$$\frac{q_0\,\omega}{2} = q_0\,\omega \sin \omega t \quad \text{or} \quad \sin \omega t = 0\cdot5 \quad \text{or} \quad \omega t = 30°$$

Now, $q = q_0 \cos \omega t$

$\therefore$ $q = 200 \times 10^{-6} \cos 30° = 200 \times 10^{-6} \times 0\cdot866$

$= 173\cdot2 \times 10^{-6}\ C = \mathbf{173\cdot2\ \mu C}$

CHAPTER
3

Alternating Currents

3.01. ALTERNATING CURRENT AND E.M.F.

The electric current, whose magnitude changes with time and direction reverses riodically, is known as alternating current.

The electric mains supply sends current in a circuit, which may be represented a sine or cosine function of time. Therefore, the instantaneous value (value at any ne t) of alternating current is given by

$$I = I_0 \sin \omega t \qquad ...(3.01)$$

or

$$I = I_0 \cos \omega t, \qquad ...(3.02)$$

here I_0 is called ***current amplitude*** or ***peak (maximum) value of alternating current.*** T is time period of alternating current and f its frequency, then

$$\omega = \frac{2\pi}{T} = 2\pi f$$

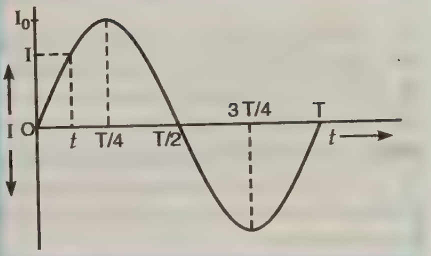

Fig. 3.01

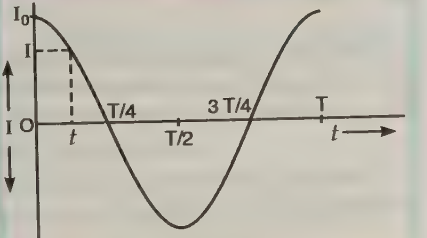

Fig. 3.02

It may be pointed out that instantaneous value of alternating current can be presented by equation (3.01) as a sine function or by equation (3.02) as a cosine nction of time t. Both the representations lead to the same result. Fig. 3.01 shows e instantaneous current I and current amplitude I_0 , when the equation (3.01) is sed to represent alternating current as a sine function of time. On the other hand, g. 3.02 represents I and I_0, when equation (3.02) is used to represent alternating urrent as a cosine function of time.

Similarly *the e.m.f. (or voltage), whose magnitude changes with time and direction verses periodically is known as alternating e.m.f.*

The instantaneous value of alternating e.m.f. may be represented by

$$E = E_0 \sin \omega t \qquad ...(3.03)$$

or

$$E = E_0 \cos \omega t \qquad ...(3.04)$$

Since alternating current varies continuously with time, its effect is measured y defining either the ***mean value*** (or ***average value***) of a.c. or by defining ***root mean quare value*** (or ***virtual value***) of a.c.

3.02. MEAN OR AVERAGE VALUE OF A.C.

It is that steady current, which when passed through a circuit for half the time period f the alternating current, sends the same amount of charge as is done by the alternating urrent in the same time through the same circuit.

It is denoted by I_m or I_a.

Relation between mean value and peak value of a.c. The instantaneous value f a.c. in a circuit is given by

$$I = I_0 \sin \omega t$$

The alternating current continuously changes with time. Suppose that the current through the circuit remains constant for an infinitesimally small time dt. Then, he small amount of charge that will pass through the circuit in time dt is given by

$$dq = I\,dt$$

or

$$dq = I_0 \sin \omega t\, dt$$

The amount of charge that will pass through the circuit in time T/2 (half time period of a.c.) can be obtained by integrating the above equation between the limits = 0 to $t = T/2$ *i.e.*

$$q = \int_0^{T/2} I_0 \sin \omega t\, dt = I_0 \int_0^{T/2} \sin \omega t\, dt = I_0 \left| -\frac{\cos \omega t}{\omega} \right|_0^{T/2} = -\frac{I_0}{\omega} \left| \cos \omega t \right|_0^{T/2}$$

$$= -\frac{I_0}{2\pi/T} \left| \cos \frac{2\pi}{T} \cdot \frac{T}{2} - \cos \frac{2\pi}{T} \cdot 0 \right| = -\frac{I_0 T}{2\pi} \left| \cos \pi - \cos 0 \right| = -\frac{I_0 T}{2\pi} \left| -1-1 \right|$$

or $$q = \frac{I_0 T}{\pi} \qquad ...(3.05)$$

If I_m is mean value of a.c., then by definition

$$q = I_m \cdot \frac{T}{2} \qquad ....(3.06)$$

From equations (3.05) and (3.06), we have

$$I_m \cdot \frac{T}{2} = \frac{I_0 T}{\pi}$$

or $$I_m = \frac{2 I_0}{\pi} = 0 \cdot 636 \, I_0 \qquad ...(3.07)$$

Thus, the mean or average value of alternating current during a half cycle is 0·636 times (or 63·6% of) its peak value. Similarly, it can be proved that mean value of alternating e.m.f. is

$$E_m = \frac{2 E_0}{\pi} = 0 \cdot 636 \, E_0 \qquad ...(3.08)$$

During the next half cycle, the mean value of a.c. will be equal in magnitude but opposite in direction. For this reason, the average value of a.c. over a complete cycle is always zero. It may be noted that as the average value of a.c. over the complete cycle of a.c. is zero, it is always defined over a half cycle of a.c.

3.03. ROOT MEAN SQUARE (RMS) OR VIRTUAL VALUE OF A.C.

It is that steady current, which when passed through a resistance for a given time will produce the same amount of heat as the alternating current does in the same resistance and in the same time.

It is denoted by I_{rms} or I_v.

Relation between virtual value and peak value of a.c. The instantaneous value of a.c. passing through a resistance R is given by

$$I = I_0 \sin \omega t$$

The alternating current changes continuously with time. Suppose that the current through the resistance remains constant for an infinitesimally small time dt. Then, small amount of heat produced in the resistance R in time dt is given by

$$dH = I^2 R \, dt \, (I_0 \sin \omega t)^2 R \, dt = I_0^2 R \sin^2 \omega t \, dt$$

The amount of heat produced in the resistance in time T/2 (half time period) can be obtained by integrating the above equation between the limits $t = 0$ to $t = T/2$ *i.e.*

$$H = \int_0^{T/2} I_0^2 R \sin^2 \omega t \, dt = I_0^2 R \int_0^{T/2} \sin^2 \omega t \, dt = I_0^2 R \int_0^{T/2} \frac{1 - \cos 2\omega t}{2} dt$$

or $$H = \frac{I_0^2 R}{2} \left(\int_2^{T/2} dt - \int_0^{T/2} \cos 2\omega t \, dt \right) \qquad ...(3.09)$$

Now, $$\int_0^{T/2} dt = | t |_0^{T/2} = \frac{T}{2} - 0 = \frac{T}{2}$$

and $$\int_0^{T/2} \cos 2\omega t \, dt = \left| \frac{\sin 2\omega t}{2\omega} \right|_0^{T/2} = \frac{1}{2\omega} \left| \sin \frac{2\pi}{T} \cdot \frac{T}{2} - \sin \frac{2\pi}{T} \cdot 0 \right|$$

$$= \frac{1}{2\omega} | \sin \pi - \sin 0 | = \frac{1}{2\omega} | 0 - 0 | = 0$$

Substituting the values of the two integrals obtained above in equation (3.09), we have

$$H = \frac{I_0^2 R}{2} \left(\frac{T}{2} - 0 \right) = \frac{I_0^2 R}{2} \cdot \frac{T}{2} \qquad ...(3.10)$$

If I_v is virtual or r.m.s. value of a.c., then by definition,

$$H = I_v^2 R \cdot \frac{T}{2} \qquad ...(3.11)$$

From equations (3.10) and (3.11), we have

$$I_v^2 R \cdot \frac{T}{2} = \frac{I_0^2 R}{2} \cdot \frac{T}{2} \qquad \text{or} \qquad I_v^2 = \frac{I_0^2}{2}$$

$$\text{or} \qquad I_v = \frac{I_0}{\sqrt{2}} = 0{\cdot}707\, I_0 \qquad ...(3.12)$$

Thus, the r.m.s. or virtual value of a.c. is 0·707 times (or 70·7 % of) its peak value. imilarly, it can be proved that virtual value of alternating e.m.f. is

$$E_v = \frac{E_0}{\sqrt{2}} = 0{\cdot}707\, E_0 \qquad ...(3.13)$$

The r.m.s. or virtual value of a.c. is same even for a complete cycle of a.c. This act is made use of to construct ***hot wire instruments*** for measuring currents and oltages. Such ammeters and voltmeters record virtual values of alternating current nd voltage respectively.

3.04. PHASORS AND PHASOR DIAGRAM

We know that displacement of S.H.M. varies sinusoidally with time and its nstantaneous value is given by

$$y = r \sin \omega t$$

Further, the instantaneous value of the displacement (y) is equal to the rojection of the amplitude (r) on Y-axis.

In an a.c. circuit, the e.m.f. and current vary sinusoidally with time and may e mathematically represented as

$$E = E_0 \sin \omega t \qquad ...(3.14)$$

$$\text{and} \qquad I = I_0 \sin (\omega t + \phi) \qquad ...(3.15)$$

Here, ϕ is the phase angle between alternating e.m.f. and current.

Therefore, instantaneous values of alternating e.m.f. (E) and current (I) may e considered as the projections of e.m.f. amplitude (E_0) and current amplitude (I_0) espectively.

A quantity, which varies sinusoidally with time and represented as the projection of a otating vector, is called a ***phasor****.*

Therefore, the quantities, such as alternating e.m.f. and alternating current, may e called phasors.

The diagram, representing alternating e.m.f. and current (phasors) as the rotating ectors along with the phase angle between them, is called ***phasor diagram****.*

Let us draw phasor diagram for an a.c. circuit, in which e.m.f. and current vary according to the equations (3.14) and (3.15) as given above.

Draw two circles I and II of radii E_0 and I_0 (to the scale) respectively as shown in Fig. 3.03. Let $\angle AOX = \omega t$ and $\angle BOX = (\omega t + \phi)$. Then, $\overrightarrow{OA}$ and $\overrightarrow{OB}$ represent rotating vectors having magnitudes E_0 and I_0 (the peak values of alternating e.m.f. and current) rotating in anticlockwise direction with the same angular frequency ω. Further, the projections OM (= E) and ON (= I) represent the phasors (instantaneous values of alternating e.m.f. and alternating current respectively) and the $\angle BOA = \phi$ represents the phase angle, by which the phasor I (alternating current) leads the phasor E (alternating e.m.f.). Fig. 3.03 is called phasor diagram for the alternating e.m.f. and current in an a.c. circuit, in which e.m.f. and current vary as given by equations (3.14) and (3.15). This phasor diagram may be simply represented as shown in Fig. 3.04. When one is interested only in the phase relationship, the phase diagram may be represented as shown in Fig. 3.05.

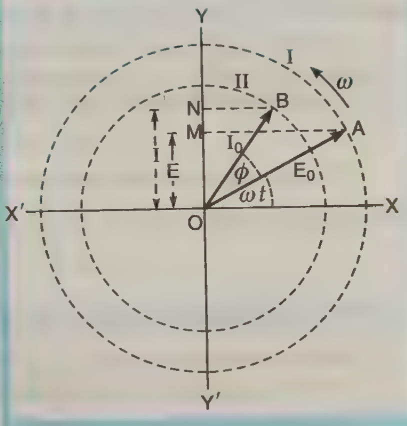

Fig. 3.03

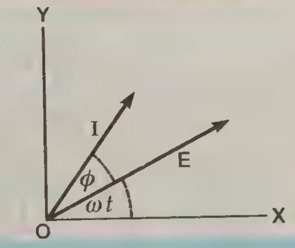

Fig. 3.04

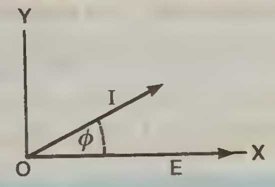

Fig. 3.05

3.05. A.C. THROUGH A RESISTOR

Consider that a pure ohmic resistor of resistance R (zero inductance) is connected to a source of an alternating e.m.f. [Fig. 3.06].

Let the instantaneous value of alternating e.m.f. be given by

$$E = E_0 \sin \omega t \qquad ...(3.16)$$

Now, the instantaneous e.m.f. due to source

= instantaneous value of potential drop across the resistance

If I is the current in the circuit at that instant, then

$$E = I\,R \qquad \text{or} \qquad I = \frac{E}{R}$$

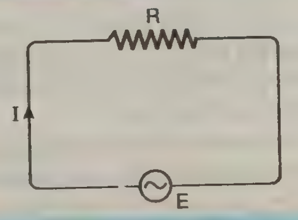

Fig. 3.06

Substituting for E, we have

$$I = \frac{E_0}{R} \sin \omega t$$

Now, $\frac{E_0}{R} = I_0$, the peak value of alternating current in the circuit. Therefore,

$$I = I_0 \sin \omega t \qquad \text{...(3.17)}$$

The equation (3.17) gives the instantaneous value of alternating current in the circuit containing R. From equations (3.16) and (3.17), it follows that the alternating current is ***in phase*** with the e.m.f., when a.c. flows through a resistance. This fact is graphically represented as shown in Fig. 3.07.

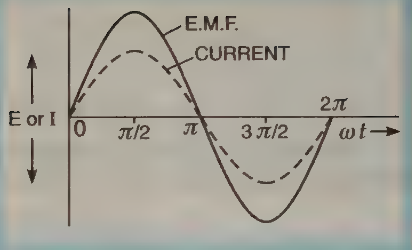

Fig. 3.07

Fig. 3.08 is the phasor diagram for alternating e.m.f. and current given by equations (3.16) and (3.17). As E and I are in phase with each other, both the phasors representing E and I have been drawn so as to make angle ωt with OX.

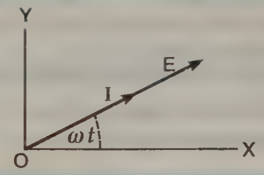

Fig. 3.08

3.06. A.C. THROUGH AN INDUCTOR

Consider that a pure inductor of inductance L (having no ohmic resistance) is connected to a source of an alternating e.m.f. [Fig. 3.09].

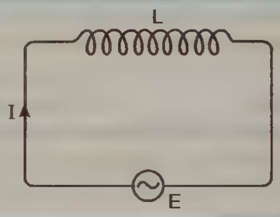

Fig. 3.09

Let the instantaneous value of alternating e.m.f. be given by

$$E = E_0 \sin \omega t \qquad \text{...(3.18)}$$

If I is the current through the circuit and $\frac{dI}{dt}$, the rate of change of current in the circuit at that instant, then the instantaneous induced e.m.f. produced across L,

$$e = -L\frac{dI}{dt}$$

Therefore, total instantaneous e.m.f. of the circuit $= E + \epsilon = E + \left(-L\frac{dI}{dt}\right)$

Now, total instantaneous e.m.f. in the circuit

= instantaneous potential drop across the circuit elements of the circuit

Since there is no circuit element across which potential drop may occur,

$$E + \left(-L\frac{dI}{dt}\right) = 0 \quad \text{or} \quad E = L\frac{dI}{dt}$$

or
$$dI = \frac{E}{L}dt = \frac{E_0}{L}\sin \omega t \, dt$$

or
$$\int dI = \frac{E_0}{L}\int \sin \omega t \, dt$$

or
$$I = \frac{E_0}{L}\left(\frac{-\cos \omega t}{\omega}\right) = -\frac{E_0}{\omega L}\cos \omega t = \frac{E_0}{\omega L}\sin\left(\omega t - \frac{\pi}{2}\right)$$

$$\left[\because \sin(\omega t - \pi/2) = \sin\{-(\pi/2 - \omega t)\} = -\sin(\pi/2 - \omega t) = -\cos \omega t\right]$$

Key point

The inductive reactance increases as the frequency of a.c. source is increased.

Now ωL has got units of resistance and it is called ***reactance of inductor*** or ***inductive reactance.*** It is denoted by X_L. Therefore,

$$I = \frac{E_0}{X_L}\sin\left(\omega t - \frac{\pi}{2}\right)$$

Further, $\frac{E_0}{X_L} = I_0$, the peak value of alternating current in the circuit.

Therefore,
$$I = I_0 \sin\left(\omega t - \frac{\pi}{2}\right) \qquad \text{...(3.19)}$$

The equation (3.19) gives the instantaneous value of current in the a.c. circuit containing L. From equations (3.18) and (3.19), it follows that the alternating current ***lags behind*** the e.m.f. by a phase angle $\pi/2$ (or e.m.f. ***leads*** the current by a phase angle $\pi/2$), when a.c. flows through an inductor. This fact is graphically represented as shown in Fig. 3.10.

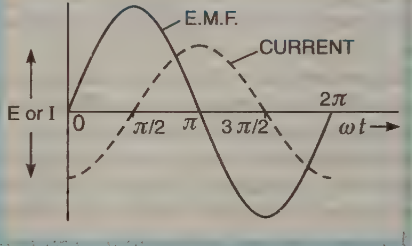

Fig. 3.10

Let us now draw phasor diagram, when a.c. flows through an inductor. The phasor representing E is drawn so as to make an angle ωt with OX in anticlockwise direction. As current lags behind the e.m.f. by phase angle $\pi/2$, the phasor representing I has been drawn so as to make angle $\pi/2$ in *clockwise direction* with the phasor representing E_v [Fig. 3.11].

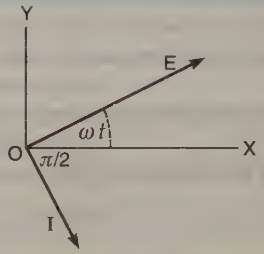

Fig. 3.11

It may be pointed out that

(*i*) the peak value of alternating current, $I_0 = \dfrac{E_0}{X_L}$

(*ii*) the inductive reactance X_L $(= \omega L = 2\pi f L)$ is zero for d.c. $(f = 0)$ and has nite value for a.c. In other words, *an inductor offers an easy path to d.c. and a resistive h to a.c.*

3.07. A.C. THROUGH A CAPACITOR

Consider that a capacitor of capacitance C is connected to a source of an ernating e.m.f. as shown in Fig. 3.12. Let the instantaneous value of alternating n.f. be given by

$$E = E_0 \sin \omega t \qquad \text{...(3.20)}$$

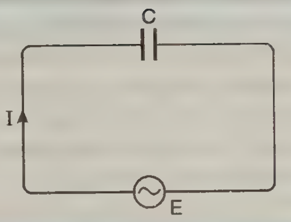

Fig. 3.12

Let I be current in the circuit and q be the charge over the capacitor at that stant. Then, the instantaneous potential difference across the capacitor $= \dfrac{q}{C}$

Now, the instantaneous e.m.f. due to source

= instantaneous potential difference across the capacitor

Therefore, $E = \dfrac{q}{C}$

or $q = C E = C E_0 \sin \omega t$

Differentiating both sides *w.r.t.* t, we have

$$\frac{dq}{dt} = \frac{d}{dt}(C E_0 \sin \omega t)$$

or $$I = C E_0 (\cos \omega t)(\omega) = \frac{E_0}{1/\omega C} \cos \omega t$$

or $$I = \frac{E_0}{1/\omega C}\left(\omega t + \frac{\pi}{2}\right) \qquad [\because \sin(\omega t + \pi/2) = \cos \omega t]$$

Key point

The capacitor reactance decreases, as frequency of a.c. source is increased.

Now, $1/\omega C$ has got units of resistance and is called ***reactance of capacitor*** or ***pacitive reactance***. It is denoted by X_C. Therefore,

$$I = \frac{E_0}{X_C} \sin\left(\omega t + \frac{\pi}{2}\right)$$

Further, $\dfrac{E_0}{X_C} = I_0$, the peak value of alternating current. Therefore,

$$I = I_0 \sin\left(\omega t + \frac{\pi}{2}\right) \qquad \text{...(3.21)}$$

The equation (3.21) gives instantaneous value of current in an a.c. circuit ntaining C. From equations (3.20) and (3.21), it follows that the alternating rrent ***leads*** the e.m.f. by phase angle $\pi/2$ (or e.m.f. ***lags behind*** the current by a hase angle $\pi/2$), when a.c. passes through a circuit containing capacitor. This fact graphically represented in Fig. 3.13.

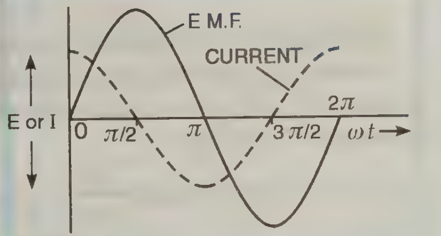

Fig. 3.13

Let us now draw phasor diagram, when a.c. flows through a circuit containing pacitor. The phasor representing E is drawn so as to make an angle ωt with OX anticlockwise direction. As current ***leads*** the e.m.f. by phase angle $\pi/2$, the phasor presenting I has been drawn so as to make an angle $\pi/2$ in *anticlock-wise direction* ith the phasor representing E [Fig. 3.14].

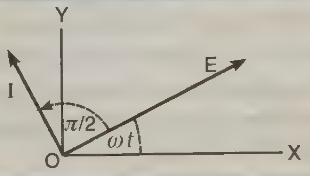

Fig. 3.14

It may be pointed out that

(*i*) the peak value of the alternating current, $I_0 = \dfrac{E_0}{X_C}$

(*ii*) the capacitive reactance $\left(X_C = \dfrac{1}{\omega C} = \dfrac{1}{2\pi f C}\right)$ is infinite for d.c. $(f = 0)$ and as a very small value for a.c. In other words, *a capacitor serves as a block for d.c. and fers an easy path to a.c.*

3.08. A.C. THROUGH LR-SERIES CIRCUIT

Consider that a source of an alternating e.m.f. is connected to a series ombination of an inductor of inductance L and a resistor of resistance R as shown Fig. 3.15.

Let E and I be the instantaneous values of e.m.f. and current in the LR-circuit and V_L and V_R be instantaneous values of the voltages across the inductor L and the resistor R respectively. Then,

$$V_L = I X_L \qquad \text{and} \qquad V_R = I R$$

Here, $X_L = \omega L$ is reactance due to the inductor.

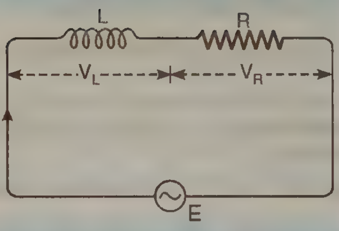

Fig. 3.15

In order to find the relation between E, V_L and V_R, let us draw phasor diagram for the current and voltages as explained below :

We know that when a.c. flows through a resistor, the voltage and the current are in phase with each other. Likewise, the phasors V_R (voltage across R) and V_I(current through R) are represented along OX [Fig. 3.16].

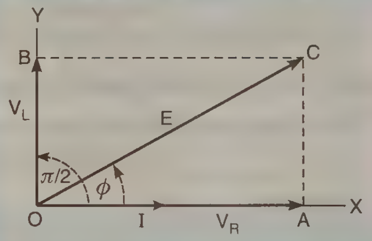

Fig. 3.16

Further, when a.c. flows through an inductor, voltage leads* the current by phase angle $\pi/2$. Since current through inductance L is also I and has been represented along OX, the phasor V_L (voltage across L) leading I by phase angle $\pi/2$ is represented along OY.

If OA and OB represent magnitudes of the phasors V_R and V_L respectively ; then OC, the resultant of OA and OB, represents E. Thus, from right angled Δ OAC, we have

$$OC = \sqrt{OA^2 + AC^2} = \sqrt{OA^2 + OB^2}$$

or

$$E = \sqrt{V_R{}^2 + V_L{}^2}$$

Substituting for V_R and V_L, we have

$$E = \sqrt{(I R)^2 + (I X_L)^2} = I\sqrt{R^2 + X_L{}^2}$$

or

$$I = \frac{E}{\sqrt{R^2 + X_L{}^2}} = \frac{E}{\sqrt{R^2 + \omega^2 L^2}} \qquad \text{...(3.22)}$$

The effective opposition offered by the series combination of L and R to a.c. is called ***impedance*** of LR-circuit. If Z is impedance of LR-circuit, then

$$I = \frac{E}{Z} \qquad \text{...(3.23)}$$

From equations (3.22) and (3.23), we have

$$Z = \sqrt{R^2 + X_L{}^2} = \sqrt{R^2 + \omega^2 L^2} \qquad \text{...(3.24)}$$

The equation (3.24) gives the impedance of LR-circuit.

Key point

In LR-circuit, the value of phase angle (ϕ) between current and e.m.f. can be

$$0 < \phi < \pi/2$$

From the phasor diagram, it follows that in L R-circuit, e.m.f. ***leads*** the current by phase $\angle COA = \phi$ (as angle is traversed in *anticlockwise direction*). From right angled Δ OAC, we have

$$\tan\phi = \frac{AC}{OA} = \frac{V_L}{V_R} = \frac{I X_L}{I R}$$

or

$$\tan\phi = \frac{V_L}{V_R} = \frac{\omega L}{R} \qquad \text{...(3.25)}$$

The equation (3.25) gives the phase angle ϕ, by which alternating e.m.f. leads the current in an L R-circuit.

3.09. A.C. THROUGH CR-SERIES CIRCUIT

Consider that a source of an alternating e.m.f. is connected to a series combination of a capacitor of capacitance C and a resistor of resistance R as shown in Fig. 3.17.

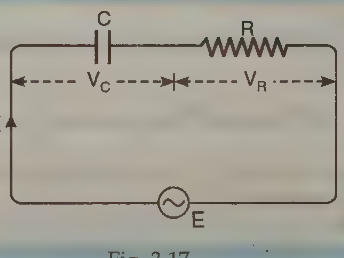

Fig. 3.17

Let E and I be the instantaneous values of e.m.f. and current in the CR-circuit and V_C and V_R be the instantaneous values of voltages across capacitor C and the resistor R respectively. Then,

$$V_C = I X_C \qquad \text{and} \qquad V_R = I R$$

Here, $X_C = \omega L$ is reactance due to the capacitor.

In order to find relation between E, V_C and V_R, let us draw the phasor diagram for the current and voltages as explained below :

---

*or the current lags behind the current voltage by phase angle $\pi/2$.

We know that when a.c. flows through a resistor, the voltage and the current re in phase with each other. Likewise, the phasors V_R (voltage across R) and I urrent through R) are represented along OX [Fig. 3.18].

Further, when a.c. flows through a capacitor, voltage lags behind* the current y phase angle $\pi/2$. Since current through the capacitor C is also I and has been epresented along OX, the phasor V_C (voltage across C) is represented along OY′. OA and OB represent the magnitudes of the phasors V_R and V_C respectively ; then C, the resultant of OA and OB, represents E. From right angled Δ OAC, we have

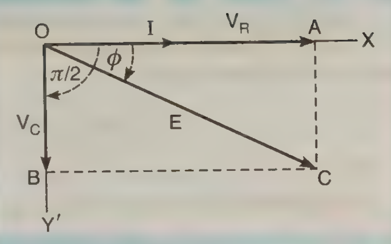

Fig. 3.18

$$OC = \sqrt{OA^2 + AC^2} = \sqrt{OA^2 + OB^2}$$

or
$$E = \sqrt{V_R{}^2 + V_C{}^2}$$

Substituting for V_R and V_C, we have

$$E = \sqrt{(I\,R)^2 + (I\,X_C)^2} = I\sqrt{R^2 + X_C{}^2}$$

or
$$I = \frac{E}{\sqrt{R^2 + X_C{}^2}} = \frac{E}{\sqrt{R^2 + 1/\omega^2 C^2}} \qquad ...(3.26)$$

The effective opposition offered by C and R to a.c. is called ***impedance*** of C R-ircuit. If Z is impedance of C R-circuit, then

$$I = \frac{E}{Z} \qquad ...(3.27)$$

From equations (3.26) and (3.27), we have

$$Z = \sqrt{R^2 + X_C{}^2} = \sqrt{R^2 + 1/\omega^2 C^2} \qquad ...(3.28)$$

Key point

In CR-circuit, the value of phase angle (ϕ) between current and e.m.f. can be
$-\pi/2 < \phi < 0$

The equation (3.28) gives impedance of C R-circuit.

From the phasor diagram, it follows that in C R-circuit, the alternating e.m.f. ***lags behind*** the current by phase $\angle\, COA = \phi$ (as angle ϕ is traversed in *clockwise* direction). From right angled Δ AOC, we have

$$\tan\phi = \frac{AC}{OA} = \frac{V_C}{V_R} = \frac{I\,X_C}{I\,R}$$

or
$$\tan\phi = \frac{X_C}{R} = \frac{1/\omega C}{R} \qquad ...(3.29)$$

The equation (3.29) gives the phase angle ϕ, by which alternating e.m.f. lags behind the current in a C R-circuit.

3.10. A.C. THROUGH LCR-SERIES CIRCUIT

Consider that a source of an alternating e.m.f. is connected to a series combination of an inductor of inductance L, a resistor of resistance R and a capacitor of capacitance C as shown in Fig. 3.19.

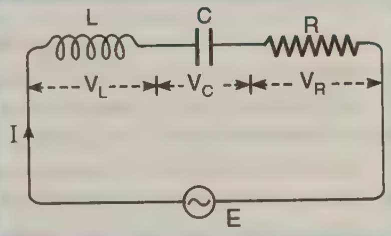

Fig. 3.19

Let E and I be the instantaneous values of e.m.f. and current in the LCR-circuit; and V_L, V_C and V_R be the instantaneous values of the voltages across inductor L, capacitor C and resistor R respectively. Then,

$$V_L = I\,X_L\,; \quad V_C = I\,X_C \quad \text{and} \quad V_R = I\,R$$

Here, $X_L = \omega\,L$ and $X_C = 1/\omega C$ are reactances due to inductor and capacitor respectively.

In order to find the relation between E, V_L, V_C and V_R, let us draw the phasor diagram for current and voltages as explained below :

In an a.c. circuit containing R only, V_R and I are in phase with each other. Therefore, both the phasors V_R and I are represented along OX [Fig. 3.20].

In an a.c. circuit containing L only, V_L leads I by phase angle $\pi/2$ and likewise the phasor V_L is represented along OY.

Finally, in an a.c. circuit containing C only, V_C lags behind I by phase angle $\pi/2$. Therefore, V_C is represented along OY ′.

Suppose that OA, OB and OC represent the magnitudes of the phasors V_R, V_L and V_C respectively.

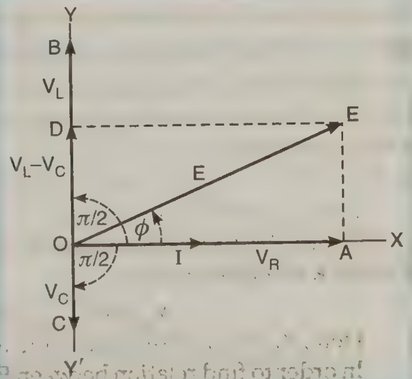

Fig. 3.20

---

*or the current leads the e.m.f. by phase angle $\pi/2$.

In case $V_L > V_C$ (as shown in figure), then OD represents $V_L - V_C$, the resultant of V_L and V_C. Finally, OE, the resultant of OA and OD represents E. Thus, from right angled Δ OAE, we have

$$OE = \sqrt{OA^2 + AE^2} = \sqrt{OA^2 + OD^2}$$

or
$$E = \sqrt{V_R{}^2 + (V_L - V_C)^2}$$

Substituting the values of V_R, V_L and V_C, we have

$$E = \sqrt{(I\,R)^2 + (I\,X_L - I\,X_C)^2} = I\sqrt{R^2 + (X_L - X_C)^2}$$

or
$$I = \frac{E}{\sqrt{R^2 + (X_L - X_C)^2}} \qquad ...(3.30)$$

The effective opposition offered by L, C and R to a.c. is called ***impedance*** of LCR-circuit. If Z is impedance of LCR circuit, then

$$I = \frac{E}{Z} \qquad ...\ (3.31)$$

From equations (3.30) and (3.31), we have

$$Z = \sqrt{R^2 + (X_L - X_C)^2} = \sqrt{R^2 + (\omega L - 1/\omega C)^2} \qquad ...(3.32)$$

The equation (3.32) gives impedance of LCR-circuit.

Key point

In LCR-circuit, the value of phase angle (ϕ) between current and e.m.f. can be
$-\pi/2 < \phi < \pi/2$

From phasor diagram, it follows that in LCR-series circuit, E leads I (in case $V_L > V_C$ or $X_L > X_C$) by phase angle ϕ (as the angle ϕ is traversed in anticlockwise direction). From right angled Δ OAE, we have

$$\tan\phi = \frac{AE}{OA} = \frac{V_L - V_C}{V_R} = \frac{I\,X_L - I\,X_C}{I\,R}$$

or
$$\tan\phi = \frac{X_L - X_C}{R} = \frac{\omega L - 1/\omega C}{R} \qquad ...(3.33)$$

The equation (3.33) gives the phase angle ϕ, by which alternating e.m.f. leads the current (in case $X_L > X_C$) in an LCR-circuit.

Let us study the phase relationship between current and e.m.f. in LCR-series circuit in the following cases :

(i) When ω **L > 1/**ω**C :** From equation (3.33), it follows that tan ϕ is positive *i.e.* ϕ is positive (between 0 and $\pi/2$). Hence, in such a case, e.m.f. leads the current.

(ii) When ω **L <** ω**C:** From equation (3.33), it follows that tanϕ is negative *i.e.* ϕ is negative (between 0 and $-\pi/2$). Hence, in such a case, e.m.f. lags behind the current.

(iii) When ω**L =** ω**C :** From equation (3.33), it follows that tan ϕ is zero *i.e.* ϕ is zero. Hence, in such a case, current and e.m.f. are in phase with each other.

In fact, when $\omega L = \omega C$, the impedance of the circuit becomes just equal to R (minimum). In other words, the LCR-series circuit will behave as a purely resistive circuit. Due to the minimum value of impedance (equal to R), the current in LCR-series circuit will be maximum and this condition is known as ***resonance***.

3.11. RESONANCE IN LCR-SERIES CIRCUIT (Series resonant circuit)

When an alternating source of e.m.f. is connected across the series combination of L, C and R, the current lags behind the e.m.f. (in case $X_L > X_C$) by phase angle ϕ, which is given by

$$\tan\phi = \frac{\omega L - 1/\omega C}{R}$$

Here, ω is the angular frequency of the a.c. source. Further, the impedance of the LCR-circuit is given by

$$Z = \sqrt{R^2 + (\omega L - 1/\omega C)^2}$$

The instantaneous value of current in the LCR-circuit is given by

$$I = \frac{E}{Z} = \frac{E}{\sqrt{R^2 + (\omega L - 1/\omega C)^2}}$$

It follows that in addition to the values of the circuit elements R, L and C, the m.s. value of current in the LCR-circuit depends upon the angular frequency ω f the a.c. source. It is because, the values of inductive and capacitive reactances e. ω L and $1/\omega$ C change with change in the angular frequency ω . When ω is low, nductive reactance ω L is low but capactive reactance $1/\omega$ C is high. As the value f ω is increased ; the inductive reactance increases, while the capacitive reactance ecreases. At a particular value of the angular frequency of the a.c. source, say ω_0, he inductive reactance and capacitive reactance will become just equal to each ther *i.e.*

$$\omega_0 L = 1/\omega_0 C \qquad \text{...(3.34)}$$

When it happens so, *i.e.* $\omega = \omega_0$, the impedence of the LCR-circuit is given by

$$Z \text{ (at } \omega_0) = \sqrt{R^2 + (\omega_0 L - 1/\omega_0 C)^2}$$

or

$$Z \text{ (at } \omega_0) = R \qquad (\because \omega_0 L = 1/\omega_0 C)$$

Thus, when angular frequency of a.c. source is equal to ω_0, the impedance of the LCR-circuit is minimum *i.e.* merely equal to the ohmic resistance of the circuit.

Also, when $\omega = \omega_0$, it follows that the value of current in LCR-circuit *i.e.*

$$I \text{ (at } \omega_0) = \frac{E}{R} \qquad \text{... (3.35)}$$

i.e. when angular frequency of a.c. source is equal to ω_0, the r.m.s. value of current in the LCR-circuit becomes maximum.

Key point

When resonance takes place in LCR-circuit,

(*i*) $\omega L = \dfrac{1}{\omega C}$,

(*ii*) impedance of the circuit becomes minimum and is equal to R,

(*iii*) current in the circuit becomes maximum and is equal to E/R ; and

(*iv*) current and e.m.f. are in phase with each other.

*A series LCR-circuit, which admits maximum current corresponding to a particular angular frequency ω_0 of the a.c. source, is called **series resonant circuit** and the angular frequency ω_0 is called the **resonant angular frequency**.*

Thus, in a series LCR-circuit, when the angular frequency of the a.c. source is equal to resonant angular frequency ω_0, impedence of the circuit becomes minimum and the r.m.s. value of current in the circuit becomes maximum. The equation (3.34), which gives the resonant angular frequency, is called ***condition for resonance*** in the LCR-circuit.

From equation (3.34), we have

$$\omega_0 = \frac{1}{\sqrt{LC}} \qquad \text{...(3.36)}$$

If f_0 is the resonance frequency corresponding to resonant angular frequency ω_0, then

$$f_0 = \frac{\omega_0}{2\pi} = \frac{1}{2\pi\sqrt{LC}} \qquad \text{...(3.37)}$$

When the resonance takes place in a series LCR-circuit, the following is found to hold for the circuit :

1. At resonance, $\omega_0 L = 1/\omega_0 C$ and therefore $\tan\phi$ and hence ϕ becomes zero. Thus, when resonance takes place in series LCR-circuit, the current and e.m.f. are in phase with each other.

2. The impedance of the series LCR-circuit becomes minimum *i.e.* equal to R.

3. The current in the series LCR-circuit attains a maximum value, which depends only on the ohmic resistance of the circuit.

3.12. QUALITY FACTOR AND SHARPNESS OF RESONANCE

At resonant frequency ω_0 , the current in the LCR-series circuit becomes maximum. Fig. 3.21 shows the variation of the current amplitude with the angular frequency of the a.c. source for three different values of resistance R (the values of L and C are same in the three cases). It follows that the current versus frequency curve is quite flat for a large value of resistance (R_1) and becomes more and more sharp as the value of the resistance is decreased. Further, from these curves, it follows that when the resistance in the circuit is low, then with a little change in angular frequency, the current in the circuit changes by a large amount in comparison to that what happens in the case, when the resistance in the circuit is high. In other words, if the value of resistance in the LCR-series circuit is very low ; then a large current flows, when angular frequency of the a.c. source is close to the resonant frequency ω_0. Such an LCR-series circuit is said to be ***more selective*** or ***more sharp***. Therefore, for a sharp resonance in LCR-circuit, the ohmic resistance of the circuit should be low.

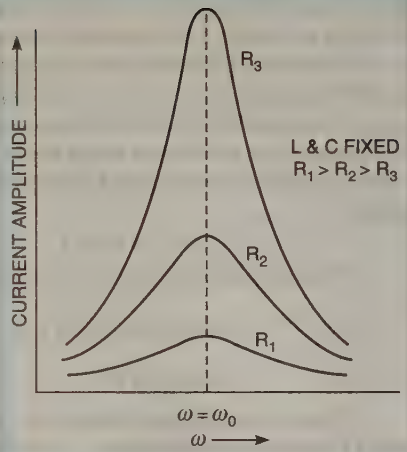

Fig. 3.21

The selectivity or sharpness of a resonant circuit is measured by ***Q-factor***, called the ***quality factor.***

The Q factor or quality factor of a resonant LCR-circuit is defined as ratio of the voltage drop across inductor (or capacitor) to the applied voltage. Thus,

$$Q = \frac{\text{voltage across L (or C)}}{\text{applied voltage}} \qquad ...(3.38)$$

When resonance occurs ; if I is instantaneous value of current through the circuit, then

voltage across L, $V_L = I\,X_L$ ...(3.39)

Since at resonant frequency, applied voltage is equal to potential drop across R, we have

applied voltage = I R ...(3.40)

Using equations (3.39) and (3.40), the equation (3.38) becomes

$$Q = \frac{I\,X_L}{I\,R} = \frac{\omega_0\,L}{R}$$

Since $\omega_0 = \frac{1}{\sqrt{LC}}$, we have

$$Q = \frac{1}{\sqrt{LC}} \times \frac{L}{R}$$

or

$$Q = \frac{1}{R}\sqrt{\frac{L}{C}} \qquad ...(3.41)$$

It follows that Q-factor of LCR-series circuit will be large *i.e.* the circuit will have more selectivity or more sharpness, if R is low or L is large or C is low.

3.13. POWER OF AN A.C. CIRCUIT

In an a.c. circuit, both e.m.f. and current continuously change with time. Therefore, electric power (which is equal to product of voltage and current) can not be calculated as such. For an a.c. circuit, average power is calculated by defining the instantaneous power of the circuit.

The instantaneous power of an a.c. circuit is defined as the product of the instantaneous e.m.f. and the instantaneous current in it.

Suppose that the instantaneous e.m.f. and the current in an a.c. circuit are respectively given by

$$E = E_0 \sin \omega t$$

and

$$I = I_0 \sin (\omega t + \phi),$$

where ϕ is the phase angle by which current leads the e.m.f. in the a.c. circuit. Here, E_0 and I_0 are peak values of e.m.f. and current respectively ; and $2\pi/T$, where T is period of a.c.

If we assume that the values of e.m.f. and current in the a.c. circuit remain constant for a small time *dt*, then small amount of electrical energy consumed is given by

$$\begin{aligned} dW &= E\,I\,dt = E_0 \sin \omega t\; I_0 \sin (\omega t + \phi)\, dt \\ &= E_0 I_0 \sin \omega t\, (\sin \omega t \cos \phi + \cos \omega t \sin \phi)\, dt \\ &= E_0 I_0 (\sin^2 \omega t \cos \phi + \sin \omega t \cos \omega t \sin \phi)\, dt \qquad ...(3.42) \end{aligned}$$

Now, $\cos 2\omega t = 1 - 2\sin^2 \omega t$ or $\sin^2 \omega t = \frac{1 - \cos 2\omega t}{2}$

Also, $\sin 2\omega t = 2 \sin \omega t \cos \omega t$ or $\sin \omega t \cos \omega t = \frac{\sin 2\omega t}{2}$

Substituting for $\sin^2 \omega t$ and $\sin \omega t \cos \omega t$ in equation (3.42), we have

$$dW = E_0 I_0 \left(\frac{1 - \cos 2\omega t}{2} \cos \phi + \frac{\sin 2\omega t}{2} \sin \phi \right) dt$$

$$= \frac{E_0 I_0}{2} (\cos \phi - \cos \phi \cos 2\omega t + \sin \phi \sin 2\omega t)\, dt$$

The electrical energy consumed in the circuit in time T (period of a.c.) can be tained by integrating the above equation between $t = 0$ to $t = T$ *i.e.*

$$W = \int_0^T \frac{E_0 I_0}{2} (\cos \phi - \cos \phi \cos 2\omega t + \sin \phi \sin 2\omega t)\, dt$$

or

$$W = \frac{E_0 I_0}{2} \left(\cos \phi \int_0^T dt - \cos \phi \int_0^T \cos 2\omega t\, dt + \sin \phi \int_0^T \sin 2\omega t\, dt \right) \quad ...(3.43)$$

Now, $\int_0^T dt = |t|_0^T = T - 0 = T$

It can be shown that $\int_0^T \cos 2\omega t\, dt = \int_0^T \sin 2\omega t\, dt$

Therefore, equation (3.43) becomes

$$W = \frac{E_0 I_0}{2} [\cos \phi\, (T) - \cos \phi\, (0) + \sin \phi\, (0)]$$

or

$$W = \frac{E_0 I_0 T}{2} \cos \phi$$

The average power of the a.c. circuit is given by

$$P_{av} = \frac{W}{T} = \frac{E_0 I_0 T}{2} \cos \phi \times \frac{1}{T} = \frac{E_0 I_0}{2} \cos \phi = \frac{E_0}{\sqrt{2}} \cdot \frac{I_0}{\sqrt{2}} \cos \phi$$

or

$$P_{av} = E_v I_v \cos \phi \quad ...(3.44)$$

The average power of an a.c. circuit is also called ***true power*** of the circuit. urther, the product $E_v I_v$ is called the ***apparent power*** or ***virtual power*** and $\cos \phi$ s known as *power factor*. Thus,

average power = apparent power × power factor

Let us find the expression for average power in the following special cases :

(i) A.C. circuit having R only. For such a circuit, $\phi = 0$.

Therefore, $P_{av} = E_v I_v \cos 0 = E_v I_v (1) = E_v I_v$

(ii) A.C. circuit having L only. For such a circuit, $\phi = \pi/2$.

Therefore, $P_{av} = E_v I_v \cos \pi/2 = E_v I_v (0) = 0$

(iii) A.C. circuit containing C only. For such a circuit, $\phi = -\pi/2$

Therefore, $P_{av} = E_v I_v \cos(-\pi/2) = E_v I_v (0) = 0$

(iv) A.C. circuit containing L and R. For such a circuit, $\tan \phi = \frac{\omega L}{R}$; so that

$$\cos \phi = \frac{R}{\sqrt{R^2 + \omega^2 L^2}}$$

$$\therefore \quad P_{av} = E_v I_v \cdot \frac{R}{\sqrt{R^2 + \omega^2 L^2}}$$

(v) A.C. circuit containing C and R. For such a circuit, $\tan \phi = \frac{1/\omega C}{R}$; so that

$$\cos \phi = \frac{R}{\sqrt{R^2 + 1/\omega^2 C^2}} = \frac{1/\omega C}{R}$$

Key point

When an a.c. circuit contains resistor only, its power is maximum. When an inductor or a capacitor is connected in series to the resistor, power of the circuit always decreases.

$$\therefore \qquad P_{av} = E_v\, I_v \cdot \frac{R}{\sqrt{R^2 + 1/\omega^2 C^2}}$$

(vi) A.C. circuit containing L, C and R. For such a circuit, $\tan\phi = \dfrac{\omega L - 1/\omega C}{R}$; so that

$$\cos\phi = \frac{R}{\sqrt{R^2 + (\omega L - 1/\omega C)^2}}$$

$$\therefore \qquad P_{av} = E_v\, I_v \cdot \frac{R}{\sqrt{R^2 + (\omega L - 1/\omega C)^2}}$$

3.14. WATTLESS CURRENT

We know that average power of a.c. circuit is given by

$$P_{av} = E_v\, I_v \cos\phi,$$

where ϕ is the phase angle between r.m.s. value of e.m.f. and current in the a.c. circuit. Suppose that E_v leads I_v by phase angle ϕ as shown in Fig. 3.22. It can be assumed that I_v is the vector sum of two perpendicular components $I_v \cos\phi$ and $I_v \sin\phi$. Let us calculate power consumed due to each of the two components :

(i) Since phase angle between E_v and $I_v \cos\phi$ is zero, average power consumed in the circuit due to component $I_v \cos\phi$ is given by

$$P_{av}' = E_v\,(I_v \cos\phi)\cos 0° = E_u\, I_v \cos\phi$$

(ii) Since phase angle between E_v and $I_v \sin\phi$ is $\pi/2$, average power consumed in the circuit due to component $I_v \sin\phi$ is given by

$$P_{av}'' = E_v\,(I_v \sin\phi)\cos\frac{\pi}{2} = 0$$

Thus, the average power consumed in a.c. circuit is wholly due to the component $I_v \cos\phi$ of the alternating current and the component $I_v \sin\phi$ does not contribute to consumption of power in the a.c. circuit. As the component $I_v \sin\phi$ of the current does not contribute to the power, it is called the ***idle*** or ***wattless component*** of a.c.

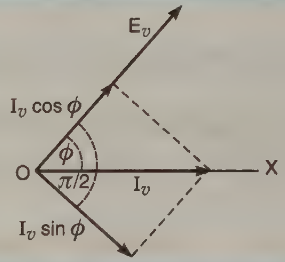

Fig. 3.22

3.15. ADVANTAGES AND DISADVANTAGES OF A.C. OVER D.C.

Advantages. 1. The generation of a.c. is found to be economical than that of d.c.

2. The alternating voltages can be easily stepped up or stepped down by using a transformer.

3. The alternating currents can be regulated by using a choke coil without any significant wastage of electrical energy.

4. The alternating voltages can be transmitted to distant places at a very small loss of the electric power.

5. Further, a.c. can be easily converted into d.c. by using rectifiers.

Disadvantages. 1. The a.c. supply is more fatal and dangerous than d.c. in terms of shock received due to them.

2. The alternating current always flows on the outer layer of the wire. It is called *skin effect*. Therefore, for use in a.c. circuits ; instead of a single thick wire, the wire for its use on a.c. supply is prepared by putting a number of thin wires together. As such, the alternating current flows through all the wires and the skin effect is avoided.

3. The alternating current cannot be used in electrolytic processes, such as electroplating, electrotyping, etc.

SOLVED NUMERICAL PROBLEMS

Type A. On Mean and R.M.S. Value of a.c.

Problem 3.01. The electric mains in a house is marked as 220 V, 50 c.p.s. Write down the equation for the instantaneous voltage.

Sol. Effective virtual value of voltage, $E_v = 220$ V ; frequency, $f = 50$ c.p.s.

Now, peak value of voltage,

$$E_0 = \sqrt{2}\,E_v = \sqrt{2} \times 220 = 311 \cdot 08 \approx 311 \text{ V}$$

Therefore, instantaneous value of voltage,

$$E = E_0 \sin 2\pi f t = 311 \sin (2\pi \times 50\, t)$$

or $$E = 311 \sin 100\, \pi t$$

Problem 3.02. The equation of alternating current for circuit is given by

$$I = 50 \cos 100\, \pi t$$

Find (*i*) frequency of a.c. applied (*ii*) mean value of rrent during positive half of the cycle (*iii*) virtual value current and (*iv*) the value of current 1/300 second after it as zero.

Sol. The value of current in an a.c. circuit is given by

$$I = I_0 \cos \omega t = I_0 \cos 2\pi f t$$

Here, $$I = 50 \cos 100\, \pi t$$

Comparing the two equations, we have

$$2\pi f t = 100\, \pi t \qquad ...(i)$$

and $$I_0 = 50 \text{ A} \qquad ...(ii)$$

Using these equations, we have

(*i*) Frequency, $f = \dfrac{100\,\pi t}{2\pi t} = 50$ **c.p.s.**

(*ii*) Mean value of a.c.

$$I_m = 0{\cdot}636\, I_0 = 0{\cdot}636 \times 50 = \mathbf{31{\cdot}8\ A}$$

(*iii*) Virtual value of a.c.,

$$I_v = 0{\cdot}707\, I_0 = 0{\cdot}707 \times 50 = \mathbf{33{\cdot}35\ A}$$

(*iv*) The value of current at time t (= 1/300 s) is given by

$$I = 50 \sin 100 \times \pi \times \frac{1}{300} = 50 \sin \frac{\pi}{3} = 50 \sin 60°$$

$$= 50 \times 0{\cdot}866 = \mathbf{43{\cdot}3\ A}$$

Type B. On a.c. circuit containing resistor

Problem 3.03. A sinusoidal voltage E = 200 sin 314 *t* is pplied to a resistor of 10 Ω resistance. Calculate (*i*) r.m.s. alue of the voltage (*ii*) r.m.s. value of the current, and *iii*) power dissipated as heat in watt. (*C.B.S.E. 1998*)

Sol. Here, R = 10 Ω

Instantaneous value of voltage,

$$E = 200 \sin 314\, t \qquad ...(i)$$

But instantaneous e.m.f. in a.c. circuit,

$$E = E_0 \sin \omega t \qquad ...(ii)$$

(*i*) Comparing the equations (*i*) and (*ii*), we have

$$E_0 = 200 \text{ V}$$

(*ii*) Therefore, r.m.s. value of voltage,

$$E_v = \frac{E_0}{\sqrt{2}} = \frac{200}{\sqrt{2}} = \mathbf{141{\cdot}4\ V}$$

The r.m.s. value of current,

$$I_v = \frac{E_v}{R} = \frac{141{\cdot}4}{10} = \mathbf{14{\cdot}14\ A}$$

(*iii*) Average power dissipated as heat,

$$P_{av} = E_v I_v = 141{\cdot}4 \times 14{\cdot}14 = \mathbf{2{,}000\ W}$$

Type C. On a.c. circuit containing inductor

Problem 3.04. A pure inductance of 1·0 H is connected across a 110 V, 70 Hz source. Find (*a*) reactance (*b*) current (*c*) peak value of current. (*I.S.C.E. 1997*)

Sol. Here, L = 1·0 H ; E_v = 110 V ; *f* = 70 Hz

(*a*) Now, $X_L = \omega L = 2\pi f L$

$$= 2 \times \frac{22}{7} \times 70 \times 1{\cdot}0 = \mathbf{440\ \Omega}$$

(*b*) Current through inductance,

$$I_v = \frac{E_v}{X_L} = \frac{110}{440} = \mathbf{0{\cdot}25\ A}$$

(*c*) Peak value of current,

$$I_0 = \sqrt{2}\, I_v = \sqrt{2} \times 0{\cdot}25$$

$$= \mathbf{0{\cdot}354\ A}$$

Problem 3.05. The current through a coil of inductance 2 mH is represented by I = 0·2 sin 200 *t* ampere. Calculate the maximum value of the induced current. (*P.S.S.C.E. 2001*)

Sol. Here, L = 2 mH = 2×10^{-3} H ;

and $$I = 0{\cdot}2 \sin 200\, t \qquad ...(i)$$

The instantaneous value of alternating current is given by

$$I = I_0 \sin \omega t \qquad ...(ii)$$

Comparing equation (*i*) and (*ii*), we have

$$\therefore \quad \omega = 200 \text{ rad s}^{-1}$$

The inductive reactance,

$$X_L = \omega L = 200 \times 2 \times 10^{-3} = 0{\cdot}4\ \Omega$$

The induced e.m.f. (in magnitude) produced in the coil,

$$e = L \frac{dI}{dt} = 2 \times 10^{-3} \times \frac{d}{dt}(0{\cdot}2 \sin 200\, t)$$

$$= 2 \times 10^{-3} \times 0{\cdot}2 \times \cos 200\, t \times 200$$

$$= 0{\cdot}08 \cos 200\, t$$

Therefore, maximum value of induced e.m.f.,

$$e_0 = 0{\cdot}08 \text{ V}$$

Hence, maximum value of induced current,

$$I_0 = \frac{e_0}{X_L} = \frac{0{\cdot}08}{0{\cdot}4} = \mathbf{0{\cdot}2\ A}$$

Type D. On a.c. circuit containing capacitor

Problem 3.06. Find the virtual value of current through a capacitor of capacitance 10 μF, when connected to a source of 110 volt at 50 cycles supply. What is its reactance ?

Sol. Here, C = 10 μF = 10×10^{-6} F ; *f* = 50 cycles s^{-1} ;

E_v = 110 volt ;

Now, $$X_C = \frac{1}{2\pi f C} = \frac{1}{2\pi \times 50 \times 10 \times 10^{-6}}$$

$$= \mathbf{318{\cdot}3\ ohm}$$

Now, $$I_v = \frac{E_v}{X_C} = \frac{110}{318{\cdot}3} = \mathbf{0{\cdot}346\ A}$$

Type E. On LR–Circuit

Problem 3.07. A coil of inductance 4/π henry is joined in series with a resistance of 30 ohm. Calculate the current flowing in the circuit, when connected to a.c. mains of 200 volt and frequency 50 Hz.

Sol. Here, L = 4/π henry ; R = 30 ohm ;

E_v = 200 volt ; *f* = 50 Hz ;

Inductive reactance,

$$X_L = \omega L = 2\pi f L = 2\pi \times 50 \times \frac{4}{\pi} = 400\ \Omega$$

Now, impedance of L R-circuit,

$$Z = \sqrt{R^2 + (\omega L)^2}$$

$$= \sqrt{(30)^2 + (400)^2} = \sqrt{160900} = 401{\cdot}1\ \Omega$$

Therefore, current in the circuit is given by

$$I_v = \frac{E_v}{Z} = \frac{200}{401{\cdot}1} = \mathbf{0{\cdot}499\ ampere}$$

Problem 3.08. When 100 volt d.c. is applied across a coil, a current of 1 ampere flows through it. When 100 volt a.c. at 50 cycle s^{-1} is applied to the same coil, only 0·5 ampere current flows. Calculate the resistance, the impedance and the inductance of the coil.

Sol. *In d.c. circuit* : The ohmic resistance of the coil,

$$R=\frac{E}{I}=\frac{100}{1}=\mathbf{100\ ohm}$$

In a.c. circuit : Impedance of the coil,

$$Z=\frac{E_v}{I_v}=\frac{100}{0\cdot5}=\mathbf{200\ ohm}$$

Thus, impedance of the coil for a.c. is greater than its ohmic resistance for d.c. It means that the coil has both inductive reactance X_L and the ohmic resistance R.

Now, $Z=\sqrt{R^2+X_L{}^2}$

or $X_L{}^2=Z^2-R^2=(200)^2-(100)^2$

$=40000-10000=30000$

or $X_L=\sqrt{3}\times100=173\cdot2$ ohm

But $X_L=2\pi fL$

$\therefore$ $L=\frac{X_L}{2\pi f}=\frac{173\cdot2}{2\times3\cdot14\times50}=\mathbf{0\cdot55\ henry}$

Problem 3.09. A coil of inductance 0·50 H and resistance 100 Ω is connected is a 240 V, 50 Hz a.c. supply. (*a*) What is the maximum current in the coil ? (*b*) What is the phase difference between the voltage maximum and current maximum ? (*Text Problem*)

Sol. Here, $L=0\cdot50$ H ; $R=100\ \Omega$; $f=50$ Hz ; $E_v=240$ V ;

(*a*) $$I_v=\frac{E_v}{\sqrt{R^2+\omega^2L^2}}=\frac{E_v}{\sqrt{R^2+(2\pi fL)^2}}$$

$$=\frac{240}{\sqrt{100^2+(2\pi\times50\times0\cdot50)^2}}$$

$$=\frac{240}{\sqrt{10000+24674}}=\frac{240}{186\cdot2}=1\cdot29\ A$$

Now, $I_0=\sqrt{2}\,I_v=\sqrt{2}\times1\cdot29=\mathbf{1\cdot824\ A}$

(*b*) For LR-circuit,

$$\tan\phi=\frac{\omega L}{R}=\frac{2\pi fL}{R}=\frac{2\pi\times50\times0\cdot50}{100}=1\cdot5707$$

or $\phi=\mathbf{57°31'}$ **(e.m.f. leads current)**

Problem 3.10. When an alternating voltage of 220 V is applied across a device X, a current of 0·5 A flows through the circuit and is in phase with the applied voltage. When the same voltage is applied across another device Y, the same current again flows through the circuit, but it lags behind the applied voltage by $\pi/2$ radians. (*a*) Name the devices X and Y. (*b*) Calculate the current flowing in the circuit, when same voltage is applied across the series combination of X and Y. (*C.B.S.E. 1997*)

Sol. (*a*) The current and voltage are in phase with each other, when alternating voltage is applied across a resistor. Hence, the **device X is a resistor.**

Obviously, $R=\frac{E_v}{I_v}=\frac{220}{0\cdot5}=440\ \Omega$

The current lags behind the voltage by phase angle $\pi/2$, when alternating voltage is applied across an inductor. Hence, the **device Y is an inductor.**

Obviously, $X_L=\frac{E_v}{I_v}=\frac{220}{0\cdot5}=440\ \Omega$

(*b*) Here, $E_v=220$ V ; $R=440\ \Omega$; $X_L=440\ \Omega$

If Z is impedance of LR-circuit, then

$$Z=\sqrt{R^2+X_L^2}=\sqrt{440^2+440^2}=440\sqrt{2}\ \Omega$$

Therefore, current in the LR-circuit,

$$I_v=\frac{E_v}{Z}=\frac{220}{440\sqrt{2}}=\mathbf{0\cdot354\ A}$$

Problem 3.11. An inductance coil has a reactance o 100 Ω. When a.c. signal of frequency 1000 Hz is applied t the coil, the applied voltage leads the current by 45 Calculate the self inductance of the coil. (*C.B.S.E. 1998 S*

Sol. Since voltage applied across the inductance lead the current by 45° (and not by 90°), the given inductance i not a pure inductance.

The given inductance behaves as a series combinatio of L and R. If Z is impedance of the given inductance and is the phase angle by which applied voltage leads the curren then

$$Z=\sqrt{R^2+X_L^2}\qquad ...(i$$

and $$\tan\phi=\frac{X_L}{R}\qquad ...(ii$$

Here, $Z=100\ \Omega$; $\phi=45°$

From equation (*i*), we have

$$\sqrt{R^2+X_L^2}=100\qquad ...(iii$$

Also, from equation (*ii*), we have

$$\tan45°=\frac{X_L}{R}\quad \text{or}\quad 1=\frac{X_L}{R}$$

or $R=X_L$

Substituting for R in equation (*iii*), we have

$$\sqrt{X_L^2+X_L^2}=100\quad \text{or}\quad \sqrt{2}\,X_L=100$$

or $X_L=70\cdot01\ \Omega$

If L is self inductance of the coil, then

$X_L=2\pi fL$

or $L=\frac{X_L}{2\pi f}=\frac{70\cdot71}{2\pi\times1000}=\mathbf{1\cdot1254\times10^{-2}\ H}$

Type F. On CR-circuit

Problem 3.12. A series circuit contains a resistor o 10 Ω, a capacitor and an ammeter of negligible resistance It is connected to a source of 220 V-50 Hz. If the reading o an ammeter is 2·0 A, calculate the reactance of the capacito (*P.S.S.C.E. 1998*

Sol. Here, $R=10\ \Omega$; $E_v=220$ V ; $f=50$ Hz ; $I_v=2\cdot0$ A ;

If Z is impedance of C R-circuit, then

$$Z=\frac{E_v}{I_v}=\frac{220}{2\cdot0}=110\ \Omega$$

But $Z=\sqrt{R^2+X_C^2}$

or $X_C=\sqrt{Z^2-R^2}=\sqrt{110^2-10^2}=\sqrt{120\times100}$

$=109\cdot54\ \Omega$

Problem 3.13. A circuit consists of a resistance 10 ohm and a capacitance 0·1 μF. If an alternating e.m.f. of 100 volt 50 Hz is applied, calculate the current in the circuit.

Sol. Here, $R=10\ \Omega$; $C=0\cdot1\ \mu F=0\cdot1\times10^{-6}$ F ;

$E_v=100$ volt ; $f=50$ Hz

The impedance of the C R-circuit is given by

$$Z = \sqrt{R^2 + (1/\omega C)^2} = \sqrt{R^2 + (1/2\pi f C)^2}$$

$$= \sqrt{(10)^2 + \left(1/2\pi \times 50 \times 0\cdot1 \times 10^{-6}\right)^2}$$

$$= \sqrt{(10)^2 + \left(10^5/\pi\right)^2} = 31831\ \Omega$$

Now, $I_v = \dfrac{E_v}{Z} = \dfrac{100}{31831} = 3{\cdot}142 \times 10^{-3}$ **A**

Problem 3.14. A 100 μF capacitor in series with a 40 Ω sistance is connected to a 110 V-60 Hz supply. (*a*) What is e maximum current in the circuit ? (*b*) What is the phase g between the current maximum and voltage maximum ? (*Text Problem*)

Sol. Here, $C = 100\ \mu F = 10^{-4}$ F ; $R = 40\ \Omega$;

$E_v = 110$ V ; $f = 60$ Hz

(*a*)
$$I_v = \frac{E_v}{\sqrt{R^2 + 1/\omega^2 C^2}} = \frac{E_v}{\sqrt{R^2 + 1/(2\pi f C)^2}}$$

$$= \frac{110}{\sqrt{40^2 + 1/(2\pi \times 60 \times 10^{-4})^2}}$$

$$= \frac{110}{\sqrt{1600 + 703\cdot62}} = \frac{110}{48} = 2\cdot292 \text{ A}$$

Now, $I_v = \sqrt{2}\, I_0 = \sqrt{2} \times 2\cdot292 = 3{\cdot}24$ **A**

(*b*) For C R-circuit,

$$\tan\phi = \frac{1/\omega C}{R} = \frac{1}{2\pi f C R}$$

$$= \frac{1}{2\pi \times 60 \times 10^{-4} \times 40} = 0\cdot6631$$

∴ **$\phi = 33°33'$ (e.m.f. lags behind the current)**

ype G. On LCR-circuit

Problem 3.15. A capacitor of capacitance 100 μF and coil of resistance 50 Ω and inductance 0·5 H are connected n series with a 110 V-50 Hz source. Calculate the r.m.s. value f the current in the circuit. (*C.B.S.E. 1998*)

Sol. Here, $C = 100\ \mu F = 100 \times 10^{-6} = 10^{-4}$ F ; $R = 50\ \Omega$;

$L = 0{\cdot}5$ H ; $E_v = 110$ V ; $f = 50$ Hz

Impedance of LCR-circuit, $Z = \sqrt{R^2 + (X_L - X_C)^2}$

or
$$Z = \sqrt{R^2 + (2\pi f L - 1/2\pi f C)^2}$$

$$= \sqrt{50^2 + \left(2\pi \times 50 \times 0\cdot5 - 1/2\pi \times 50 \times 10^{-4}\right)^2}$$

$$= \sqrt{50^2 + (157\cdot08 - 31\cdot83)^2} = \sqrt{50^2 + (125\cdot25)^2}$$

$$= \sqrt{2500 + 15687\cdot6}$$

or $Z = 134{\cdot}86\ \Omega$

If I_v is r.m.s. value of current in the circuit, then

$$I_v = \frac{E_v}{Z} = \frac{110}{134\cdot86} = \mathbf{0{\cdot}816\ A}$$

Problem 3.16. A 25 μF capacitor, 0·1 henry inductor and a 25·0 ohm resistor are connected in series with a source, whose e.m.f. is given by :

E = 310 cos 314 *t* volt

(*a*) What is the frequency of the e.m.f. ? (*b*) What is the reactance of the circuit ? (*c*) What is the impedance of the circuit ? (*d*) What is the current in the circuit ? (*e*) What is the phase angle of the current by which it leads or lags the applied e.m.f. ? (*f*) What is the expression for the instantaneous value of current in the circuit ? (*g*) What are the effective voltages across the capacitor, inductor and the resistor ? (*h*) What value of inductance will make the impedance of the circuit minimum ? (*Text Problem*)

Sol. Here, $L = 0{\cdot}1$ H ; $C = 25\ \mu F = 25 \times 10^{-6}$ F ; $R = 25\ \Omega$

Also, the e.m.f. of the source is given by

$$E = 310 \cos 314\, t \qquad \ldots(i)$$

The instantaneous value of alternative e.m.f. is given by

$$E = E_0 \cos 2\pi f t \qquad \ldots(ii)$$

Comparing the equations (*i*) and (*ii*), we have

(*a*) Frequency, $f = \dfrac{314}{2\pi} = \dfrac{314}{2 \times 3\cdot14} =$ **50 cycles s^{-1}**

(*b*) Inductive reactance, $X_L = 2\pi f L = 2 \times 3{\cdot}14 \times 50 \times 0{\cdot}1$

$= 31{\cdot}4\ \Omega$

Capacitive reactance, $X_C = \dfrac{1}{2\pi f C}$

$$= \frac{1}{2 \times 3\cdot14 \times 50 \times 25 \times 10^{-6}} = 127\cdot4\ \Omega$$

Net reactance of the circuit, $X_C - X_L = 127{\cdot}4 - 31{\cdot}4 =$ **96 Ω**

As $X_C > X_L$, the net reactance is ***capacitive.***

(*c*) Impedance of the circuit,

$$Z = \sqrt{R^2 + (X_C - X_L)^2}$$

$$= \sqrt{(25)^2 + (96)^2} = \mathbf{99{\cdot}2\ \Omega}$$

(*d*) Also, from equations (*i*) and (*ii*), $E_0 = 310$ V

Therefore, virtual voltage, $E_v = \dfrac{E_0}{\sqrt{2}} = \dfrac{310}{\sqrt{2}} = 219{\cdot}2$ V

Hence, virtual current, $I_v = \dfrac{E_v}{Z} = \dfrac{219\cdot2}{99\cdot2} =$ **2·21 A**

(*e*) The phase angle ϕ is given by

$$\tan\phi = \frac{X_C - X_L}{R} = \frac{96}{25} = 3\cdot84$$

or $\phi = 75\cdot4° = \dfrac{7\cdot54 \times \pi}{180} =$ **1·316 rad**

As $X_C > X_L$, the current ***leads*** the voltage by the angle ϕ as obtained above.

(*f*) The instantaneous current is given by

$$I = I_0' \cos(2\pi f t - \phi) = \frac{E_0}{Z} \cos(314\, t - 1\cdot316)$$

$$= \frac{310}{99\cdot2} \cos(314\, t - 1\cdot316)$$

or **$I = 3{\cdot}125 \cos(314\, t - 1{\cdot}316)$**

(*g*) Voltage across capacitor $= I_v X_C = 2{\cdot}21 \times 127{\cdot}4$

= 281·6 V

Voltage across inductor $= I_v X_L = 2{\cdot}21 \times 31{\cdot}4 =$ **69·4 V**

Voltage across resistor $= I_v R = 2{\cdot}21 \times 25 =$ **55·25 V** (*h*) For impedance of the circuit to be minimum,

$$\omega L = 1/\omega C$$

Therefore, the required value of inductance,

$$L = \frac{1}{\omega^2 C} = \frac{1}{(2\pi f)^2 C}$$

$$= \frac{1}{(2\pi \times 50)^2 \times 25 \times 10^{-6}} = \mathbf{0{\cdot}405\ H}$$

Type H. On Resonance

Problem 3.17. A capacitor, a 5 Ω resistor and 101· 5 mH inductor are placed in series with a 50 Hz a.c. source. Calculate the capacitance of the capacitor, if the current is observed in phase with the voltage. (*C.B.S.E. 1992*)

Sol. When in an LCR-circuit, the current and e.m.f. are in phase with each other

$$\therefore \qquad \omega L = 1/\omega C$$

$$\text{or} \qquad C = \frac{1}{\omega^2 L} = \frac{1}{(2\pi f)^2 L}$$

Here, $f = 50$ Hz ; L = 101·5 mH = 101·5 × 10^{-3} H ;

Therefore, required capacitance of the capacitor,

$$C = \frac{1}{(2\pi \times 50)^2 \times 101{\cdot}5 \times 10^{-3}}$$

$$= 99{\cdot}8 \times 10^{-6}\ \text{F} \approx \mathbf{100\ \mu F}$$

Problem 3.18. A variable frequency 230 V alternating voltage source is connected across a series combination of L = 5 H, C = 80 μF and R = 40 Ω. Calculate (*a*) the angular frequency of the source which derives the circuit in resonance, (*b*) the impedance of the circuit and (*c*) amplitude of the current at resonance. (*C.B.S.E. 2001 S*)

Sol. Here, E_v = 230 V ; L = 5 H ;

C = 80 μF = 80 × 10^{-6} F and R = 40 Ω

(*a*) For an LCR-circuit to be in resonance,

$$X_L = X_C \quad \text{or} \quad 2\pi f L = 1/2\pi f C$$

$$\text{or} \qquad f = \frac{1}{2\pi\sqrt{LC}} = \frac{1}{2\pi\sqrt{5 \times 80 \times 10^{-6}}}$$

$$= \mathbf{7{\cdot}96\ Hz}$$

(*b*) Impedance of the circuit,

$$Z = \sqrt{R^2 + (X_L - X_C)^2}$$

Since $X_L = X_C$, we have

$$Z = R = \mathbf{40\ \Omega}$$

(*c*) The peak value of e.m.f. of the source,

$$E_0 = \sqrt{2}\, E_v = 230\sqrt{2}\ \text{V}$$

Therefore, amplitude of the current at resonance

$$= \frac{E_0}{R} = \frac{230\sqrt{2}}{40} = \mathbf{8{\cdot}13\ A}$$

Problem 3.19. A 2 μF capacitor, 100 Ω resistor and 8 H inductor are connected in series with an a.c. source. What should be the frequency of this a.c. source, for which the current drawn in the circuit is maximum ? If the peak value of e.m.f. of the source is 200 V, find for maximum current, (*i*) the inductive and capacitive reactances of the circuit ; (*ii*) total impedance of the circuit ; (*iii*) peak value of current in the circuit ; (*iv*) the phase relation between voltages across inductor and resistor ; (*v*) the phase differen between voltages across inductor and capacitor. (*I.S.C.E. 199*

Sol. Here, C = 2 μF = 2 × 10^{-6} F ; R = 100 Ω ; L = 8 H ;

E_0 = 200 V

The current in the circuit becomes maximum, whe frequency of the a.c. source becomes equal to the resonar frequency f_0.

The resonant frequency,

$$f_0 = \frac{1}{2\pi\sqrt{LC}} = \frac{1}{2\pi\sqrt{8 \times 2 \times 10^{-6}}} = \mathbf{39{\cdot}79\ H}$$

(*i*) X_L (or X_C) at resonant frequency

$$= 2\pi f_0 L = 2\pi \times 39{\cdot}79 \times 8 = \mathbf{2000\ \Omega}$$

(*ii*) Total impedance of the circuit at resonant frequenc is simply equal to ohmic resistance in the circuit *i.e.* **100 Ω**

(*iii*) Peak value of current, $I_0 = \frac{E_0}{Z} = \frac{E_0}{R} = \frac{200}{100} = \mathbf{2\ A}$

(*iv*) The voltages across inductor and resistor differ phase by **90°.**

(*v*) The voltages across inductor and capacitor differ phase by **180°.**

Problem 3.20. A series LCR-circuit is connected to a a.c. source (220 V-50 Hz) as shown in Fig. 3.23. If the re dings of the three voltmeter V_1, V_2 and V_3 are 65 V, 415 and 204 V respectively, calculate (*i*) the current in the circui (*ii*) the value of the inductor L ; (*iii*) the value of the capacit C ; and (*iv*) the value of C (for the same L) required produce resonance. (*I.S.C.E. 199*

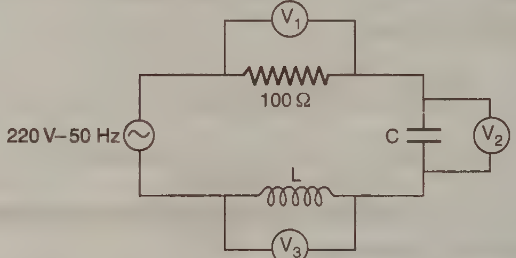

Fig. 3.23

Sol. Here, E_v = 220 V ; f = 50 Hz ; R = 100 Ω

V_R = 65 V ; V_C = 415 V ; V_L = 204 V ;

(*i*) Let I_v be r.m.s. value of current in the circuit. Ther

$$V_R = I_v R$$

$$\text{or} \qquad I_v = \frac{V_R}{R} = \frac{65}{100} = \mathbf{0{\cdot}65\ A}$$

$$(ii) \qquad V_L = I_v X_L$$

$$\text{or} \qquad X_L = \frac{V_L}{I_v} = \frac{204}{0{\cdot}65} = 313{\cdot}85\ \Omega$$

$$\text{Now,} \qquad X_L = 2\pi f L$$

$$\therefore \qquad L = \frac{X_L}{2\pi f} = \frac{313{\cdot}85}{2\pi \times 50} = \mathbf{1{\cdot}0\ H}$$

(*iii*) Again, $V_C = I_v X_C$

$$\text{or} \qquad X_C = \frac{V_C}{I_v} = \frac{415}{0{\cdot}65} = 638{\cdot}46\ \Omega$$

$$\text{Now,} \qquad X_C = \frac{1}{2\pi f C}$$

$$\therefore \quad C = \frac{1}{2\pi f X_C}$$

$$= \frac{1}{2\pi \times 50 \times 638\cdot 46} = 5 \times 10^{-6} = \mathbf{5\ \mu F}$$

(*iv*) If C′ is capacitance of the capacitor that will produce nance with inductor (L = 1·0 H), then

$$f = \frac{1}{2\pi\sqrt{LC'}}$$

$$\text{or} \quad C' = \frac{1}{4\pi^2 f^2 L} = \frac{1}{4\pi^2 \times (50)^2 \times 1\cdot 0}$$

$$= 10\cdot 1 \times 10^{-6}\ \text{F} = \mathbf{10\cdot 1\ \mu F}$$

Problem 3.21. Obtain the resonant frequency and actor of a series L C R-circuit with L = 3·0 H, C = 27 μF R = 7·4 Ω. *(Text Problem)*

Sol. Here, L = 3·0 H ; C = 27 μF = 27 × 10⁻⁶ F ;

$R = 7\cdot 4\ \Omega$;

Resonant angular frequency,

$$\omega_0 = \frac{1}{\sqrt{LC}} = \frac{1}{\sqrt{3\cdot 0 \times 27 \times 10^{-6}}} = \mathbf{111\cdot 1\ rad\ s^{-1}}$$

$$\text{Q-factor} = \frac{1}{R}\sqrt{\frac{L}{C}} = \frac{1}{7\cdot 4}\sqrt{\frac{3\cdot 0}{27 \times 10^{-6}}} = \mathbf{45\cdot 05}$$

pe I. On Power of a.c. circuit

Problem 3.22. Find the power consumed in a circuit ving a resistance of 30 ohm in series with an inductance 40 ohm in series with an a.c. with peak current of mpere and peak voltage of 220 volt.

Sol. Here, R = 30 ohm ; $X_L = 40$ ohm

Therefore, impedance of the LR-circuit,

$$Z = \sqrt{R^2 + X_L{}^2} = \sqrt{(30)^2 + (40)^2} = \sqrt{900 + 1600}$$

$$= \sqrt{2500} = 50 \text{ ohm}$$

$$\text{Power factor, } \cos\phi = \frac{R}{Z} = \frac{30}{50} = 0\cdot 6$$

Now, $E_0 = 220$ volt ; $I_0 = 1$ ampere

$$\therefore \quad P_{av} = E_v I_v \cos\phi$$

$$= \frac{E_0}{\sqrt{2}} \times \frac{I_0}{\sqrt{2}} \cos\phi = \frac{220 \times 1 \times 0\cdot 6}{\sqrt{2} \times \sqrt{2}} = \mathbf{66\ watt}$$

Problem 3.23. An alternating e.m.f. of 100 V (r.m.s.), Hz is applied across a capacitor of 10 μF and a resistor 100 Ω in series. Calculate (*a*) the reactance of the pacitor ; (*b*) the current flowing ; (*c*) the average power pplied. *(I.S.C.E. 1996)*

Sol. Here, $E_v = 100$ V ; $f = 50$ Hz ;

$C = 10\ \mu F = 10 \times 10^{-6} = 10^{-5}$ F ; R = 100 Ω

(*a*) Capacitive reactance,

$$X_C = \frac{1}{\omega C} = \frac{1}{2\pi f C} = \frac{1}{2\pi \times 50 \times 10^{-5}}$$

$$= \mathbf{318\cdot 31\ \Omega}$$

(*b*) Current through the capacitor,

$$I_v = \frac{E_v}{X_C} = \frac{100}{318\cdot 31} = \mathbf{0\cdot 314\ A}$$

(*c*) Average power supplied,

$$P_{av} = E_v I_v \cos\phi = E_v I_v \cdot \frac{R}{\sqrt{R^2 + X_C{}^2}}$$

$$\text{or} \quad P_{av} = 100 \times 0\cdot 314 \times \frac{100}{\sqrt{100^2 + (318\cdot 31)^2}}$$

$$= \frac{3\cdot 14 \times 10^3}{333\cdot 65} = \mathbf{9\cdot 14\ W}$$

Problem 3.24. A 60 volt, 10 watt lamp is to be run on 100 volt-60 hertz a.c. mains. Calculate (*i*) the inductance of the choke required. (*ii*) If resistance is to be used instead of choke, what will be its value ? (*iii*) What will be the disadvantage in the latter case ?

Sol. Here, voltage marked on the lamp = 60 volt ;

power marked on the lamp = 10 watt

Therefore, current rating of the lamp

$$= \frac{\text{power}}{\text{voltage}} = \frac{10}{60} = \frac{1}{6} \text{ ampere}$$

$$\text{Resistance of the lamp, } R = \frac{60}{1/6} = 360 \text{ ohm}$$

When lamp is worked on 100 V a.c. :

$E_v = 100$ volt ; $f = 60$ Hz

Let Z be the impedance, which would maintain a current of 1/6 ampere through the lamp, when it is run on 100 volt a.c. Then,

$$Z = \frac{E_v}{1/6} = 100 \times 6 = 600 \text{ ohm}$$

(*i*) If L is the required inductance, then

$$Z = \sqrt{R^2 + (2\pi f L)^2}$$

$$\text{or} \quad L = \frac{\sqrt{Z^2 - R^2}}{2\pi f} = \frac{\sqrt{(600)^2 - (360)^2}}{2\pi \times 60}$$

$$= \frac{\sqrt{960 \times 240}}{2\pi \times 60} = \frac{240 \times 2}{2\pi \times 60} = \frac{4}{\pi} = \mathbf{1\cdot 273\ henry}$$

(*ii*) Let R′ be the resistance connected in series to lamp (360 ohm), which will maintain a current of 1/6 ampere, when the lamp is worked on 100 volt a.c. Then,

$$R' + 360 = \frac{100}{1/6} = 600$$

$$\text{or} \quad R' = 600 - 360 = \mathbf{240\ ohm}$$

(*iii*) If resistance is used in place of inductance, the **electrical energy will be wasted** in the form of heat across the additional resistance (R′).

Problem 3.25. A 20 watt, 50 volt filament is connected in series to an a.c. mains of 250 volt-50 hertz. Calculate the value of the capacitor required to run the lamp.

Sol. Here, voltage marked on the lamp = 50 volt ;

power marked on the lamp = 20 watt

Therefore, current rating of the lamp,

$$I = \frac{\text{power}}{\text{voltage}} = \frac{20}{50} = 0\cdot 4 \text{ ampere}$$

$$\text{Resistance of the lamp, } R = \frac{50}{0\cdot 4} = 125 \text{ ohm}$$

When lamp is worked on 250 V a.c. :

$E_v = 250$ volt ; $f = 50$ hertz

Let Z be the impedance, which will maintain a current of 0·4 ampere, when the lamp is run on 250 volt a.c. Then,

$$Z = \frac{E_v}{0\cdot 4} = \frac{250}{0\cdot 4} = 625 \text{ ohm}$$

If C is the required capacitance, then

$$Z=\sqrt{R^2+(1/2\pi f C)^2}$$

or $$C=\frac{1}{2\pi f\sqrt{Z^2-R^2}}=\frac{1}{2\pi\times50\times\sqrt{(625)^2-(125)^2}}$$

$$=\frac{1}{2\pi\times50\times250\sqrt{6}}$$

$= 5{\cdot}198 \times 10^{-6}$ F

Problem 3.26. A circuit consists of a non-inductive resistance of 50 ohm, an inductance of 0·3 henry and a capacitor of 40 microfarad in series and supplied with a current of 200 volt-50 hertz. Find the impedance and power in the circuit. Take $\pi = 3{\cdot}142$.

Sol. Here, $E_v = 200$ volt ; $f = 50$ hertz ; R = 50 ohm ;
$L = 0{\cdot}3$ henry ; $C = 40\ \mu F = 40 \times 10^{-6}$ F ;

Now, inductive reactance, $X_L = 2\pi f L$
$= 2 \times 3{\cdot}142 \times 50 \times 0{\cdot}3 = 94{\cdot}26$ ohm

Capacitive reactance,

$$X_L=\frac{1}{2\pi f C}=\frac{1}{2\times3{\cdot}142\times50\times40\times10^{-6}}$$

$$=\frac{10^3}{2\times3{\cdot}142\times2}=\frac{250}{3{\cdot}142}=79{\cdot}57\text{ ohm}$$

The impedance of the LCR-circuit is given by

$$Z=\sqrt{R^2+(X_L-X_C)^2}$$

$$=\sqrt{(50)^2+(94{\cdot}26-79{\cdot}57)^2}$$

$$=\sqrt{(50)^2+(14{\cdot}69)^2}=\mathbf{52{\cdot}11\ ohm}$$

Now, $$I_v=\frac{E_v}{Z}=\frac{200}{52{\cdot}11}=3{\cdot}838\text{ ampere}$$

The power factor, $$\cos\phi=\frac{R}{Z}=\frac{50}{52{\cdot}11}=0{\cdot}9595$$

Therefore, average power,

$P_{av} = E_v I_v \cos\phi = 200 \times 3{\cdot}838 \times 0{\cdot}9595$
$= \mathbf{736{\cdot}5\ watt}$

Problem 3.27. A 200 V variable frequency a.c. sourc is connected to a series combination of L = 5 H, C = 80 μ and R = 40 Ω. Calculate (*a*) angular frequency of the sourc to get maximum current in the circuit, (*b*) the curren amplitude at resonance and (*c*) the power dissipation in th circuit. (*C.B.S.E. 200*

Sol. Here, $E_v = 200$ V ; L = 5 H ;
$C = 80\ \mu F = 80 \times 10^{-6}$ F and R = 40 Ω

(*a*) For maximum current (or resonance) in the circui

$$X_L = X_C$$

Let ω_0 be the angular frequency of the source th provides maximum current in the circuit. Then,

$$\omega_0 L=\frac{1}{\omega_0 C}\quad\text{or}\quad\omega_0=\frac{1}{\sqrt{LC}}$$

or $$\omega_0=\frac{1}{\sqrt{5\times80\times10^{-6}}}=\mathbf{50\ rad\ s^{-1}}$$

(*b*) At resonance, the impedance of LCR-circuit is equ to the ohmic resistance in the circuit. Therefore, r.m.s. value of current at resonance,

$$I_v=\frac{E_v}{R}=\frac{200}{40}=5\text{ A}$$

Therefore, current amplitude at resonance,

$$I_0=\sqrt{2}\,I_v=\sqrt{2}\times5=\mathbf{7{\cdot}07\ A}$$

(*c*) Now, $P_{av} = E_v I_v \cos\phi$

Since at resonance, the circuit is purely resistive, $\phi = 0$

Therefore, average power consumed in the circuit,

$P_{av} = 200 \times 5 \times \cos 0° = \mathbf{1000\ W}$

abc TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 3.28. In an LCR-circuit, a variable frequency 230 V source is connected to L = 5·0 H, C = 80 μF, R = 40 Ω.

(*a*) Determine the source frequency, which drives the circuit in resonance.

(*b*) Obtain the impedance of the circuit and the amplitude of current at the resonating frequency.

(*c*) Determine the r.m.s. potential drops across the three elements of the circuit. Show that the potential drop across the LC-combination is zero at the resonating frequency.

(*C.B.S.E. 1998 ; Text Problem*)

Sol. Here, L = 5·0 H ; $C = 80\ \mu F = 80 \times 10^{-6}$ F ; R = 40 Ω ;
$E_v = 230$ V

(*a*) The resonant angular frequency ω_0 is given by

$$\omega_0=\frac{1}{\sqrt{LC}}=\frac{1}{\sqrt{5{\cdot}0\times80\times10^{-6}}}=\mathbf{50\ rad\ s^{-1}}$$

(*b*) At resonance, impedance of the LCR-circuit is simply equal to R.

Therefore, at resonance, Z = R = **40 Ω**

Therefore, r.m.s. value of current at resonance frequenc

$$I_v=\frac{E_v}{R}=\frac{230}{40}=5{\cdot}75\text{ A}$$

Hence, current amplitude at resonant frequency,

$$I_0=\sqrt{2}\,I_v=\sqrt{2}\times5{\cdot}75=\mathbf{8{\cdot}13\ A}$$

(*c*) R.M.S. potential drop across R
$= I_v R = 5{\cdot}75 \times 40 = \mathbf{230\ V}$

R.M.S. potential drop across L
$= I_v \omega_0 L = 5{\cdot}75 \times 50 \times 5{\cdot}0 = \mathbf{1437{\cdot}5\ V}$

R.M.S. potential drop across C

$$=I_v(1/\omega_0 C)=\frac{5{\cdot}75}{50\times80\times10^{-6}}=\mathbf{1437{\cdot}5\ V}$$

R.M.S. potential drop across LC
$= I_v(\omega_0 L - 1/\omega_0 C) = 5{\cdot}75\,(1437{\cdot}5 - 1437{\cdot}5) =$

Problem 3.29. A series LCR circuit with L = 0·12 H C = 480 nF, R = 23 Ω is connected to a 230 V variabl frequency supply.

(*a*) What is the source frequency for which current plitude is maximum ? Obtain this maximum value.

(*b*) What is the source frequency for which average wer absorbed by the circuit is maximum ? Obtain the ue of this maximum power. (*Text Problem*)

Sol. Here, $L = 0{\cdot}12\text{ H} ; C = 480\text{ nF} = 480 \times 10^{-9}\text{ F} ;$
$R = 23\ \Omega ; E_v = 230\text{ V}$

(*a*) Current amplitude is maximum at resonant quency. It is given by

$$\omega_0 = \frac{1}{\sqrt{LC}} = \frac{1}{\sqrt{0{\cdot}12 \times 480 \times 10^{-9}}}$$
$$= \mathbf{4166{\cdot}7\ rad\ s^{-1}}$$

$$\text{Now,} \qquad I_v = \frac{E_v}{\sqrt{R^2 + (\omega L - 1/\omega C)^2}}$$

$$\text{or} \qquad I_0 = \frac{\sqrt{2}\,E_v}{\sqrt{R^2 + (\omega L - 1/\omega C)^2}}$$

$$\therefore I_0\ (\text{at } \omega_0) = \frac{\sqrt{2}\,E_v}{R} = \frac{\sqrt{2} \times 30}{23} = \mathbf{14{\cdot}14\ A}$$
$$(\because \omega_0 L - 1/\omega_0 C = 0)$$

(*b*) Average power will also be maximum at resonant equency *i.e.* at **4166·7 rad s^{-1}**

$$P_{av} = E_v I_v . \cos\phi = E_v I_v \times \frac{R}{\sqrt{R^2 + (\omega L - 1/\omega C)^2}}$$

$$\therefore P_{av}\ (\text{at } \omega_0) = E_v I_v \times \frac{R}{\sqrt{R^2 + 0^2}}$$

$$= E_v I_v = 230 \times \frac{14{\cdot}14}{\sqrt{2}} = \mathbf{2300\ W}$$

Problem 3.30. A circuit containing a 80 mH inductor and a 60 μF capacitor in series is connected to a 230 V, Hz supply. The resistance of the circuit is negligible.

(*a*) Obtain the current amplitude and r.m.s. values.

(*b*) Obtain the r.m.s. values of potential drops across each element.

(*c*) What is the average power transferred to the inductor ?

(*d*) What is the average power transferred to the capacitor ?

(*e*) What is the total average power absorbed by the circuit ? (*Text Problem*)

Sol. Here, $L = 80\text{ mH} = 80 \times 10^{-3}\text{ H} ;$
$C = 60\ \mu\text{F} = 60 \times 10^{-6}\text{ F} ; E_v = 230\text{ V} ; f = 50\text{ Hz}$

$$(a) \quad I_v = \frac{E_v}{\omega L - 1/\omega C} = \frac{E_v}{2\pi f L - 1/2\pi f C}$$
$$= \frac{230}{2\pi \times 50 \times 80 \times 10^{-3} - 1/2\pi \times 50 \times 60 \times 10^{-6}}$$
$$= \frac{230}{25{\cdot}13 - 53{\cdot}05} = \frac{230}{27{\cdot}92} = \mathbf{8{\cdot}24\ A}$$

[Take magnitude of (25·13 – 53·05)]

$$\therefore \quad I_0 = \sqrt{2}\,I_v = 2 \times 8{\cdot}24 = \mathbf{11{\cdot}65\ A}$$

(*b*) R.M.S. potential drop across L
$$= I_v\,\omega L = I_v \times 2\pi f L$$
$$= 8{\cdot}24 \times 2\pi \times 50 \times 80 \times 10^{-3} = \mathbf{207{\cdot}\ 1\ V}$$

R.M.S. potential drop across C
$$= I_v \frac{1}{\omega C} = I_v \frac{1}{2\pi f C}$$
$$= 8{\cdot}24 \times \frac{1}{2\pi \times 50 \times 60 \times 10^{-6}} = \mathbf{437{\cdot}1\ W}$$

(*c*) As in inductor, e.m.f. leads current by $\pi/2$,
$$P_{av} = E_v I_v \cos\frac{\pi}{2} = \mathbf{0}$$

(*d*) As in capacitor, e.m.f. lags current by $\pi/2$,
$$P_{av} = E_v I_v \cos\left(-\frac{\pi}{2}\right) = \mathbf{0}$$

(*e*) Total average power absorbed = **0**

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 3.01. What is the frequency of direct current ? (*H.P.S.S.C.E. 1999 S*)

Ans. Zero.

Q. 3.02. The instantaneous current from a.c. source is = 5 sin 314 *t*. What is the peak value of current ? (*H.P.S.S.C.E. 2002*)

Ans. Since $I = I_0 \sin \omega t$, it follows that I_0 = **5 A.**

Q. 3.03. Define the mean value of an alternating urrent. (*P.S.S.C.E. 2001*)

Ans. Refer to section 3.02.

Q. 3.04. Define root mean square value of an alter-ating current. (*P.S.S.C.E. 2001 ; I.S.C.E. 1995*)

Ans. Refer to section 3.03.

Q. 3.05. What is the relation between peak value and oot mean sqare value of alternating e.m.f. ? (*H.S.S.C.E. 2001*)

$$\textbf{Ans. } I_{r.m.s.} = \frac{I_0}{\sqrt{2}}$$

Q. 3.06. The instantaneous current from an a.c. source is I = 6 sin 314 *t*. What is the r.m.s. value of the current ? (*C.B.S.E. 2000, 1996*)

Ans. Since $I = I_0 \sin \omega t$; it follows that $I_0 = 6$ A

$$\therefore I_{r.m.s.} = \frac{I_0}{\sqrt{2}} = \frac{6}{\sqrt{2}} = \mathbf{3\sqrt{2}\ A}$$

Q. 3.07. The electric mains in a house are marked 220 V, 50 Hz. Write down the equation for instantaneous voltage. (*H.S.S.C.E. 2002*)

Ans. Here, $f = 50$ Hz and $E_v = 220$ V

The instantaneous voltage is given by

$$E = E_0 \sin \omega t = \sqrt{2}\,E_v \sin 2\pi f t$$
$$\text{or} \qquad E = \sqrt{2} \times 200 \sin 2\pi \times 50\,t$$
$$= \mathbf{200\sqrt{2} \sin 100\pi t}$$

Q. 3.08. Which value of the current do you measure with an a.c. ammeter ?

Ans. Root mean square value of the current.

Q. 3.09. The divisions marked on the scale of an a.c. ammeter are not equally spaced. Why ?

Ans. An a.c. ammeter is constructed on the basis of heating effect of the electric current. Since the heat produced varies as the square of current (and not directly with current), the divisions marked on the scale are not equally spaced.

Q. 3.10. Why a d.c. voltmeter and d.c. ammeter cannot read a.c. ? *(P.S.S.C.E. 1998 S)*

Ans. It is because, average value of a.c. is zero over a complete cycle.

Q. 3.11. Show that resistance offered by an ideal inductor to the flow of direct current is zero. *(P.S.S.C.E. 1999 S)*

Or

What is the resistance offered by an inductance to d.c. ? *(H.S.S.C.E. 1992)*

Ans. For d.c., $f = 0$.

Therefore, $X_L = 2\pi f L = 2\pi (0) L = 0$

Q. 3.12. With reference to alternating currents and voltages, state any one fundamental difference between 'resistance' and 'reactance'. *(I.S.C.E. 1998)*

Ans. An ohmic resistor has fixed value of resistance, while reactance changes with change in frequency of a.c. supply.

Q. 3.13. The frequency of a.c. is doubled. What happens to X_L ?

Ans. Now, $X_L = 2\pi f L$

Therefore, on doubling the frequency of a.c. supply, X_L also becomes double.

Q. 3.14. Prove that an inductor offers an easy path to d.c. and a resistive path to a.c.

Ans. Inductive reactance, $X_L = \omega L = 2\pi f L$

It follows that X_L is zero for d.c. ($f = 0$) and has a finite value for a.c. Hence, an inductor offers an easy path to d.c. and a resistive path to a.c.

Q. 3.15. What is the phase relationship between current and voltage in an inductor ? *(H.S.S.C.E. 2002, 2001)*

Ans. The current lags behind the voltage by phase angle $\pi/2$.

Q. 3.16. What is meant by the statement that the current through an inductor lags e.m.f. across it by $\pi/2$?

Ans. It means that if at any instant, the e.m.f. is maximum (or minimum) in the circuit, then the current will become so after a time $T/4$, where T is period of a.c.

Q. 3.17. Sketch a graph showing the variation of inductive reactance with frequency of the applied voltage. *(H.S.S.C.E. 2002)*

Ans. Refer to Fig. 3.25.

Q. 3.18. What is capacitive reactance ? Give its SI unit. *(P.S.S.C.E. 1999 S)*

Ans. *The resistance offered by a capacitor in an a.c. circuit is called capacitive reactance.*

Its S.I. unit is **ohm.**

Q. 3.19. Find the reactance of a capacitance C at f Hz. *(I.S.C.E. 1997)*

Ans. Capacitive reactance, $X_C = \dfrac{1}{\omega C} = \dfrac{1}{2\pi f C}$

Q. 3.20. For a very high frequency a.c. supply, a capacitor behaves as a pure conductor. Why ?

Ans. Now, $X_C = \dfrac{1}{2\pi f C}$

When frequency of a.c. supply is high, X_C will be approxi-mately zero *i.e.* capacitor will behave as a conductor

Q. 3.21. A capacitor blocks d.c. but allows a.c. to pass through it. Explain, why. *(H.S.S.C.E. 2001*

Or

Discuss the behaviour of a capacitor in a.c. circuit. *(H.S.S.C.E. 1995*

Ans. Capacitve reactance, $X_C = \dfrac{1}{\omega C} = \dfrac{1}{2\pi f C}$

It follows that capacitive reactance is infinite for d.c ($f = 0$) and has a finite value for a.c. In other words, a capacito serves as a block for d.c. and offers an easy path to a.c.

Q. 3.22. Sketch a graph showing the variation o reactance of a capacitor with frequency of the applie voltage. *(H.S.S.C.E. 2002, C.B.S.E. 2001)*

Ans. Refer to Fig. 3.26.

Q. 3.23. What do you mean by the impedance of LCR circuit ?

Ans. The effective resistance offered to the flow of curren by the LCR-circuit is called its impedance. It is given by

$$Z = \sqrt{R^2 + (\omega L - 1/\omega C)^2}$$

Q. 3.24. What is the phase difference between th voltage across an inductor and a capacitor in an a.c. circuit *(C.B.S.E. 1999*

Ans. 180°.

Q. 3.25. When are the voltage and current in LCR circuit in same phase ? *(H.S.S.C.E. 2002*

Ans. The voltage and current in an LCR-circuit are i same phase, when $X_L = X_C$.

Q. 3.26. When does a series LCR-circuit have minimun impedance ? *(I.S.C.E. 1996*

Ans. At resonance.

Q. 3.27. Give the phase difference between the applie a.c. voltage and the current in an LCR-circuit at resonance *(C.B.S.E. 1997*

Ans. It is zero.

Q. 3.28. If the frequency of the a.c. source in a LCR series circuit is increased, how does the current in the circuit change ? *(C.B.S.E. 1998 S*

Ans. With increase in frequency, current in a.c. circui first increases, attains a maximum value (at resonan frequency) and then decreases.

Q. 3.29. What is the power dissipation in an a.c. circui in which voltage and current are given by

$$E = 300 \sin (\omega t + \pi/2) \quad \text{and} \quad I = 5 \sin \omega t \ ?$$

(C.B.S.E. 2001

Ans. Here, $E_v = \dfrac{300}{\sqrt{2}}$ V ; $I_v = \dfrac{5}{\sqrt{2}}$ A and $\phi = \dfrac{\pi}{2}$

Average power dissipated in the circuit,

$$\therefore \ P_{av} = E_v I_v \cos\phi = \frac{300}{\sqrt{2}} \times \frac{5}{\sqrt{2}} \cos\frac{\pi}{2} = 0$$

Q. 3.30. Define power factor.

(P.S.S.C.E. 2001, 1999 ; H.S.S.C.E. 2001, 1997 S

Ans. The cosine of the phase angle between alternating ent and e.m.f. in an a.c. circuit is called its power factor. , power factor = cos ϕ.

Q. 3.31. What are the maximum and minimum values ower factor of a.c. circuit ? *(P.S.S.C.E. 1999 S)*

Ans. The maximum value of power factor is 1 and the mum value is 0.

Q. 3.32. In an a.c. circuit, there is no power consum- n in an ideal inductor. Explain. *(C.B.S.E. 1998 ; P.S.S.C.E. 1998 S, 1991)*

Or

Prove mathematically that the average power over a plete cycle of alternating current through an ideal ıctor is zero. *(C.B.S.E. 1997)*

Ans. Average power of an a.c. circuit,

$$P_{av} = E_v I_v \cos\phi$$

For a.c. circuit containing an ideal inductor, $\phi = \pi/2$

$$\therefore \qquad P_{av} = E_v I_v \cos \pi/2 = E_v I_v (0) = 0$$

Q. 3.33. How much power is consumed in a (*i*) purely inductive and (*ii*) purely capacitive a.c. circuit ? *(C.B.S.E. 1992)*

Ans. The power consumed is zero in both the cases.

Q. 3.34. In a series LCR circuit, what is the value of power factor at resonance ? *(C.B.S.E. 1999 ; I.S.C.E. 1994)*

Ans. It is unity.

Q. 3.35. Write two advantages of alternating current (a.c.) over direct current (d.c.). *(P.S.S.C.E. 1999 S)*

Ans. Refer to section 3.15.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 3.01. Distinguish between 'average value' and s. value' of an alternating current. *(C.B.S.E. 1997)*

Ans. Refer to sections 3.02 and 3.03.

Q. 3.02. Calculate the r.m.s. value of alternating current wn in Fig. 3.24. *(C.B.S.E. 1998)*

Ans. Since the value of current has either a value of 2 – 2 A with the passage of time, the r.m.s. value of the nating current shown in Fig. 3.24 is also 2 A.

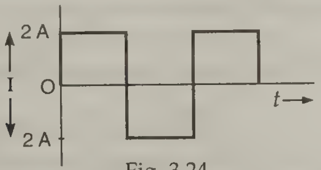

Fig. 3.24

Q. 3.03. Prove mathematically that the average value lternating current over one complete cycle is zero. *(C.B.S.E. 1997)*

Ans. Refer to section 3.02 :

The, average value of alternating current over one plete cycle,

$$I_a = \frac{1}{T}\int_0^T I_0 \sin\omega t\, dt = \frac{I_0}{T}\int_0^T \sin\omega t\, dt$$

$$= \frac{I_0}{T} - \cos\omega t\Big|_0^T = -\frac{I_0}{T}\Big|\cos\omega t\Big|_0^T$$

$$= -\frac{I_0}{T}\left[\cos\frac{2\pi}{T}\cdot T - \cos\frac{2\pi}{T}\cdot 0\right]$$

$$= -\frac{I}{T}(\cos 2\pi - \cos 0) = -\frac{I}{T}(1-1) = 0$$

Q. 3.04. A 110 V d.c. heater is used on an a.c. source, h that the heat produced is the same. What would be the .s. value of the alternating voltage ? *(I.S.C.E. 1996)*

Ans. Let E_v be the required value of r.m.s. voltage. Then, t produced in heater of resistance R in time T/2,

$$H_1 = \frac{E_v^2}{R}\cdot\frac{T}{2} \qquad \ldots(i)$$

Heat produced at 110 V d.c. in time T/2,

$$H_2 = \frac{E^2}{R}\cdot\frac{T}{2} = \frac{(110)^2}{T}\cdot\frac{T}{2} \qquad \ldots(ii)$$

Since $H_1 = H_2$, we have

$$\frac{(110)^2}{R}\cdot\frac{T}{2} = \frac{E_v^{\,2}}{R}\cdot\frac{T}{2} \qquad \text{or} \qquad E_v = 110 \text{ V}$$

Q. 3.05. The effective value of current in a 50 cycle a.c. circuit is 5·0 A. What is the value of the current $\frac{1}{300}$ s after it is zero ? *(P.S.S.C.E. 1994)*

Ans. Here, $I_v = 5{\cdot}0$ A ; $f = 50$ cycles s^{-1}

$$\text{Now,} \qquad I = I_0 \sin\omega t = \sqrt{2}\, I_v \sin 2\pi f t$$

$$= \sqrt{2} \times 5{\cdot}0 \sin 2\pi \times 50 \times \frac{1}{300}$$

$$= \sqrt{2} \times 5{\cdot}0 \sin\frac{\pi}{3} = \sqrt{2} \times 5{\cdot}0 \times \frac{\sqrt{3}}{2}$$

$$= 6{\cdot}124 \text{ A}$$

Q. 3.06. A coil has an inductive reactance of 160 ohm at frequency of 50 Hz. Calculate the self inductance of the coil. *(H.S.S.C.E. 1997 S)*

Ans. Here, $X_L = 160\ \Omega$; $f = 50$ Hz

$$\text{Now,} \qquad X_L = 2\pi f L \qquad \text{or} \qquad L = \frac{X_L}{2\pi f} = \frac{160}{2\pi \times 50}$$

$$= 0{\cdot}51 \text{ H}$$

Q. 3.07. An inductor of 1 H and negligible resistance is used on the mains of frequency 50 Hz. Find the reactance of the inductor. *(I.S.C.E. 1993 ; H.S.S.C.E. 1997)*

Ans. Inductive reactance, $X_L = 2\pi f L$

Here, $L = 1$ H ; $f = 50$ Hz

$$\therefore \qquad X_L = 2\pi \times 50 \times 1 = 100\,\pi \text{ H}$$

Q. 3.08. An inductor is in turn put across 220 V-50 Hz and 220 V-100 Hz supplies. Will the current flowing through it in the two cases be the same or different ? *(C.B.S.E. 1998)*

Ans. Now, $I_v = \frac{E_v}{X_L} = \frac{E_v}{2\pi f L}$

$$\text{Thus,} \qquad I_v \propto \frac{1}{f}$$

Thus, current flowing in the two cases will be **different**.

Q. 3.09. Calculate the capacitive reactance of 5 μF capacitor for a frequency of (*i*) 50 Hz, (*ii*) 10^6 Hz. (*H.S.S.C.E. 1995*)

Ans. Here, $C = 5\ \mu F = 5 \times 10^{-6}$ F

(*i*) For $f = 50$ Hz,

$$X_C = \frac{1}{2\pi \times 50 \times 5 \times 10^{-6}} = \mathbf{636{\cdot}6\ \Omega}$$

(*ii*) For $f = 10^6$ Hz,

$$X_C = \frac{1}{2\pi \times 10^{-6} \times 5 \times 10^{-6}} = \mathbf{0{\cdot}032\ \Omega}$$

Q. 3.10. A capacitor blocks d.c. Why ? (*H.S.S.C.E. 2001, 2000 ; P.S.S.C.E. 2001, 1993*)

Or

What is the capacitive reactance of a capacitor used in a circuit having d.c. e.m.f. ? Explain. (*P.S.S.C.E. 1992*)

Ans. The capacitive reactance is given by

$$X_C = \frac{1}{2\pi f C}$$

For d.c., $f = 0$

$$\therefore\ X_C\ (\text{for d.c.}) = \frac{1}{2\pi(0)C} = \infty$$

Thus, a capacitor offers infinite resistance to d.c. and hence acts as a perfect block for it.

Q. 3.11. An electric lamp connected in series with a variable capacitor and an a.c. source is glowing with some brightness. How will the brightness change on increasing the value of capacitance and why ? (*C.B.S.E. 1998*)

Ans. Capacitive reactance, $X_C = \frac{1}{\omega C} = \frac{1}{2\pi f C}$

When the capacitance (C) is increased, the capacitive reactance (X_C) will decrease. Due to decrease in the value of X_C, the current in the circuit will increase and hence brightness of the source will also increase.

Thus, a capacitor offers infinite resistance to d.c. and hence acts as a perfect block for it.

Q. 3.12. Distinguish between resistance, reactance and impedance for an a.c. circuit. (*C.B.S.E. 2000, 1999, 1994 ; H.S.S.C.E. 1999*)

Ans. Resistance. *The resistance of an a.c. circuit is the ohmic resistance offered by a conductor connected in the circuit.* It is due to the nature of the material (resistivity) of the conductor.

Reactance. *The reactance of an a.c. circuit is the resistance offered by an inductor or a capacitor connected in the circuit.* It arises because of the fact that the alternating e.m.f. and the current differ in phase by $\pi/2$, when a.c. flows through an inductor or a capacitor.

Impedance. *The impedance of an a.c. circuit is the effective resistance offered by the LR-circuit or CR-circuit or LCR-circuit.*

Q. 3.13. Explain the terms reactance and impedance as applied to components of an a.c. circuit. (*C.B.S.E. 2001 S*)

Ans. Refer to SAQ 3.12.

Q. 3.14. The frequency of a.c. source is doubled. How do R, X_L and X_C get affected ?

Ans. There is no effect of doubling the frequency of the a.c. source on R.

Since $X_L = 2\pi f L$, the value of X_L becomes double on doubling the frequency of a.c. source.

Further, $X_C = \frac{1}{2\pi f C}$. Therefore, the value of X becomes half on doubling the frequency of a.c. source.

Q. 3.15. Draw the graph showing the variation reactance of (*a*) a capacitor and (*b*) an inductor with th frequency of an a.c. circuit. (*C.B.S.E. 2002 ; 2000, 199 1998, 1995, 1994 ; H.S.S.C.E. 199*

(*a*) Reactance of a capacitor,

$$X_C = \frac{1}{2\pi f C} \quad \text{or} \quad X_C \propto \frac{1}{f}$$

Graph between f and X_C will be as shown in Fig. 3.25

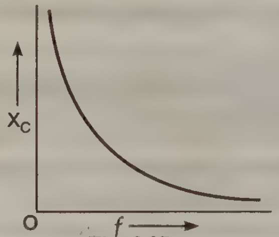

Fig. 3.25

(*b*) Reactance of an inductor,

$$X_L = 2\pi f L \quad \text{or} \quad X_L \propto f$$

Graph between f and X_L will be as shown in Fig. 3.26

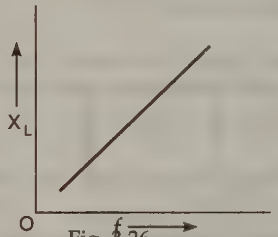

Fig. 3.26

Q. 3.26. An air core coil and an electric bulb a connected in series across a 220 V-50 Hz a.c. source. Th bulb glows with some brightness. How will the glow of th bulb be affected on introducing a capacitor in series in th circuit ? Justify your answer. (*C.B.S.E. 199*

Ans. The brilliance of the bulb depends upon the curre through the bulb. If R is resistance of the filament of the bu and L the inductance of the coil, then current through th bulb,

$$I_v = \frac{E}{\sqrt{R^2 + \omega^2 L^2}}$$

When capacitor is put in series, the current through th bulb becomes

$$I_v' = \frac{E}{\sqrt{R^2 + (\omega L - 1/\omega C)^2}}$$

Since $I'_v > I_v$, the bulb will glow more brightly on puttin the capacitor in series.

Q. 3.17. When an a.c. circuit with a series combinatio of inductance, capacitance and resistance is brought in resonance, the current in the circuit increases to a larg value. Why ?

Ans. In an LCR-series circuit, the current is given by

$$I_v = \frac{E_v}{\sqrt{R^2 + (\omega L - 1/\omega C)^2}}$$

An LCR-circuit comes into resonance, when $\omega L = \frac{1}{\omega C}$.

In that case, the current is given by

$$I'_v = \frac{E_v}{R}$$

Since $R < \sqrt{R^2 + (\omega L - 1/\omega C)^2}$, it follows that $I'_v > I_v$.

Q. 3.18. When a capacitor is connected in series with a series LR- circuit, the alternating current flowing in the circuit increases. Explain, why. (*C.B.S.E. 1998*)

Ans. The impedance of LR-circuit,

$$Z_1 = \sqrt{R^2 + \omega^2 L^2}$$

Therefore, current in LR- circuit,

$$I_1 = \frac{E_v}{Z_1} = \frac{E_v}{\sqrt{R^2 + \omega^2 L^2}} \qquad \text{...}(i)$$

When a capacitor is connected in series with LR-circuit, then

$$Z_2 = \sqrt{R^2 + (\omega L - 1/\omega C)^2}$$

Hence, current in the circuit,

$$I_2 = \frac{E_v}{\sqrt{R^2 + (\omega L - 1/\omega C)^2}} \qquad \text{...}(ii)$$

From equations (*i*) and (*ii*), it follows that $I_2\ I_1$. Hence, when a capacitor is connected in series to an LR-circuit, current in the circuit increases.

Q. 3.19. Discuss resonance in a LCR-series a.c. circuit. (*H.S.S.C.E. 1994*)

Ans. Refer to section 3.11.

Q. 3.20. An inductor L of reactance X_L is connected in series with a bulb B to an a.c. source as shown in Fig. 3.27. Briefly explain how does the brightness of the bulb change, when (*a*) number of turns of the inductor is reduced and (*b*) a capacitor of reactance $X_C = X_L$ is included in series in the same circuit. (*C.B.S.E. 2002*)

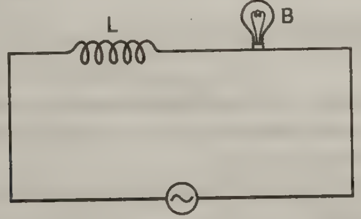

Fig. 3.27

Ans. (***a***) If R is resistance of the filament of bulb, the impedance of the circuit,

$$Z = \sqrt{R^2 + X_L^2}$$

When number of turns of the inductor is reduced, X_L and hence Z will decrease. This will result in increase of current in the circuit and hence the bulb will glow more brightly.

(***b***) When a capacitor of reactance X_C is connected in series, then impedance of the circuit,

$$Z = \sqrt{R^2 + (X_L - X_C)^2}$$

Since $X_L = X_C$, $Z = R$ *i.e.* impedance of the circuit will be minimum (merely equal to the resistance of the filament of the bulb). Therefore, brightness of the bulb will become maximum.

Q. 3.21. What is the quality factor (Q) in an a.c. circuit ? (*C.B.S.E. 1992*)

Ans. Refer to section 3.12.

Q. 3.22. Explain sharpness of resonance. (*H.S.S.C.E. 1994*)

Ans. Refer to section 3.12.

Q. 3.23. What do you mean by power factor ? On what factors does it depend ? (*H.S.S.C.E. 1998*)

Ans. Power factor. *The cosine of the phase angle between alternating e.m.f. and current in an a.c. circuit is called the power factor of the circuit.*

If ϕ is the phase angle between alternating e.m.f. and current in an a.c. circuit, then

power factor of a.c. circuit,

$$\cos\phi = \frac{R}{\sqrt{R^2 + (\omega L - 1/\omega C)^2}}$$

It follows that power factor of an a.c. circuit, in addition to the values of the circuit elements R, L and C, depends upon the frequency of the a.c. source.

Note. Also, true power (or average power)

= apparent power × power factor

Therefore, power factor $= \frac{\text{true power}}{\text{apparent power}}$

Thus, *power factor of an a.c. circuit may also be defined as the ratio of true power of the circuit to its apparent power.*

Q. 3.24. Explain the importance of power factor. (*P.S.S.C.E. 1997 S*)

Ans. The average power, $P = E_v I_v \cos\phi$

In the electric circuits operating some electric appliance, the power factor is kept as low as possible. It is done so that the power consumption in the circuit is low.

On the other hand, when power is to be transmitted, the power factor is made as large as possible.

Since $\qquad I_v = \frac{P}{E_v \cos\phi}$,

the large value of power factor will reduce current and hence dissipation of electric energy in the form of heat along the line wires will be low.

Q. 3.25. Which is more dangerous in use : a.c. or d.c. ? Explain, why.

Ans. The a.c. is more dangerous than d.c. of the same voltage. It is because, the peak value of a.c. is more than the indicated value. For example, a 220 V a.c. has a peak value of $220 \times \sqrt{2}$ V $\approx$ 311 V, whereas peak value of a 220 d.c. is same *i.e.* 220 V.

Q. 3.26. Why is a.c. more dangerous than d.c. for the same voltage ? (*H.S.S.C.E. 2001*)

Or

Why 220 V a.c. is more dangerous than 220 V d.c. ? (*P.S.S.C.E. 2001*)

Ans. Refer to SAQ 3.25.

TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 3.01. A choke coil in series with a lamp is connected to a d.c. line. The lamp is seen to shine brightly. Insertion of an iron core in the choke causes to change the lamp's brightness. Predict the corresponding observation, if the connection is to an a.c. line. *(Text Question)*

Ans. When constant d.c. is flowing, choke coil has no reactance. Therefore, even when iron core is inserted, the brightness of the lamp will not be affected. In case the lamp is connected to a.c. line, the insertion of iron core will increase the inductance of the choke coil and hence its reactance. Due to this, lesser current will flow and brightness of the lamp will be reduced.

Q. 3.02. A lamp is connected in series with a capacitor. Predict your observations for d.c. and a.c. connections. What happens in each case, if the capacitance of the capacitor is reduced ? *(Text Question)*

Ans. When a lamp is connected to d.c. line through the capacitor, it will be an open circuit. It is because, a capacitor acts as a block for d.c. ($X_C = \infty$). Therefore, lamp will not glow, even if C is reduced.

When the lamp is connected to a.c. through the capacitor, the lamp will glow. It is because, a capacitor has finite reactance for a.c. On reducing C, reactance due to capacitor $\left(X_C = I/\omega C\right)$ will increase. Since current becomes lesser, the lamp will shine less brightly.

Q. 3.03. In any a.c. circuit, is the applied instantaneous voltage equal to the algebraic sum of the instantaneous voltages across the series elements of the circuit ? Is the same true for r.m.s. voltages ? *(Text Question)*

Ans. No, the applied instantaneous voltage is not equal to the algebraic sum of the instantaneous voltages across the series elements of the circuit. It is because, voltages across different elements are not in phase. For the same reason, it is also not true for r.m.s. voltage.

Q. 3.04. An applied voltage signal consists of a superposition of a d.c. voltage and a.c. voltage of high frequency. The circuit consists of an inductor and a capacitor in series. Show that the d.c. signal will appear across C and the a.c. signal across L . *(Text Question)*

Ans. We know, $X_L = \omega L$ and $X_C = 1/\omega C$

X_L has zero value for d.c. and high value for a.c., while X_C has infinite value for d.c. and low value for a.c. When applied voltage signal consisting of superposition of a d.c. voltage and an a.c. voltage, the inductor will oppose a.c., whereas it will allow easy path to d.c. Therefore, a.c. voltage will appear across L. For similar reason, d.c. voltage will appear across C.

Q. 3.05. Explain : voltages across L and C in series are 180° out of phase ; while for L and C in parallel, currents in L and C are 180° out of phase. *(Text Question)*

Ans. For given current I (= $I_0 \cos \omega t$), the expression for voltages across L and C in the LC-series circuit are

$$E = E_0 \cos\left(\omega t + \frac{\pi}{2}\right) \quad \text{and} \quad E = E_0 \cos\left(\omega t - \frac{\pi}{2}\right)$$

respectively.

It follows that the voltages are 180° out of phase, when L and C are in series.

For given voltage $E = E_0 \cos \omega t$, the expressions for current through L and C in the LC-parallel circuit are

$$I = I_0 \cos\left(\omega t - \frac{\pi}{2}\right) \text{ and } I = I_0 \cos\left(\omega t + \frac{\pi}{2}\right)$$

respectively. It follows that the, currents are 180° out of phase, when L and C are in parallel.

Q. 3.06. The total impedance of a circuit decreases, when a capacitor is added in series with L and R. Explain, why.

Ans. The impedance of LR-circuit is given by

$$Z_1 = \sqrt{R^2 + \omega^2 L^2}$$

When capacitor is added in series with L and R, impedance of the circuit becomes

$$Z_2 = \sqrt{R^2 + (\omega L - 1/\omega C)^2}$$

Since $(\omega L - 1/\omega C) < \omega L$, it follows that $Z_2 < Z_1$.

Q. 3.07. For circuits used for transporting electric power, a low power factor implies large power loss in transm-ission. Why ? *(Text Question)*

Ans. We know, $P_{av} = E_v I_v \cos \phi$

or $$I_v = \frac{P_{av}}{E_v \cos \phi}$$

To supply a given power, low power factor *i.e.* low value of $\cos \phi$ means larger current will flow across the line wires. Since energy dissipation is $I_v^2 R$, large heat losses will occur in such a case.

Q. 3.08. Power factor can often be improved by the use of a capacitor of appropriate capacitance in the circuit. Explain. *(Text Question)*

Ans. We know, $$\cos \phi = \frac{R}{Z} = \frac{R}{\sqrt{R^2 + (\omega L - 1/\omega C)^2}}$$

By adjusting C, $1/\omega$ C can be made equal to L *i.e.* the value of Z can be made equal to (or approach) R, so that power factor becomes unity.

Q. 3.09. Why power factor correction is must in heavy machinery ? *(P.S.S.C.E. 2001, 1996)*

Ans. A heavy machinery requires a large power. We know that

$$P_{av} = E_v I_v \cos \phi$$

For given supply voltage, the required power can be supplied to the heavy machinery either by supplying large current or by improving power factor ($\cos \phi$). So that large current can be drawn by the machinery, thick wires have to be used. It will result in greater cost of installation. Therefore, in practice, power factor ($\cos \phi$) is corrected by decreasing ϕ. It is achieved by connecting a capacitor of suitable value. As the capacitive reactance and the inductive reactance are always out of phase with each other, the presence of capacitor increases the value of $\cos \phi$.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Prove mathematically that the average value of alternating current over one complete cycle is zero. (*C.B.S.E. 1999 S*)
2. Distinguish between the terms 'peak-value', 'mean value' and 'root mean square value' of an alternating current. How are they related to each other ?
3. Define peak value and root mean square value of alternating current. Derive an expression for the root mean square value of alternating current. (*H.P.S.S.C.E. 1999*)
4. Define virtual e.m.f. and find the relation between virtual e.m.f. and maximum e.m.f. in a.c. (*H.S.S.C.E. 1992*)
5. What is meant by root mean square value of alternating current ? Derive an expression for r.m.s. value of alternating current. (*H.P.S.S.C.E. 1998*)
6. An a.c. voltage $E = E_0 \sin \omega t$ is applied across an inductance L. Obtain an expression for the current I. (*P.S.S.C.E. 2001, C.B.S.E. 1990*)
7. Show that in an inductance, the voltage leads the current by $\pi/2$.
8. Derive an expression for impedance of a coil in an a.c. circuit. (*C.B.S.E. 1992*)
9. An alternating e.m.f. is applied across a capacitor. Show that current in it leads the applied e.m.f. by 90°. What is capacitive reactance of such a circuit ? Write down the units of capacitive reactance.
10. Discuss phase relationship between current and e.m.f. in an a.c. circuit containing a capacitor only. (*P.S.S.C.E. 1992*)
11. Derive the expression for the impedance of an a.c. circuit with an inductor 'L' and a resistor 'R' in series. (*C.B.S.E. 1993*)
12. An alternating source of e.m.f. is applied to an inductor and resistor in series. Investigate the phase relationship between current and e.m.f. What is the impedance of the circuit ?
13. Derive the expression for the impedance of an a.c. circuit with a capacitor and a resistor in series. (*C.B.S.E. 1993*)
14. An alternating source of e.m.f. is applied to a capacitor and resistor in series. Investigate the phase relationship between current and e.m.f. What is the impedance of the circuit ?
15. What do you mean by inductive reactance, capacitive reactance and impedance ? Show that a capacitor is a block for d.c. ; and inductor, a block for a.c.
16. What is impedance ? Derive a relation for it in an a.c. series LCR-circuit. Show it by a vector diagram. (*P.S.S.C.E. 1996 S*)
17. What is meant by an LCR-circuit ? Find the impedance of such a circuit. What is the phase relationship between the current and e.m.f. in such a circuit ?
18. How does the term electric 'resistance' differ from 'impedance' ? With the help of a suitable phasor diagram, obtain a relation for impedance in an a.c. series LCR-circuit. (*P.S.S.C.E. 1994*)
19. What do you mean by impedance of LCR-circuit ? Derive expression for it. What is the condition for resonance ? (*H.P.S.S.C.E. 1993*)
20. Discuss the phenomenon of resonance in a LCR series a.c. circuit. (*C.B.S.E. 1992*)
21. Explain the term resonance for a series LCR-circuit. Calculate the resonant frequency. (*H.S.S.C.E. 1998*)
22. Obtain condition for the resonance of LCR-circuit and show that resonance frequency is $\frac{1}{2\pi\sqrt{LC}}$. (*H.P.S.S.C.E. 1998 S*)
23. Draw a circuit diagram showing a series LCR-circuit and derive an equation for its resonant frequency. (*I.S.C.E. 1996*)
24. What do you mean by sharpness of resonance in a series resonant circuit ? Find expression for Q-factor of the circuit. (*H.S.S.C.E. 1992*)
25. Prove that an ideal resistor connected to an a.c. source dissipates power $\frac{V_{eff}^2}{R}$. (*C.B.S.E. 1996*)
26. Show mathematically that an ideal inductor does not consume any power in an a.c. circuit. (*P.S.S.C.E. 2002, 2001 ; C.B.S.E. 1990*)
27. Prove that an ideal inductor does not dissipate power in an a.c. circuit. (*C.B.S.E. 2001 S*)
28. Show mathematically that the average power supplied to an ideal capacitor by a source over a complete cycle of a.c. is zero. (*C.B.S.E. 2001 S*)
29. Prove that an ideal capacitor connected to an a.c. source does not dissipate power. (*H.S.S.C.E. 2001*)
30. Distinguish between the terms reactance and impedance of an a.c. circuit. Prove that an ideal capacitor connected to an a.c. source does not dissipate power. (*C.B.S.E. 1996*)
31. Derive an expression for the power in an LCR a.c. circuit. (*P.S.S.C.E. 2000, 1999 S, 1999, 1997 S ; H.S.S.C.E. 1998*)
32. Show that the average power transferred to an a.c. circuit is in general given by $P = V_{r.m.s.} I_{r.m.s.} R/Z$, where R is the resistance in the circuit. (*C.B.S.E. 1990*)
33. Find the expression for the true power and apparent power in an a.c. circuit. Determine the condition that a current in the circuit may be wattless.
34. Derive a relation for power in a.c. series LCR-circuit. What is power factor ? (*P.S.S.C.E. 1996*)

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. Define mean value and root mean square value of alternating current. Derive an expression for root mean square value of alternating current. (*H.S.S.C.E. 2001*)
2. Derive the relations for average value and r.m.s. value (effective value) of a.c. (*P.S.S.C.E. 2000*)
3. Derive the relations for average and r.m.s. value of an alternating current. Which value of the current, do we measure with an a.c. ammeter ? (*P.S.S.C.E. 1998 S*)
4. An alternating e.m.f. is supplied to (*i*) a pure resistance, (*ii*) a pure inductance, (*iii*) a pure capacitance. Investigate the phase relationship between current and e.m.f. in each of the above cases.
5. How does the term ohmic resistance differ from inpedance ? With the help of a suitable phasor diagram, obtain the relation for impedance in an a.c. series LCR-circuit. (*P.S.S.C.E. 2002, 2000*)
6. Using phasor diagram, derive an expression for impedance of an a.c. circuit containing LCR in series. What do you mean by resonance of such a circuit ? (*P.S.S.C.E. 2002, 2000*)

7. A series circuit contains L, C and R as circuit elements. Discuss current-voltage relation, when a.c. is passed through such a circuit and hence find the expression for the impedance of the circuit and resonant frequency of the circuit. *(H.P.S.S.C.E. 2000)*
8. What is impedance of an electric circuit ? Derive an expression for impedance of an a.c. LCR series circuit. Also find the expression for resonant frequency. *(P.S.S.C.E. 2000)*
9. With the help of a phasor diagram, obtain a relation for impedance in an a.c. series LCR-circuit. What is meant by resonance of this circuit ? Find relation for resonant frequency of series LCR-circuit. *(P.S.S.C.E. 1999, 1995)*
10. Define an expression for the impedance of an a.c. circuit with an inductor L and a resistor R in series. Also obtain the expression for average power in this circuit. *(P.S.S.C.E. 2001)*
11. Deirve an expression for the impedance of an a.c. circuit with capacitor C and resistor R in series. Also obtain an expression for its average power in this circuit. *(P.S.S.C.E. 2001)*
12. Define power in an a.c. circuit and obtain expression for (*a*) instantaneous power (*b*) the average power over a complete cycle in case of a circuit containing inductance, resistance and capacitance. What is power factor and wattless current ?
13. Derive an expression between true power and virtual power of an a.c. circuit. How will you differentiate between true power and virtual power ? *(P.S.S.C.E. 2002)*
14. Derive an expression for the average power in a LCR-series circuit connected to a.c. supply. Hence define power factor. *(H.S.S.C.E. 2002)*
15. Find an expression for power of an a.c. circuit containing L, C and R. *(H.S.S.C.E. 2000)*
16. L, C and R are in series with an a.c. source. Calculate the power of such a circuit. Also obtain expression for resonant frequency. *(H.S.S.C.E. 1996)*

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Equation for Instantaneous value of a.c.

1. A man is given a shock with 220 volt d.c. and thereafter with 220 volt (r.m.s.) a.c. Will he feel the same intensity of shock in the two cases ? Give reasons in support of your answer. [**Ans.** In case of 220 volt a.c., shock will be of greater intensity as peak value of e.m.f. is 311·1V]
2. The instantaneous current from an a.c. source is
$$I = 6 \sin 314\, t$$
What is the r.m.s. value of the current ? *(C.B.S.E. 1996)* [**Ans.** 4·24 A]
3. Find the time required for a 50 Hz alternating current to change its value from zero to the r.m.s. value. [**Ans.** $2{\cdot}5 \times 10^{-3}$ s]

Type B. On a.c. circuit containing resistor

4. A resistance of 20 Ω is connected to a source of alternating current rated 110 V, 50 Hz. Find (*a*) the r.m.s. of current, (*b*) the maximum instantaneous current in the resistor. [**Ans.** (*a*) 5·5 A, (*b*) 7·78 A]
5. A 100 ohm iron is connected to a 220 volt, 50 cycles wall plug. What is its (*i*) peak potential difference (*ii*) average potential difference and (*iii*) r.m.s. current ? [**Ans.** (*i*) 311·1 V ; (*ii*) 198·1 V ; (*iii*) 2·2 A]

Type C. On a.c. circuit containing inductor

6. A 100 Hz a.c. is flowing in a 14 millihenry coil. Find the reactance of the coil. *(H.S.S.C.E. 1998)* [**Ans.** 8·8 Ω]
7. At what ferquency will a 0·5 H inductor have a reactance of 1000 Ω ? *(H.S.S.C.E. 2002)* [**Ans.** 318·3 Hz]
8. Find the value of current through an inductor of 2·0 H and negligible resistance, when connected to an a.c. source of 150 V and 50 Hz. *(P.S.S.C.E. 1997)* [**Ans.** 0·239 A]
9. Find the maximum value of current, when inductance of one henry is connected to 200 volt, 50 cycles supply. *(P.S.S.C.E. 2000)* [**Ans.** 0·9 A]
10. An inductance of negligible resistance, whose reactance is 22 ohm at 200 hertz is connected to a 220 volt, 50 hertz power line. What is the value of the inductance and reactance ? [**Ans.** $1{\cdot}75 \times 10^{-2}$ H ; 5·5 Ω]

Type D. On a.c. circuit containing capacitor

11. Calculate the capacitive reactance of a capacitor of capacitance 1 microfarad for a frequency of $10^6/2\pi$ Hz. [**Ans.** 1 Ω]
12. One microfarad capacitor is joined to 200 volt, 50 hertz alternator. Find the r.m.s. current through the capacitor. [**Ans.** 0·0628 A]
13. A capacitor of 1 μF is connected to a source of a.c. having e.m.f. given by equation
$$E = 200 \cos 120\, \pi t$$
Find the value of r.m.s. current through the capacitor. [**Ans.** 0·0533 A]

Type E. On LR-circuit

14. A bulb of resistance 10 Ω, connected to an inductor of inductance L, is in series with an a.c. source marked 100 V – 50 Hz. If the phase angle between the voltage and current is $\pi/4$ radian, calculate the value of L. *(C.B.S.E. 2001)* [**Ans.** 0·032 H]
15. An a.c. source of 100 V (r.m.s.), 50 Hz is connected across a 20 ohm resistance and a 50 mH inductor in series. Calculate (*i*) impedance of the circuit and (*ii*) r.m.s. current in the circuit. *(C.B.S.E. 1993)* [**Ans.** (*i*) 25·43 Ω ; (*ii*) 3·93 A]
16. A current of 11 A flows through a coil, when connected to a 110 V d.c. When 110 V a.c. of 50 Hz is applied to the same coil, only 0·5 A current flows. Calculate the (*i*) resistance, (*ii*) impedance and (*iii*) inductance of the coil. *(C.B.S.E. 1992)* [**Ans.** (*i*) 10 Ω; (*ii*) 220 Ω ; (*iii*) 0·7 H]
17. A coil of inductance 0·5 H and resistance 100 Ω is connected to a 240 V, 50 Hz supply. What is the maximum current in the coil ? *(Pre-degree Kerala, 1994)* [**Ans.** 1·82 A (peak value)]
18. A 100 V, 50 Hz a.c. source is connected to a series combination of an inductance of 100 mH and a resistance of 25 ohm. Calculate the magnitude and phase of the current. *(C.B.S.E. 1991)* [**Ans.** 2·49 A, 51° 29′]
19. An alternating e.m.f. of 110 V is applied to a circuit containing a resistance of 40 Ω and an inductance L in series. The current is found to lag behind the voltage by an angle $\phi = \tan^{-1} 3/4$. Find the (*a*) inductive reactance ; (*b*) impedance of the circuit and (*c*) current flowing in the circuit. If the inductance has a value of 0·1 H, find the frequency of the applied e.m.f. *(I.S.C.E. 1995)* [**Ans.** (*a*) 30 Ω ; (*b*) 50 Ω ; (*c*) 2·2 A ; 47·75 Hz]
20. An a.c. circuit that contains an inductance and a resistance has an impedance of 50 ohm at 100 Hz and an impedance

of 100 ohm at 500 Hz. What are the values of inductance and the resistance of the circuit ?
[Ans. $28{\cdot}14 \times 10^{-3}$ H, 46·74 Ω]

21. When a series combination of a coil of inductance L and a resistor of resistance R is connected across a 12 V–50 Hz supply, a current of 0·5 A flows through the circuit. The current differs in phase from applied voltage by $\pi/3$ radian. Calculate the value of L and R. *(C.B.S.E. 1997)*
[Ans. 0·066 H, 12 Ω]

22. When a series combination of inductance and resistance is connected with a 10 V–50 Hz supply, a current of 1 A flows through the circuit. The voltage leads the current by a phase angle of $\pi/3$ radian. Calculate the values of inductance and resistance. *(C.B.S.E. 1999)*
[Ans. 0·028 H, 5 Ω]

23. A coil of negligible resistance and inductance 0·02 henry is connected in series with a wire of zero inductance and resistance 12 ohm. An alternating e.m.f. of 130 volt and 40 Hz is applied. Calculate the current, potential difference across the resistance and the angle of lag.
[Ans. 10 A, 120 V, 22° 44′]

24. An electric lamp, which runs at 100 volt d.c. and 10 ampere current, is to be run on 220 volt, 50 cycles a.c. mains. Calculate the inductance of the required choke coil.
[Ans. 0·0624 H]

25. An electric lamp marked 220 V d.c. consumes a current 10 A. It is connected to a 250 V – 50 Hz a.c. mains through a choke. Calculate the inductance of the choke required. *(P.S.S.C.E. 2002)* **[Ans.** 0·446 H]

26. An 80 V–800 W heater is to be operated on a 100 V–50 Hz supply. Calculate the inductance of the choke required. *(H.S.S.C.E. 2002)* **[Ans.** 0·031 H]

ype F. On CR-circuit

27. A series circuit contains a resistor of 20 Ω, a capácitor and an ammeter of negligible resistance. It is connected to a source of 220 V–50 Hz. If the reading of an ammeter is 2·5 A , calculate the reactance of the capacitor. *(P.S.S.C.E. 1999)* **[Ans.** 85·7 Ω]

28. What is the value of current in the a.c. circuit containing R = 10 Ω, C = 50 μF in series across 200 V, 50 Hz a.c. source ? *(C.B.S.E. 1993)* **[Ans.** 3·1 A]

29. An alternating current of 1·5 mA and angular frequency 300 rad s^{-1} flows through 10 kΩ resistor and a 0·5 μF capacitor in series. Find the r.m.s. voltage across the capacitor and impedence of the circuit. *(C.B.S.E. 1993)*
[Ans. 10 V, $1{\cdot}2 \times 10^4$ Ω]

30. When an electric derive X is connected to a 220 V, 50 Hz a.c. supply, the current is 0·5 A and is in same phase as the applied voltage. When another device Y is connected to the same supply, the electric current is again 0·5 A, but it leads the potential difference by $\pi/2$. (*a*) What are the devices X and Y ? (*b*) When X and Y are connected in series across the same source, what will be the current ?
(C.B.S.E. 1992)
[Ans. X–resistor, Y–capacitor, 0·354 A]

ype G. On LCR-circuit

31. A resistor of 50 ohm, an inductor of $20/\pi$ henry and a capacitor of $5/\pi$ microfarad are connected in series to a voltage source 230 V–50 Hz. Find the impedence of the cicruit. **[Ans.** 50 Ω]

32. A resistor of 12 Ω, a capacitor of reactance 14 Ω and a pure inductor of inductance 0·1 H are joined in series and placed across a 220 V–50 Hz a.c. supply. Calculate (*a*) the current in the circuit and (*b*) the phase angle between the current and voltage. Take $\pi = 3$. **[Ans.** (*a*) 11 A (*b*) 53·13°]

Type H. On Resonance

33. A series circuit with L = 0·12 H, C = 0·48 mF and R = 25 Ω is connected to a 220 V variable frequency power supply. At what frequency is the ciruit current maximum ?
(H.S.S.C.E. 2002) **[Ans.** 21 Hz]

34. A series LCR-circuit with L = 0·12 H, C = $4{\cdot}8 \times 10^{-7}$ F, and R = 23 ohm is connected to a variable frequency supply. At what frequency is the current maximum ?
(C.B.S.E. 1990) **[Ans.** 663·15 Hz]

35. A resistor, a capacitor of 100 μF capacitance and an inductor are in series with an a.c. source of frequency 50 Hz. If the current in the circuit is in phase with the voltage, calculate the inductance of the inductor used.
(C.B.S.E. 2000) **[Ans.** 0·1 H]

36. An inductor L, a capacitor 20 μF and a resistor 10 Ω are connected in series with an a.c. source of frequency 50 Hz. If the current is in phase with the voltage, calculate the inductance of the inductor. *(C.B.S.E. 2001)* **[Ans.** 0·507 H]

37. A capacitor, resitor of 5 Ω and an inductor of 50 mH are in series with an a.c. source marked 100 V, 50 Hz. It is found that voltage is in phase with the current. Calculate the capacitance of the capacitor and the impedance of the circuit. *(C.B.S.E. 1999)* **[Ans.** 202·64 μF, 5 Ω]

38. Find the capacitive reactance of a 10 μF capacitor at 1000 cycles s^{-1}. Calculate the inductance required to produce series resonance with the capacitor at this frequency. *(H.S.S.C.E. 2002)*
[Ans. 15·92 Ω, $2{\cdot}533 \times 10^{-3}$ H]

39. A 100 mH inductor, a 25 μF capacitor and a 15 Ω resistor are connected in series to a 120 V, 50 Hz a.c. source. Calculate (*i*) impedance of the circuit at resonance, (*ii*) current at resonance and (*iii*) resonant frequency.
(C.B.S.E. 2000) **[Ans.** (*i*) 15 Ω (*ii*) 8 A (*iii*) 100·66 Hz]

40. A variable frequency 230 V alternating voltage source is connected across a series combination L = 5·0 H, C = 80 μF and R = 40 Ω. Calculate (*a*) the angular frequency of the source which drives the circuit in resonance, (*b*) the amplitude of the current at resonant frequency and (*c*) r.m.s. potential drop across the inductor at resonating frequency. *(C.B.S.E. 2001 S)*
[Ans. (*a*) 50 rad s^{-1}, (*b*) 5·75 A (*c*) 1437·5 V]

41. A resistance of 2 Ω, a coil of inductance 0·01 H are connected with a capacitor and put across a 200 V and 50 Hz supply. Calculate (*i*) the capacitance of the capacitor, so that the circuit resonates and (*ii*) the current and voltage across the capacitor at resonance. (Take $\pi = 3$)
(C.B.S.E. 1999 S) **[Ans.** (*i*) 1·11 mF ; (*ii*) 100 A, 300·3 V]

Type I. On Power in a.c. circuit

42. A 100 ohm geyser is connected to 220 volt, 50 cycles s^{-1}. What is its (*i*) peak potential difference, (*ii*) average power delivered, (*iii*) peak power and (*iv*) energy delivered in 10 minutes ?
[Ans. (*i*) 311·1 V ; (*ii*) 484 W ; (*iii*) 967·8 W ; (*iv*) $2{\cdot}904 \times 10^5$ J]

43. A group of electric lamps having total power rating of 900 watt is supplied an a.c. voltage
$$E = 200 \cos(314\, t + 60°)$$
Find r.m.s. value of a.c. current. **[Ans.** 12·73 A]

44. An alternating voltage E = 200 sin 300 *t* is applied across a series combination of resistance of 10 Ω and an inductor of 800 mH. Calculate (*i*) impedance of the circuit, (*ii*) peak value of current in the circuit and (*iii*) power factor of the circuit. *(C.B.S.E. 1994)*
[Ans. (*i*) 240·2 Ω ; (*ii*) 0·833 A; (*iii*) 0·042]

45. An electric lamp runs at 120 volt a.c. and consumes 12 ampere. It is connected to 220 volt, 50 hertz a.c. Find

the value of inductance required and the power factor.
[**Ans.** 0·049 H ; 0·0545]

46. Find the capacitance of a capacitor, which when put in series with a resistance of 10 ohm makes the power factor equal to 0·5. Assume an 80 volt–100 Hz a.c. supply.
[**Ans.** $9 \cdot 19 \times 10^{-5}$ F]

47. A choke of 0·5 henry, a capacitor of 15 μF and resistance of 100 ohm are connected in series across 200 volt, 50 hertz main. Find (*i*) current in the circuit, (*ii*) power factor of the circuit. [**Ans.** (*i*) 1·752 A ; (*ii*)0·876]

48. A resistor of 12 Ω, a capacitor of reactance 14 Ω and an inductor of reactance 30 Ω are joined in series and placed across a 230 V, 50 Hz supply. Calculate (*a*) the current in circuit, (*b*) the phase angle between the current and the voltage and (c) power factor. (*H.S.S.C.E. 2002*)
[**Ans.** (*a*) 11·5 A (*b*) 53·13° (*c*) 0·6]

49. Calculate the value of an inductance, which should be connected in series with a capacitance of 5 μF, resistance of 10 ohm and a.c. source of 50 Hz, so that the power factor of the circuit is unity. [**Ans.** 2·026 H]

50. A series LCR-circuit with R = 10 Ω, L = 2 H and C = 25 μF is connected to a variable frequency 200 V a.c. supply. When the frequency of the supply equals the natural frequency of the circuit, what is the average power transferred to the circuit in one complete cycle? (*H.S.S.C.E. 2001*)
[**Ans.** 4000 W]

MISCELLANEOUS PROBLEMS

51. Obtain the answers to (*a*) and (*b*) in solved problem 3·09, if the circuit is connected to a high frequency supply (240 V, 10 kHz). Hence explain the statement that at ver high frequency, an inductor in a circuit nearly amounts t an open circuit. How does an inductor behave in a d. circuit after the steady state?
[**Ans.** (*a*) $1 \cdot 08 \times 10^{-2}$ A ; (*b*) ≈ 90°, inductor behaves like conductor in a d.c. circuit

52. Obtain the answers to (*a*) and (*b*) in solved problem 3·1 if the circuit is connected to a 110 V, 12 kHz supply. Henc explain the statement that a capacitor is a conductor at ver high frequencies. Compare this behaviour with that of capacitor in a d.c. circuit after the steady state.
[**Ans.** (*a*) 3·89 A ; (*b*) ≈ 0°, capacitor amount to an open path in a d.c.. circui

53. In an a.c. circuit, the potential difference across a inductance and resistance joined in series is respectivel 12 V and 16 V. Find the total potential difference across th circuit. [**Ans.** 20 V

54. A circuit containing a 80 mH inductor and a 60 μ capacitor in series is connected to a 230 V, 50 Hz suppl If the circuit has a resistance of 15 ohm, obtain the averag power transferred to each element of the circuit and th total power absorbed. (*H.S.S.C.E. 200*
[**Ans.** $P_{av}(R) = 790 \cdot 6$ W, $P_{av}(L) = 0$, $P_{av}(C) =$
$P_{av}(\text{total}) = 790 \cdot 6$ W

55. A coil has an inductance 0·7 henry and is joined in serie with a resistance of 220 ohm. Find the wattless componen of the current in the circuit, when an alternating e.m.f. o 220 volt at a frequency of 50 Hz is supplied to it.
[**Ans.** 0·5 A

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. Refer to SAQ 3.25.

2. Proceed as in solved problem no. 3.02 (*iii*).

3. Now, $I = I_0 \sin \omega t$ ...(*i*)

Suppose that when $t = t'$, $I = I_v = \dfrac{I_0}{\sqrt{2}}$

Setting the above condition in equation (*i*), we get

$$\frac{I_0}{\sqrt{2}} = I_0 \sin \omega t' \quad \text{or} \quad \sin \omega t' = \frac{1}{\sqrt{2}}$$

$$\text{or } \omega t' = \frac{\pi}{4} \quad \text{or} \quad t' = \frac{\pi}{4\omega} = \frac{\pi}{4 \times 2\pi / T} = \frac{T}{8}$$

$$\text{or } \quad t' = \frac{1}{8f} = \frac{1}{8 \times 50} = \mathbf{2 \cdot 5 \times 10^{-3}\ s} \qquad \left(\because T = \frac{1}{f}\right)$$

4. (*a*) $I_v = \dfrac{E_v}{R} = \dfrac{110}{20} = \mathbf{5 \cdot 5\ A}$

(*b*) $I_0 = \sqrt{2}\, I_v = \sqrt{2} \times 5 \cdot 5 = \mathbf{7 \cdot 78\ A}$

5. (*i*) $E_0 = \sqrt{2}\, E_v = \sqrt{2} \times 220 = \mathbf{311 \cdot 1\ V}$

(*ii*) $E_{av} = \dfrac{2E_0}{\pi} = \dfrac{2 \times 311 \cdot 1}{\pi} = \mathbf{198 \cdot 1\ V}$

(*iii*) $I_v = \dfrac{E_v}{R} = \dfrac{220}{100} = \mathbf{2 \cdot 2\ A}$

6. Proceed as in solved problem no. 3.04 (*a*).

7. Proceed as in solved problem no. 3.04 (*a*).

8. Proceed as in solved problem no. 3.04 .

9. $X_L = 2\pi f \times L = 2\pi \times 50 \times 1 = 100\,\pi$ H

$$\therefore \quad I_v = \frac{E_v}{X_L} = \frac{200}{100\,\pi} = 0 \cdot 637 \text{ A}$$

Hence, $I_0 = \sqrt{2}\, I_v = \sqrt{2} \times 0 \cdot 637 = \mathbf{0 \cdot 9\ A}$

10. Here, at $f = 200$ Hz, $X_L = 22\ \Omega$

Now, $X_L = \omega L = 2\pi f \times L$ or $22 = 2\pi \times 200 \times L$

$$\text{or} \quad L = \frac{22}{2\pi \times 200} = \mathbf{1 \cdot 75 \times 10^{-2}\ H}$$

When connected to 220 V – 50 Hz supply :

$X_L' = 2\pi f' \times L = 2\pi \times 50 \times 1 \cdot 75 \times 10^{-2} = \mathbf{5 \cdot 5\ \Omega}$

11. $$X_C = \frac{1}{2\pi f C} = \frac{1}{2\pi \times (10^6 / 2\pi) \times 10^{-6}} = \mathbf{1\ \Omega}$$

12. Proceed as in solved problem no. 3.06.

13. Here, $E = 200 \cos 120\,\pi t$

$\therefore E_0 = 200$ V and $\omega = 120\,\pi$

$$\text{Now, } X_C = \frac{1}{\omega C} = \frac{1}{120\,\pi \times 10^{-6}} = 2652 \cdot 6\ \Omega$$

$$\therefore \quad I_0 = \frac{E_0}{X_c} = \frac{200}{2652 \cdot 6} = 0 \cdot 0754 \text{ A}$$

$$\text{Hence, } I_v = \frac{I_0}{\sqrt{2}} = \frac{0 \cdot 0754}{\sqrt{2}} = \mathbf{0 \cdot 0533\ A}$$

14. $$\tan\phi = \frac{\omega L}{R} = \frac{2\pi f \times L}{R} \quad \text{or} \quad \tan\frac{\pi}{4} = \frac{2\pi \times 50 \times L}{10}$$

$$\text{or} \quad 1 = 10\,\pi L \quad \text{or} \quad L = \frac{1}{10\,\pi} = \mathbf{0 \cdot 032\ H}$$

15. Here, $E_v = 100$ V ; $f = 50$ Hz ; $R = 20\ \Omega$,
$L = 50$ mH $= 0 \cdot 05$ H

(*i*) $$Z = \sqrt{R^2 + (2\pi f L)^2} = \sqrt{(20)^2 + (2\pi \times 50 \times 0 \cdot 05)^2}$$
$$= \sqrt{400 + 246 \cdot 74} = \mathbf{25 \cdot 43\ \Omega}$$

(*ii*) $$I_v = \frac{E_v}{Z} = \frac{100}{25 \cdot 43} = \mathbf{3 \cdot 93\ A}$$

16. Proceed as in solved problem no. 3.08.

17. Proceed as in solved problem no. 3.09 (*a*).

18. Proceed as in solved problem no. 3.09.

19. Here, $E_v = 110$ V ; $R = 40\ \Omega$ and $\tan\phi = \dfrac{3}{4}$

(*a*) $\tan\phi = \dfrac{\omega L}{R} = \dfrac{X_L}{R}$

or $X_L = R \times \tan\phi = 40 \times \dfrac{3}{4} = \mathbf{30\ \Omega}$

(*b*) $Z = \sqrt{R^2 + {X_L}^2} = \sqrt{(40)^2 + (30)^2} = \mathbf{50\ \Omega}$

(*c*) $I_v = \dfrac{E_v}{Z} = \dfrac{110}{50} = \mathbf{2{\cdot}2\ A}$

Now, $X_L = 2\pi f L$

or $f = \dfrac{X_L}{2\pi L} = \dfrac{30}{2\pi \times 0{\cdot}1} = \mathbf{47{\cdot}75\ Hz}$

20. Now, $Z = \sqrt{R^2 + (2\pi f L)^2}$

At $f = 100$ Hz, $Z = 50\ \Omega$

$\therefore$ $50 = \sqrt{R^2 + (2\pi \times 100 \times L)^2}$

or $\sqrt{R^2 + (200\pi L)^2} = 50$ ...(*i*)

At $f = 500$ Hz, $Z = 100\ \Omega$

$\therefore$ $100 = \sqrt{R^2 + (2\pi \times 500 \times L)^2}$

or $\sqrt{R^2 + (1000\pi L)^2} = 100$ ...(*ii*)

From equations (*i*) and (*ii*), it can be obtained that

$\mathbf{L = 28{\cdot}14 \times 10^{-3}\ H}$ and $\mathbf{R = 46{\cdot}74\ \Omega}$

21. $I_v = \dfrac{E_v}{\sqrt{R^2 + (2\pi f L)^2}}$ or $0{\cdot}5 = \dfrac{12}{\sqrt{R^2 + (2\pi \times 50 \times L)^2}}$

or $\sqrt{R^2 + (100\pi L)^2} = 24$ ...(*i*)

Also, $\tan\phi = \dfrac{\omega L}{R} = \dfrac{2\pi f L}{R}$ or $\tan\dfrac{\pi}{3} = \dfrac{2\pi \times 50 \times L}{R}$

or $\dfrac{100\pi L}{R} = \tan 60°$ or $\dfrac{100\pi L}{R} = \sqrt{3}$

or $100\pi L = \sqrt{3}\,R$ ...(*ii*)

From equations (*i*) and (*ii*), we have

$\sqrt{R^2 + (\sqrt{3}\,R)^2} = 24$ or $R = 12\ \Omega$

From equation (*ii*), we have

$L = \dfrac{\sqrt{3}\,R}{100\pi} = \dfrac{\sqrt{3} \times 12}{100\pi} = \mathbf{0{\cdot}066\ H}$

22. Proceed as in problem no. 21.

23. Here, $L = 0{\cdot}02$ H ; $R = 12\ \Omega$; $E_v = 130$ V ; $f = 40$ Hz

$$I_v = \frac{E_v}{\sqrt{R^2 + (2\pi f L)^2}} = \frac{130}{\sqrt{(12)^2 + (2\pi \times 40 \times 0{\cdot}02)^2}}$$

$$= \frac{130}{13} = \mathbf{10\ A}$$

Potential difference across R, $V_R = I \times R = 10 \times 12 = \mathbf{120\ V}$

Also, $\tan\phi = \dfrac{\omega L}{R} = \dfrac{2\pi f L}{R} = \dfrac{2\pi \times 40 \times 0{\cdot}02}{12} = 0{\cdot}4189$

or $\phi = \mathbf{22°\ 44'}$

24. ***When lamp is run on 100 V d.c. :***

If R is resistance of the lamp, then

$$R = \frac{E}{I} = \frac{100}{10} = 10\ \Omega$$

When lamp is run on 220 V a.c. :

Suppose that choke coil of inductance L is connected in series to the lamp so that current of 10 A (equal to its current rating) flows through it.

Now, $I_v = \dfrac{E_v}{\sqrt{R^2 + (2\pi f L)^2}}$

or $10 = \dfrac{220}{\sqrt{(10)^2 + (2\pi \times 50 \times L)^2}}$

or $\sqrt{100 + (100\pi L)^2} = 22$ or $100\pi L = \sqrt{(22)^2 - 100}$

or $L = \dfrac{\sqrt{(22)^2 - 100}}{100\pi} = \mathbf{0{\cdot}0624\ H}$

25. Proceed as in problem no. 24.

26. Here, $R = \dfrac{V^2}{P} = \dfrac{(80)^2}{800} = 8\ \Omega$

Now proceed as in problem no. 24.

27. Proceed as in solved problem no. 3.12.

28. Proceed as in solved problem no. 3.13.

29. Here, $I_v = 1{\cdot}5$ mA $= 1{\cdot}5 \times 10^{-3}$ A ; $\omega = 300$ rad s^{-1},

$R = 10\ \text{k}\Omega = 10^4\ \Omega$ and $C = 0{\cdot}5\ \mu F = 0{\cdot}5 \times 10^{-6}$ F

Now, $X_C = \dfrac{1}{\omega C} = \dfrac{1}{300 \times 0{\cdot}5 \times 10^{-6}} = 6{\cdot}67 \times 10^3\ \Omega$

Therefore, r.m.s. voltage across the capacitor,

$V_C = I_v \times X_C = 1{\cdot}5 \times 10^{-3} \times 6{\cdot}67 \times 10^3 = \mathbf{10\ V}$

Also, $Z = \sqrt{R^2 + {X_C}^2} = \sqrt{(10^4)^2 + (6{\cdot}67 \times 10^3)^2}$

$= \mathbf{1{\cdot}2 \times 10^4\ \Omega}$

30. (*a*) When device X is connected to a.c. supply, the current and voltage are in phase with each other. Therefore, the device X is **resistor.** Its resistance is given by

$$R = \frac{220}{0{\cdot}5} = 440\ \Omega$$

When device Y is connected to a.c. supply, the current leads e.m.f. by phase angle $\pi/2$. Therefore, the device Y is **capacitor.** Its reactance is given by

$$X_C = \frac{220}{0{\cdot}5} = 440\ \Omega$$

(*b*) Now, $Z = \sqrt{R^2 + {X_C}^2} = \sqrt{(440)^2 + (440)^2} = 440\sqrt{2}\ \Omega$

$\therefore$ $I_v = \dfrac{E_v}{Z} = \dfrac{220}{440\sqrt{2}} = \mathbf{0{\cdot}354\ A}$

31. Here, $R = 50\ \Omega$; $L = \dfrac{20}{\pi}$ H ; $C = \dfrac{5}{\pi}\ \mu F = \dfrac{5}{\pi} \times 10^{-6}$ F ;

$E_v = 230$ V and $f = 50$ Hz

Now, $Z = \sqrt{R^2 + (X_L - X_C)^2}$

Here, $X_L = 2\pi f L = 2\pi \times 50 \times \dfrac{20}{\pi} = 2000\ \Omega$

and $X_C = \dfrac{1}{2\pi f C} = \dfrac{1}{2\pi \times 50 \times (5/\pi \times 10^{-6})} = 2000\ \Omega$

$\therefore$ $Z = \sqrt{(50)^2 + (2000 - 2000)^2} = \mathbf{50\ \Omega}$

32. Here, $R = 12\ \Omega$; $X_C = 14\ \Omega$, $L = 0{\cdot}1$ H, $E_v = 220$ V ; $f = 50$ Hz

(*a*) Now, $X_L = 2\pi f L$

$= 2 \times 3 \times 50 \times 0{\cdot}1 = 30\ \Omega$ (Take $\pi = 3$)

$\therefore$ $Z = \sqrt{R^2 + (X_L - X_C)^2} = \sqrt{(12)^2 + (30 - 14)^2} = 20\ \Omega$

Hence, $I_v = \dfrac{E_v}{Z} = \dfrac{220}{20} = \mathbf{11\ A}$

(*b*) $\tan\phi = \dfrac{X_L - X_C}{R} = \dfrac{30 - 14}{12} = 1{\cdot}3333$

or $\phi = \mathbf{53{\cdot}13°}$

33. Here, $L = 0{\cdot}12$ H ; $C = 0{\cdot}48$ mF $= 0{\cdot}48 \times 10^{-3}$ F,
$R = 25\ \Omega$, $E_v = 220$ V

Now, $I_v = \dfrac{E_v}{\sqrt{R^2 + (X_L - X_C)^2}}$

The current in the circuit will be maximum, when impedance of the circuit is minimum

i.e. $X_L = X_C$ or $2\pi f L = \dfrac{1}{2\pi f C}$

or $f = \dfrac{1}{2\pi\sqrt{LC}} = \dfrac{1}{2\pi\sqrt{0{\cdot}12 \times 0{\cdot}48 \times 10^{-3}}} = \mathbf{21\ Hz}$

34. Proceed as in problem no. 33.

35. Here, $C = 100\ \mu F = 10^{-4}$ F ; $f = 50$ Hz

The current in LCR-circuit is in phase with the voltage,

when $X_L = X_C$ or $2\pi f L = \dfrac{1}{2\pi f C}$

or $L = \dfrac{1}{4\pi^2 f^2 C} = \dfrac{1}{4\pi^2 \times (50)^2 \times 10^{-4}} = \mathbf{0{\cdot}1\ H}$

36. Proceed as in problem no. 35

37. Now, $C = \dfrac{1}{4\pi^2 f^2 L} = \dfrac{1}{4\pi^2 \times (50)^2 \times 50 \times 10^{-3}}$

$= 2{\cdot}0264 \times 10^{-4}$ F $= \mathbf{202{\cdot}64\ \mu F}$

Also, $Z = \sqrt{R^2 + (X_L - X_C)^2}$

Since $X_L = X_C$, $Z = R = 5\ \Omega$

38. $X_C = \dfrac{1}{2\pi f C} = \dfrac{1}{2\pi \times 1000 \times 10 \times 10^{-6}} = \mathbf{15{\cdot}92\ \Omega}$

For finding the value of L, proceed as in problem no. 35.

39. Here, $L = 100$ mH $= 0{\cdot}1$ H ; $C = 25\ \mu F = 25 \times 10^{-6}$ F ;
$R = 15\ \Omega$ and $E_v = 120$ V

(*i*) At resonance, $Z = R = \mathbf{15\ \Omega}$

(*ii*) At resonance, $I_v = \dfrac{E_v}{Z} = \dfrac{120}{15} = \mathbf{8\ A}$

(*iii*) Resonant frequency,

$$f = \frac{1}{2\pi\sqrt{LC}} = \frac{1}{2\pi\sqrt{0{\cdot}1 \times 25 \times 10^{-6}}} = \mathbf{100{\cdot}66\ Hz}$$

40. Here, $E_v = 230$ V ; $L = 5{\cdot}0$ H ; $C = 80\ \mu F = 80 \times 10^{-6}$ F ;
$R = 40\ \Omega$

(*a*) For resonance in circuit,

$X_L = X_C$ or $\omega L = \dfrac{1}{\omega C}$ or $\omega = \dfrac{1}{\sqrt{LC}}$

or $\omega = \dfrac{1}{\sqrt{5{\cdot}0 \times 80 \times 10^{-6}}} = \mathbf{50\ rad\ s^{-1}}$

(*b*) Current at resonance, $I_v = \dfrac{E_v}{R} = \dfrac{230}{40} = \mathbf{5{\cdot}75\ A}$

(*c*) $V_L = I_v \times \omega L = 5{\cdot}75 \times 50 \times 5 = \mathbf{1437{\cdot}5\ V}$

41. Here, $R = 2\ \Omega$; $L = 0{\cdot}01$ H ; $E_v = 200$ V ; $f = 50$ Hz

(*i*) At resonance, $X_L = X_C$

or $C = \dfrac{1}{4\pi^2 f^2 L} = \dfrac{1}{4 \times (3)^2 \times (50)^2 \times 0{\cdot}01}$ (Take $\pi = 3$)

$= 1{\cdot}11 \times 10^{-3}$ F $= \mathbf{1{\cdot}11\ mF}$

(*ii*) At resonance, current through capacitor (or circuit),

$I_v = \dfrac{E_v}{Z} = \dfrac{200}{2} = \mathbf{100\ A}$

(*iii*) At resonance, voltage across capacitor,

$V_L = I_v \times X_C = I_v \times \dfrac{1}{2\pi f C}$

$= \dfrac{100}{2 \times 3 \times 50 \times 1{\cdot}11 \times 10^{-3}}$ ...... (Take $\pi = 3$)

$= \mathbf{300{\cdot}3\ V}$

42. Here, $R = 100\ \Omega$, $E_v = 220$ V ; $f = 50$ Hz

(*i*) $E_v = \sqrt{2}\,E_v = \sqrt{2} \times 200 = \mathbf{311{\cdot}1\ V}$

(*ii*) $P_{av} = E_v\, I_v \cos\phi = 220 \times \dfrac{220}{100} \times \cos 0° = \mathbf{484\ W}$

(*iii*) Peak power $= E_0\, I_0 = 311{\cdot}1 \times \dfrac{311{\cdot}1}{100} = \mathbf{967{\cdot}8\ W}$

(*iv*) Energy delivered in 10 minutes,

$W = P_{av} \times t = 484 \times 10 \times 60 = \mathbf{2{\cdot}904 \times 10^5\ J}$

43. Here, $P_{av} = 900$ W and $E = 200 \cos(314\, t + 60°)$

$\therefore E_0 = 200$ V, $\omega = 314$ rad s^{-1} and $\phi = 60°$

Now, $P_{av} = E_v\, I_v \cos\phi = \dfrac{E_0}{\sqrt{2}} \times I_v \cos\phi$

or $900 = \dfrac{200}{\sqrt{2}} I_v \cos 60°$ or $I_v = \dfrac{900\sqrt{2}}{200 \times \cos 60°} = \mathbf{12{\cdot}73\ A}$

44. Here, $R = 10\ \Omega$; $L = 800$ mH $= 0{\cdot}8$ H

and $E = 200 \sin 300\, t$

$\therefore E_0 = 200$ V and $\omega = 300$ rad s^{-1}

(*i*) Now, $X_L = \omega L = 300 \times 0{\cdot}8 = 240\ \Omega$

$\therefore Z = \sqrt{R^2 + X_L{}^2} = \sqrt{(10)^2 + (240)^2} = \mathbf{240{\cdot}2\ \Omega}$

(*ii*) $I_0 = \dfrac{E_0}{Z} = \dfrac{200}{240{\cdot}2} = \mathbf{0{\cdot}833\ A}$

(*iii*) Power factor, $\cos\phi = \dfrac{R}{Z} = \dfrac{10}{240{\cdot}2} = \mathbf{0{\cdot}042}$

45. To find L, proceed as in problem no. 24. It will be found that resistance of the lamp, $R = 10\ \Omega$ and $L = 0{\cdot}049$ H. Now, power factor,

$$\cos\phi = \frac{R}{\sqrt{R^2 + (2\pi f L)^2}} = \frac{10}{\sqrt{(10)^2 + (2\pi \times 50 \times 0{\cdot}049)^2}}$$

$= \mathbf{0{\cdot}0545}$

46. Here, $\cos\phi = 0{\cdot}5$, $R = 10\ \Omega$; $E_v = 80$ V ; $f = 100$ Hz

Now, $\cos\phi = \dfrac{R}{\sqrt{R^2 + X_C{}^2}}$ or $0{\cdot}5 = \dfrac{10}{\sqrt{(10)^2 + X_C{}^2}}$

or $\sqrt{100 + X_C{}^2} = 20$ or $X_C = \sqrt{300}$

or $\dfrac{1}{2\pi f C} = \sqrt{300}$

or $C = \dfrac{1}{2\pi f \times \sqrt{300}} = \dfrac{1}{2\pi \times 100 \times \sqrt{300}} = \mathbf{9{\cdot}19 \times 10^{-5}\ F}$

47. Here, $L = 0{\cdot}5$ H ; $C = 15\ \mu F = 15 \times 10^{-6}$ F ; $R = 100\ \Omega$,
$E_v = 200$ V ; $f = 50$ Hz

(*i*) $I_v = \dfrac{E_v}{\sqrt{R^2 + (X_L - X_C)^2}}$

Now, $X_L = 2\pi f L = 2\pi \times 50 \times 0{\cdot}5 = 1571\ \Omega$

and $X_C = \dfrac{1}{2\pi f C} = \dfrac{1}{2\pi \times 50 \times 15 \times 10^{-6}} = 212{\cdot}21\ \Omega$

$\therefore I_v = \dfrac{200}{\sqrt{(100)^2 + (157{\cdot}1 - 212{\cdot}21)^2}} = \mathbf{1{\cdot}752\ A}$

(*ii*) Power factor,

$$\cos\phi = \frac{R}{\sqrt{R^2 + (X_L - X_C)^2}} = \frac{100}{\sqrt{(100)^2 + (157{\cdot}1 - 212{\cdot}21)^2}}$$

$= \mathbf{0{\cdot}876}$

48. Here, $R = 12\ \Omega$; $X_C = 14\ \Omega$; $X_L = 30\ \Omega$, $E_v = 230$ V ; $f = 50$ Hz

Now, $Z = \sqrt{R^2 + (X_L - X_C)^2} = \sqrt{(12)^2 + (30-14)^2} = 20\ \Omega$

(a) $I_v = \dfrac{E_v}{Z} = \dfrac{230}{20} = \mathbf{11{\cdot}5\ A}$

(b) $\tan\phi = \dfrac{X_L - X_C}{R} = \dfrac{30-14}{12} = 1\cdot3333$

or $\qquad \phi = \mathbf{53{\cdot}13^\circ}$

(c) Power factor, $\cos\phi = \dfrac{R}{Z} = \dfrac{12}{20} = \mathbf{0{\cdot}6}$

49. Here, $C = 5\ \mu F = 5 \times 10^{-6}$ F ; $R = 10\ \Omega$; $f = 50$ Hz

The power factor of an a.c. circuit is unity, when the circuit is purely resistive *i.e.* $X_L = X_C$

or $L = \dfrac{1}{4\pi^2 f^2 C} = \dfrac{1}{4\pi^2 \times (50)^2 \times 5 \times 10^{-6}} = \mathbf{2{\cdot}026\ H}$

50. Here, $R = 10\ \Omega$; $L = 2$ H ; $C = 25\ \mu F = 25 \times 10^{-6}$ F ; $E_v = 200$ V

When the frequency of the a.c. supply equals the natural frequency of the circuit, $X_L = X_C$ *i.e.* $Z = R$

$\therefore\ P_{av} = E_v I_v = E_v \times \dfrac{E_v}{R} = \dfrac{200 \times 200}{10} = \mathbf{4000\ W}$

51. Here, $R = 100\ \Omega$; $L = 0{\cdot}50$ H ; $f = 10$ kHz $= 10^4$ Hz ; $E_v = 240$ V

(a) $I_v = \dfrac{E_v}{\sqrt{R^2 + (2\pi f L)^2}} = \dfrac{240}{\sqrt{(100)^2 + (2\pi \times 10^4 \times 0{\cdot}50)^2}}$

$= \dfrac{240}{31416{\cdot}1} = 7{\cdot}64 \times 10^{-3}$ A

Now, $I_0 = \sqrt{2}\, I_v = \sqrt{2} \times 7{\cdot}64 \times 10^{-3} = \mathbf{1{\cdot}08 \times 10^{-2}\ A}$

(b) $\tan\phi = \dfrac{\omega L}{R} = \dfrac{2\pi f L}{R} = \dfrac{2\pi \times 10^4 \times 0{\cdot}50}{100} = 314{\cdot}16$

or $\qquad \phi = 89{\cdot}82^\circ \approx \mathbf{90^\circ}$

From the solved problem 3.09 (*a*), it follows that when $f = 50$ Hz, $I_v = 1{\cdot}29$ A

However, when frequency is very high ($\approx$ 10 kHz), the current drops to $1{\cdot}08 \times 10^{-2}$ A (nearly zero). Hence, at very high frequency in an a.c. circuit, an inductor nearly amounts to **an open circuit** (offers very high resistance).

For a d.c. supply, $f = 0$

$\therefore \qquad X_L = 2\pi f L = 2\pi \times 0 \times 0{\cdot}50 = 0$

Thus, in a d.c. circuit, inductor offers no resistance *i.e.* it **behaves like a conductor.**

52. Here, $R = 40\ \Omega$; $C = 100\ \mu F = 10^{-4}$ F ; $E_v = 110$ V ; $f = 12$ kHz $= 12 \times 10^3$ Hz

(a) $I_v = \dfrac{E_v}{\sqrt{R^2 + X_C^2}}$

Now, $X_C = \dfrac{1}{2\pi f C} = \dfrac{1}{2\pi \times 12 \times 10^3 \times 10^{-4}} = 0\cdot133\ \Omega$

$\therefore \qquad I_v = \dfrac{110}{\sqrt{(40)^2 + (0\cdot133)^2}} = 2\cdot75$ A

Hence, $I_0 = \sqrt{2}\, I_v = \sqrt{2} \times 2{\cdot}75 = \mathbf{3{\cdot}89\ A}$

(b) $\tan\phi = \dfrac{X_C}{R} = \dfrac{0\cdot133}{40} = 0\cdot0033$

or $\qquad \phi = 0{\cdot}2^\circ \approx \mathbf{0^\circ}$

In absence of capacitor,

current through the circuit $= \dfrac{E_v}{R} = \dfrac{110}{40} = 2\cdot75$ A

It follows that when frequency is very high ($\approx$ 12 kHz), current in the circuit is same, whether capacitor is connected in the circuit or not. In other words, at very high frequency capacitor **behaves like a conductor** in an a.c. circuit.

For d.c. supply, $f = 0$

$\therefore\ X_C = \dfrac{1}{2\pi f C} = \dfrac{1}{2\pi \times 0 \times 10^{-4}} = \infty$

Thus, in d.c. circuit, a capacitor amounts to **an open circuit** (offers infinite resistance).

53. Here, $V_L = 12$ V and $V_R = 16$ V

Let I_v be r.m.s. value of current in the circuit. Then,

$$X_L = \frac{V_L}{I_v} = \frac{12}{I_v} \quad \text{and} \quad R = \frac{V_R}{I_v} = \frac{16}{I_v}$$

$$\therefore \quad Z = \sqrt{R^2 + X_L^{\,2}} = \sqrt{(16/I_v)^2 + (12/I_v)^2}$$

$$= \frac{\sqrt{(16)^2 + (12)^2}}{I_v} = \frac{20}{I_v}$$

Hence, potential difference across the circuit,

$$E_v = I_v \times Z = I_v \times \frac{20}{I_v} = \mathbf{20\ V}$$

54. Here, $L = 80$ mH $= 0{\cdot}08$ H ; $C = 60\ \mu F = 60 \times 10^{-6}$ F ; $R = 15\ \Omega$; $E_v = 230$ V ; $f = 50$ Hz

$$Z = \sqrt{R^2 + (X_L - X_C)^2}$$

Now, $X_L = 2\pi f L = 2\pi \times 50 \times 0{\cdot}08 = 25{\cdot}13\ \Omega$

and $X_C = \dfrac{1}{2\pi f C} = \dfrac{1}{2\pi \times 50 \times 60 \times 10^{-6}} = 53{\cdot}05\ \Omega$

$$\therefore \quad Z = \sqrt{(15)^2 + (25\cdot13 - 53\cdot05)^2} = 31\cdot7\ \Omega$$

Also, $I_v = \dfrac{E_v}{Z} = \dfrac{230}{31\cdot7} = 7\cdot26$ A

Now, average power transferred to R,

$$P_{av}(R) = V_R \times I_v \cos 0^\circ = (I_v R) \times I_v \times 1 = I_v^{\,2} R$$

$$= (7{\cdot}26)^2 \times 15 = \mathbf{790{\cdot}6\ W}$$

Average power transferred to L,

$$P_{av}(L) = V_L \times I_v \cos \pi/2 = \mathbf{0}$$

Average power transferred to C,

$$P_{av}(C) = V_C \times I_v \cos(-\pi/2) = \mathbf{0}$$

Total power absorbed by the circuit,

$$P_{av}\text{(total)} = 790{\cdot}6 + 0 + 0 = \mathbf{790{\cdot}6\ W}$$

Aliter. Total power absorbed by the circuit,

$$P_{av}\text{(total)} = E_v I_v \cos\phi = E_v I_v \times \frac{R}{Z}$$

$$= \frac{230 \times 7\cdot26 \times 15}{31\cdot7} = \mathbf{790{\cdot}1\ W}$$

55. Here, $L = 0{\cdot}7$ H ; $R = 220\ \Omega$; $E_v = 220$ V ; $f = 50$ Hz

Now, $X_L = 2\pi f L = 2\pi \times 50 \times 0{\cdot}7 = 220\ \Omega$

$$\therefore \quad I_v = \frac{E_v}{\sqrt{R^2 + X_L^{\,2}}} = \frac{220}{\sqrt{(220)^2 + (220)^2}} = 0\cdot707\ \text{A}$$

Also, $\tan\phi = \dfrac{X_L}{R} = \dfrac{220}{220} = 1$ $\qquad$ or $\qquad \phi = 45^\circ$

Therefore, wattless component of the current,

$$I_v \sin\phi = 0\cdot707 \sin 45^\circ = \mathbf{0{\cdot}5\ A}$$

CHAPTER
4

Electrical Machines & Device

4.01. TRANSFORMER

It is a device used for converting low alternating voltage at high current into high voltage at low current and vice-versa.

Principle. It works on the principle of mutual induction *i.e. if two coils are inductively coupled and when current or magnetic flux is changed through one of the two coils, then induced e.m.f. is produced in the other coil.*

Construction. It consists of two coils P and S wound on a soft iron core. The coils P and S are called primary coil and secondary coil respectively [Fig. 4.01]. The a.c. input is applied across the primary coil and the transformed output is obtained across the secondary coil. To minimise eddy currents, the soft iron core is laminated.

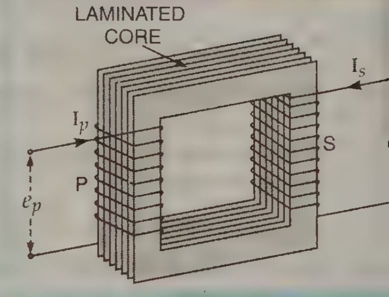

Fig. 4.01

The transformers are of following two types :

Step-up transformer. In a step-up transformer, the number of turns in secondary coil (N_s) is greater than the number of turns in primary coil (N_p) *i.e.* $N_s > N_p$. The primary coil is made of a thick insulated copper wire, while the secondary coil is made of a thin insulated wire. It converts a ***low voltage at high current*** into a ***high voltage at low current.***

Step-down transformer. The number of turns in secondary coil (N_s) of a step-down transformer is less than that in primary coil (N_p) *i.e.* $N_s < N_p$. In a step down transformer, the primary coil is made of a thin wire and the secondary coil is made of a thick wire. It converts a ***high voltage at low current*** into a ***low voltage at high current.***

Key point

A transformer cannot work on d.c.

Key point

In a step-up transformer, the increase
voltage is at the cost of current.

Theory. When an alternating e.m.f. is applied across the primary coil, the input voltage keeps on changing with time. Due to this, the magnetic flux through the primary coil also keeps on changing with time. The changing magnetic flux gets linked up with secondary coil through the laminated core, which in turn produces alternating e.m.f. across the secondary coil. The soft iron core is capable of coupling practically the whole of the magnetic flux produced in the primary coil with the secondary coil. If the magnetic field lines remain confined to the soft iron core, then all the field lines across the primary coil link up with each turn of secondary coil. Therefore, the magnetic flux linked with two coils are simply proportional to their number of turns. If ϕ_p and ϕ_s are magnetic flux linked with primary and secondary coils at any instant, then

$$\frac{\phi_s}{\phi_p} = \frac{N_s}{N_p} \qquad \text{...(4.01)}$$

or

$$\phi_s = \frac{N_s}{N_p}\,\phi_p$$

Differentiating both sides *w.r.t. t*, we have

$$\frac{d\phi_s}{dt} = \frac{d}{dt}\left(\frac{N_s}{N_p}\,\phi_p\right)$$

or

$$\frac{d\phi_s}{dt} = \frac{N_s}{N_p}\cdot\frac{d\phi_p}{dt} \qquad \text{...(4.02)}$$

According to Faraday's law of electromagnetic induction, the induced e.m.f. produced is given by

$$e = -\frac{d\phi}{dt}$$

Therefore, if e_p and e_s are the instantaneous values of induced e.m.f. produced in primary and secondary coils respectively, then

$$e_p = -\frac{d\varphi_p}{dt}$$

and $$e_s = -\frac{d\phi_s}{dt}$$

Using the above two expressions, equation (4.02) becomes

$$e_s = \frac{N_s}{N_p} = e_p \qquad \text{...(4.03)}$$

The ratio $\frac{N_s}{N_p} = k$ is called ***transformation ratio.***

For a step-up transformer, transformation ratio is greater than one, while for -down transformer, its value is less than one.

If we assume that there is no loss of energy, then

instantaneous output power = instantaneous input power

i.e. $e_s I_s = e_p I_p$

Here, I_p and I_s are respectively the values of current in primary and secondary at the instant, when the respective values of the voltage across the two coils $_p$ and e_p.

Therefore, $$\frac{e_s}{e_p} = \frac{I_p}{I_s}$$

Since in a step-up transformer, $e_s > e_p$, it follows that $I_s < I_p$. Thus, in accordance the law of conservation of energy, a step-up transformer increases the voltage ecreasing the current. Similarly, a step-down transformer decreases the voltage creasing the current. In other words, a transformer neither creates nor destroys lectric energy. It simply transforms the voltages and currents, obeying the law nservation of energy.

Need for laminated core. When a.c. input is applied across P- coil, the induced f. is produced in S-coil due to change of magnetic flux across it. In fact, magnetic changes through the soft iron core also and it produces induced e.m.f. in the core also. The induced e.m.f. developed in the iron core produces current in ore in the form of closed loops, called eddy currents. Since resistance of the core is quite small, the magnitude of eddy currents is quite large. As a result, ge amount of heat is produced and it may damage the insulation of the copper dings.

To avoid it, a laminated iron core is used in a transforer. The laminated iron is prepared by joining similar iron strips together after coating them with ish. As such, the induced e.m.f. produced in the core will cause eddy currents ch iron strip separately. Since, an iron strip is quite thin and possesses very large stance, the magnitude of eddy currents produced is quite small and hence only all amount of heat is produced.

Key point

The core of a transformer is made of soft iron. It is because, area of hysteresis loop for soft iron is small and as a result, dissipation of energy also becomes small.

4.02. ENERGY LOSSES IN ATRANSFORMER

In practice, a number of types of energy losses occur in a transformer. Due to the effeciency of a practical transformer is never 1 or 100%. The various types nergy losses, which occur in a transformer, are as given below :

(i) Flux losses. The coupling of the primary and secondary coils is never perfect whole of the magnetic flux produced in primary coil never gets linked up with secondary coil.

(ii) Copper losses. Due to resistance of the windings of primary and secondary s, some electrical energy is always converted into heat energy.

(iii) Iron losses. The varying magnetic flux produces eddy currents in the iron , which also leads to the wastage of energy in the form of heat. It is minimised using a laminated iron core.

(iv) Hysteresis losses. The alternating current flowing through the coils gnetises and demagnetises the iron core again and again over complete cycles. ring each cycle of magnetisation, some energy is lost due to hysteresis, the energy during a cycle of magnetisation being equal to area of the hysteresis loop (in gnitude). However, the loss of energy can be minimised by selecting the material ore, which has a narrow hysteresis loop.

(v) Humming losses. Due to the passage of alternating current, the core of the nsformer starts vibrating and produces humming sound. Thus, some part (may be very small) of the electrical energy is wasted in the form of humming sounds produced by the vibrating core of the transformer.

On account of the energy losses given above, the output power of a transformer is always less than the input power *i.e.*

$$e_s I_s < e_p I_p$$

The efficiency of the transformer is given by

$$\eta = \frac{e_s I_s}{e_p I_p} \qquad \text{...(4.05)}$$

Hence, in practice, the efficiency of a transformer is never 100%.

4.03. USE OF TRANSFORMER FOR LONG DISTANCE TRANSMISSION OF ELECTRIC ENERGY

When electrical energy has to be transmitted to a distant place, the resistance of line wires is considerable. Due to this, a good deal of electric power I^2R is dissipated as heat, where I is current through line wires and R is resistance. Also, a sufficient fall of potential I R occurs along the line wires. Hence, the effective voltage at the distant place will be much smaller than the actual value of the voltage supplied by the transmitting station. In addition to it, a few more difficulties are encountered, if transmission of electrical energy is done at low voltage (220 V). However, by the transmission of electrical energy at high voltage (say 22000 V), the difficulties encountered in the power transmission can be minimised. To understand the role of two factors which are important in power transmission, consider that 11000 watt of electric power is transmitted first at 220 V and then at 22000 V.

1. Loss of electric energy. When transmission of electric energy is done at 220 V, a current of $\frac{11000}{220}$ *i.e.* 50 A flows through the line wires. If R is resistance of line wires, energy equal to 50^2 R *i.e.* 2500 R joule will be dissipated per second as heat energy. On the other hand, when transmission is done at 22000 V, a current of $\frac{11000}{22000}$ *i.e.* 0·5 A only flows through the line wires. In this case, the electric energy dissipated per second as heat will be $0{\cdot}5^2$ R *i.e.* 0·25 R joule per second only.

Key point

The transmission of a.c. is done at hig voltage. As such, current through li wires and hence energy wasted in the for of heat across the wires becomes low.

Therefore, we conclude that *if transmission of electric energy is done at high voltage, the dissipation of energy is much reduced.*

2. Cost of transmission. If transmission of electric energy is done at 220 V, then as discussed above, to transmit electric power of 11000 W, the current capacity of line wires has to be 50 A and if transmission is done at 22000 V, the current capacity of line wires has to be only 0·5 A. Therefore, if transmission is done at low voltage, thick wires have to be used. Due to the use of thick line wires, the cost of transmission will increase. Further, stronger poles would be needed in order to support thicker line wires. It will further add to the cost of transmission. On the other hand, if the transmission is done at high voltage, the line wires required are of low current capacity *i.e.* thin wires and light poles may be used. Due to this, the cost of transmission will be low.

Therefore, it may be concluded that *if transmission is done at high voltage, the transmission is much economical from the point of view of the cost of line wires and poles.*

Keeping in view the above two factors, transmission of electric energy is done at high voltage and for this a step-up transformer is used. No doubt, there will be some loss of energy in transformer also, but the energy loss in a transformer is negligible as compared to the energy loss along the long line wires between two stations.

4.04. OTHER USES OF A TRANSFORMER

1. A step-down transformer is used for obtaining large current for electric welding.

2. A step-down transformer is used in induction furnace for melting the metals.

3. A step-up transformer is used for the production of X-rays.

4. Transformers are used in voltage regulators and stabilised power supplies.

5. Small transformers are used in radio sets, televisions, telephones, loud speakers, etc.

4.05. FLEMING'S RIGHT HAND RULE

We know that when a conductor is moved inside the magnetic field in a direction perpendicular to the direction of magnetic field, induced e.m.f. is produced across its two ends. The direction of flow of current can be found by applying Lenz's rule. The direction of flow of the induced current can also be found by applying Fleming's right hand rule, when the direction of motion of conductor inside the magnetic field and the direction of magnetic field acting on it are known.

Fleming's right hand rule. *It states that if the thumb, fore finger and the central finger of the right hand are kept perpendicular to each other [Fig. 4.02], so that the fore finger points in the direction of the field and the thumb in the direction of motion of the conductor, then the induced current flows in the direction of the central finger.*

It may be pointed out that in this rule, the word 'current' refers to ***conventional current.***

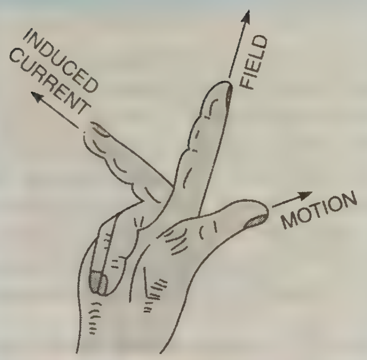

Fig. 4.02

Watch Out !

The word 'generator' is a misnomer. It generates nothing. It simply converts mechanical energy into electrical energy.

4.06. ALTERNATING CURRENT GENERATOR (A.C. DYNAMO)

An electric generator is a device used to convert mechanical energy into electrical energy.

Principle. It is based on the principle of the electromagnetic induction. *When a coil is rotated about an axis perpendicular to the direction of uniform magnetic field, an induced e.m.f. is produced across it.*

Construction. The a.c. generator consists of the following parts :

1. *Armature.* A rectangular coil ABCD consisting of a large number of turns of copper wire wound over a soft iron core is called the armature. The soft iron core is used to increase the magnetic flux.

2. *Field magnet.* It is usually a strong permanent magnet having concave poles. The armature is rotated between the two poles of a magnet, so that axis of the armature is perpendicular to magnetic field lines [Fig. 4.03].

3. *Slip rings.* The leads from the arms of the armature are connected to the two rings R_1 and R_2 separately. These rings help to provide movable contact and for this reason, they are called slip rings. As the armature and hence the leads rotate, the rings R_1 and R_2 also rotate about the central axis.

4. *Brushes.* The flexible metallic pieces B_1 and B_2, called brushes, are used to pass on the current from armature to the slip rings across which the external load resistance R is connected. As the slip rings rotate, the brushes provide movable contact by keeping themselves pressed against the rings.

Working. The working of the a.c. generator is illustrated with the help of five different positions of the armature ABCD at times $t = 0$, T/4, T/2, 3T/4 and T respectively [Fig. 4.04 (*a*)].

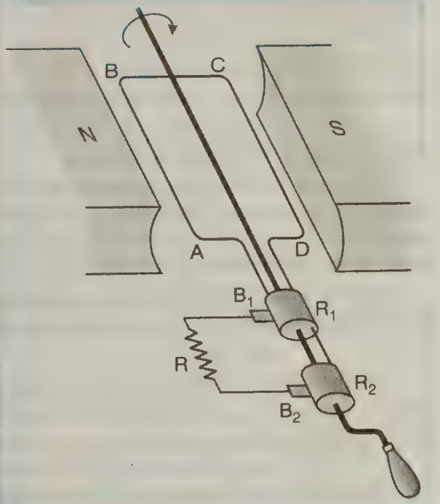

Fig. 4.03

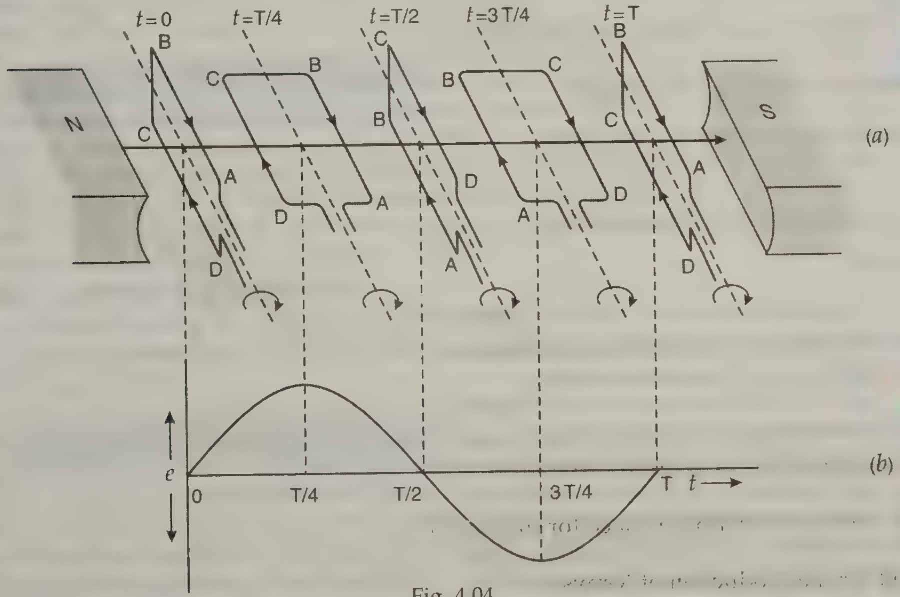

Fig. 4.04

Direction of flow of current. Initially at $t = 0$, the armature ABCD is vertical with arm AB up and CD down. During the motion of armature between $t = 0$

Key point

The direction of flow of induced current in the coil a generator is found by applying Fleming's right hand rule. It may be pointed out that Fleming's left hand rule does not apply to induced currents. It is used to find the direction of force on a current carrying conductor.

to $t = T/2$, the arm AB moves down and CD moves up. The application of Fleming's right hand rule tells that the current in the armature will flow in the direction DCBA (from the end B to A in arm AB and the end D to C in arm CD). On the other hand, during the motion of armature between $t = T/2$ to $t = T$, the motion of the two arms is just opposite to that what happens during $t = 0$ to $t = T/2$, *i.e.* the arm AB moves up and CD moves down. Therefore, during this interval, the current in the armature will flow in the direction ABCD.

Magnitude of induced e.m.f. Whenever the armature is vertical, its arms AB and CD momentarily move parallel to the field *i.e.* the rate of change of magnetic flux through the armature becomes zero. Accordingly, the induced e.m.f. $e\left(=-\dfrac{d\phi}{dt}\right)$ corresponding to the vertical positions of the armature is also zero $\left(\text{as } \dfrac{d\phi}{dt}=0\right)$ *i.e.* at time $t = 0$, T/2 and T, the induced e.m.f. produced is zero. Whenever the armature is horizontal, the arms AB and CD move normally to the direction of magnetic field lines and hence they cut or intercept the magnetic field lines with maximum speed*. Hence, the rate of change of magnetic flux is fastest or maximum corresponding to horizontal positions. Thus, at times $t = T/4$ and $3\,T/4$, the induced e.m.f. produced is maximum.

Key point

1. When a coil is rotated in magnetic field, induced e.m.f. produced is maximum when the magnetic field lines are perpendicular to its plane. It is because, near this position, the rate of intercepting the field lines is maximum.

2. The induced e.m.f. produced is zero (minimum), when the magnetic field lines are parallel to the plane of coil. It is because, near this position, the rate of intercepting the field lines is practically zero.

Therefore, output e.m.f. across the load resistance R during a complete rotation of the armature will vary as shown in Fig. 4.04 (*b*). The expression for instantaneous e.m.f. developed across R is given by

$$e = e_p \sin \omega t,$$

which can be deduced as below :

Expression for instantaneous e.m.f. produced. Fig. 4.05 shows the armature of the a.c. generator consisting of n turns and placed in uniform magnetic field B, such that its axis of rotation is perpendicular to the direction of the field. Initially, at $t = 0$, the coil is vertical with arm AB up and CD down.

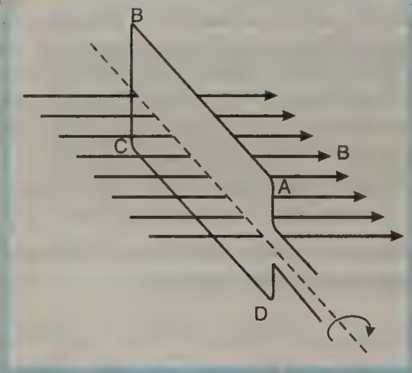

Fig. 4.05

Fig. 4.06 shows the position of the coil at any time t *i.e.* its plane makes an angle θ with the vertical. If ω is uniform angular speed of the coil, then

$$\theta = \omega t$$

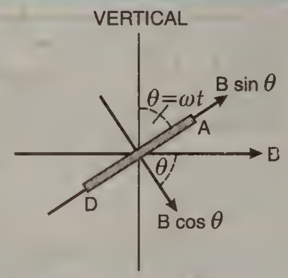

Fig. 4.06

In the position of the coil as shown in Fig. 4.06, the component of the field normal to the plane of the coil is B cos θ. If A is area of the coil and n, the number of turns in the coil, then magnetic flux linked with the coil in this position is given by

$$\phi = n\,B\cos\theta\,(A) = n\,B\,A\cos\theta = n\,B\,A\cos\omega t \qquad \text{...(4.06)}$$

The effect of number of turns n in the coil is to increase the magnetic flux linked with the coil to n times.

Differentiating both sides of the equation (4.06) *w.r.t.* time, we get

$$\frac{d\phi}{dt} = \frac{d}{dt}(n\,B\,A\cos\omega t) = n\,B\,A\frac{d}{dt}(\cos\omega t) = n\,B\,A\,(-\sin\omega t)\,(\omega)$$

$$= n\,B\,A\,\omega\sin\omega t$$

If e is the instantaneous induced e.m.f. produced at this instant, then

$$e = -\frac{d\phi}{dt} = -(-n\,B\,A\,\omega\sin\omega t)$$

or

$$e = n\,B\,A\,\omega\sin\omega t \qquad \text{...(4.07)}$$

The equation (4.07) gives the instantaneous induced e.m.f. in the coil. It follows that $n\,B\,A\,\omega$ is the maximum value of the e.m.f., say e_0. Therefore, we have

$$e = e_0 \sin \omega t \qquad \text{...(4.08)}$$

Thus, the induced e.m.f. produced is a function of time and therefore as the coil passes through different positions with the passage of time, e.m.f. produced changes with time as given by equation (4.08). The e.m.f. would be zero for $\omega t = 0$ (when coil is vertical) ; positive maximum for $\omega t = \pi/2$ (when the coil is horizontal), zero for $\omega t = \pi$ (when coil is vertical) ; negative maximum for $\omega t = 3\,\pi/2$ (when the coil is horizontal) and again zero for $\omega t = \pi/2$ (when the coil is vertical and returns to its initial position). Thus, graphically, e.m.f. will vary with time as shown in Fig. 4.04 (*b*).

---

*It may be pointed out that speed of rotation of the armature is uniform. But when armature is horizontal, its speed of cutting the magnetic field lines is maximum.

4.07. D.C. GENERATOR

It is a device, which converts mechanical energy into electrical energy in the form of irectional e.m.f. or current, called the direct current.

Principle. It is based on the principle of electromagnetic induction.

When a coil is rotated about an axis perpendicular to the direction of uniform magnetic , an induced e.m.f. is produced across it.

Construction. Fig. 4.07 shows the essential parts of a d.c. generator. In principle, construction of d.c. dynamo is the same as that of a.c. dynamo. The main erence is that the slip rings are replaced by the arrangement known as ***split ring mutators*** in order to obtain a unidirectional continuous current through the out- load resistance.

The split rings are two halves R_1 and R_2 of the same metallic ring insulated from h other as well from the axle of the dynamo. Each of the two rings is connected he either end of the armature coil. During the rotation of the armature, the leads m arms AB and CD of the armature remain connected to the rings R_1 and R_2 pectively. The rings are so arranged that during a half revolution of the coil, each g remains in contact with a particular brush but during next half revolution, the gs interchange their contacts and establish contact with the other brushes. By this angement, the current in the outer circuit remains in the same direction.

Working. To start with, suppose that ring $R_1$is in contact with brush B_1 and g R_2 is in contact with brush B_2. If the coil rotates in clockwise direction, then ring the first half of revolution, the direction of current in the armature coil will ABCD (by applying Fleming's right hand rule) *i.e.* in the outer load resistance it will enter from the brush B_2 and flow towards B_1as shown in Fig. 4.07. After f the revolution, R_1 establishes contact with brush B_2, while R_2 comes in contact th B_1. The direction of current in the armature coil is now DCBA and in the outer d resistance R, the current again flows from B_2 to B_1 *i.e.* in the same direction, in ich it was flowing during first half of the revolution [Fig. 4.08]. The strength of current is, however, not constant and during each half cycle, it varies from zero maximum and maximum to zero in the same direction [Fig. 4.09]. Such a current alled pulsating direct current. Thus, the current produced is unidirectional, but ctuates between maximum and zero values. As such, it is inconvenient for actical purposes.

To overcome this difficulty, we take two coils whose planes are inclined to each ner at an angle of 90° and divide the ring mounted on the same spindle into four rts. The leads of each coil are connected to the two diametrically opposite parts the split ring. In such a case, either of the coils will give the current curve of the me type but with the difference that when the current in one reaches a maximum lue, the current curve given by the other has zero value. However, the brushes w receive the current from one set of commutator segments only for quarter riod and that also when the value of the current is comparatively large. So, the sultant e.m.f. in the output circuit is less varying as shown by the thick curve in g. 4.10. Similarly, if we use four coils inclined at an angle of 45° to each other and vide the ring into eight parts, we get still less fluctuating current. It is, thus, clear at by taking a large number of coils with double the number of commutator ring gments, the final current curve will be practically parallel to the time axis and, erefore, will be constant in strength.

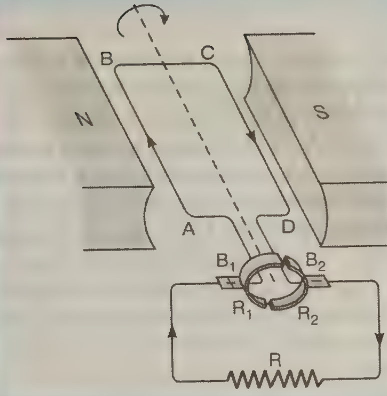

Fig. 4.07

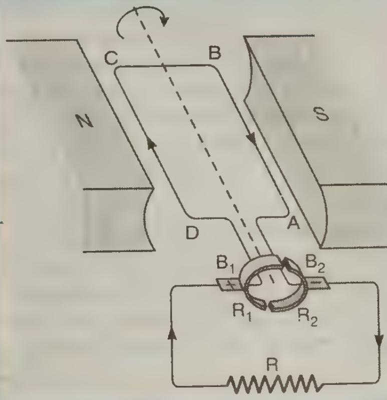

Fig. 4.08

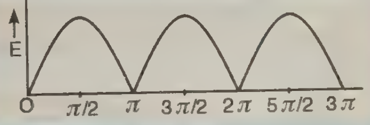

Fig. 4.09

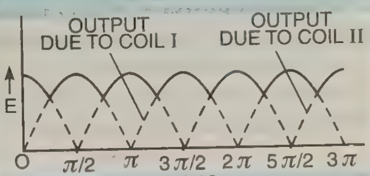

Fig. 4.10

4.08. SIMPLE D.C. MOTOR

An electric motor is a device for converting electrical energy into mechanical energy.

Principle. It is based on the fact that a current carrying coil experiences a torque a magnetic field.

Construction. A simple d.c. motor consists of an armature ABCD (a coil of a rge number of turns) wound on an iron core. It is placed in the magnetic field roduced due to the flow of current through the field windings [Fig. 4.11]. The ends f the armature are connected to two split rings R_1 and R_2 (two halves of a single ng). The two split rings alternately come in contact with carbon brushes, B_1 and $_2$ during the rotation of the armature. A battery is connected across the two brushes, o as to send d.c. through the armature.

Working. Suppose that initially the armature is horizontal, such that the split ing R_1 connected to arm AB is in contact with brush B_1, while the split ring R_2 onnected to arm CD is in contact with brush B_2. As the positive pole of the battery

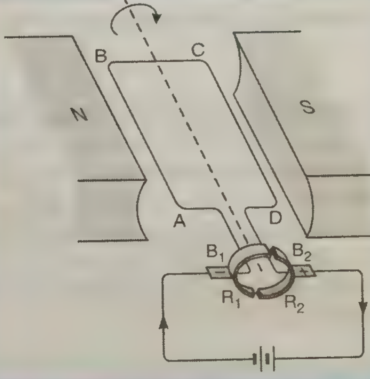

Fig. 4.11

is connected to brush B_2, the conventional current flows through the armature in the direction DCBA. According to Fleming's left hand rule, an upward force equal to $nBIl$ acts on arm AB, while an equal downward force $nBIl$ acts on arm CD. The two equal and opposite forces acting on the arms AB and CD of the armature constitute a torque and as a result of it, the armature starts rotating in clockwise direction. As such, during rotation of the coil, the perpendicular distance between the forces on the two arms goes on decreasing and becomes zero, when the armature becomes vertical and as a result of it, the armature tends to come to rest on reaching the vertical position. However, due to inertia, the armature is carried past the vertical position. As it happens, the split ring R_1 comes in contact with brush B_2, while the split ring R_2 assumes contact with brush B_1. Due to this, the direction of the flow of current through the armature gets reversed *i.e.* the current starts flowing in the direction ABCD. Since the directions of motion of arms AB and CD also get reversed (earlier arm AB was moving up and CD down, but now arm AB moves down, while CD moves up), the direction of rotation of the armature remains unchanged leading to an uninterrupted rotatory motion of the armature in one direction.

Back e.m.f. The armature of a motor continuously rotates inside the magnetic field. As the magnetic flux linked with the armature changes during its rotation, an induced e.m.f., say e is produced in the armature. According to Lenz's law, this induced e.m.f. opposes the applied battery e.m.f. and it is called ***back e.m.f.*** If E is the applied battery e.m.f. and R is the resistance of the armature, then current through the armature is given by

$$I = \frac{\text{effective e.m.f.}}{\text{resistance of the armature}} = \frac{E-e}{R} \qquad \text{...(4.09)}$$

It may be pointed out that when electric motor is just switched on, the magnitude of back e.m.f. is quite small due to the low speed of the motor. As such, the battery e.m.f. sends current through the armature, which may be large enough to burn the motor by breaking the insulation of the coils. To avoid damage to the motor on this account, a ***motor starter*** is used in series with the motor.

The motor starter also saves the motor from damage, if the electric supply fails by chance, while the motor is running. It is because, the magnitude of back e.m.f. is very large at break.

Efficiency of an electric motor. The efficiency of a motor decreases both due to the production of back e.m.f. and the production of heat in the armature coil.

The efficiency of an electric motor is defined as the ratio of the output power to the input power.

Thus, $$\eta = \frac{\text{output power}}{\text{input power}} \qquad \text{...(4.10)}$$

Now, input power = battery e.m.f. × current through armature = E I,
where I is current through the armature and is given by the equation (4.09).

Heat produced per second in the armature = $I^2 R$

Therefore, output power = $EI - I^2R = (E - IR) \times I$

From equation (4.09), we have

$$E - IR = e$$

Substituting for (E – I R) in above equation, we have

output power = eI

Substituting for output power and input power in equation (4.10), we have

$$\eta = \frac{eI}{EI} = \frac{e}{E} \qquad \text{...(4.11)}$$

Thus, *efficiency of a motor is equal to the ratio of the back e.m.f. produced to the applied battery e.m.f.*

Condition for maximum efficiency. From equation (4.11), it follows that efficiency of a motor will be 1 (maximum), if back e.m.f. setup in the armature is equal to applied battery e.m.f. In that event, the current through the armature will be zero and the motor will not run at all. Therefore, condition for maximum efficiency of the motor is obtained by finding the condition, so that output power is maximum.

Now, output power = $eI = \dfrac{e(E-e)}{R}$

he output power varies with back e.m.f. Therefore, output power will be ıum, if

$$\frac{d}{de}\left[\frac{e(E-e)}{R}\right]=0 \text{ or } \frac{d}{de}[eE-e^2]=0 \text{ or } E-2e=0$$

r

$$e=\frac{E}{2}$$

hus, *an electric motor will be maximum efficient i.e. the motor will deliver maximum power, when the back e.m.f. set up in the armature is half the value of the applied e.m.f.*

Vhen the motor is delivering maximum output power, then

$$\eta=\frac{E/2}{E}=\frac{1}{2} \text{ (or 50\%)}$$

Thus, *while delivering maximum output power, the motor has an efficiency of 50%.*

.09 MOTOR STARTER

motor starter is basically a variable resistor connected in series with the motor.

Vhen a motor is switched on and it has not attained its full speed, the back (*e*) produced will be very small. The current flowing through the armature is by

$$I=\frac{E-e}{R},$$

e R is the resistance of the armature and E is the e.m.f. applied to the motor. esistance of armature is usually kept small, so as to reduce copper losses. fore, due to low resistance of the armature and small back e.m.f. produced at art of the motor, current through the armature will be quite large, when the r is just switched on. Due to this, motor sometimes gets burnt due to breaking insulation of the coils. In order to save the motor from getting damaged on ccount, a motor starter is used.

Key point

When motor is just switched on, back e.m.f. produced in the armature is practically zero and hence a large current flows through it, which may cause damage to its windings. The motor starter introduces a resistance in the circuit, so as to keep the current low, when the motor is just switched on. When motor attains its full speed, it withdraws the resistance. Then, current is maintained at safe value by the back e.m.f.

Fig. 4.12 shows the essential parts of a motor starter and the lay out of its series ections to the motor M. To start the motor, the handle H of the starter is brought position A. As such, the entire resistance R of the motor starter comes in series the armature of the motor and only a safe low current flows through the ture. The electromagnet E gets magnetised due to the passage of current through l it attracts the iron piece I attached to the handle. Due to this, the resistance of notor starter decreases gradually. As the motor picks up speed, the back e.m.f. ncreases gradually. The result is that the current through the armature always ins within the safe value. Ultimately, the handle reaches the position D and the er resistance gets out of the circuit. At this stage, the motor attains its full speed he current through the armature is controlled by the back e.m.f.

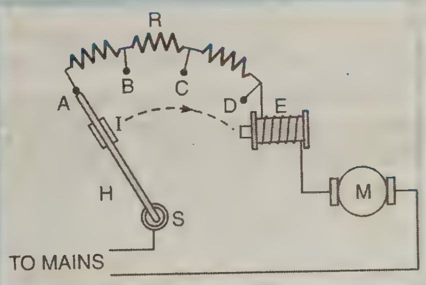

Fig. 4.12

When the motor is switched off, the electromagnet loses its magnetism and equently the handle gets released and goes to OFF-position due to spring action e spring S attached to the handle.

In case supply current fails suddenly, a large back e.m.f. will be produced at oreak and it may burn the motor. The motor also gets burnt in case the supply age increases due to certain reason. To save the motor in these situations, the or starter is designed accordingly.

4.10. CHOKE COIL

A choke coil is an electrical appliance used for controlling current in an a.c. circuit out wasting electrical energy in the form of heat.

Principle. A choke coil is based upon the principle that *when a.c. flows through nductor, the current lags behind the e.m.f. by a phase angle* $\pi/2$.

Construction. A choke coil is basically an inductance. It consists of a large nber of turns of insulated copper wire wound over a soft iron core. In order to imise loss of electrical energy due to production of eddy currents, a laminated core is used [Fig. 4.13].

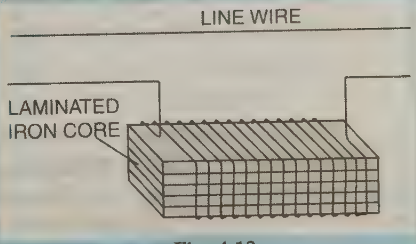

Fig. 4.13

In practice, a *low frequency choke coil* is made of insulated copper wire wound soft iron core, while a *high frequency choke coil* has air as core material.

Working. The choke coil is put in series with the electrical device, such as rescent tube requiring a low value of current. The inductive reactance decreases current. Since the alternating e.m.f. leads the current by phase angle $\pi/2$, the average power consumed by the choke coil is given by

$$P_{av} = E_v\, I_v \cos\frac{\pi}{2} = 0$$

However, a practical inductance possesses a small resistance *i.e.* a practical inductance may be treated as a series combination of inductance L and a small resistance r. Therefore, a practical inductance will consume a small average power given by

$$P_{av} = E_v\, I_v \times \frac{r}{\sqrt{r^2 + \omega^2 L^2}}$$

Here, $\frac{r}{\sqrt{r^2 + \omega^2 L^2}}$ is power factor ($\cos\phi$) for practical inductance, which is a series combination of L and r.

Uses. In a.c. circuits, a choke coil is used to control the current in place of a resistance. If a resistance is used to control the current, the electrical energy will be wasted in the form of heat. A choke coil decreases the current without wasting electrical energy in the form of heat.

SOLVED NUMERICAL PROBLEMS

Type A. On Transformer

Problem 4.01. A power transmission line feeds input power at 2300 V to a step down transformer having 4000 turns in its primary. What should be the number of turns in the secondary to get output power at 230 V ?

(*C.B.S.E. 1997*)

Sol. Here, $e_p = 2300$ V ; $N_p = 4000$; $e_s = 230$ V

Now, $$\frac{e_s}{e_p} = \frac{N_s}{N_p}$$

$$\therefore \quad N_s = N_p \times \frac{e_s}{e_p} = 4000 \times \frac{230}{2300} = \mathbf{400}$$

Problem 4.02. How much current is drawn by the primary of a transformer connected to 220 V supply, when it delivers power to a 110 V and 550 W refrigerator ?

Sol. Here, $e_p = 220$ V ; $e_s = 110$ V ; $e_s I_s = 550$ W

Now, $e_p I_p = e_s I_s$

or $$I_p = \frac{e_s I_s}{e_p} = \frac{550}{220} = \mathbf{2{\cdot}5\ A}$$

Problem 4.03. How much current is drawn by the primary coil of a transformer, which steps down 220 V to 22 V to operate a device with an impedance of 220 Ω ?

(*H.S.S.C.E. 2001*)

Sol. Here, $e_p = 220$ V ; $e_s = 22$ V

Impedance of the device connected across secondary,

$Z = 220\ \Omega$

Therefore, current in secondary coil,

$$I_s = \frac{e_s}{Z} = \frac{22}{220} = 0 \cdot 1\ \text{A}$$

If I_p is current in primary coil, then

$$e_p I_p = e_s I_s$$

or $$I_p = \frac{e_s}{e_p} \times I_s = \frac{22}{220} \times 0 \cdot 1 = \mathbf{0{\cdot}01\ A}$$

Problem 4.04. In an ideal transformer, number of turns in the primary and secondary are 200 and 1000 respectively. If the power input to the primary is 10 kW at 200 V, calculate (*a*) output voltage and (*b*) current in parimary.

(*C.B.S.E. 2002*)

Sol. Here $N_p = 200$; $N_s = 1000$; $e_p = 200$ V

Power input to primary, $e_p I_p = 10$ kW $= 10^4$ W

(*a*) Now, $$e_s = \frac{N_s}{N_p} \times e_p = \frac{1000}{200} \times 200 = \mathbf{1000\ V}$$

(*b*) $$I_p = \frac{10^4}{e_p} = \frac{10^4}{200} = \mathbf{50\ A}$$

Problem 4.05. When a voltage of 120 V is impresse across the primary of a transformer, the current in th primary is 1·85 A. Find the voltage across the secondar when it delivers 150 mA. The transformer has an efficienc of 95%.

Sol. Here, $e_p = 120$ V ; $I_p = 1 \cdot 85$ A ;

$I_s = 150$ mA $= 150 \times 10^{-3}$ A ; $\eta = 95\% = 0 \cdot 95$

Now, $$\eta = \frac{e_s I_s}{e_p I_p}$$

$$\therefore \quad e_s = \frac{\eta\, e_p I_p}{I_s} = \frac{0 \cdot 95 \times 120 \times 1 \cdot 85}{150 \times 10^{-3}} = \mathbf{1406\ V}$$

Problem 4.06. In a step-up transformer, the transfo mation ratio is 100. The primary voltage is 220 volt and inpu is 1100 watt. The number of turns in primary is 10 Calculate (*i*) the number of turns in the secondary (*ii*) th current in the primary, (*iii*) the voltage across the secondar and (*iv*) the current in the secondary.

Sol. Here, transformation ratio, $k = 100$; $N_p = 100$

(*i*) Now, $$k = \frac{N_s}{N_p}$$

$$\therefore \quad N_s = k \times N_p = 100 \times 100 = \mathbf{10{,}000}$$

(*ii*) Input power, $e_p I_p = 1100$ watt ; $e_p = 220$ volt

$$\therefore \quad I_p = \frac{1100}{e_p} = \frac{1100}{220} = \mathbf{5\ A}$$

(*iii*) Also, $$k = \frac{e_s}{e_p}$$

$$\therefore \quad e_s = k\, e_p = 100 \times 200 = \mathbf{22{,}000\ V}$$

(*iv*) Also, $$\frac{e_s}{e_p} = \frac{I_p}{I_s}$$

$$\therefore \quad I_s = \frac{e_p}{e_s} \times I_p = \frac{220}{22{,}000} \times 5 = \mathbf{0{\cdot}05\ A}$$

Problem 4.07. 11 kW of electric power can be trans- ted to a distant station at (*i*) 220 V, or (*ii*) 22,000 V. Which he two modes of transmission should be preferred and y ? Support your answer with possible calculations. (*C.B.S.E. 1998*)

Sol. Here, $e_p\,I_p = 11\text{ kW} = 11{,}000\text{ W}$

(i) When power is transmitted at $e_s = 220$ V :

If I_s is current in secondary coil, then

$$e_s\,I_s = e_p\,I_p$$

or $$I_s = \frac{11{,}000}{220} = 50\text{ A}$$

If R is resistance of transmission lines, then electrical ergy dissipated as heat I_s^2

$$= 50^2\,R = 2500\,R\text{ watt}$$

(*ii*) When power is transmitted at *e_s = 22,000 V.*

If I_s is current in secondary coil, then

$$e_s'\,I_s' = e_p'\,I_p'$$

or $$I_s' = \frac{e_p\,I_p}{e_s'} = \frac{11{,}000}{22{,}000} = 0{\cdot}5\text{ A}$$

Therefore, electrical energy dissipated as heat

$$= (I_s')^2\,R = (0{\cdot}5)^2\,R = 0{\cdot}25\,R\text{ watt}$$

Since electrical energy dissipated as heat is much less, en transmission is done at 22,000 V ; transmission should done at **22,000 V.**

pe B. On a.c. generator

Problem 4.08. A rectangular coil of dimensions 0 m × 0·5 m consisting of 2000 turns rotates about axis parallel to its long side, making 2100 volutions per minute in a field of 0·1 T. What is e maximum e.m.f. induced in the coil ? Also find e instantaneous e.m.f, when the coil is at 30° to the eld.

Sol. Here, $B = 0{\cdot}1\text{ T}\,;\ n = 2000\,;$

area of the coil, $A = 0{\cdot}10\text{ m} \times 0{\cdot}5\text{ m} = 0{\cdot}05\text{ m}^2$

angular velocity, $\omega = 2100$ r.p.m.

$$= \frac{2\,\pi \times 2100}{60} = 220\text{ rad s}^{-1}$$

Maximum e.m.f. induced in the coil,

$$e_0 = n\,B\,A\,\omega = 2100 \times 0{\cdot}1 \times 0{\cdot}05 \times 220$$
$$= \mathbf{2200\ V}$$

The e.m.f. induced in the coil, when it makes an angle *t* with the vertical is given by

$$e = e_0 \sin \omega t$$

Here, the angle, which the coil makes with the vertical,

$$\omega t = 90° - 30° = 60°$$

$$\therefore \quad e = 2200 \sin 60° = \mathbf{1905{\cdot}3\ V}$$

Problem 4.09. An a.c. generator consists of a coil of 00 turns and cross-sectional area of 3 m², rotating at a onstant angular speed of 60 rad s⁻¹ in a uniform magnetic ield 0·04 T. The resistance of the coil is 500 Ω. Calculate (*a*) naximum current drawn from the generator and (*b*) naximum power dissipation in the coil. (*C.B.S.E. 2002*)

Sol. Here, $n = 100\,;\ A = 3\text{ m}^2\,;\ \omega = 60\text{ rad s}^{-1}\,;\ B = 0{\cdot}04\text{ T}$

(*a*) Maximum e.m.f. produced in the coil,

$$e_0 = n\,B\,A\,\omega = 100 \times 0{\cdot}04 \times 3 \times 60 = 720\text{ V}$$

Since resistance of the coil is 50 Ω, the maximum current rawn from the generator,

$$I_0 = \frac{e_0}{R} = \frac{720}{500} = \mathbf{1{\cdot}44\ A}$$

(*b*) Maximum power dissipation in the coil,

$$e_0\,I_0 = 720 \times 1{\cdot}44 = 1036{\cdot}8\text{ W}$$

Problem 4.10. An a.c. generator consists of a coil of 50 turns and area 25 m² rotating at an angular speed of 60 rad s⁻¹ in a uniform magnetic field B = 0·30 T between two fixed pole pieces. The resistance of the circuit including that of the coil is 500 Ω.

(*a*) What is the maximum current drawn from the generator ?

(*b*) What is the flux through the coil, when the current is zero ? What is the flux, when the current is maximum ?

(*c*) Would the generator work, if the coil were stationary and instead of the pole pieces rotated together with the same speed as above ? (*Text Problem*)

Sol. Here, $n = 50\,;\ A = 2{\cdot}5\text{ m}^2\,;\ \omega = 60\text{ rad s}^{-1}\,;$

$$B = 0{\cdot}30\text{ T}\,;\ R = 500\ \Omega$$

(*a*) Maximum e.m.f. produced,

$$e_0 = n\,B\,A\,\omega = 50 \times 0{\cdot}30 \times 2{\cdot}5 \times 60 = 2250\text{ V}$$

Therefore, maximum current drawn from the generator,

$$I_0 = \frac{e_0}{R} = \frac{2250}{500} = 4{\cdot}5\text{ A}$$

(*b*) The current is zero, when coil is vertical. In this position, flux through the coil is maximum. On the other hand, the current is maximum, when coil is horizontal. In this position, flux through the coil is minimum.

(*c*) Yes. For generation of electricity, there should be relative motion between magnetic field and the coil.

Type C. On Motor

Problem 4.11. The back e.m.f. of a d.c. motor delivering 5 kW of mechanical power is 200 V, when operating on a 220 V line. Determine the armature current and the motor resistance. (*I.S.S.C.E. 1997*)

Sol. Here, $E = 220\text{ V}\,;\ e = 200\text{ V}\,;$

Let R be motor resistance and I be the armature current. Since mechanical output power is 5 kW *i.e.* 5000 W,

$$e\,I = 5000 \quad \text{or} \quad 200\,I = 5000 \quad \text{or} \quad \mathbf{I = 25\ A}$$

Also, $$I = \frac{E - e}{R}$$

$$\therefore \quad R = \frac{E - e}{I} = \frac{220 - 200}{25} = \frac{20}{25} = \mathbf{0{\cdot}8\ \Omega}$$

Problem 4.12. A small d.c. motor operating at 200 V draws a current of 5·0 A at its full speed of 3000 r.p.m. The resistance of the armature of the motor is 8·5 Ω. Determine the back e.m.f. of the motor. Obtain the power input, power output (mechanical) and the efficiency of the motor. (*Text Problem*)

Sol. Here, $R = 8{\cdot}5\ \Omega\,;\ E = 200\text{ V}\,;\ I = 5\text{ A}$

When the rotor of motor rotates, the back e.m.f. *e* is produced. Therefore, current drawn by motor,

$$I = \frac{E - e}{R}$$

so that $$e = E - I\,R = 200 - 5 \times 8{\cdot}5 = \mathbf{157{\cdot}5\ V}$$

Power input $= E\,I = 200 \times 5 = \mathbf{1000\ W}$

Power output $= E\,I - I^2\,R = 200 \times 5 - 5^2 \times 8{\cdot}5$
$= \mathbf{787{\cdot}5\ W}$

$$\text{Efficiency of the motor} = \frac{\text{power output}}{\text{power input}} = \frac{787{\cdot}5}{1000}$$
$$= \mathbf{0{\cdot}7875 \text{ or } 78{\cdot}75\%}$$

abc TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & Curious Students

Problem 4.13. At a hydroelectric power plant, the water pressure head is at a height of 300 m and the water flow available is 100 m^3 s^{-1}. If the turbine-generator efficiency is 60%, estimate the electric power available from the plant ($g = 9{\cdot}8$ m s^2). *(Text Problem)*

Sol. Here, $h = 300$ m ; $g = 9{\cdot}8$ m s^{-2} ; $= 100$ m^3 s^{-1} ; volume of water flowing per second

Now, density of water, $\rho = 1000$ kg m^{-3} ;

Therefore, mass of water flowing per second

$$= 100 \times 1000 = 10^5 \text{ kg s}^{-1}$$

Potential energy of water made use of per second

$$= 10^5 \times 9{\cdot}8 \times 300 = 2{\cdot}94 \times 10^8 \text{ J s}^{-1} = 2{\cdot}94 \times 10^8 \text{ W}$$

Efficiency of turbine = 60%

Therefore, electric power available from the plant

$$= \frac{2{\cdot}94 \times 10^8 \times 60}{100} = 1{\cdot}764 \times 10^8 \text{ W}$$

$$= \mathbf{176{\cdot}4\ MW}$$

Problem 4.14. A small town with a demand of 800 kW of electric power at 220 V is situated 15 km away from an electric plant generating power at 440 V. The resistance of the two-wire line carrying power is 0·5 Ω per km. The town gets power from the line through a 4000–220 V step-down transformer at a sub-station in the town. (*a*) Estimate the line power loss in the form of heat. (*b*) How much power must the plant supply, assuming there is negligible power loss due to leakage ? (*c*) Characterize the step-up transformer at the plant. *(Text Problem)*

Sol. Here, length of wire line $= 15 \times 2 = 30$ km ;

resistance of wire line, $R = 30 \times 0{\cdot}5 = 15\ \Omega$

voltage at which power is transmitted = 4000 V ;

power transmitted, $P = 800 \text{ kW} = 8 \times 10^5$ W

Now, $P = e_s I_s$

$$\therefore \quad I_s = \frac{P}{e_s} = \frac{8 \times 10^5}{4000} = 200 \text{ A}$$

(*a*) Line power loss $I_s^2 R = (200)^2 \times 15 = 6 \times 10^5$ W

$$= \mathbf{600\ kW}$$

(*b*) Power that must be supplied by the plant

$$= 800 + 600 = \mathbf{1400\ kW}$$

(*c*) Voltage drop across wire line $= 15 \times 200 =$ **3000**

The plant generates power at 440 V and it has to stepped up, so that after a voltage drop of 3000 V across w line, the power at 4000 V is received at the sub-station in town. Therefore, the step up transformer at the plan 440 V – (4000 + 3000) V *i.e.* **440 V – 7000 V.**

Problem 4.15. A circular coil of radius 8·0 cm and turns rotates about its vertical diameter with an angu speed of 50 rad s^{-1} in a uniform horizontal magnetic fi of magnitude 3·0 × 10^{-2} T. Obtain the maximum and average e.m.f. induced in the coil. If the coil forms a clos loop of resistance 10Ω, how much power is dissipated as h ? What is the source of this power ? *(Text Proble*

Sol. Here, radius of coil, $r = 8{\cdot}0 \text{ cm} = 8 \times 10^{-2}$ m ;

number of turns, $n = 20$; $\omega = 50$ rad s^{-1} ; $B = 3{\cdot}0 \times 10^{-}$

and area of coil, $A = \pi r^2 = \pi \times (8 \times 10^{-2})^2 = 64\,\pi \times 10^{-4}$

Now, $e = n\,B\,A\,\omega \sin \omega\, t$

$$\therefore \quad e_0 = n\,B\,A\,\omega = 20 \times 3{\cdot}0 \times 10^{-2} \times 64\,\pi \times 10^{-4} \times$$

$$= \mathbf{0{\cdot}6032\ V}$$

The average value of an alternating e.m.f. is zero ove complete cycle. Therefore,

$$e_{av} = 0$$

The average power consumed by a resistor,

$$P_{av} = \frac{e_{max}}{\sqrt{2}} \cdot \frac{I_{max}}{\sqrt{2}} = \frac{e_{max}\, I_{max}}{2} = \frac{e_{max}^2}{2R}$$

Here, $R = 10\ \Omega$

$$\therefore \quad P_{av} = \frac{(0 \cdot 6032)^2}{2 \times 10} = \mathbf{0{\cdot}0182\ W}$$

The external agent which keeps the coil rotating is source of this power.

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 4.01. Write the principle of a transformer. *(H.S.S.C.E. 1997 S ; P.S.S.C.E. 1992)*

Ans. Mutual induction.

Q. 4.02. Why cannot transformer work on d.c. ? *(H.S.S.C.E. 2001)*

Or

A transformer cannot be used to step up d.c. voltage. Why ? *(P.S.S.C.E. 1999 S)*

Ans. If d.c. voltage is applied across the primary coil of a transformer, then the magnetic flux linked with the coil will not vary with time and hence no induced e.m.f. will be produced in the secondary coil.

Q. 4.03. Does a step up transformer contradict the principle of conservation of energy ? *(H.S.S.C.E. 1993)*

Ans. No, it does not.

Q. 4.04. Give two reasons for power loss in a transformer.

Ans. Magnetic flux loss and hysteresis loss.

Q. 4.05. What is iron loss in a transformer and hov can be reduced ? *(P.S.S.C.E. 2000, 1999, 1998*

Ans. Due to production of eddy currents in the iron co the loss of electrical energy (in the form of heat energy known as iron loss. It is reduced by making use of a lamina iron core.

Q. 4.06. What is copper loss in a transformer ? *(P.S.S.C.E. 19*

Ans. Refer to section 4.02.

Q. 4.07. What causes the core of a transformer to heated up under operation ? *(I.S.C.E. 19*

Ans. Due to the production of eddy currents in the c of the transformer.

Q. 4.08. Why is the core of a transformer laminate Explain. *(P.S.S.C.E. 2002, 1999, 19*

Ans. The core of a transformer is laminated, so as reduce loss of energy due to eddy currents. The magnitu of the eddy currents set up is considerably minimised, wh the core is laminated.

Q. 4.09. A transformer is used to step down a.c. voltage. at appliance will you use to step down a d.c. voltage ?

Ans. A pure resistance can be used to step down d.c. tage.

Q. 4.10. Why is the core of a transformer made of a gnetic material of high permeability ? (*C.B.S.E. Sample Q. Paper*)

Ans. The transformer works on the principle of mutual duction. In case the core has a high value of magnetic rmeability, the magnetic field lines will crowd through the re and the linkage of magnetic flux between the two coils ll also be more.

Q. 4.11. State the principle on which induction coil is nstructed.

Ans. It is constructed on the principle of mutual duction.

Q. 4.12. A capacitor is used in the primary circuit of an duction coil. Why ? (*Text Question*)

Ans. At the break, a large induced e.m.f. is produced. case capacitor is not connected, sparking will take place. ut when capacitor is used, the large induced e.m.f. produced break is used up in charging the capacitor and no sparking kes place.

Q. 4.13. Name two useful devices based on the phenomenon of mutual induction.

Ans. Transformer and induction coil.

Q. 4.14. State the principle of a.c. generator. (*H.S.S.C.E. 1995*)

Ans. Refer to section 4.06.

Q. 4.15. From where does the electric energy come in a generator ?

Ans. The mechanical energy used to rotate a coil inside magnetic field is converted into electric energy.

Q. 4.16. At which position of the rotating coil in the magnetic field, the induced e.m.f. is maximum ?

Ans. The induced e.m.f. is maximum, when the plane of the coil is parallel to magnetic field lines.

Q. 4.17. Write down principle of a d.c. motor. (*P.S.S.C.E. 2000, 1999 ; H.S.S.C.E. 2001, 1998 S, 1997*)

Ans. It is based on the principle that a current carrying coil placed inside a magnetic field experiences a torque.

Q. 4.18. Is the motor starter a variable R or L or C ?

Ans. Motor starter is a variable resistor.

Q. 4.19. What is the function of a choke coil in a fluorescent tube ? (*H.S.S.C.E. 1999 S ; I.S.C.E. 1996*)

Ans. The choke coil decreases current in the circuit without wasting electrical energy in the form of heat energy.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS
With Answers/Hints

Q. 4.01. What are the factors which reduce the effi-iency of the transformer ?

Ans. Copper losses due to the heating of the primary and econdary coils ; iron losses due to the eddy currents set up n core ; hysteresis loss due to the loss of energy in nagnetising and demagnetising the iron core and the leakage f magnetic flux are the various reasons, which reduce the fficiency of the transformer.

Q. 4.02. How are the energy losses reduced in a trans-ormer ? (*P.S.S.C.E. 1999*)

Or

What are the factors which help in increasing the efficiency of a transformer ?

Ans. The efficiency of a transformer can be increased by using (*i*) laminated core to minimise the loss of energy due o eddy currents and (*ii*) by selecting a material for the core, whose B-H curve has lesser area in order to minimise hysteresis loss.

Q. 4.03. The core of a transformer is made of a material whose hysteresis loop is narrow. Why ?

Ans. A transformer works on a.c. supply. Therefore, during its operation, the iron core of the transformer is taken over the complete cycle of magnetisation again and again. In taking the core over a complete cycle of magnetisation, the energy spent per unit volume of the core is equal to area of the hysteresis loop. Therefore, to minimise the loss of energy, the core of the transformer is made of a material, whose hysteresis loop is narrow.

Q. 4.04. Discuss the use of transformer for long distance transmission of electrical energy. (*P.S.S.C.E. 2001*)

Ans. Refer to section 4.03.

Q. 4.05. Can a transformer be helpful in reducing the cost of transmission of electrical energy to long distances ? Explain.

Ans. By using a step-up transformer, the cost of transmission of electrical energy to long distances can be reduced. For details, refer to section 4.03.

Q. 4.06. A transformer of 100% efficiency has 500 turns in the primary and 10,000 turns in the secondary coil. If the primary is connected to 220 V mains supply, what is the voltage across the secondary coil ? (*I.S.C.E. 1994*)

Ans. For a 100% efficient transformer,

$$e_s = e_p \times \frac{N_s}{N_p}$$

Here, $N_p = 500$; $N_s = 100{,}000$ and $e_p = 220$ V

$$\therefore \quad e_s = 220 \times \frac{10{,}000}{500} = \mathbf{4400\ V}$$

Q. 4.07. State the factors on which the induced e.m.f. in a coil rotating in a uniform magnetic field depends. (*P.S.S.C.E. 1991*)

Ans. The induced e.m.f. produced in a coil rotated inside a magnetic field is given by

$$e = n\,\mathrm{B}\,\mathrm{A}\,\omega \sin \omega t$$

Therefore, induced e.m.f. depends upon number of turns of the coil ; area of coil ; its angular speed of rotation and the strength of the magnetic field.

Q. 4.08. State and explain Fleming's right hand rule. (*P.S.S.C.E. 1999*)

Ans. Refer to section 4.05.

Q. 4.09. Although direction of current through the armature reverses after each half cycle, yet it keeps on rotating in one direction. Why ?

Ans. Refer to section 4.08 (working of d.c. motor).

Q. 4.10. What is back e.m.f. in a d.c. motor ? *(I.S.C.E. 1997)*

Ans. Refer to section 4.08.

Q. 4.11. When a motor is at its full speed, a lesser current flows through the armature. Why ?

Ans. Refer to section 4.08.

Q. 4.12. What is the use of a starter ?

Ans. When a motor is just switched on, the back e.m.f. is zero and hence, due to a large current through the armature, the motor may get burnt. A starter is a variable resistance. When it is used in series with the motor, the effective resistance (resistance of the armature and starter resistance) becomes quite large. Therefore, when the motor is switched on, a small current will flow even in the absence of back e.m.f.

Q. 4.13. Why is choke preferred to rheostat in controlling a.c. supply ? *(H.P.S.S.C.E. 1998 S)*

Or

Why is a choke coil preferred over a resistor to adjust current in an a.c. circuit ? *(I.S.C.E. 1993)*

Ans. If a rheostat is used in controlling a.c. supply, electrical energy will be wasted in the form of heat energy across the resistance wire (windings of the rheostat). However, a.c. supply can be controlled with a choke without any wastage of energy. This is because, power factor (cos ϕ) for a resistance is one and it is zero for an inductance.

Q. 4.14. An ideal inductor consumes no electric powe in an a.c. circuit. Explain. *(H.P.S.S.C.E. 199*

Ans. Refer to section 4.10.

Q. 4.15. Why choke coil cannot be used in d.c ? *(H.S.S.C.E. 2001, 1997*

Ans. In a.c. circuit, a choke coil (inductance) offers rea tance (resistance) to the flow of current, which is given by

$$X_L = \omega L = 2\pi f L,$$

where f is frequency of a.c.

The frequency of d.c. supply is zero. Therefore, reactanc due to inductance in d.c. circuits,

$$X_L = 2\pi(0) L = 0$$

Hence, choke coil cannot be used in d.c. circuits.

Q. 4.16. A radio frequency choke is air-cored, wherea an audio frequency choke is iron-cored. Give reasons fo this difference. *(C.B.S.E. 199*

Ans. The inductive reactance,

$$X_L = \omega L = 2\pi f (\mu_0 \mu_r n^2 l A)$$

It follows that at radio frequency (f = very high), X will be very large, even when the choke is air-cored ($\mu_r = 1$ and at audio frequency (f = quite low), X_L will be larg provided the choke is iron-cored (μ_r =large). Hence, a radi frequency choke is air-cored and an audio frequency chok is iron-cored.

TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 4.01. Fig. 4.14 below shows three different orientations of a circular coil rotating in the magnetic field between the poles of a horse shoe magnet.

(*a*) Determine the direction of induced current in the coil, if the rotation is anticlockwise as viewed by the reader.
(*b*) In which orientation during rotation (with uniform angular speed) is the induced e.m.f. greatest ?

(Text Question)

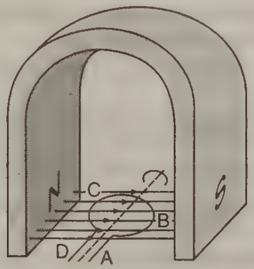

Fig. 4.14 (*a*)

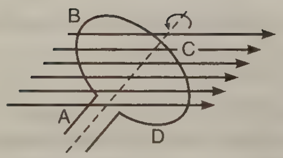

Fig. 4.14 (*b*)

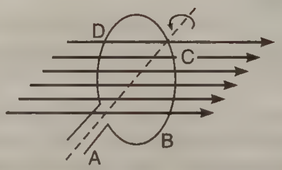

Fig. 4.14 (*c*)

Ans. (*a*) In position of coil shown in Fig. 4.14 (*a*), induced current will flow along ABCD.

In position of coil shown in Fig. 4.14 (*b*), induced current will flow along ABCD.

As the plane of the loop is normal to the field ; no current will flow, when the coil is in position as shown in Fig. 4.14 (*c*).

(*b*) Greatest induced e.m.f. is produced corresponding t orientation as shown in Fig. 4.14 (*a*). It is because, when co is horizontal, $\frac{d\phi}{dt}$ is maximum.

Q. 4.02. Why is the e.m.f. zero, when maximu number of magnetic lines of force pass through th coil ?

Ans. In the vertical position of the coil, the magnetic flu linked with the coil is maximum. But as the coil starts rotatin from this position, the rate of change of magnetic flux is zer

Since $e = -\frac{d\phi}{dt}$, the induced e.m.f. produced is zero.

Q. 4.03. When the motor of an electric refrigerat starts, the lights in the house become dim momen tarily. Why ?

Ans. When the electric motor of the refrigerator starts, draws maximum current from the a.c. mains. It is because, ju at the start of the motor, the back e.m.f. is zero. Due to the larg current drawn by the motor, the current through the light (connected in parallel) decreases and they become dim However, as the armature of the motor rotates, back e.m.f. produced and the motor draws current less than that draw in the beginning. Then, the lights recover their brilliance.

Q. 4.04. Can a capacitor of suitable capacitance repla a choke coil in an a.c. circuit ? Explain.

Ans. In an a.c. circuit, reactance offered by capacitor given by

$$X_C = \frac{1}{2\pi f C}$$

Since the alternating e.m.f. lags the current by a pha angle $\pi/2$ the average power consumed in a capacitor wi e zero. Thus, capacitor will also decrease current in a.c. circuit vithout consuming power just as the choke coil does and ence it can replace the choke coil in a.c. circuit.

Q. 4.05. Write the working principle of a starter used along with a choke in a fluorescent tube.

(C.B.S.E. 1998 S)

Ans. A starter used along with a choke in a fluorescent ube is a thermal switch in the form of a bimetallic strip. When the circuit is switched on, a high current passes through the thermal switch and raises the electrodes at the two ends of the fluorescent tube to incandescence. Due to rise in temperature inside the starter, the bimetallic strip bends and the contact is instantaneously broken. Due to this, a high potential difference (≈ 1000 V) is induced between the electrodes of the tube, which allows a discharge to pass through the mercury vapours enclosed in the tube.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. With the help of a labelled diagram, explain the working principle of a step-up transformer. *(C.B.S.E. 2002)*
2. Explain the principle and theory of a transformer. Why is the efficiency of a transformer always less than one ? *(H.P.S.S.C.E. 1995 ; P.S.S.C.E. 1994)*
3. Discuss the principle, working and use of a transformer for long distance transmission of electrical energy. *(P.S.S.C.E. 1997)*
4. What is the principle of a transformer ? Explain its theory and its application for long distance transmission of electrical energy. *(P.S.S.C.E. 1996 S)*
5. Draw a labelled diagram of an a.c. generator. Write the principle on which it works. *(C.B.S.E. 2002)*
6. Explain on what factors the induced e.m.f. in a coil rotating in a uniform magnetic field depends. Explain, why there is sparking when an electrical circuit is broken, but not when it is made. *(C.B.S.E. Sample Q. Paper)*
7. A rectangular coil of n turns and area A is held in a uniform magnetic field B. If the coil is rotated at a steady angular speed ω, deduce an expression for the induced e.m.f. in the coil at any instant of time.
8. State law of electromagnetic induction. A rectangular loop of N turns of length `$a$' and width `b' is rotated with an angular velocity ω in a uniform magnetic field of induction B. Show that induced e.m.f. is given by
   $$e = \omega \, N \, b \, a \, B \sin \omega \, t$$
9. Draw a labelled diagram of a d.c. generator and describe its construction briefly. *(P.S.S.C.E. 2002)*
10. Briefly explain the use of a starter for operating a d.c. motor. *(H.S.S.C.E. 2001)*
11. Explain the use of a motor starter. *(P.S.S.C.E. 2001, 1991)*
12. Describe principle, construction and uses of a choke coil. *(H.S.S.C.E. 1996)*
13. Explain the construction and working of a choke. Where is it used ? Explain, why is it preferred to resistance in a.c. circuits. *(C.B.S.E. Sample Q. Paper)*

14. Draw a neat diagram of a d.c. motor and explain its working. What is the function of starter ? *(H.S.S.C.E. 2002)*
15. Draw a labelled diagram of a d.c. motor. State its principle and explain its working. *(C.B.S.E. Sample Q. Paper)*
16. What is choke coil ? Describe its construction, working and uses. Why it cannot be used in a d.c. circuit ? *(P.S.S.C.E. 2001)*

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Transformer

1. An a.c. voltage of 200 V is applied to the primary of a transformer and voltage of 2000 V is obtained from the secondary. Calculate the ratio of the currents through the primary and secondary coils. *(C.B.S.E. Sample Q. Paper)* **[Ans.** 10]
2. In an ideal transformer, the number of turns in primary and secondary coils are 2000 and 100 respectively. If maximum voltage in primary is 120 V, what is maximum voltage in secondary ? *(H.P.S.S.C.E. 1999 S)* **[Ans.** 6 V]

3. The output voltage of an ideal transformer, connected to a 240 V a.c. mains, is 24 V. When this transformer is used to light a bulb with rating 24 V – 24 W, calculate the current in the primary coil of the circuit. (*C.B.S.E. 2000*) [**Ans.** 0·1 A]

4. A step-up transformer is used on a 120 volt line to provide a potential difference of 2400 volt at 2 ampere current. If primary has 1000 turns, find the number of turns in secondary and current in the primary coil. [**Ans.** 20,000 ; 40 A]

5. How much current is drawn by the primary coil of a transformer, which steps down 220 V to 44 V to operate a device with an impedance of 440 Ω ? (*H.S.S.C.E. 1998*) [**Ans.** 0·02 A]

6. A step-up transformer operates on a 200 volt line and supplies a load of 2 ampere. The ratio of primary and secondary windings is 1 : 5. Determine the secondary voltage, primary current and power output. Assume efficiency to be 100%. [**Ans.** 1000 V, 10 A, 2000 W]

7. A step-down transformer is used at 220 volt line to provide a current of 0·5 ampere to a 15 watt bulb. If the secondary has 20 turns, find the current and number of turns in the primary coil. [**Ans.** 0·0682 A, 147]

8. A transformer has an efficiency of 80%. It works at 4 kilowatt and 100 volt. If the secondary voltage is 240 volt, calculate the primary and secondary currents. (*C.B.S.E. 2001*) [**Ans.** 40 A ; 13·33 A]

9. Calculate the current drawn by the primary of a transformer, which steps down 200 V to 20 V to operate a device of resistance 20 Ω. Assume the efficiency of the transformer to be 80%. (*C.B.S.E. 2001*) [**Ans.** 0·125 A]

10. A step-down tranformer converts a voltage of 2200 V into 220 V in the transmission line. Number of turns in primary coil is 5000. Efficiency of transformer is 90% and its ouput power is 8 kW. Calculate (*a*) number of turns in secondary coil and (*b*) input power. [**Ans.** (*a*) 500 (*b*) 8·889 kW]

Type B. On a.c. generator

11. A closely wound rectangular coil of 200 turns and size 0·3 m × 0·1 m is rotating in a magnetic field of induction 0·005 Wb m^{-2} with a frequency of 1800 r.p.m. about an axis normal to the field. Calculate the maximum value o induced e.m.f. [**Ans.** 5·655 V

12. A rectangular coil 25 cm × 10 cm and having 700 turn rotates about an axis at right angles to a magnetic field o 20 gauss at 1500 revolutions per minute. Calculate th maximum value of the e.m.f. generated in the coil. [**Ans.** 5·5 V

13. A flat coil of 500 turns, each of area 50 cm^2, rotates in uniform magnetic field of 0·14 Wb m^{-2} at an angular spee of 150 rad s^{-1}. The coil has a resistance of 5 Ω. The induce e.m.f. is applied to an external resistance of 10 Ω. Calculat the peak current through the resistance. (*C.B.S.E. 1995* [**Ans.** 3·5 A

14. An a.c. generator consists of a coil of 2000 turns each of are 80 cm^2 and rotating at an angular speed of 200 r.p.m. in uniform magnetic field of 4·8 × 10^{-2} T. Calculate the pea and r.m.s. value of e.m.f. induced in the coil. (*P.S.S.C.E. 2001*) [**Ans.** 16·085 V, 11·375 V

15. A rectangular coil of dimension 40 cm × 25 cm havin 1000 turns rotates in a uniform magnetic field of strengt 0·08 Wb m^{-2} about an axis perpendicular to the field. I the coil makes 300 revolutions per minute, find the valu of instantaneous e.m.f. when the plane of the coil make angle of (*i*) 0° (*ii*) 45° (*iii*) 90° with magnetic lines of force [**Ans.** (*i*) 251·33 V ; (*ii*) 177·72V ; (*iii*) zerc

Type C. On Motor

16. An electric motor operating at 200 V draws a current c 5 A at its full speed. The resistance of the armature is 1 Ω. Calculate the back e.m.f. and efficiency of the motor. [**Ans.** 150 V, 75 %

17. A motor runs at 220 V. The resistance of the armature i 11 Ω. If the back e.m.f. produced is 198 V, when at ful speed ; then calculate the current through armature, whe (*i*) motor is just switched on and (*ii*) motor is at full speed [**Ans.** (*i*) 20 A (*ii*) 2 A

18. A motor develops back e.m.f. of 210 V, when it is run a 240 V. If the armature current is 5 A, calculate (*a*) resistanc of the armature, (*b*) the mechanical output power and (*c* the power dissipated in the motor. [**Ans.** (*a*) 6 Ω, (*b*) 1050 W (*c*) 150 W

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. $\dfrac{I_p}{I_s}=\dfrac{e_s}{e_p}=\dfrac{2000}{200}=10$

2. Proceed as in solved problem no. 4.01.

3. Proceed as in solved problem no. 4.02.

4. Here, $e_p = 120$ V, $e_s = 2400$ V ; $I_s = 2$ A, $N_p = 1000$

$$\text{Now, } N_s = N_p \times \frac{e_s}{e_p} = \frac{1000\times 2400}{120} = \mathbf{20{,}000}$$

$$\text{Also, } I_p = I_s \times \frac{e_s}{e_p} = \frac{2\times 2400}{120} = \mathbf{40\ A}$$

5. Proceed as in solved problem no. 4.03.

6. Here, $e_p = 200$ V ; $I_s = 2$ A ; $\dfrac{N_p}{N_s}=\dfrac{1}{5}$

$$\text{Now, } e_s = e_p \times \frac{N_s}{N_p} = \frac{e_p}{N_p/N_s} = \frac{200}{1/5} = \mathbf{1000\ V}$$

$$\text{Also, } I_p = I_s \times \frac{e_s}{e_p} = \frac{2\times 1000}{200} = \mathbf{10\ A}$$

Output power = $e_s I_s$ = 1000 × 2 = **2000 W**

7. Here, $e_p = 220$ V ; $I_s = 0\cdot5$ A ; $e_s I_s = 15$ W, $N_s = 20$

$$\text{Now, } I_p = \frac{e_s I_s}{e_p} = \frac{15}{220} = \mathbf{0\cdot0682\ A}$$

$$\text{Also, } e_s = \frac{e_s I_s}{e_p} = \frac{15}{0\cdot5} = 30\ \text{V}$$

$$\therefore\ N_p = N_s \times \frac{e_p}{e_s} = \frac{20\times 220}{30} = \mathbf{147}$$

8. Here, $\eta = 80\%$, $e_p I_p = 4$ kW $= 4000$ W ;
$e_p = 100$ V ; $e_s = 240$ V

$$\text{Now, } I_p = \frac{e_p I_p}{e_p} = \frac{4000}{100} = \mathbf{40\ A}$$

$$\text{Also, } \eta = \frac{e_s I_s}{e_p I_p} \quad \text{or} \quad \frac{80}{100} = \frac{240\times I_s}{4000}$$

$$\text{or } I_s = \frac{80\times 4000}{100\times 240} = \mathbf{13\cdot33\ A}$$

9. Here, $\eta = 80\%$, $e_p = 200$ V ; $e_s = 20$ V and Z = 20 Ω

$$\therefore\ I_s = \frac{e_s}{Z} = \frac{20}{20} = 1\ \text{A}$$

Now, $\eta = \dfrac{e_s I_s}{e_p I_p}$ or $\dfrac{80}{100} = \dfrac{20 \times 1}{200 \times I_p}$

or $I_p = \dfrac{20 \times 1 \times 100}{200 \times 80} = \mathbf{0{\cdot}125\ A}$

10. Here, $e_p = 2200$ V ; $e_s = 220$ V, $N_p = 5000$,
$e_s I_s = 8$ kW $= 8000$ W and $\eta = 90\%$

(a) Now, $N_s = N_p \times \dfrac{e_s}{e_p} = \dfrac{5000 \times 220}{2200} = \mathbf{500}$

(b) Also, $\eta = \dfrac{e_s I_s}{e_p I_p}$ or $\dfrac{90}{100} = \dfrac{e_s I_s}{e_p I_p}$

or $e_p I_p = \dfrac{e_s I_s \times 100}{90} = \dfrac{8000 \times 100}{90} = 8889 \text{ W} = \mathbf{8{\cdot}889\ kW}$

11. Proceed as in solved problem no. 4.08.

12. Proceed as in solved problem no. 4.08.

13. Here, $n = 500$; $A = 50 \text{ cm}^2 = 50 \times 10^{-4} \text{ m}^2$,
$B = 0{\cdot}14 \text{ Wb m}^{-2}$ and $\omega = 150 \text{ rad s}^{-1}$
Now, $e_0 = n B A \omega = 500 \times 0{\cdot}14 \times 50 \times 10^{-4} \times 150 = 52{\cdot}5$ V
Resistance of the coil, $R = 5\ \Omega$
and external resistance, $R_L = 10\ \Omega$
Therefore, peak current through external resistance,

$$I_0 = \frac{e_0}{R + R_L} = \frac{52{\cdot}5}{5 + 10} = \mathbf{3{\cdot}5\ A}$$

14. Here, $n = 2000$; $A = 80 \text{ cm}^2 = 80 \times 10^{-4} \text{ m}^2$;
$B = 4{\cdot}8 \times 10^{-2}$ T

and $\omega = 200$ r.p.m. $= \dfrac{2\pi \times 200}{60} = \dfrac{20\pi}{3} \text{ rad s}^{-1}$

Now, $e_0 = n B A \omega = 2000 \times 4{\cdot}8 \times 10^{-2} \times 80 \times 10^{-4} \times \dfrac{20\pi}{3}$
$= \mathbf{16{\cdot}085\ V}$

Also, $e_{r.m.s.} = \dfrac{e_0}{\sqrt{2}} = \dfrac{16{\cdot}085}{\sqrt{2}} = \mathbf{11{\cdot}375\ V}$

15. Proceed as in solved problem no. 4.08.

16. Now, $I = \dfrac{E - e}{R}$ or $5 = \dfrac{200 - e}{10}$

or $e = 200 - 50 = \mathbf{150\ V}$
Input power $= E\,I = 200 \times 5 = 1000$ W
Output power $= E\,I - I^2 R = 200 \times 5 - (5)^2 \times 10 = 750$ W

$\therefore \quad \eta = \dfrac{750}{1000} \times 100 = \mathbf{75\ \%}$

Aliter. $\eta = \dfrac{e}{E} \times 100 = \dfrac{150}{200} \times 100 = \mathbf{75\ \%}$

17. Here, $E = 220$ V ; $e = 198$ V ; $R = 11\ \Omega$
(i) When motor is just switched on, $e = 0$

$\therefore \quad I = \dfrac{E - e}{R} = \dfrac{220 - 0}{11} = \mathbf{20\ A}$

(ii) When motor is at full speed,

$I = \dfrac{E - e}{R} = \dfrac{220 - 198}{11} = \mathbf{2\ A}$

18. **(a)** Now, $I = \dfrac{E - e}{R}$ or $5 = \dfrac{240 - 210}{R}$

or $R = \mathbf{6\ \Omega}$
(b) Output power $= E\,I - I^2 R = 240 \times 5 - (5)^2 \times 6 = \mathbf{1050\ W}$
(c) Power dissipated in the motor $= I^2 R = (5)^2 \times 6 = \mathbf{150\ W}$
Aliter. Input power $= E\,I = 240 \times 5 = 1200$
Output power $= e\,I = 210 \times 5 = \mathbf{1050\ W}$
Therefore, power dissipated $= 1200 - 1050 = \mathbf{150\ W}$

Competitive Examination File (Unit IV)

REVISION AT A GLANCE

Chapter 1. Electromagnetic induction

☐ **Magnetic flux.** *The number of magnetic field lines crossing a surface normally is called magnetic flux (ϕ) linked with the surface.*

Mathematically : $\phi = \vec{B} . \vec{A} = BA \cos \theta$,

where B is the magnetic field, A is the area of the surface and θ is the angle between the direction of the magnetic field and normal to the surface.

Unit. In SI, unit of magnetic flux is **weber (Wb)**

1 weber = 10^8 maxwell

☐ **Electromagnetic induction.** *It is the phenomenon of production of e.m.f. in a coil, when the magnetic flux linked with the coil is changed.*

The e.m.f. so produced is called ***induced e.m.f.*** and the current so produced is called ***induced current***.

☐ **Faraday's laws of electromagnetic induction :**

First law. *Whenever magnetic flux linked with a circuit (a loop of wire or a coil or an electric circuit in general) changes, induced e.m.f. is produced.*

Second law. *The induced e.m.f. lasts as long as the change in the magnetic flux continues.*

Third law. *The magnitude of the induced e.m.f. is directly proportional to the rate of change of the magnetic flux.*

Mathematically : Induced e.m.f., $e = -\frac{d\phi}{dt} = -\frac{\phi_2 - \phi_1}{t}$

☐ **Lenz's law.** It states that *the induced current produced in a circuit always flows in such a direction that it opposes the change or the cause that produces it.*

Lenz's law can be used to find the direction of induced current.

☐ **Motional E.M.F.** When a conductor of length l moves with a velocity v in a magnetic field B, so that magnetic field is perpendicular to both the length of the conductor and its direction of motion, the magnetic Lorentz force on the conductor gives rise to e.m.f.

Mathematically : $e = Blv$

☐ **Eddy currents.** *The currents induced in the body of a conductor, when the magnetic flux linked with the conductor changes, are called eddy currents (or Focault's currents).*

The direction of the eddy currents set up in the conductor can be found by applying ***Lenz's law*** or ***Fleming's right hand rule***.

☐ **Self induction.** *The phenomenon according to which an opposing induced e.m.f. is produced in a coil as a result of change in current or magnetic flux linked with it, is called self induction.*

☐ **Coefficient of self induction.** *The coefficient of self induction or simply self-inductance (L) of a coil is numerically equal to the magnetic flux (ϕ) linked with the coil, when a unit current flows through it.*

Mathematically : $\phi = LI$

The self-inductance of a coil is also numerically equal to the induced e.m.f. produced in the coil, when the rate of change of current in the coil is unity.

Mathematically : $e = -L\frac{dI}{dt}$

Unit : In SI, the unit of self-inductance is **henry (H).**

The self-inductance of a coil is said to be one henry, if a rate of change of current of 1 ampere per second induces an e.m.f. of 1 volt in it.

☐ **Self-inductance of a long solenoid.** The self-inductance of a long solenoid of length l, area of cross-section A and number of turns per unit length n is given by

$$L = \mu_0 n^2 l A$$

☐ **Mutual induction.** *The phenomenon according to which an opposing induced e.m.f. is produced in a coil as a result of change in current or magnetic flux linked with a neighbouring coil is called mutual induction.*

☐ **Coefficient of mutual induction.** *The coefficient of mutual induction or simply mutual inductance (M) of the two coils is numerically equal to the magnetic flux (ϕ) linked with one coil, when a unit current flows through the neighbouring coil.*

Mathematically : $\phi = MI$

The mutual inductance of two coils is also numerically equal to the induced e.m.f. produced in one coil, when the rate of change of current is unity in the other coil.

Mathematically : $e = -M \frac{dI}{dt}$

Unit. In SI, the unit of mutual inductance is **henry (H).**

The mutual inductance of two coils is said to be one henry, if a rate of change of current of 1 ampere per second in one coil induces *ı e.m.f. of 1 volt in the neighbouring coil.*

$$\textbf{1 henry} = \frac{\textbf{1 volt}}{\textbf{1 ampere second}^{-1}}$$

☐ **Mutual inductance of two long solenoids.** When over a solenoid S_1 of length l, area of cross-section A and number f turns per unit length n_1, another solenoid S_2 of same length and number of turns per unit length n_2 is wound, then mutual ductance between the two solenoids (current is passed through solenoid S_1) is given by

$$M = \mu_0 n_1 n_2 l A$$

ome Useful Facts :

1. The induced e.m.f. in a coil can be produced in three ways, namely : by changing magnetic field B, by changing area f the coil inside the field or by changing inclination of the coil with the magnetic field.

2. When a conductor is moved inside a magnetic field, the e.m.f. produced across its two ends is due to magnetic Lorentz rce experienced by the electrons inside the conductor.

3. The eddy currents have both ***practical useful applications*** as well as ***undesirable effects***.

Chapter 2. Transient current

☐ **Growth of current in LR-circuit.** The instantaneous current is given by

$$I = I_0 \left(1 - e^{-\frac{R}{L}t}\right)$$

☐ **Decay of current in LR-circuit.** The instantaneous current is given by

$$I = I_0 e^{-\frac{R}{L}t}$$

Both growth and decay of current in an LR-circuit are exponential in nature.

☐ **Inductive time constant.** $\frac{L}{R}$ has dimensions of time and it is called ***inductive time constant*** of LR-circuit.

The inductive time constant of an LR-circuit is defined as the time, in which current grows from zero to 0·632 of its maximum alue during growth or decays from maximum value to 0·368 of its maximum value during decay.

The current takes practically a time equal to $\frac{5L}{R}$ to grow from zero to maximum value (during growth) or to decay om maximum value to zero (during decay).

☐ **Growth of charge in CR-circuit.** The instantaneous charge on the capacitor is given by

$$q = q_0 \left(1 - e^{-\frac{t}{CR}}\right)$$

Also potential difference across the two plates of the capacitor and current in the CR-circuit at any instant are respectively iven by

$$V = E \left(1 - e^{-\frac{t}{CR}}\right)$$

and $$I = I_0 e^{-\frac{t}{CR}}$$

☐ **Decay of charge in CR-circuit.** The instantaneous charge on the capacitor, potential difference across its plates and ne current in the circuit are respectively given by

$$q = q_0 e^{-\frac{t}{CR}}$$

$$V = E e^{-\frac{t}{CR}}$$

and $$I = -I_0 e^{-\frac{t}{CR}}$$

☐ **Capacitive time constant.** CR has dimensions of time and it is called ***capacitive time constant*** of circuit.

The capacitive time constant of a CR-circuit is defined as the time, in which charge grows from zero to 0·632 of its maximum value during growth or decays from maximum to 0·368 of its maximum value during decay.

☐ **Energy stored in an inductor.** When current flows through an inductor, the energy stored in it is given by

$$U = \frac{1}{2} L I^2,$$

where I_0 is final value of current in the inductor. The energy is stored inside an inductor in the form of magnetic field.

☐ **Energy stored in a capacitor.** Energy stored in a capacitor, when it is charged, is given by

$$U = \frac{1}{2} C E^2 = \frac{1}{2} \frac{q_0^2}{C} = \frac{1}{2} q_0 E$$

where E is maximum value of potential difference set up across the two plates of the capacitor.

The energy is stored inside the capacitor in the form of electric field between the plates of the capacitor.

☐ **LC-oscillations.** When a charged capacitor discharges through an inductor, LC-oscillations are produced. The frequency of the oscillations is given by

$$f = \frac{1}{2\pi \sqrt{LC}}$$

Some Useful Facts :

1. In a CR-circuit, current always decays from maximum value to zero during both the growth and decay of charge in a CR- circuit.

2. In an inductance or in a capacitor, energy is stored at the expense of the energy of the source of e.m.f.

Chapter 3. Alternating current

☐ **Alternating current.** *The current, whose magnitude changes with time and the direction reverses periodically is known as alternating current.*

It can be represented by a sine or cosine function of time.

The instantaneous value (value at any time *t*) of alternating current is given by

$$I = I_0 \sin \omega t \qquad \text{or} \qquad I = I_0 \cos \omega t$$

Here, I_0 is called ***peak value*** of a.c. and $\omega = \frac{2\pi}{T} = 2\pi f$

Similarly, the alternating e.m.f. is represented as

$$E = E_0 \sin \omega t \qquad \text{or} \qquad E = E_0 \cos \omega t$$

☐ **Mean or Average value of a.c.** *It is that steady current, which when passed through a circuit for half the time period of the alternating current sends the same amount of charge as is done by the alternating current in the same time through the same circuit.*

Mathematically : $I_m \text{ (or } I_a) = \frac{2 I_0}{\pi} = 0 \cdot 636\, I_0$

☐ **Root mean square (r.m.s.) or virtual value of a.c.** *It is that steady current, which when passed through a resistance for a given time will produce the same amount of heat as the alternating current does in the same resistance and in the same time.*

Mathematically : $I_{r.m.s.} \text{ (or } I_v) = \frac{I_0}{\sqrt{2}} = 0 \cdot 707\, I_0$

☐ **a.c. through a resistor.** The alternating e.m.f. is ***in phase*** with the current, when a.c. flows through a resistor.

☐ **a.c. through an inductor.** The alternating e.m.f. ***leads*** the current by a phase angle $\pi/2$, when a.c. flows through an inductor.

☐ **Inductive reactance.** *It is the opposition offered by the inductor to the flow of alternating current through it.*

Mathematically : $X_L = \omega L = 2\pi f L$

The inductive reactance is zero for d.c. ($f = 0$) and has a finite value for a.c.

☐ **a.c. through a capacitor.** The alternating e.m.f. ***lags behind*** the current by a phase angle $\pi/2$, when a.c. flows through a capacitor.

☐ **Capacitive reactance.** *It is the opposition offered by the capacitor to the flow of alternating current through it.*

Mathematically : $X_C = \frac{1}{\omega C} = \frac{1}{2\pi f C}$

The capacitive reactance is infinite for d.c. ($f = 0$) and has a finite value for a.c.

☐ **Phasor diagram.** *A diagram representing alternating voltages and currents (of same frequency) as vectors along with the phase angle between them is called a phasor diagram.*

☐ **a.c. through a series LR-circuit.** The alternating e.m.f. ***leads*** the current by a phase angle ϕ given by

$$\tan\phi = \frac{\omega L}{R}$$

Impedance of LR-circuit, $Z = \sqrt{R^2 + \omega^2 L^2}$

☐ **a.c. through a series CR-circuit.** The alternating e.m.f. ***lags behind*** the current by a phase angle ϕ is given by

$$\tan\phi = \frac{1/\omega C}{R}$$

Impedance of CR-circuit, $Z = \sqrt{R^2 + \frac{1}{\omega^2 C^2}}$

☐ **a.c. through a series LCR-circuit.** The alternating e.m.f. ***leads/lags behind*** the current by a phase angle ϕ given by

$$\tan\phi = \frac{\omega L - 1/\omega C}{R}$$

The e.m.f. leads the current, if $\omega L > 1/\omega C$ and it lags behind the current, if $\omega L < 1/\omega C$.

Impedance of LCR-circuit, $Z = \sqrt{R^2 + (\omega L - 1/\omega C)^2}$

☐ **Resonant series LCR-circuit.** When the frequency of a.c. supply is such that the inductive reactance and capacitive ctance become equal ($X_L = X_C$), the impedance of the series LCR-circuit is merely equal to the ohmic resistance in the circuit. such, the current in the circuit becomes maximum. Such a series LCR-circuit is called ***resonant series LCR-circuit*** and frequency of the a.c. supply is called ***resonant frequency*** (f_0). The resonant frequency is given by

$$f_0 = \frac{1}{2\pi\sqrt{LC}}$$

☐ **Q-factor.** It indicates the sharpness of the resonance.

Mathematically : Q-factor $= \frac{R}{2\pi f_0 L}$

The higher value of Q-factor indicates sharper peak in the current.

☐ **Average power of an a.c. circuit.** It is given by

$$P_{av} = E_v I_v \cos\phi,$$

ere $E_v I_v$ is called ***apparent power*** and $\cos\phi$ is called ***power factor.***

For a.c. circuit having R only ; L only ; C only ; L and R ; C and R ; and L, C and R ; the power factor is equal to 1 ; 0 ; 0 ;

$\frac{R}{{}^2 + \omega^2 L^2}$; $\frac{R}{\sqrt{R^2 + 1/\omega^2 C^2}}$ and $\frac{R}{\sqrt{R^2 + (\omega L - 1/\omega C)^2}}$ respectively.

☐ **Wattless current.** The component $I_v \sin\phi$ of alternating current is called ***wattless*** or ***idle current.***

me Useful Facts :

1. The average value of a.c. is zero over a complete cycle of a.c.
2. The peak value of a.c. in a circuit containing inductor is $\frac{E_0}{X_L}$ and in a circuit containing capacitor is $\frac{E_0}{X_C}$.
3. An inductor offers an easy path to d.c. and a resistive path to a.c.
4. A capacitor serves as a block for d.c. and an easy path to a.c.

Chapter 4. Electrical machines and devices

☐ **Transformer.** *It is a device used to change low alternating voltage at high current into high voltage at low current and vice-sa.* It is based on the phenomenon of mutual induction. For an ideal transformer,

$$\frac{e_s}{e_p} = \frac{I_p}{I_s} = \frac{N_s}{N_p} = k$$

Here, k is called ***transformation ratio.***

For a ***step up transformer,*** $k > 1$ *i.e.* $e_s > e_p$, $I_s < I_p$ and $N_s > N_p$.

For a ***step down transformer,*** $k < 1$ *i.e.* $e_s < e_p$, $I_s > I_p$ and $N_s < N_p$.

In practice, efficiency of a transformer,

$$\eta = \frac{e_s\, I_s}{e_p\, I_p}$$

☐ **Induction coil.** *It is a device used to obtain high potential difference from a low d.c. potential difference.*

It is based upon the phenomenon of mutual induction.

☐ **Alternating current generator.** *It is a device used to obtain a supply of alternating e.m.f. by converting rotational mechanical energy into electrical energy.* It is based on the phenomenon of electromagnetic induction.

The instantaneous value of e.m.f. produced is given by

$$e = n\, B\, A\, \omega \sin \omega\, t,$$

where n is number of turns of the coil ; A is the area of coil and ω is angular frequency of rotation of the coil inside a magnetic field strength B.

☐ **d.c. motor.** *It is a device used to convert electrical energy in the form of d.c. supply into mechanical energy of rotation.*

The current through the armature of the motor is given by

$$I = \frac{E - e}{R},$$

where E is applied d.c. e.m.f., e is back e.m.f. produced and R is resistance of the armature.

☐ **Motor starter.** *It is a variable resistor, which is used to protect the motor from the possible damage, during its operation.*

☐ **Choke coil.** *It is an inductor used to control the flow of current in an a.c. circuit.*

Practically, average power comsumed by a choke coil is zero.

Some Useful Facts :

1. In a transformer, if we gain in voltage, we lose in current and vice-versa.
2. The transmission of electric energy is done at high voltage, so as to reduce the dissipation of energy.
3. In an induction coil, although the potential difference across the terminals reverses regularly, yet a large effective potential difference is obtained in one direction.
4. A practical inductance consumes a small electrical energy due to its small ohmic resistance.

NUMERICAL PROBLEMS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Electromagnetic induction

Problem 1.01. A current of 10 A is flowing in a long straight wire situated near a rectangular circuit, whose two sides of length 0·2 m are parallel to the wire. One of them is at a distance of 0·05 m and the other at a distance of 0·1 m from the wire. The wire is in the plane of the rectangle. Find the magnetic flux through the rectangular circuit. If the current decays uniformly to zero in 0·02 s, find the e.m.f. induced in the circuit and indicate the direction in which the induced current flows. *(Roorkee, 1994)*

Sol. Fig. 1.01 shows a rectangular circuit ABCD, whose two sides AD and BC, each of length = 0·02 m are at distances $r_1 = 0{\cdot}5$ m and $r_2 = 0{\cdot}1$ m from the long straight wire carrying current I = 10 A.

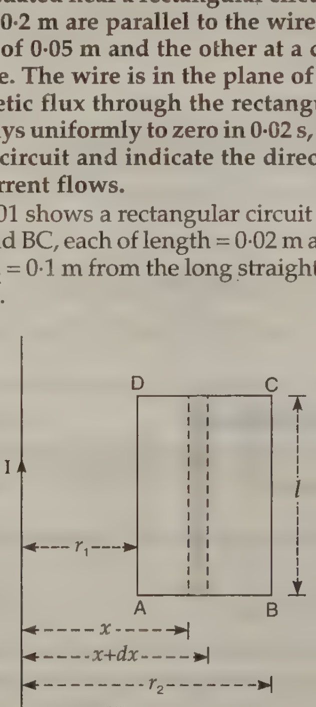

Fig. 1.01.

The magnetic field due to the current carrying wire decreases, as the distance from the wire increases. If B is magnetic field at a distance x from the wire, then the magnetic flux linked with the shaded strip,

$$d\phi = B \times \text{area of shaded strip}$$

$$= \frac{\mu_0}{4\pi} \cdot \frac{2I}{x} \times l\, dx$$

Therefore, magnetic flux linked with the rectangular circuit,

$$\phi = \int_{r_1}^{r_2} d\phi = \frac{\mu_0}{4\pi} \cdot 2Il \int_{r_1}^{r_2} \frac{1}{x}\, dx = \frac{\mu_0}{4\pi} \times 2Il \left| \log_e x \right|_{r_1}^{r_2}$$

$$= \frac{\mu_0}{4\pi} \cdot 2Il \left| \log_e r_2 - \log_e r_1 \right| = \frac{\mu_0}{4\pi} \cdot 2Il \log_e \frac{r_2}{r_1}$$

Setting values of I, l, r_1 and r_2, we have

$$\phi = 10^{-7} \times 2 \times 10 \times 0 \cdot 2 \log_e \frac{0 \cdot 1}{0 \cdot 05} = 4 \times 10^{-7} \log_e 2$$

$$= 4 \times 10^{-7} \times 0{\cdot}693$$

or $\boldsymbol{\phi = 2{\cdot}772 \times 10^{-7}}$ **Wb**

When the current changes to zero in time 0·02 s, the final magnetic flux linked with the coil becomes zero. If e is induced e.m.f. produced, then

$$e = -\frac{d\phi}{dt} = -\frac{0 - 2 \cdot 772 \times 10^{-7}}{0 \cdot 02} = 1 \cdot 386 \times 10^{-5}$$

$$= \mathbf{13{\cdot}86}\ \boldsymbol{\mu}\mathbf{V}$$

Problem 1.02. A pair of parallel horizontal conducting ls of negligible resistance shorted at one end is fixed on able. The distance between the rails is L. A conducting assless rod of resistance R can slide on the rails ctionlessly. The rod is tied to a massless string which sses over a pulley fixed to the edge of the table. A mass tied to the other end of the string, hangs vertically. A nstant magnetic field B exists perpendicular to the table. the system is released from rest. Calculate

(*a*) the terminal velocity achieved by the rod and

(*b*) the acceleration of the mass at the instant, when the elocity of the rod is half the terminal velocity.

(I.I.T. 1997)

Sol. (*a*) Fig. 1.02 shows a conducting rod AB of length and resistance R sliding with a velocity v along Y-axis, while constant magnetic field B exists along Z- axis.

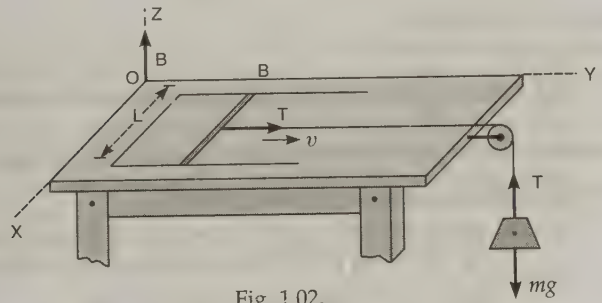

Fig. 1.02.

The e.m.f. induced in the rod,

$$e = \mathrm{B\,L}\,v$$

The induced current flowing through the rod,

$$\mathrm{I} = \frac{e}{\mathrm{R}} = \frac{\mathrm{B\,L}\,v}{\mathrm{R}}$$

The direction of flow of the current through the rod AB vill be such that the induced e.m.f. produced would oppose he motion of the rod along OY. Thus, the rod will experience orce along negative Y-axis. The magnitude of the force is iven by

$$\mathrm{F} = \mathrm{B\,I\,L} = \mathrm{B} \times \frac{\mathrm{B\,L}\,v}{\mathrm{R}} \times \mathrm{L}$$

$$= \frac{\mathrm{B}^2\,\mathrm{L}^2\,v}{\mathrm{R}}$$

The force acting on the rod equals the tension in the tring. If the rod moves with acceleration a along OY, then

$$m\,a = m\,g - \mathrm{T} = m\,g - \mathrm{F} = m\,g - \frac{\mathrm{B}^2\,\mathrm{L}^2\,v}{\mathrm{R}}$$

or $$a = g - \frac{\mathrm{B}^2\,\mathrm{L}^2\,v}{\mathrm{MR}} \qquad ...(i)$$

If the rod acquires the terminal velocity v_0, then $a = 0$. Setting $v = v_0$ and $a = 0$ in equation (*i*), we have

$$0 = g - \frac{\mathrm{B}^2\,\mathrm{L}^2\,v}{m\mathrm{R}}$$

or $$v_0 = \frac{m\,g\,\mathrm{R}}{\mathrm{B}^2\,\mathrm{L}^2}$$

(*b*) The acceleration of the rod, when it moves with velocity $v = \frac{1}{2}v_0$ *i.e.* $v = \frac{m\,g\,\mathrm{R}}{2\,\mathrm{B}^2\,\mathrm{L}^2}$ is given by

$$a = g - \frac{\mathrm{B}^2\,\mathrm{L}^2}{m\,\mathrm{R}}\,\frac{m\,g\,\mathrm{R}}{2\,\mathrm{B}^2\mathrm{L}^2} = g - 0{\cdot}5\,g = 0{\cdot}5\,g$$

Problem 1.03. Two parallel vertical metallic rails AB and CD are separated by 1 m. They are connected at the two ends by resistances R_1 and R_2 as shown in Fig. 1.03. A horizontal metallic bar L of mass 0·2 kg slides without friction, vertically down the rails under the action of gravity. There is a uniform horizontal magnetic field of 0·6 T perpendicular to the plane of the rails. It is observed that when the terminal velocity is attained, the powers dissipated in R_1 and R_2 are 0·76 W and 1·2 W respectively. Find the terminal velocity of the bar L and the values of R_1 and R_2.

(I.I.T. 1994)

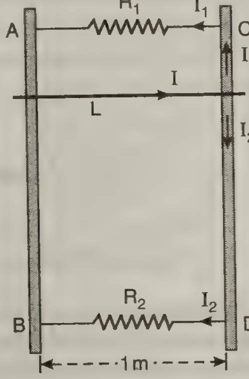

Fig. 1.03.

Thought Process

1. The metallic bar will attain terminal velocity, when the weight (m g) of the bar and the magnetic Lorentz force (B I l) on it become equal and opposite.

2. The induced e.m.f. produced is equal to potential difference across resistance R_1 or across R_2.

Sol. Let e be the induced e.m.f. and I be the induced current in the metallic bar. The bar slides down under the action of the following two forces :

(*i*) The weight $m\,g$ of the bar acting vertically downwards and

(*ii*) The force on the bar $\mathrm{B\,I}\,l$ due to magnetic field acting vertically upwards.

The bar will attain terminal velocity, when

$$\mathrm{B\,I}\,l = m\,g$$

Here, $\mathrm{B} = 0{\cdot}6\ \mathrm{T}$; $m = 0{\cdot}2$ kg and $l = 1$ m

$$\therefore \quad 0{\cdot}6 \times \mathrm{I} \times 1 = 0{\cdot}2 \times 9{\cdot}8$$

or $$\mathrm{I} = \frac{0{\cdot}2 \times 9{\cdot}8}{0{\cdot}6 \times 1} = 3{\cdot}266\ \mathrm{A}$$

If v is the terminal velocity attained, then

$$e = \mathrm{B}\,v\,l \qquad ...(i)$$

Suppose that part I_1 of the induced current flows through resistance R_1 and the remaining part I_2 flows through R_2. Then,

$$I_1 + I_2 = I$$

or $$I_1 + I_2 = 3{\cdot}266\ \mathrm{A} \qquad ...(ii)$$

Further, power dissipated in resistance R_1,

$$e\,I_1 = 0{\cdot}76 \qquad ...(iii)$$

and power dissipated in resistance R_2, $e\,I_2 = 1{\cdot}2$ ...(*iv*)

Dividing the equation (*iii*) by (*iv*), we have

$$\frac{e\,I_1}{e\,I_2} = \frac{0{\cdot}76}{1{\cdot}2} = 0{\cdot}633$$

or $\quad I_1 = 0{\cdot}633\, I_2$ ...(*v*)

Substituting for I_1 in equation (*ii*), we have

$$0{\cdot}633\, I_2 + I_2 = 3{\cdot}266 \text{ or } I_2 = 2 \text{ A}$$

From equation (*v*), we have

$$I_1 = 0{\cdot}633 \times 2 = 1{\cdot}266 \text{ A}$$

Substituting for I_1 in equation (*iii*), we have

$$e = 1{\cdot}266 = 0{\cdot}76 \text{ or } e = 0{\cdot}6 \text{ V}$$

Substituting for ε in equation (*i*), we have

$$0{\cdot}6 = 0{\cdot}6 \times v \times 1 \text{ or } v = \mathbf{1\ m\ s^{-1}}$$

Now, induced e.m.f. produced is also equal to potential difference across resistance R_1 or across R_2, we have

$$I_1 R_1 = I_2 R_2 = \varepsilon$$

$$\therefore \quad R_1 = \frac{e}{I_1} = \frac{0{\cdot}6}{1{\cdot}266} = \frac{9}{19} = \mathbf{0{\cdot}474\ \Omega}$$

and $\quad R_2 = \dfrac{e}{I_2} = \dfrac{0{\cdot}6}{2} = 0{\cdot}3\ \Omega$

Problem 1.04. A metal bar AB can slide on two parallel thick metallic rails separated by a distance *l*. A resistance R and an inductance L are connected to the rails as shown in Fig. 1.04. A long straight wire carrying a constant current

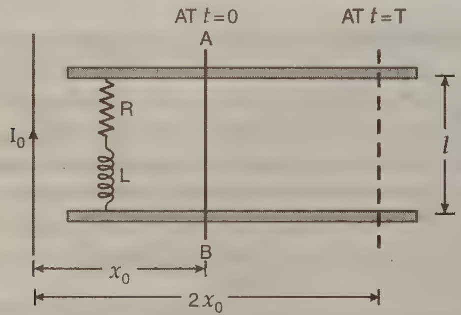

Fig. 1.04

I_0 is placed in the plane of the rails and perpendicular to them as shown in the figure. The bar AB is held at rest at a distance x_0 from the long wire. At $t = 0$, it is made to slide on the rails away from the wire. Answer the following questions :

(*a*) Find the relation among I, $\dfrac{dI}{dt}$ and $\dfrac{d\phi}{dt}$, where I is the current in the circuit and ϕ is the flux of the magnetic field due to the long wire through the circuit.

(*b*) It is observed that at time $t = T$, the metal bar AB is at a distance $2\,x_0$ from the long wire and the resistance R carries a current I_1. Obtain an expression for the net charge that has flown through resistance R from $t = 0$ to $t = T$.

(*c*) The bar is suddenly stopped at time T. The current through resistance R is found to be $I_1/4$ at time 2 T. Find the value of L/R in terms of the other given quantities.

(*I.I.T. 2002*)

Thought Process

1. When the bar AB moves away, magnetic flux linked with the circuit increases due to increase in enclosed area of the circuit. As a result, induced e.m.f. $\dfrac{d\phi}{dt}$ *is produced in the circuit due to rate of change of magnetic flux linked with the circuit. Also induced e.m.f.* $-L\dfrac{dI}{dt}$ *is produced in the inductance due to rate of current through it. The induced e.m.f. in the inductance will oppose the e.m.f.* $\dfrac{d\phi}{dt}$.

2. When the bar AB is suddenly stopped, the current in LR-circuit decays according to the relation,

$$I = I_0\, e^{-\frac{R}{L}t}$$

Sol. (*a*) Let $\dfrac{d\phi}{dt}$ be rate of change of magnetic flux linked with the circuit ; I, the current and $\dfrac{dI}{dt}$, rate of change of current in the circuit at any instant. Then,

$$\frac{d\phi}{dt} + \left(-L\frac{dI}{dt}\right) = IR$$

$$\text{or} \quad \frac{d\phi}{dt} = IR + L\frac{dI}{dt} \qquad ...(i)$$

It is the required relation between I, $\dfrac{dI}{dt}$ and $\dfrac{d\phi}{dt}$.

(*b*) From equation (*i*), we have

$$d\phi = IR\,dt + L\,dI \quad \text{or} \quad d\phi = R\,dq + L\,dI$$

$$\text{or} \quad dq = \frac{1}{R}[d\phi - L\,dI] \qquad ...(ii)$$

Let ϕ_1 be magnetic flux linked with the circuit at time $t = 0$ (when bar AB is at a distance x_0 from the straight current) and ϕ_2 be magnetic flux linked with the circuit at time $t = T$ (when bar AB is at a distance $2x_0$ from the straight conductor. At $t = 0$, current through the circuit is zero and at time $t = T$, current through the circuit is I_1.

Integrating both sides of equation (*ii*) within proper limits, we have

$$\int_0^q dq = \frac{1}{R}\left[\int_{\phi_1}^{\phi_2} d\phi - L\int_0^{I_1} dI\right]$$

$$\text{or} \quad |\,q\,|_0^q = \frac{1}{R}\left[\,|\,\phi\,|_{\phi_1}^{\phi_2} - L\,|\,I\,|_0^{I_1}\right]$$

$$\text{or} \quad q = \frac{1}{R}[(\phi_2 - \phi_1) - L\,I_1] \qquad ...(iii)$$

To evaluate $\phi_2 - \phi_1$ **:** Suppose that the bar AB is at a distance x from the straight conductor at any time t. Then, magnetic field at the bar AB at time t,

$$B = \frac{\mu_0}{4\pi}\cdot\frac{2\,I_0}{x} = \frac{\mu_0\, I_0}{2\pi x}$$

Here, I_0 is current passed through the straight conductor. Further, suppose that the conductor moves through an tesimally small distance dx in time dt. Then, small ge in magnetic flux linked with the circuit,

$$d\phi = B\,(l\,dx) = \frac{\mu_0\, I_0\, l}{2\pi x}\, dx$$

Therefore, change in magnetic flux, when the bar moves initial distance x_0 to distance $2\,x_0$ from the straight uctor,

$$\phi_2 - \phi_1 = \int_{x_0}^{2x_0} \frac{\mu_0\, I_0\, l}{2\pi x}\, dx$$

$$= \frac{\mu_0\, I_0\, l}{2\pi} \int_{x_0}^{2x_0} \frac{1}{x}\, dx = \frac{\mu_0\, I_0\, l}{2\pi} \left| \log_e x \right|_{x_0}^{2x_0}$$

$$= \frac{\mu_0\, I_0\, l}{2\pi} (\log_e 2\,x_0 - \log_e x_0) = \frac{\mu_0\, I_0\, l}{2\pi} \log_e 2$$

Substituting for $\phi_2 - \phi_1$ in equation (*iii*), we get

$$q = \frac{1}{R}\left[\frac{\mu_0\, I_0\, l}{2\pi} \log_e 2 - L\, I_1\right]$$

(*c*) When the bar is suddenly stopped at time T, current through the LR-circuit is I_1. It, then, decays with time according to relation,

$$I = I_1\, e^{-\frac{R}{L}t} \qquad \text{...(iv)}$$

At time 2 T, current in the circuit is found to be $I_1/4$. Thus, when $t = 2\,T - T = T$, $I = I_1/4$

Setting the above condition in equation (*iv*), we have

$$\frac{I_1}{4} = I_1\, e^{-\frac{R}{L}T} \qquad \text{or} \qquad e^{\frac{R}{L}T} = 4$$

$$\text{or} \quad \frac{R}{L}T = \log_e 4 \qquad \text{or} \qquad \frac{L}{R} = \frac{T}{\log_e 4}$$

Chapter 2. Transient current

Problem 2.01. An inductor of inductance L = 400 mH resistors of resistances R_1 = 2 Ω and R_2 = 2 Ω are nected to a battery of e.m.f. E = 12 V as shown in Fig. The internal resistance of the battery is negligible. The ch S is closed at time t = 0. What is the potential drop ss L as a function of time ? After the steady state is hed, the switch is opened. What is the direction and the nitude of current through R_1 as a function of time ?

(*I.I.T. 2001*)

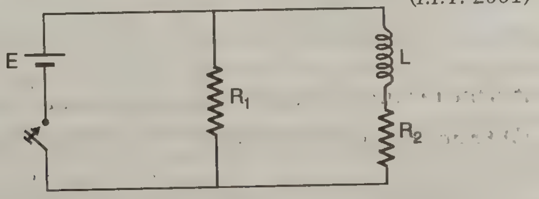

Fig. 2.01

Sol. Here, $R_1 = R_2 = 2\,\Omega$; L = 400 mH = 0·4 H

and $E = 12\,V$

When at t = 0, switch S is closed : Current equal to $\frac{E}{R_1}$

$\frac{12}{2}$ *i.e.* 6 A will flow through resistance R_1, while current eries combination of L and R_2 will grow according to the ation,

$$I = I_0\left(1 - e^{-\frac{R_2}{L}t}\right) \qquad \text{...(i)}$$

ere $I_0 = \frac{E}{R_2} = \frac{12}{2} = 6\,A$

Therefore, equation (*i*) becomes

$$I = 6\left(1 - e^{-\frac{2}{0\cdot4}t}\right) = 6\left(1 - e^{-5t}\right)$$

Hence, potential drop across L at any time t,

$$V = L\frac{dI}{dt} = L\frac{d}{dt}\left[6\,(1 - e^{-5t})\right] = 0\cdot4 \times 6\left[0 - 6^{-5t}\,(-5)\right]$$

or $\qquad V = 12\, e^{-5t}$

When after steady state, switch is opened : The current rough the inductance decays through series combination resistances R_1 and R_2 with time according to the relation,

$$I = I_0\, e^{-\frac{R_1 + R_2}{L}t}$$

$$\text{or} \qquad I = 6\, e^{-\frac{2+2}{0\cdot4}t} = 6\, e^{-10\,t}$$

The direction of current through R_1 will be from its lower to upper end.

Problem 2.02. In the circuit shown in Fig. 2.02, the battery is an ideal one with e.m.f. V. The capacitor is initially uncharged. The switch S is closed at time t = 0.

(*a*) Find the charge Q on the capacitor at time t.

(*b*) Find the current in AB at time t. What is the limiting value as $t \to \infty$?

(*I.I.T. 1998*)

Sol. (*a*) Here, at $t = 0$, charge on capacitor, Q = 0

When the switch S is closed, the current begins to flow in the circuit and the capacitor starts charging. Let at any time t, Q be charge on the capacitor and I be the current in the circuit from the battery. The current divides in various parts of the circuit in accordance with Kirchhoff's first law as shown in the figure.

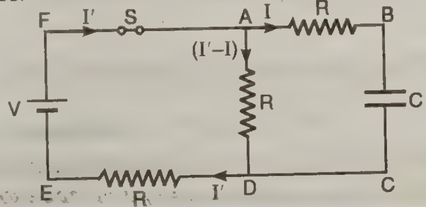

Fig. 2.02

In the closed part FABCDEF of the circuit : According to Kirchhoff's second law, we have

$$V = I\,R + \frac{Q}{C} + I'\,R$$

$$\text{or} \qquad I'\,R = V - \frac{Q}{C} - I\,R \qquad \text{...(i)}$$

In the closed part ABCDA of the circuit : According to Kirchhoff's second law, we have

$$I\,R + \frac{Q}{C} - (I' - I)\,R = 0$$

$$\text{or} \qquad 2\,I\,R + \frac{Q}{C} - I'\,R = 0 \qquad \text{...(ii)}$$

From equation (*i*), substituting for I′ R in equation (*ii*), we have

$$2IR + \frac{Q}{C} - \left(V - \frac{Q}{C} - IR\right) = 0$$

or $$V = \frac{2Q}{C} + 3IR \qquad ...(iii)$$

Setting $I = \frac{dQ}{dt}$, equation (*iii*) becomes

$$V = \frac{2Q}{C} + 3R\frac{dQ}{dt}$$

or $$\frac{dQ}{dt} = \frac{V}{3R} - \frac{2Q}{3CR} = -\frac{2}{3CR}\left(Q - \frac{VC}{2}\right)$$

or $$\frac{dQ}{Q - VC/2} = -\frac{2}{3CR}\,dt$$

Integrating both sides of the above equation within proper limits, we have

$$\int_0^Q \frac{dQ}{Q - VC/2} = -\frac{2}{3CR}\int_0^t dt$$

or $$\left|\log_e\left(Q - \frac{VC}{2}\right)\right|_0^Q = -\frac{2}{3CR}\,|\,t\,|_0^t$$

or $$\log_e\left(Q - \frac{VC}{2}\right) - \log_e\left(-\frac{VC}{2}\right) = -\frac{2}{3CR}(t - 0)$$

or $$\log_e \frac{Q - VC/2}{-VC/2} = -\frac{2}{3CR}t$$

or $$\log_e\left(1 - \frac{2}{VC}Q\right) = -\frac{2}{3CR}t$$

or $$1 - \frac{2}{VC}Q = e^{-\frac{2}{3CR}t}$$

or $$Q = \frac{VC}{2}\left(1 - e^{-\frac{2}{3CR}t}\right)$$

It gives the charge on the capacitor at any time *t*.

(*b*) Now, current in the closed part ABCDA,

$$I = \frac{dQ}{dt} = \frac{d}{dt}\left[\frac{VC}{2}\left(1 - e^{-\frac{2}{3CR}t}\right)\right]$$

$$= \frac{VC}{2}\left(0 - e^{-\frac{2}{3CR}t}\right) \times \left(-\frac{2}{3CR}\right)$$

$$= \frac{V}{3R}e^{-\frac{2}{3CR}t}$$

The current through branch AB of the circuit *i.e.* (I′ – I) can be found by using equation (*ii*). Dividing both sides of equation (*ii*) by R, we have

$$2I + \frac{Q}{CR} - I' = 0$$

or $$I' - I = I + \frac{Q}{CR}$$

Substituting for I and Q, we have

$$I' - I = \frac{V}{3R}e^{-\frac{2}{3CR}t} + \frac{1}{CR} \times \frac{VC}{2}\left(1 - e^{-\frac{2}{3CR}t}\right)$$

$$= \frac{V}{3R}e^{-\frac{2}{3CR}t} + \frac{V}{2R} - \frac{V}{2R}e^{-\frac{2}{3CR}t}$$

or $$I' - I = \frac{V}{2R} - \frac{V}{6R}e^{-\frac{2}{3CR}t}$$

It gives the current through branch AB of the circuit at any time *t*.

The limiting value of current through AB, as *t* → ∞,

$$I' - I = \underset{t \to \infty}{\text{Lt}}\left[\frac{V}{2R} - \frac{V}{6R}e^{-\frac{2}{3CR}t}\right]$$

$$= \frac{V}{2R} - \frac{V}{6R}e^{-\frac{2}{3CR}\times\infty} = \frac{V}{2R} - 0 = \frac{V}{2R}$$

Chapter 3. Alternating currents

Problem 3.01. A lamp having a hot resistance of 25 Ω is not allowed to pass current more than 5 A. Find the value of the inductance, which must be used in series with the lamp, which is supplied by an a.c. of maximum r.m.s. 325 V at 50 Hz. (*I.S.M. Dhanbad, 1993*)

Sol. Here, R = 25 Ω ; E_v = 325 V ; *f* = 50 Hz

Since the lamp cannot allow current more than 5 A to pass through it, it follows that I_v = 5 A. Let L be the required inductance that should be used in series with the lamp.

Now, $$I_v = \frac{E_v}{\sqrt{R^2 + (\omega L)^2}}$$

∴ $$5 = \frac{325}{\sqrt{25^2 + (2\pi \times 50 \times L)^2}}$$

or $$25^2 + (314{\cdot}16\,L)^2 = \left(\frac{325}{5}\right)^2 = 65^2$$

or $$314{\cdot}16\,L = \sqrt{65^2 - 25^2} \quad \text{or} \quad L = 0{\cdot}191\ \text{H}$$

Problem 3.02. An LCR circuit has L = 10 m H, R = 3 Ω and C = 1 μF connected in series to a source of 15 cos ω t volt. Calculate the current amplitude and the average power dissipated per cycle at a frequency that is 10% lower than the resonant frequency. (*Roorkee, 1988*)

Sol. Here, L = 10 mH = 10^{-2} H ; R = 3 Ω ;

C = 1 μF = 10^{-6} F

If ω_0 is resonant angular frequency, then

$$\omega_0 L = \frac{1}{\omega_0 C} \quad \text{or} \quad \omega_0 = \frac{1}{\sqrt{LC}} = \frac{1}{\sqrt{10^{-2} \times 10^{-6}}}$$

$$= 10^4\ \text{rad s}^{-1}$$

If ω is angular frequency 10% lower than ω_0, then

$$\omega = \omega_0 - \frac{\omega_0 \times 10}{100} = 10^4 - \frac{10^4 \times 10}{100} = 9 \times 10^3\ \text{rad s}^{-1}$$

The values of inductive and capacitive reactances at gular frequency ω are given by

$$X_L = \omega L = 9 \times 10^3 \times 10^{-2} = 90\ \Omega$$

$$\text{and } X_C = \frac{1}{\omega C} = \frac{1}{9 \times 10^3 \times 10^{-6}} = 111 \cdot 11\ \Omega$$

Therefore, impedance of LCR-circuit at angular equency ω,

$$Z = \sqrt{R^2 + (X_L - X_C)^2} = \sqrt{3^2 + (90 - 111 \cdot 11)^2}$$

$$= 21{\cdot}32\ \Omega$$

Now, applied voltage, $E_v = 15 \cos \omega t$

It follows that $E_0 = 15$ V

Therefore, current amplitude, $I_0 = \dfrac{E_0}{Z} = \dfrac{15}{21 \cdot 32} = \mathbf{0{\cdot}704\ A}$

$$\text{Average power, } P = E_v\, I_v \cos \phi = \frac{1}{2} E_0\, I_0 \left(\frac{R}{Z}\right)$$

$$= \frac{1}{2} \times 15 \times 0 \cdot 704 \times \frac{3}{21 \cdot 32} = \mathbf{0{\cdot}743\ W}$$

Problem 3.03. A 750 Hz, 20 V source is connected to a esistance of 100 W, an inductance of 0·1803 H and a apacitance of 10μF all in series. Calculate the time in which he resistance (thermal capacity = 2 J °C^{-1}) will get heated y 10°C. *(Roorkee, 1989)*

Sol. Here, R = 100 Ω ; L = 0·1803 H ;

$C = 10\ \mu F = 10^{-5}$ F ; $E_v = 20$ V ; $f = 750$ Hz

$$\text{Now,} \quad Z = \sqrt{R^2 + \left(\omega L - \frac{1}{\omega C}\right)^2}$$

$$= \sqrt{100^2 + \left(2\pi \times 750 \times 0 \cdot 1803 - \frac{1}{2\pi \times 750 \times 10^{-5}}\right)^2}$$

$$= \sqrt{100^2 + (849 \cdot 64 - 21 \cdot 22)^2} = \sqrt{100^2 + 828 \cdot 42^2}$$

$$= 834{\cdot}43\ \Omega$$

Average power, $P = E_v\, I_v \cos \phi$

$$= E_v \left(\frac{E_v}{Z}\right) \frac{R}{Z} = E_v^{\,2} \times \frac{R}{Z^2}$$

$$= \frac{20^2 \times 100}{(834 \cdot 43)^2} = 0 \cdot 0574\ \text{W}$$

If t is the required time, then

$P \times t$ = thermal capacity × rise in temperature

or $0{\cdot}0574 \times t = 2 \times 10$

or $\quad t = \dfrac{2 \times 10}{0 \cdot 0574} = \mathbf{348{\cdot}4\ s}$

Chapter 4. Electric machines and devices

Problem 4.01. A very small circular loop of area 5×10^{-4} m^2, resistance 2 Ω and negligible inductance is nitially coplanar and concentric with a much larger fixed ircular loop of radius 0·1 m. A constant current of 1 A is assed in the bigger loop and the smaller loop is rotated with angular velocity ω rad s^{-1} about a diameter. Calculate i) the flux linked with the smaller loop, (*ii*) induced e.m.f. nd (*iii*) induced current in the smaller loop, as a function of time. *(Roorkee, 1992)*

Sol. Fig. 4.01 shows two concentric circular loops of radii a_1 and a_2, such that $a_1 > a_2$. The current $I_1 = 1$ A is passed through the larger loop and the smaller loop is rotated with angular velocity ω about its diameter X′OX.

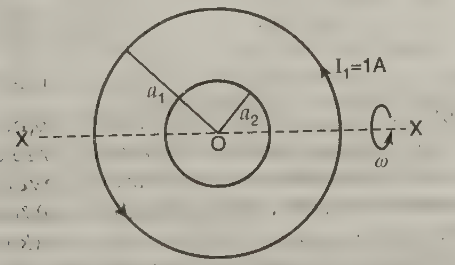

Fig. 4.01.

Also, radius of larger loop, $a_1 = 0{\cdot}1$ m

and area of smaller loop,

$$A_2 = \pi a_2^2 = 5 \times 10^{-4}\ \text{m}^2.$$

Magnetic field produced by the larger loop,

$$B_1 = \frac{\mu_0 I_1}{2 a_1} = \frac{4\pi \times 10^{-7} \times 1}{2 \times 0 \cdot 1}$$

$$= 2\pi \times 10^{-6}\ \text{Wb m}^{-2}$$

(*i*) Initially, the loops are coplanar. Therefore, at $t = 0$, the magnetic field produced due to larger loop will be perpendicular to the plane of the smaller loop. At any time t, the plane of the smaller loop will turn through angle θ (= ω t), so that magnetic flux linked with the smaller loop at any time t,

$$\phi_2 = B_1 A_2 \cos \omega t$$

$$\text{or} \quad \omega_2 = 2\pi \times 10^{-6} \times 5 \times 10^{-4} \cos \omega t$$

$$= \boldsymbol{\pi \times 10^{-9} \cos \omega t\ \text{Wb}}$$

(*ii*) If e_2 is induced e.m.f. produced in smaller loop at any time t, then

$$e_2 = -\frac{d\phi_2}{dt} = -\frac{d}{dt}(\pi \times 10^{-9} \cos \omega t)$$

$$= \pi \times 10^{-9}(-\sin \omega t) \times \omega$$

$$\text{or} \quad e_2 = \pi \times 10^{-9} \sin \omega t\ \text{V}$$

(*iii*) If I_2 is induced current in the smaller loop at any time t, then

$$I_2 = \frac{e_2}{R_2} = \frac{\pi \times 10^{-9}\ \omega \sin \omega t}{2}$$

$$= \boldsymbol{5\pi \times 10^{-10}\ \omega \sin \omega t\ \text{A}}$$

MULTIPLE CHOICE QUESTIONS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Electromagnetic induction

PART I. TEXT-BASED QUESTIONS

1. **The SI unit of magnetic flux is :**
   (A) gauss (B) oersted
   (C) tesla (D) weber
2. **In electromagnetic induction, the induced e.m.f. is independent of**
   (A) change of flux. (B) time.
   (C) number of turns in the coil.
   (D) resistance of the coil.
3. **Magnitude of e.m.f. produced in a coil, when a magnet is inserted into it ; does not depend upon :**
   (A) number of turns in the coil.
   (B) resistance of the coil.
   (C) magnetic moment of magnet.
   (D) speed of the magnet.
4. **A magnet is moved towards a coil, first quickly and then slowly. The induced e.m.f. produced is**
   (A) larger in first case. (B) smaller in first case.
   (C) equal in both cases.
   (D) larger or smaller, depending upon resistance of the coil.
5. **Refer to the figure. Deflection in the galvanometer (G) occurs, when :**

   (A) the magnet is pushed into the coil.
   (B) the magnet is rotated into the coil.
   (C) the magnet is stationary at the centre of the coil.
   (D) the number of turns in the coil is reduced.
   (Karnataka Entrance, 1992, 1990)
6. **Faraday's law of electromagentic induction is related to the law of conservation of**
   (A) charge (B) energy
   (C) mass (D) angular momentum.
   (C.E.T. 1998)
7. **A conducting square loop of side L and resistance R moves in its plane with a uniform velocity v perpendicular to one of its sides. A magnetic induction B constant in time and space, pointing perpendicular and into the plane of the loop exists everywhere. The current induced in the loop is**

   (A) $\frac{B l v}{R}$ clockwise (B) $\frac{B l v}{R}$ anticlockwise
   (C) $\frac{2 B l v}{R}$ anticlockwise
   (D) zero *(I.I.T. 1989)*
8. **A square shaped coil of side 10 cm and number of turns 500 is placed perpendicular to magnetic flux lines, which is changing at the rate of 1·0 T s^{-1}. The e.m.f. induced in the coil is**
   (A) 0·1 V (B) 0·5 V
   (C) 1·0 V (D) 5·0 V *(C.P.M.T. 19*
9. **A magnetic field of 2×10^{-2} T acts at right angles to a of area 100 cm^2 with 50 turns. The average e.m.f. indu in the coil is 0·1 V, when it is removed from the field in time t. The value of t is**
   (A) 0·1 s (B) 0·01 s
   (C) 1 s (D) 10 s *(C.B.S.E. 19*
10. **Magnetic flux ϕ (in weber) in a closed circuit of resista 10 Ω varies with time t (in seconds) according to equation : $\phi = 5t^2 - 4t + 1$.**
    The magnitude of the induced e.m.f. in the circui t = 0·2 s is :
    (A) 0·4 V (B) – 0·4 V
    (C) – 2 V (D) 2 V
11. **Lenz's law is a consequence of the law of conservation**
    (A) charge only. (B) momentum only.
    (C) energy only. (D) energy and momentum.
    (Pre-degree Kerala, 1
12. **The direction of induced e.m.f. is given by**
    (A) Fleming's left hand rule.
    (B) Fleming's right hand rule.
    (C) Lenz's law. (D) Biot Savart's law.

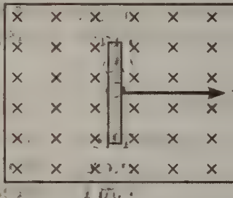
    (A) 10 Wb (B) 4×10^{-4} Wb
    (C) 4×10^{-2} Wb (D) 0·1 Wb
15. **A conductor of length l is moved perpendicular to unif magnetic field B with velocity v as shown in figure. e.m.f. induced across the length of the conductor is**
    (A) zero
    (B) B l v
    (C) B l v/2
    (D) B l^2 v/2 *(C.P.M.T. 1993)*



16. **An aeroplane in which the distance between the tip the wings is 50 m is flying horizontally with a spee 360 km h^{-1} over a place, where the vertical componen earth's magnetic field is $2{\cdot}0 \times 10^{-4}$ T. The poten difference between the tips of the wings would be**
    (A) 0·1 V (B) 1·0 V
    (C) 0·2 V (D) 0·01 V *(C.P.M.T. 19*
17. **A car moves on a plane road. The induced e.m.f. in the connecting the two wheels is maximum, when it mov**
    (A) eastwards at the equator.
    (B) westwards at the equator.
    (C) eastwards in the latitude 45°.
    (D) at the poles.
18. **The two rails of a railway track insulated from each ot and the ground are connected to millivoltmeter. What is reading of the millivoltmeter, when a train passes speed of 180 km h^{-1} along the track, given that the vert**

component of earth's magnetic field is 0·2 × 10^{-4} Wb m^{-2} and rails are separated by 1 m ?

(A) 10^{-2} V　(B) 10 mV
(C) 1 V　(D) 1 mV　*(I.I.T. 1981)*

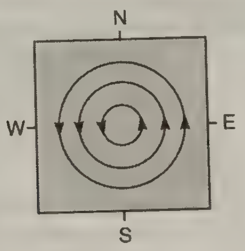
19. **Two rails of a railway track 1 m apart and insulated from each other and the ground are connected to a millivoltmeter. What is the reading on the millivoltmeter, when a train travels at a speed of 20 m s^{-1} along the track. Given that the horizontal component of earth's magnetic field is 0·2 × 10^{-4} T.**

(A) 4 mV　(B) 0·4 mV
(C) zero　(D) 10 mV

20. **Eddy currents are**

(A) induced currents due to a changing magnetic flux.
(B) induced currents due to a high magnetic flux.
(C) induced currents in a inhomogeneous material.
(D) unstable currents in a conductor.
(Karnataka Entrance, 1991)

21. **When a sheet of metal is placed in magnetic field, which changes from zero to a maximum value, induced currents are set up in the direction shown in the diagram. What is the direction of the magnetic field ?**



(A) Into the plane of paper.
(B) Out of the plane of the paper.
(C) East to west.　(D) North to south.

22. **An induction furnace works on the principle of**

(A) self induction　(B) mutual induction
(C) eddy currents　(D) Faraday's laws *(C.E.T. 1999)*

23. **The SI unit of inductance, the henry, can be written as**

(A) weber ampere^{-1}　(B) volt second ampere^{-1}
(C) joule ampere^{-2}　(D) ohm second.　*(I.I.T. 1998)*

24. **When the current in a coil changes from 2 A to 4 A in 0·05 s, an e.m.f. of 8 V is induced in the coil. The coefficient of self-induction of the coil is**

(A) 0·1 H　(B) 0·2 H
(C) 0·4 H　(D) 0·8 H
(M.N.R. 1993, 1980 ; C.P.M.T. 1991)

25. **The current in a self-inductance L = 40 mH is to be increased uniformly from 1 A to 11 A in 4 millisecond. The e.m.f. induced in the inductor during the process is**

(A) 100 V　(B) 0·4 V
(C) 40 V　(D) 440 V　*(C.B.S.E. 1990)*

26. **When the current through a solenoid increases at a constant rate, the induced current**

(A) is constant and is in the direction of inducing current.
(B) is constant and is opposite to the direction of the inducing current.
(C) increases with time and is in the direction of the inducing current.
(D) increases with time and opposite to the direction of the inducing current.　*(M.N.R. 1992)*

27. **When the number of turns and length of a solenoid are doubled keeping the area of cross-section same, the inductance**

(A) is halved　(B) remains the same
(C) is doubled　(D) becomes four times.
(A.F.M.C. 1995)

28. **A solenoid has 2,000 turns wound over a length of 0·3 m. The area of its cross-section is 1·2 × 10^{-3} m^2. Around its central part, a coil of 300 turns is wound. If an initial current of 2 A is reversed in 0·25 s, the induced e.m.f. produced in the coil is**

(A) 6 × 10^{-4} V　(B) 4·8 × 10^{-2} V
(C) 6 × 10^{-2} V　(D) 48 V.

29. **The mutual inductance between two coils depends on**

(A) medium between the coils only.
(B) separation between two coils only.
(C) both (A) and (B).
(D) none of (A) and (B).　*(C.P.M.T. 1993)*

30. **Two coils have a mutual inductance 0·005 H. The current changes in the first coil according to equation $I = I_0 \sin \omega t$, where I_0 = 10 A and $\omega = 100\,\pi$ rad s^{-1}. The maximum value of e.m.f. in the second coil is**

(A) $2\,\pi$　(B) $5\,\pi$
(C) $6\,\pi$　(D) $12\,\pi$　(C.B.S.E. 1998)

PART II. THOUGHT-BASED QUESTIONS

31. **A copper ring is held horizontally and bar magnet is dropped through the ring with its length along the axis of the ring. The acceleration of the falling magnet is**

(A) equal to that due to gravity.
(B) less than that due to gravity.
(C) more than that due to gravity.
(D) depends on the diameter of the ring and the length of the magnet.　*(C.B.S.E. 1996 ; M.N.R. 1987)*

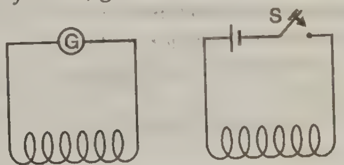
32. **A circular loop of radius R, carrying current I, lies in XY-plane with its centre at origin. The total magnetic flux through XY-plane is**

(A) directly proportional to I
(B) directly proportional to R
(C) inversely proportional to R
(D) zero.　*(I.I.T. 1999)*

33. **In electromagnetic induction, the induced charge is independent of :**

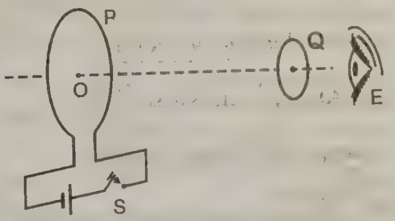
(A) time.　(B) change of flux.
(C) resistance of the coil. (D) none of the above.

34. **The switch (S) is closed and opened in the circuit periodically. Then, galvanometer (G) shows**



(A) no deflection.
(B) a steady deflection to the left.
(C) a steady deflection to the right.
(D) periodic deflections.　*(Karnataka Entrance, 1990)*

35. **As shown in the figure, P and Q are two coaxial conducting loops separated by some distance. When the switch S is**

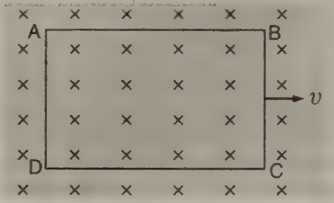


closed, a clockwise current I_P flows in P (as seen by E) and an induced current I_{Q_1} flows in Q. The switch remains

closed for a long time. When S is opened, a current I_{Q_2} flows in Q. Then the direction of I_{Q_1} and I_{Q_2} (as seen by E) are

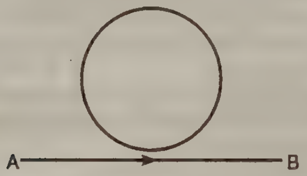
(A) both clockwise (B) both anticlockwise
(C) respectively clockwise and anticlockwise
(D) respectively anticlockwise and clockwise. (*I.I.T. 2002*)

36. **A metallic square loop ABCD is moving in its own plane with velocity v in a uniform magnetic field perpendicular to its plane as shown in the figure. Electric field is induced :**



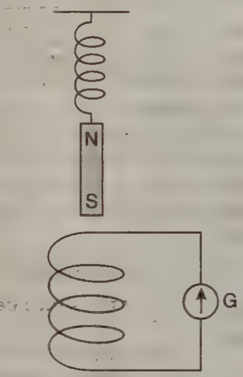
(A) in AD, but not in BC
(B) in BC, but not in AD
(C) neither in AD nor in BC
(D) in both AD and BC. (*I.I.T. 2001*)

37. **An electron moves along the line AB, which lies in the same plane as a circular loop of conducting wires. What will be the direction of the current induced in the loop, if any ?**



(A) No current will be induced.
(B) The current will be clockwise.
(C) The current will be anticlockwise.
(D) The current will change direction as the electron passes by.

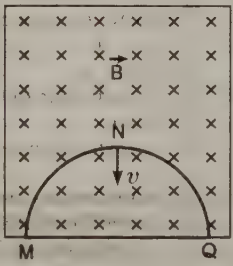
38. **A magnet NS is suspended from a spring and while it oscillates, the magnet moves in and out of the coil C. The coil is connected to a galvanometer G. Then, as the magnet oscillates,**



(A) G shows deflection to the left and right with constant amplitude.
(B) G shows deflection on one side.
(C) G shows no deflection.
(D) G shows deflection to the left and right, but the amplitudes steadily decreases.

(*Karnataka Entrance, 1989*)

39. **A thin semicircular conducting ring of radius R is falling with its plane vertical in a horizontal magnetic induction $\vec{B}$ as shown in the figure. At the position MNQ, the speed of the ring is v. Then, the potential difference developed across the ring is**



(A) zero.
(B) $\frac{1}{2} B v R^2$ and M is at higher potential.
(C) $\pi R B v$ and Q is at higher potential.
(D) $2 R B v$ and Q is at higher potential. (*I.I.T. 1996*)

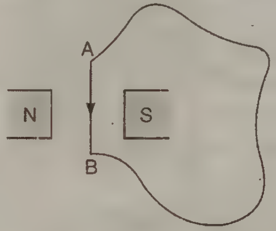
40. **A metal sheet is placed in front of the pole of a very strong magnet. A force is needed to**

(A) hold the sheet in its position, if the metal is magnetic.
(B) hold the sheet in its position, if the metal is non-magnetic.
(C) move the sheet away with a uniform velocity, if the metal is magnetic.
(D) move the sheet away with a uniform velocity, if the metal is non-magnetic.

41. **A metal rod moves at a constant velocity in a direction perpendicular to its length. A constant, uniform magnetic field exists in space in a direction perpendicular to the rod as well as its velocity. Select the correct statement (s) from the following :**

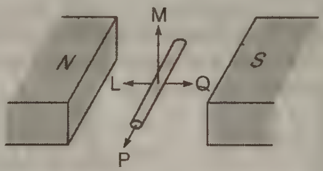
(A) The entire rod is at the same electric potential.
(B) There is an electric field in the rod.
(C) The electric potential is highest at the centre of the rod and decreases towards its ends.
(D) The electric potential is lowest at the centre of the rod and increases towards its ends. (*I.I.T. 1998*)

42. **In what way should the conductor AB be moved in a magnetic field, such that the current flows as shown in the figure ?**



(A) Normally into the plane of the paper.
(B) Vertically downward.
(C) Vertically upwards. (D) None of the above.

43. **A potential difference will be induced between the ends of the conductor shown in the figure, when the conductor moves along**



(A) P (B) Q
(C) L (D) M (*A.I.I.M.S. 1982*)

44. **Dimensions of coefficient of self induction is**

(A) $[M L^2 T^2 A^{-2}]$ (B) $[M L^2 T^{-3} A^{-2}]$.
(C) $[M L^2 T^{-3}]$ (D) none of the above.

(*B.H.U. 1997*)

45. **The self-inductance of a straight conductor is**

(A) zero. (B) infinity.
(C) very large. (D) very small.

46. **In an inductor of self inductance L = 2 mH, current changes with time according to relation $I = t^2 e^{-t}$. At what time, e.m.f. is zero ?**

(A) 4 s (B) 3 s
(C) 2 s (D) 1 s (*C.B.S.E. 2001*)

47. **If N is the number of turns in a coil, the value of self-inductance varies as**

(A) N^0 (B) N
(C) N^2 (D) N^{-2} (*C.B.S.E. 1993*)

A short-circuited coil is placed in a time varying magnetic field. Electrical power is dissipated due to the current induced in the coil. If the number of turns were to be quadrupled and the wire radius halved, the electrical power dissipated would be
(A) halved (B) the same
(C) doubled (D) quadrupled (I.I.T. 2002)

A small square loop of wire of side l is placed inside a large square loop of wire of side L (L >> l). The loops are co-planar and their centres coincide. The mutual inductance of the system is proportional to
(A) l/L (B) l^2/L
(C) L/l (D) L^2/l (I.I.T. 1998)

Two pure inductors each of self-inductance L are connected in parallel but are well separated from each other. Then, the total inductance is
(A) L (B) 2 L
(C) $\frac{\text{L}}{2}$ (D) $\frac{\text{L}}{4}$

A coil is wound on a former of rectangular cross- section. If all the linear dimensions of the former are increased by a factor of 2 and the number of turns per unit length of the coil remain unchanged, the self-inductance of the coil increases by a factor of
(A) 2 (B) 4
(C) 8 (D) 16 (A.I.I.M.S. 1980)

52. A constant current is passed through a solenoid. If an iron rod is inserted along the axis of the solenoid, which of the following quantities will increase ?
(A) Rate of production of heat due to Joule heating.
(B) Magnetic field at the centre of the solenoid.
(C) Magnetic flux linked with the solenoid.
(D) Self inductance of the solenoid.

53. Two identical circular loops of metal wire are lying on a table without touching each other. Loop-A carries a current, which increases with time. In response, loop-B
(A) remains stationary.
(B) is attracted by the loop-A.
(C) is repelled by the loop-A.
(D) rotates about its C.M., with C.M. fixed.
(I.I.T. 1999)

Chapter 2. Transient current

RT I. TEXT-BASED QUESTIONS

In an LR-circuit, the current rises to final value slowly, when
(A) L is small. (B) L is large.
(C) L is zero. (D) none of the above.

An inductance of 2 H and a resistance of 10 Ω are connected to a battery of 5 V. The time constant of the circuit is
(A) 20 s (B) 0·2 s
(C) 5 s (D) 100 s

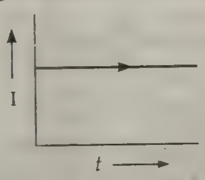
In Q. No. 2, the final steady current is
(A) 0·5 A (B) 2·5 A
(C) 2 A (D) 0·25 A

In Q. No. 2, the initial rate of increase of current is
(A) 0·5 A s^{-1} (B) 2·5 A s^{-1}
(C) 2 A s^{-1} (D) 0·25 A s^{-1}

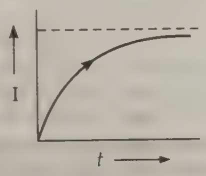
In Q. No. 2, the rate of increase of current in the circuit at the instant current is 0·3 A, is
(A) 0·2 A s^{-1} (B) 0·015 A s^{-1}
(C) 1 A s^{-1} (D) 0·05 A s^{-1}

A coil of inductance 8 mH and resistance 6 Ω is connected to a 12 V battery. The current in the coil is 1·0 A at the time (approximately)
(A) 500 s (B) 20 s
(C) 35 ms (D) 1 ms (I.I.T. 1999)

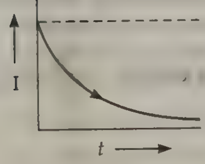
In an LR-circuit, the current grows with time as shown in figure :



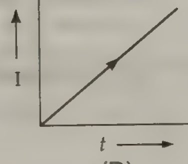
(A)



(B)

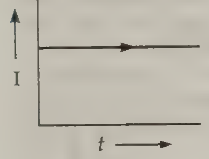


(C)

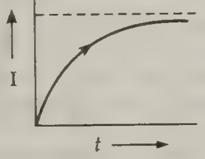


(D)

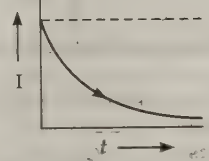
8. In an LR-circuit, the variation of voltage across the inductance with time during growth is :



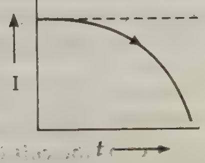
(A)



(B)



(C)



(D)

9. Which of the following has dimensions same as that of time ?
(A) L C (B) $\frac{\text{R}}{\text{L}}$
(C) $\frac{\text{L}}{\text{R}}$ (D) $\frac{\text{C}}{\text{L}}$
(C.E.T. 1999 ; C.B.S.E. 1996)

10. A 10 μF capacitor charged to 100 V is discharged through 10^{-6} Ω resistor. The time taken for half the charge to leak is :
(A) 693 s (B) 6·93 s
(C) 0·693 s (D) 13·86 s
Given that $\log_e 2 = 0·693$

11. The time constant of CR-circuit is
(A) 1/C R (B) C/R
(C) C R (D) R/C (C.B.S.E. 1992)

12. The dimensions of CR is that of
(A) time. (B) inverse time.
(C) square of time. (D) square of inverse time.
(C.B.S.E. 1995)

13. An inductor may store energy in
(A) its electric field. (B) its coils.
(C) its magnetic field.
(D) both in electric and magnetic fields. (C.B.S.E. 1990)

14. In Q. No. 2, when the steady state is reached, the energy stored in the inductance in the form of magnetic field is
(A) 0·25 J (B) 6·25 J
(C) 2 J (D) 0·0625 J

15. A 100 mH coil carries a current of 1 A. Energy stored in the form of magnetic field is
(A) 0·5 J (B) 1 J
(C) 0·05 J (D) 0·1 J *(C.B.S.E. 1992)*

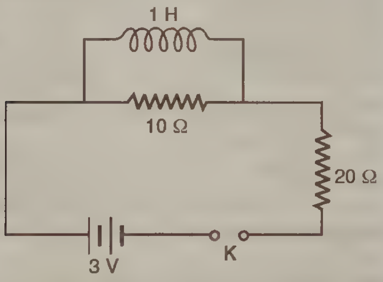
16. If a capacitor of capacitance C is connected in series with an inductor of inductance L, then the angular frequency is
(A) $\sqrt{LC}$ (B) LC
(C) $\sqrt{L/C}$ (D) $1/\sqrt{LC}$ *(A.F.M.C. 1997)*

17. An LC-circuit cannot produce oscillations, when
(A) capacitance is large. (B) inductance is large.
(C) resistance is large. (D) none of the above.

PART II. THOUGHT-BASED QUESTIONS

18. An inductor and a resistance are connected to a battery. Which of the following quantities is not zero just after the connection ?
(A) current in the circuit.
(B) e.m.f. produced in the inductor.
(C) energy stored in the inductor.
(D) power delivered by the battery.

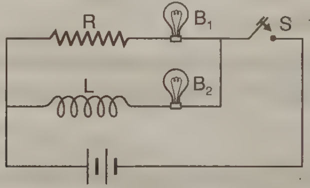
19. In the circuit shown, what is the final value of current in 10 Ω resistance on inserting the plug in the key K ?



(A) 0·3 A (B) 0·15 A
(C) 0·1 A (D) zero.

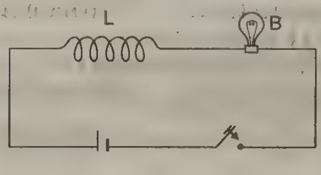
20. In the circuit shown in last question, what is the final value of current in 20 Ω resistance, on inserting the plug in the key K ?
(A) 0·3 A (B) 0·15 A
(C) 0·1 A (D) zero.

21. Figure shows two bulbs B_1 and B_2, resistor R and an inductor L. When the switch S is turned off,



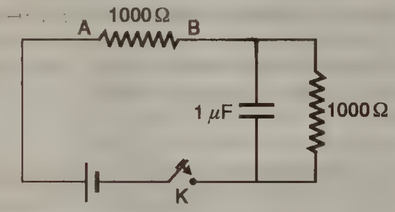
(A) both B_1 and B_2 die out promptly.
(B) both B_1 and B_2 die out with some delay.
(C) B_1 dies out promptly, but B_2 with some delay.
(D) B_2 dies out promptly, but B_1 with some delay.
(C.P.M.T. 1989)

22. In the circuit shown, the bulb will become suddenly bright, if



(A) contact is made or broken.
(B) contact is made. (C) contact is broken.
(D) will not become bright at all. *(C.B.S.E. 1*

23. When the key K is pressed at time $t = 0$, then which o following statement about the current I in the resisto of the given circuit is true ?

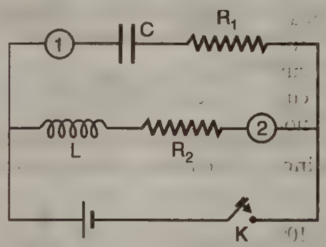


(A) I = 1 mA at all t.
(B) I = 2 mA at all t.
(C) I oscillates between 1 mA and 2 mA.
(D) at $t = 0$, I = 2 mA and with time, it goes to 1 mA.
(A.F.M.C. 1996 ; C.B.S.E. 1

24. A coil of wire having finite inductance and resistance a conducting ring placed co-axially within it. The co connected to a battery at time $t = 0$, so that a ti dependent current $I_1(t)$ starts flowing through the co $I_2(t)$ is the current induced in the ring and $B(t)$ is magnetic field at the axis of the coil due to $I_1(t)$, then function of time ($t > 0$), the product $I_2(t)\,B(t)$
(A) increases with time.
(B) decreases with time.
(C) does not vary with time.
(D) passes through a maximum. *(I.I.T. 2*

25. L, C and R represent the physical quantities inducta capacitance and resistance respectively. The combina which have the dimensions of frequency are
(A) $\frac{1}{RC}$ (B) $\frac{RL}{C}$
(C) $\frac{R}{LC}$ (D) $\frac{C}{L}$ *(B.I.T. 1*

26. In a circuit given in the figure, 1 and 2 are ammeters. If K is pressed to complete the circuit, the readin ammeters is



(A) zero in both 1 and 2.
(B) maximum in both 1 and 2.
(C) zero in 1, maximum in 2.
(D) maximum in 1, zero in 2. *(C.B.S.E. 1*

27. In an oscillating circuit, the restoring force is must. I LC-circuit, the restoring force is provided by
(A) a capacitor (B) an inductance
(C) a resistance (D) none of the above.

Chapter 3. Alternating current

PART I. TEXT-BASED QUESTIONS

1. **A normal domestic electric supply is an alternating current, whose average value is**
(A) zero.
(B) half the peak value.
(C) the peak value multiplied by $\frac{\pi}{2}$.
(D) the peak value divided by $\frac{\pi}{2}$.
(Karnataka Entrance, 1992)

2. **The mean value of a.c. is related to peak value of a.c. by the equation**
(A) $I_m = \sqrt{2}\, I_0$ (B) $I_0 = \sqrt{2}\, I_m$
(C) $I_m = \frac{2 I_0}{\pi}$ (D) $I_0 = \frac{2 I_m}{\pi}$

3. **The r.m.s. value of a.c. is related to peak value of a.c. by the equation**
(A) $I_{r.m.s.} = \sqrt{2}\, I_0$ (B) $I_0 = \sqrt{2}\, I_{r.m.s.}$
(C) $I_{r.m.s.} = \frac{2 I_0}{\pi}$ (D) $I_0 = \frac{2 I_{r.m.s.}}{\pi}$

4. **The equation of an a.c. voltage is**
$V = 200 \sin 50\, \pi\, t$.
Then, the r.m.s. value of voltage is
(A) $100\sqrt{2}$ V (B) $200\sqrt{2}$ V
(C) 100 V (D) 400 V
(Pre-degree Kerala, 1989)

5. **An electric lamp is connected to 220 V-50 Hz supply. The peak voltage in the circuit is**
(A) 110 V (B) 220 V
(C) 311 V (D) 320 V *(A.F.M.C. 1996)*

6. **An electric bulb rated 220 V is connected to 220 V-5 Hz source. Then, the bulb**
(A) does not glow. (B) glows intermittently.
(C) glows continuously. (D) fuses.

7. **An inductor**
(A) allows a.c. to pass, but blocks d.c.
(B) allows d.c. to pass, but blocks a.c.
(C) allows both a.c. and d.c. to pass.
(D) blocks d.c.

8. **In an a.c. circuit containing inductance,**
(A) current lags the voltage by 90°.
(B) current lags the voltage by 180°.
(C) current leads the voltage by 90°.
(D) none of the above. *(Karnataka Entrance, 1984)*

9. **The inductive reactance of an inductance of $\frac{1}{\pi}$ H at 50 Hz is**
(A) 100 Ω (B) $\frac{50}{\pi}$ Ω
(C) $\frac{\pi}{50}$ Ω (D) $50\,\pi$ Ω

10. **An alternating e.m.f. is applied to a pure inductance, such that inductive reactance is 10 Ω. If the frequency of a.c. is doubled, the reactance will become**
(A) 5 Ω (B) 10 Ω
(C) 15 Ω (D) 20 Ω

11. **When a.c. flows through a capacitor, then the current**
(A) leads e.m.f. by $\frac{\pi}{2}$. (B) lags e.m.f by $\frac{\pi}{2}$.
(C) is in phase with e.m.f.
(D) none of the above.

12. **A capacitor**
(A) offers easy path to a.c., but blocks d.c.
(B) offers easy path to d.c., but blocks a.c.
(C) offers easy path to both a.c. and d.c.
(D) blocks a.c.

13. **The reactance of a capacitor of capacitance C is X. If both the frequency and capacitance be doubled, then new reactance will be**
(A) X (B) 2 X
(C) 4 X (D) X/4 *(C.B.S.E. 2001)*

14. **An alternating e.m.f. is applied to a pure capacitance, such that the capacitive reactance is 10 Ω. If the frequency of a.c. is doubled, the reactance will become**
(A) 5 Ω (B) 10 Ω
(C) 15 Ω (D) 20 Ω

15. **An a.c. voltage source $E = 200\sqrt{2} \sin 100\, t$ is connected across a circuit containing an a.c. ammeter and a capacitor of capacitance 1 μF. The reading of ammeter is**
(A) 10 mA (B) 20 mA
(C) 40 mA (D) 80 mA
(C.P.M.T. 1991 ; N.C.E.R.T. 1984)

16. **In an a.c. circuit, the current**
(A) is always in phase with the e.m.f.
(B) always leads the e.m.f.
(C) always lags the e.m.f.
(D) any of the above, depending upon the elements (L, C or R) of the circuit.

17. **A 220 V-50 Hz a.c. source is connected to an inductance of 0·2 henry and a resistance of 20 ohm in series. What is the current in the circuit ?**
(A) 10 A (B) 5 A
(C) 33·3 A (D) 3·33 A
(Karnataka Entrance, 1991)

18. **In an LCR-series a.c. circuit, the current**
(A) is always in phase with the voltage.
(B) always lags the generator voltage.
(C) always leads the generator voltage.
(D) may lag behind or lead the voltage.
(C.E.T. 1998 ; C.P.M.T. 1992)

19. **The impedance of an a.c. (LCR) circuit is given by**
(A) $\sqrt{R^2 - (X_C + X_L)^2}$ (B) $\sqrt{R^2 + (X_C - X_L)^2}$
(C) $\sqrt{R^2 - (X_C - X_L)^2}$ (D) $\sqrt{R^2 + (X_C + X_L)^2}$
(Karnataka Entrance, 1984)

20. **For the current in LCR-circuit to be maximum,**
(A) $\omega^2 = L\,C$ (B) $\omega^2 = \frac{1}{L\,C}$
(C) $\omega = \frac{1}{L\,C}$ (D) $\omega = L\,C$

21. **A 1 mH inductance and 10 μF capacitance, when connected in series to an a.c. source, possess equal reactance. The angular frequency of the a.c. source is**
(A) 10^4 (B) 100
(C) 10 (D) $200\,\pi$

22. **In Q. 21, the value of the reactance of either of them is**
(A) 0·1 Ω (B) 0·01 Ω
(C) $0{\cdot}2\,\pi$ Ω (D) 10 Ω

23. **An a.c. circuit using an inductor and a capacitor in series has a maximum current. If L = 0·5 H and C = 8 μF, then the angular frequency of a.c. voltage will be**
(A) 500 (B) 5×10^5
(C) 4000 (D) 5000 *(C.P.M.T. 1991)*

24. In an LCR-circuit, the capacitance is changed from C to 4 C. For the same resonant frequency, the inductance should be changed from L to
(A) 2 L (B) L/2
(C) 4 L (D) L/4

25. An LCR-circuit is connected to a source of a.c. current under resonant condition. The phase difference between the applied voltage and the current in the circuit is
(A) $\pi/4$ (B) $\pi/2$
(C) π (D) zero *(C.E.T. 1999)*

26. For the current in LCR-circuit to be maximum,
(A) $X_L = 0$ (B) $X_C = 0$
(C) $X_L = X_C$ (D) $R = X_L + X_C$

27. The average power of an a.c. circuit is
(A) $E_v I_v$ (B) $E_v I_v \cos\phi$
(C) $E_v I_v \sin\phi$ (D) zero.

28. In an a.c. circuit, with phase voltage V and current I, the power dissipated is
(A) $\frac{1}{2}VI$ (B) $\frac{1}{\sqrt{2}}VI$
(C) VI
(D) depends on the phase angle between V and I *(C.B.S.E. 1997)*

29. The average power dissipation in a pure inductance is
(A) zero (B) $\frac{1}{2}LI^2$
(C) $\left(\frac{1}{2}LI^2\right)^2$ (D) $\sqrt{\frac{1}{2}LI^2}$

30. In an a.c. circuit, E and I are given by
$$E = 100 \sin 100\,t \quad \text{(in volt)}$$
and $$I = 100 \sin(100\,t + \pi/3) \quad \text{(in mA)}$$
The power dissipated in the circuit is
(A) 10^4 W (B) 10 W
(C) 2500 W (D) 5·0 W *(C.P.M.T. 1991)*

31. A current $I = I_0 \sin(\omega t + \pi/2)$ flows in a circuit across which an alternating potential $E = E_0 \sin \omega t$ is applied. The power consumed in the circuit is
(A) $E_0 I_0/2$ (B) $E_0 I_0$
(C) E (D) zero
(C.E.T. 1998 ; similar C.B.S.E. 1995)

32. The minimum and maximum values of power factor in an a.c. circuit are
(A) 0 and 1 (B) 1 and ∞
(C) 0 and ∞ (D) 0·1 and 1

33. An a.c. supply may be used directly for all these except for one. Identify the one, for which it cannot be used :
(A) Heating (B) Lighting
(C) Transforming voltage
(D) Electroplating. *(Karnataka Entrance, 1992, 1989)*

PART II. THOUGHT-BASED QUESTIONS

34. An alternating current is given by
$$I = I_1 \sin \omega t + I_2 \cos \omega t.$$
The r.m.s. value of the current is given by
(A) $(I_1 + I_2)/\sqrt{2}$ (B) $(I_1 + I_2)/2$
(C) $\sqrt{I_1^2 + I_2^2}/\sqrt{2}$ (D) $\sqrt{I_1^2 + I_2^2}/2$

35. In a.c. circuits, the a.c. meters measure
(A) r.m.s. values. (B) peak values.
(C) mean values. (D) mean square values.

36. Hot wire ammeters are used for measuring
(A) both a.c. and d.c. (B) only a.c.
(C) only d.c. (D) neither a.c. nor d.c.

37. In an electrical circuit carrying an alternating current, moving coil galvanometer cannot be used, because
(A) the net magnetic field is too high.
(B) the net magnetic field is zero.
(C) there is too much energy loss.
(D) the voltage is too high. *(Karnataka Entrance, 1987*

38. Ohm's law (E = I R)
(A) can never be applied to a.c.
(B) can be applied to a.c. in the same manner as to d.c.
(C) can be applied to a.c., but after replacing R by (impedance).
(D) none of the above.

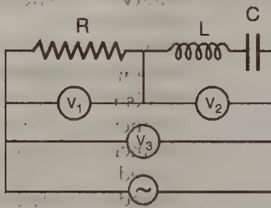
39. When 100 V d.c. is applied across a solenoid, a current o 1·0 A flows in it. When 100 V a.c. is applied across the sam coil, the current drops to 0·5 A . If the frequency of a. source is 50 Hz, the impedance and inductance of solenoi are
(A) 200 Ω and 0·55 H (B) 100 Ω and 0·86 H
(C) 200 Ω and 1·0 H (D) 100 Ω and 0·93 H.
(C.P.M.T. 1990

40. The reactance of an a.c. circuit is zero. Then, the circui contains
(A) an inductor, but no capacitor.
(B) a capacitor, but no inductor.
(C) both an inductor and a capacitor.
(D) neither an inductor nor a capacitor.

41. In a series resonant circuit, the a.c. voltage across resistanc R, inductance L and capacitance C are 5 V, 10 V and 10 respectively. The a.c. voltage applied to the circuit will be
(A) 20 V (B) 10 V
(C) 5 V (D) 25 V
(Karnataka Entrance, 1994

42. A wire of resistance R is connected in series with a inductor of reactance ωL. Then quality factor of LR-circui is
(A) $R/\omega L$ (B) $\omega L/R$
(C) $\frac{R}{\sqrt{R^2 + \omega^2 L^2}}$ (D) $\frac{\omega L}{\sqrt{R^2 + \omega^2 L^2}}$ *(C.B.S.E. 200*

43. A resistance R , an inductance L , a capacitance C an voltmeters V_1, V_2 and V_3 are connected to an alternatin source of e.m.f. as shown. When the frequency of th source is increased, then at resonant frequency, the readin of voltmeter V_3 is equal to
(A) that of V_1.
(B) that of V_2.
(C) both of V_1 and V_2.
(D) neither of V_1 nor of V_2.



44. An inductor is connected to an a.c. source of e.m.f. If th energy stored inside the inductor in the form of magneti field changes from maximum to minimum value in 5 m then the frequency of the source is
(A) 20 Hz (B) 50 Hz
(C) 200 Hz (D) 500 Hz

45. In a.c. circuit, the power is consumed only in
(A) inductance. (B) capacitance.
(C) resistance. (D) all the given above.

46. The current flowing in a coil is 3 A and the powe consumed is 108 W. If the a.c. source is of 120 V-50 Hz, th resistance in the circuit is
(A) 24 Ω (B) 36 Ω
(C) 12 Ω (D) 6 Ω *(A.F.M.C. 1998*

. For a series LCR-circuit, the power loss at resonance is

(A) $\dfrac{V^2}{\omega L - 1/\omega C}$ (B) $\dfrac{V^2}{\omega C}$

(C) $I^2 \omega C$ (D) $I^2 R$ (C.B.S.E. 2002)

. The power in a.c. circuit is given by

$$P = E_v I_v \cos\phi$$

The value of power factor cos ϕ in series LCR-circuit at resonance is

(A) zero (B) 1

(C) 1 / 2 (D) $1/\sqrt{2}$ (C.P.M.T. 1993)

49. Wattless current is possible, only in

(A) resistive circuit. (B) non-resistive circuit.

(C) LR-circuit. (D) LCR-circuit.

Chapter 4. Electrical machines and devices

RT I. TEXT-BASED QUESTIONS

. A transformer is used to change

(A) mechanical energy into electrical energy.

(B) electrical energy into mechanical energy.

(C) high voltage d.c. into low voltage d.c.

(D) high voltage a.c. into low voltage a.c.

(Karnataka Entrance, 1991)

. A transformer steps up or steps down

(A) a.c. only (B) d.c. only

(C) either a.c. or d.c. (D) a.c. mixed with d.c.

(Karnataka Entrance, 1988)

. The primary winding of a transformer has 500 turns, whereas its secondary has 5000 turns. The primary is connected to an a.c. supply 20 V-50 Hz. The secondary will have an output of

(A) 200 V-50 Hz (B) 200 V-500 Hz

(C) 2 V-50 Hz (D) 2 V-5 Hz

(C.B.S.E. 1997 ; A.F.M.C. 1995)

. A transformer has 200 windings in the primary and 400 windings in the secondary. The primary is connected to an a.c. supply of 110 V and a current of 10 A flows in it. The voltage across the secondary and the current in it respectively are

(A) 55 V, 20 A (B) 440 V, 5 A

(C) 220 V, 10 A (D) 220 V, 5 A

. A step-up transformer operates on a 230 V line and supplies a current of 2 A . The ratio of primary and secondary windings is 1 : 25. The primary current is

(A) 12·5 A (B) 50 A

(C) 8·8 A (D) 25 A

(C.B.S.E. 1998 ; A.I.I.M.S. 1989)

. A step-down transformer is used to reduce 220 V supply to 11 V. The primary draws 5 A of current, while the secondary 90 A. The efficiency of the transformer is

(A) 20% (B) 40%

(C) 70% (D) 90%

. The core used in transformers and other electromagnetic devices is laminated, so as

(A) to increase the magnetic field.

(B) to increase the magnetic flux.

(C) to reduce the magnetism in the core.

(D) to reduce eddy current losses in the core.

(N.C.E.R.T. 1984)

. Power is transmitted from a power station at a very high a.c. voltage, because

(A) the rate of transmission is faster at high voltage.

(B) it is more economical due to less power loss.

(C) power can not be generated at low voltage.

(D) theft of power is not possible at high voltage.

. In an induction coil, the coefficient of mutual inductance is 4 H. If the current of 5 A in the primary coil is cut off in 1/1500 s, the e.m.f. at the terminals of the secondary coil will be

(A) 15 kV (B) 60 kV

(C) 10 kV (D) 30 kV (N.C.E.R.T. 1984)

. In an induction coil, the secondary e.m.f. is :

(A) zero during break of the circuit.

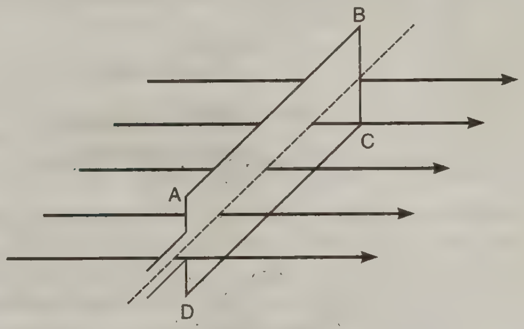
(B) very high during make of the circuit.

(C) zero during make of the circuit.

(D) very high during the break of the circuit.

(Karnataka Entrance, 1994)

11. A rectangular coil ABCD is rotated anticlockwise with a uniform angular velocity about the axis shown in the figure. The axis of rotation of the coil as well as the magnetic field B are horizontal. The induced e.m.f. in the coil would be maximum, when the plane of the coil



(A) is vertical.

(B) makes an angle of 45° with the magnetic field.

(C) is parallel to the magnetic field.

(D) makes an angle of 30° with the magnetic field.

(C.P.M.T. 1988)

12. A dynamo works on the principle of :

(A) electromagnetic induction.

(B) induced current. (C) induced magnetism.

(D) Faraday's effect. (A.F.M.C. 1998)

13. Split ring commutators are used in which of the following ?

(A) a.c. dynamo (B) d.c. dynamo

(C) a.c. motor (D) In all the above.

14. If the speed of rotation of a dynamo is doubled, then the induced e.m.f. will

(A) become half. (B) become double.

(C) become four times. (D) remain unchanged.

(A.I.I.M.S. 1999)

15. A dynamo develops 0·5 ampere at 6 volt. The power produced is

(A) 3 watt (B) 12 watt

(C) 0·083 watt (D) none of these.

(Karnataka Entrance, 1992, 1990)

16. In a region of uniform magnetic induction $B = 10^{-2}$ T, a circular coil of radius 30 cm and resistance π^2 ohm is rotated about an axis, which is perpendicular to the direction of B and which forms a diameter of coil. If the coil rotates at 200 r.p.m., the amplitude of alternating current induced in the coil is

(A) $4\pi^2$ mA (B) 30 mA

(C) 6 mA (D) 200 mA (C.B.S.E. 1990)

17. A motor

(A) converts electrical energy into mechanical energy.

(B) converts mechanical energy into electrical energy.

(C) converts electrical energy into magnetic energy.
(D) produces mechanical energy.
(Karnataka Entrance, 1990)

18. **The device that does not work on the principle of mutual induction is :**
(A) induction coil. (B) motor.
(C) tesla coil. (D) transformer.
(Karnataka Entrance, 1994)

19. **As motion of an armature increases, back e.m.f.**
(A) increases. (B) decreases.
(C) remains the same.
(D) may increase or decrease, depending on the nature of the armature.

20. **Radio frequency choke is air-cored to**
(A) keep frequency low.
(B) keep frequency high.
(C) keep inductive reactance low.
(D) keep inductive reactance high.

21. **A coil and an electric bulb are connected in series with an a.c. source. On introducing a soft iron bar inside the coil, the intensity of the bulb will**
(A) increase. (B) decrease.
(C) fluctuate. (D) remain the same.

22. **A motor starter is a :**
(A) fixed resistance. (B) a variable resistance.
(C) variable inductance. (D) variable capacitor.

PART II. THOUGHT-BASED QUESTIONS

23. **The number of turns in the primary and the secondary coils of a transformer are 1000 and 3000 respectively. If 80 V a.c. is applied to the primary coil of a transformer, then the potential difference per turn of the secondary coil will be**
(A) 240 V (B) 2400 V
(C) 0·24 V (D) 0·08 V. *(C.P.M.T. 1990)*

24. **The magnitude of the e.m.f. across the secondary of a transformer does not depend upon**
(A) the magnitude of the e.m.f. applied across the primary.
(B) the number of turns in the primary.
(C) the number of turns in the secondary.
(D) the resistance of the primary and the secondary.

25. **Soft iron is used in many parts of electrical machines for**
(A) low hysteresis loss and low permeability.
(B) low hysteresis loss and high permeability.
(C) high hysteresis loss and low permeability.
(D) high hysteresis loss and high permeability.

26. **The essential difference between an a.c. dynamo and d.c. dynamo is that**
(A) a.c. dynamo has an electromagnet, but d.c. dynamo has a permanent magnet.
(B) a.c. dynamo has slip rings, but d.c. dynamo has commutators.
(C) a.c. dynamo has coil would on soft iron, but the coil in d.c. dynamo is wound on copper.
(D) a.c. dynamo generates much high voltage.

27. **A dynamo is sometimes said to generate electricity. It actually acts as a source of—**
(A) charge. (B) magnetism.
(C) e.m.f. (D) energy.

28. **As the speed of an electric fan increases, current**
(A) increases. (B) decreases.
(C) remains the same.
(D) becomes maximum, when speed is maximum.

LECTROMAGNETIC WAVES

Electromagnetic Waves

eems we have strong reason to conclude that light itself (including radiant heat, and
er radiations, if any) is an electromagnetic disturbance in the form of waves propaga-
through field according to electromagnetic laws." **– James Clerk Maxwell**

CHAPTER 1

Electromagnetic Waves

1.01 DISPLACEMENT CURRENT AND ORIGIN OF ELECTROMAGNETIC WAVES

The origin of electromagnetic waves is connected to the concept of ***displacement ent.***

When a capacitor is allowed to charge in an electric circuit [Fig. 1.01], the current s through the connecting wires. As the capacitor charges, charge accumulates ne two plates of the capacitor and as a result, a changing electric field is produced ss the gap between its two plates. If a small compass needle is placed in the gap veen the two plates of the capacitor, it shows deflection indicating the existence agnetic field. The conduction current* that flows through the connecting wires not pass across the gap between the two plates of the capacitor. However, xwell assumed the flow of current across the gap between the plates of the acitor also, so as to explain the existence of magnetic field between the plates. amed it as displacement current and attributed its origin to the varying electric d between the plates of the capacitor. Thus, according to Maxwell, the varying tric field across the plates of the capacitor gives rise to magnetic field.

Key point

The origin of displacement current is due to varying electric field between the two plates of a charged capacitor.

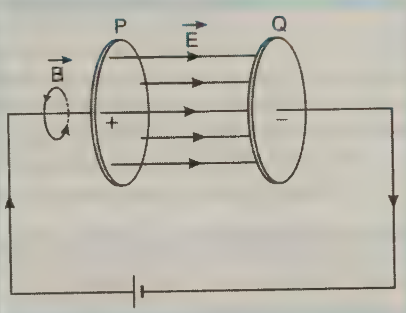

Fig. 1.01

Maxwell's concept of displacement current makes a continuous flow of current uch an electric circuit. Thus, through the connecting wires, there is flow of duction current I_C (no displacement current) and through the gap across the tes of the capacitor, there is flow of displacement current I_D (no conduction rent). In the light of this, Ampere's circuit law $\left(\oint \vec{B}\cdot\vec{dl}=\mu_0 I\right)$ was modified to

$$\oint \vec{B}\cdot\vec{dl}=\mu_0\,(I_C+I_D) \qquad \text{...(1.01)}$$

It is called ***modified Ampere's circuital law*** or ***Ampere-Maxwell's circuital law***.

The displacement current arising due to varying electric field is given by

$$I_D=\varepsilon_0\,\frac{d\phi_E}{dt} \qquad \text{...(1.02)}$$

In a circuit, the conduction current and the displacement currents are always ual. Therefore, modified Ampere-circuital law may be expressed as

$$\oint \vec{B}\cdot\vec{dl}=\mu_0\left(I_C+\varepsilon_0\,\frac{d\phi_E}{dt}\right) \qquad \text{...(1.03)}$$

Key point

When a capacitor is connected across a battery, through the connecting wires, there is flow of conduction current, while through the gap between the plates of capacitor, there is flow of displacement current.

The following inferences can be drawn from the above discussion :

1. *The conduction and displacement currents are individually discontinuous, **but the** o currents together possess the property of continuity through any closed electric circuit.*

2. *The displacement current is precisely equal to the conduction current, when **the two** present in different parts of the circuit.*

3. *The displacement current arises due to rate of change of electric flux (or electric field) ween the two plates of the capacitor.*

4. *Just as the conduction current is, the displacement current is also the source of gnetic field.*

The conduction current produces magnetic field due to charges in motion, nereas the displacement current produces magnetic field due to the time rate of ange of electric field. Thus, in the space between the plates of the capacitor, both e electric and magnetic fields exist. The time varying electric field between the

Key point

The conduction and displacement currents are entirely different from each other. However, displacement current produces magnetic field in the same manner, as the conduction current does.

---

* The current due to flow of charge is called conduction current.

plates of the capacitor is directed perpendicular to the plane of the plates and the time varying magnetic field produced by the electric field is along the perimeter of a circle in a plane parallel to the plates of the capacitor [Fig. 1.02]. Thus, the time varying electric field (E) and magnetic field (B) are perpendicular to each other.

The two mutually perpendicular time varying electric and magnetic fields may be represented by

$$E = E_0 \sin \omega (t - x/c) \quad ...(1.04)$$

and

$$B = B_0 \sin \omega (t - x/c) \quad ...(1.05)$$

respectively. The two fields combine to constitute electromagnetic wave, which propagates in space in a direction perpendicular to the directions of both the fields.

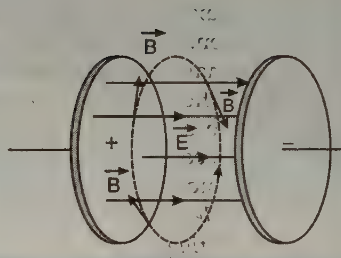

Fig. 1.02

1.02. MAXWELL'S EQUATIONS

In fact, while attempting to express the laws of electricity and magnetism, namely ***Gauss's law in electrostatics, Gauss's law in magnetism, Faraday's law of electromagnetic induction*** and ***Ampere's circuital law*** in terms of electric and magnetic fields and their sources, Maxwell noticed an inconsistency in Ampere's circuital law and an asymmetry in the laws of electromagnetism. The concept of displacement current removed the inconsistency in Ampere's circuital law and the laws of electromagnetism also became symmetrical. The above said four basic laws of physics were stated by Maxwell in the form of four equations, called ***Maxwell's equations***. These equations predict that the time and space dependent electric and magnetic fields propagate as transverse waves, called ***electromagnetic waves***, which possess velocity equal to that of light.

Key point

Maxwell's equations are mathematica formulation of Gauss's law in electrostatics, Gauss's law in magnetism, Faraday's law of electromagnetic inductio and Ampere's circuital law.

The four Maxwell's equations are as given below :

1. Gauss's law in electrostatics. It states that *the total electric flux through any closed surface is always equal to* $\frac{1}{\varepsilon_0}$ *times the net charge enclosed by the surface.*

Mathematically, $$\oint \vec{E} \cdot \vec{dl} = \frac{q}{\varepsilon_0} \quad ...(1.06)$$

The equation (1.06) is called ***Maxwell's first equation.***

2. Gauss's law in magnetism. It states that *the net magnetic flux crossing any closed surface is always zero.*

Mathematically, $$\oint \vec{B} \cdot \vec{dS} = 0 \quad ...(1.07)$$

A direct consequence of Gauss's law in magnetism is that an isolated magnetic monopole does not exist. The equation (1.07) is called ***Maxwell's second equation.***

3. Faraday's law of electromagnetic induction. It states that *the induced e.m.f. produced in a circuit is numerically equal to rate of change of magnetic flux through it.*

Mathematically, $$\varepsilon = -\frac{d\phi_B}{dt}$$

The negative sign indicates that the induced e.m.f. so produced opposes the rate of change of magnetic flux.

Since e.m.f. can be defined as the line integral of electric field, the above relation may be expressed as

$$\oint \vec{E} \cdot \vec{dl} = -\frac{d\phi_B}{dt} \quad ...(1.08)$$

In this form, the law states that *the line integral of electric field along a closed path is equal to rate of change of magnetic flux through the surface bounded by that closed path.*

The equation (1.08) is called ***Maxwell's third equation.***

4. Maxwell-Ampere's circuital law. It states that *the line integral of magnetic field along a closed path is equal to* μ_0 *times the total current (sum of conduction and displacement currents) threading the surface bounded by that closed path.*

Mathematically, $$\oint \vec{B} \cdot \vec{dl} = \mu_0 \left(I_C + \varepsilon_0 \frac{d\phi_E}{dt} \right) \quad ...(1.09)$$

The equation (1.09) is called ***Maxwell's fourth equation.***

1.03. ELECTROMAGNETIC WAVES

Maxwell gave the idea of electromagnetic waves, while Hertz and other scientists produced and studied these waves experimentally. The following is a brief account of the history of electromagnetic waves :

In 1865, Maxwell predicted the existence of electromagnetic waves on the basis hese equation. According to him, an accelerated charge produces a sinusoidal* e varying magnetic field, which in turn produces a sinusoidal time varying ctric field. The two fields so produced are mutually perpendicular and are rces of each other. The mutually perpendicular time varying electric and gnetic fields constitute electromagnetic waves, which propagate in space in a ection perpendicular to the directions of both the fields.

Thus, *the electromagnetic waves consist of sinusoidally time varying electric and gnetic fields acting at right angles to each other as well as at right angles to the direction ropagation of waves.*

Key point

Electromagnetic waves are transverse in nature.

The velocity of electromagnetic in free space is given by

$$c = \frac{1}{\sqrt{\mu_0 \, \varepsilon_0}} \qquad \text{...(1.10)}$$

ere μ_0 (= $1{\cdot}257 \times 10^{-6}$ T m A^{-1}) and ε_0 (= $8{\cdot}854 \times 10^{-12}$ C^2 N^{-1} m^{-2}) are resctively the absolute permeability and absolute permittivity of the free space. The ocity of electromagnetic waves in free space (vacuum) is equal to velocity of ht in vacuum *i.e.* 3×10^8 m s^{-1}.

1.04. PROPERTIES OF ELECTROMAGNETICWAVES

A few important properties of electromagnetic waves are as given below :

1. Electromagnetic waves propagate in the form of varying electric and gnetic fields, such that the two fields are perpendicular to each other and also the direction of propagation of the wave. In other words, electromagnetic waves transverse in nature.

2. Electromagnetic waves are produced by accelerated charges.

3. Electromagnetic waves do not require any material medium for their opagation.

4. In free space, electromagnetic waves travel with a velocity,

$$c = \frac{1}{\sqrt{\mu_0 \, \varepsilon_0}} = 3 \times 10^8 \text{ m s}^{-1}$$

with a velocity equal to that of light in free space.

In a material medium , velocity of electromagnetic waves is given by

$$v = \frac{1}{\sqrt{\mu \, \varepsilon}},$$

here μ and ε are absolute permeability and absolute permittivity of that medium.

Key point

The frequency of electromagnetic waves is its inherent characteristic. When an electromagnetic wave travels from one medium to another, its wavelength changes but frequency remains unchanged.

5. The electromagnetic waves obey the principle of superposition.

6. The variations in the amplitudes of electric and magnetic fields in the ectromagnetic waves always take place at the same time and at the same point in e space. Thus, the ratio of the amplitudes of electric and magnetic fields is always nstant and it is equal to velocity of the electromagnetic waves. Mathematically,

$$\frac{E}{B} = c$$

7. The energy in electromagnetic waves is divided equally between the electric nd magnetic field vectors.

8. The electric vector is responsible for optical effects due to an electromagnetic ave. For this reason, electric vector is called ***light vector.***

1.05. TRANSVERSE NATURE OF ELECTROMAGNETICWAVES

The electromagnetic waves consists of sinusoidally time varying electric and agnetic fields acting at right angles to each other as well as at right angles to the irection of propagation of waves. The two mutually perpendicular time varying lectric and magnetic fields may be represented by

$$E = E_0 \sin \omega \, (t - x/c)$$

and

$$B = B_0 \sin \omega \, (t - x/c)$$

espectively. The two fields combine to constitute electromagnetic wave, which ropagate in space in a direction perpendicular to the directions of both the fields.

Key point

The ratio ω/c gives the magnitude of propagation vector for an electromagnetic wave.

---

* Sine function of time.

Fig. 1.03 shows the propagation of a plane electromagnetic wave with velocity c along X-axis. The electric field vector is along Y-axis, while the magnetic field vector along Z-axis. Since the electric and magnetic fields are perpendicular to each other and to the dirction of wave propagation, the electromagnetic waves are transverse in nature.

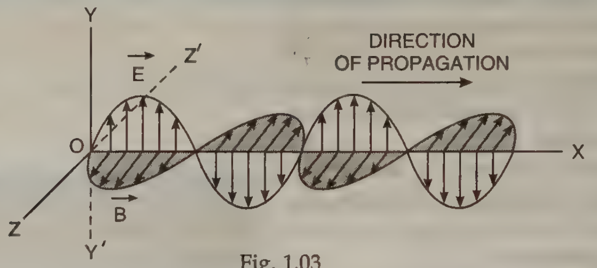

Fig. 1.03

Key point

The direction of propagation of an electromagnetic wave is given by the cross product of electric field and magnetic field vectors *i.e.* by $\vec{E} \times \vec{B}$.

As said earlier, the velocity of electromagnetic waves in free space (vacuum) is given by

$$c = \frac{1}{\sqrt{\mu_0 \, \varepsilon_0}}$$

The velocity of electromagnetic waves is also given as the ratio of the amplitudes of the time varying electric and magnetic fields *i.e.*

$$c = \frac{E_0}{B_0} \qquad ...(1.11)$$

1.06. ELECTROMAGNETIC SPECTRUM

Hertz and other scientists proved that it is possible to produce electromagnetic waves of wavelengths ranging from several kilometres to 6×10^{-3} m. The visible light is found to be electromagnetic waves of very short wave length produced by atoms and molecules, which behave as natural oscillators. By the end of last century, electromagnetic radiation ranging from several kilometres to 6 mm and from 10^{-6} m (infra-red) to 10^{-8} m (ultra-violet) became known. Then, X-rays were discovered, which were found to be electromagnetic waves of even shorter wavelength. The study of radioactive phenomenon led to the discovery of γ-rays, which are electro-magnetic waves of wavelength even shorter than X-rays. Then, originally existing gaps in the electromagnetic spectrum got filled on the production of corresponding electromagnetic waves experimentally.

Key point

All the types of electromagnetic waves travel with the same speed in free space.

The orderly distribution of electromagnetic waves (according to wavelength or frequency) in the form of distinct groups having widely differing properties is called electromagnetic spectrum.

Main parts of electromagnetic spectrum. The electromagnetic spectrum may be divided into the following main parts :

1. γ-rays. These waves are of nuclear origin and range from 3×10^{19} to 5×10^{20} Hz. γ-rays are highly energetic radiations and are mainly emitted by radioactive substances.

2. X-rays. X-rays were discovered by the German physicist W. Rontgen. These rays are of atomic origin and are produced, when a target of an element having high atomic number is bombarded by fast moving electrons. X-rays have frequencies in the range 10^{16} to 3×10^{19} Hz. X-rays possess a high penetrating power.

3. Ultra-violet rays. Ultra-violet rays were discovered by Ritter in 1801. The ultra-violet rays are part of solar spectrum. They can be produced by the arcs of mercury and iron. They can also be obtained by passing discharge through hydrogen and xenon. The frequency of ultra-violet rays lies in the range of 8×10^{14} to 10^{16} Hz.

4. Visible light. It forms a very narrow part of the electromagnetic spectrum and its frequency ranges from 4×10^{14} to 8×10^{14} Hz. The visible light is emitted due to the atomic excitation. Human eye is sensitive to only visible part of the electromagnetic spectrum.

5. Infra-red rays. Infra-red rays were discovered by Herschell. Infra-red rays are heat radiation and therefore all hot bodies are the sources of infra-red rays. About 60% of the solar radiation is infra-red in nature. The frequency range of infra-red rays is $10^{13} - 4 \times 10^{14}$ Hz.

6. Microwaves. The microwaves are produced by oscillating electronic circuits. e frequency of microwaves lies between $10^{19} - 3 \times 10^{11}$ Hz. The microwaves are ed in radar and other communication systems.

7. Radiowaves. Like microwaves, radiowaves are also produced by oscillating ctronic circuits. The frequency of radiowaves varies from a few Hz to 10^{19} Hz. e radiowaves are used as carrier waves in radio broadcasting and TV nsmission.

Electromagnetic waves are classified according to the type of the excitation. erlapping in certain parts of the spectrum means that the corresponding wavegths can be produced by two methods. For example, 10^{-4} m waves can be oduced both with the help of an artificial oscillator and in the process of thermal diation. It may be pointed out that the physical properties of electromagnetic ves are determined by the wavelength and not by the method of their excitation. e following table gives a brief account of the electromagnetic spectrum :

Electromagnetic Spectrum

ame	Frequency range (Hz)	Wavelength range (m)	How produced
-rays	3×10^9 to 5×10^{20}	6×10^{-13} to 10^{-10}	Nuclei of atoms.
-rays	10^{16} to 3×10^{19}	10^{-10} to 3×10^{-8}	Bombardment of high Z target by electrons.
ltra-Violet rays (UV)	8×10^{14} to 10^{16}	3×10^{-8} to 4×10^{-7}	Excitation of atoms and spark.
isible light	4×10^{14} to 8×10^{14}	4×10^{-7} to 8×10^{-7}	Excitation of atoms, spark and arc flame.
nfra-Red rays (IR)	10^{12} to 4×10^{14}	8×10^{-7} to 3×10^{-4}	Excitation of atoms and molecules.
icrowaves	5×10^9 to 10^{12}	3×10^{-4} to 6×10^{-2}	Oscillating currents in special vacuum tubes.
adiowaves	3×10^3 to 3×10^{11}	10^{-3} to 10^5	Oscillating circuits.

Human eye is sensitive to only visible part of the electromagnetic spectrum. ifferent types of detectors are used to detect and study the different parts of the ectrum.

The following table gives the wavelength range of different colours of visible ght :

Visible Spectrum

Colour	Wavelength (m)	Colour	Wavelength (m)
Violet	$3{\cdot}9 \times 10^{-7}$ to $4{\cdot}5 \times 10^{-7}$	Yellow	$5{\cdot}7 \times 10^{-7}$ to $5{\cdot}9 \times 10^{-7}$
Blue	$4{\cdot}5 \times 10^{-7}$ to 5×10^{-7}	Orange	$5{\cdot}9 \times 10^{-7}$ to $6{\cdot}2 \times 10^{-7}$
Green	5×10^{-7} to $5{\cdot}7 \times 10^{-7}$	Red	$6{\cdot}2 \times 10^{-7}$ to $7{\cdot}8 \times 10^{-7}$

1.07. RADIOWAVES AND MICROWAVES

Radiowaves are produced by oscillating electric circuits having an inductor nd a capacitor. Like radiowaves, microwaves are also produced by such electric rcuits. An oscillating circuit produces time varying magnetic field, which then roduces time varying electric field. The two time varying fields constitute adiowaves, which are basically electromagnetic waves. The microwaves have omparatively smaller wavelength range as compared to the radiowaves.

Properties. 1. Radiowaves and microwaves are electromagnetic waves and ravel with a speed of 3×10^8 m s^{-1}.

2. Radiowaves obey laws of reflection and refraction.

3. Radiowaves get diffracted from obstacles coming in their path. Since vavelength of radiowaves is quite large, the size of such obstacles should also be arge.

4. Microwaves produce heat, when absorbed by matter.

Applications. 1. Radiowaves are used for wireless communication purposes. hey are used to transmit radio and TV signals.

2. Radiowaves are used in radioastronomy.

3. Microwaves are used in radar systems.

4. Microwaves are used in long distance telephone communication systems.

5. Microwave ovens are used for cooking.

6. Microwaves are used in the study of atomic and molecular structure.

1.08 INFRA-RED RAYS

Infra-red rays were discovered by Herschell. Infra-red rays are heat radiation and therefore all hot bodies are the sources of infra-red rays. About 60% of the solar radiation is infra-red in nature. The following are a few sources to produce infra-red rays :

Watch out !

Short wavelength infra-red radiation is often called an infra-red light, though it cannot excite vision !

1. ***Nernst lamp.*** The filament of Nernst lamp is made from the mixture of zirconium, thorium and cerium. When a current is passed through such a filament, then at a temperature of about 1200 K , infra-red rays are emitted.

2. ***Globar.*** It is basically a rod of silicon carbide, which when heated to a temperature of about 900 K by passing current, produces infra-red rays.

3. ***LASER.*** It is used to produce monochromatic infra-red rays. For example, He – Ne LASER gives infra-red rays of wavelength $0{\cdot}69 \times 10^{-6}$ m , $1{\cdot}19 \times 10^{-6}$ m and $3{\cdot}39 \times 10^{-6}$ m. CO_2 LASER provides infra-red rays of wavelength $10{\cdot}6 \times 10^{-6}$ m.

To detect infra-red rays, thermocouples, thermopiles, bolometers, photoconducting cells are used.

Properties. 1. Infra-red rays are electromagnetic waves and travel with a speed of 3×10^8 m s^{-1}.

2. Infra-red rays obey laws of reflection and refraction.

3. Infra-red rays can produce interference and can be polarised.

4. When allowed to fall on matter, infra-red rays produce an increase in tempera-ture.

5. Infra-red rays affect a photographic plate.

6. When absorbed by molecules, the energy of infra-red rays gets converted into molecular vibrations.

7. They are scattered less as compared to the visible light by the atmosphere. Hence, infra-red rays can travel through longer distances through atmosphere under the conditions of smoke, fog, etc. Nitrogen and oxygen gases are found to be transparent medium to all the wavelengths of infra-red rays.

Applications. 1. Infra-red rays from the sun keep the earth warm and hence help to sustain life on earth.

2. The coal deposits in the interior of earth are the result of conversion of forest wood into coal due to infra-red rays.

3. Infra-red rays are used in solar water heaters and cookers.

4. Infra-red rays photographs are used for weather forecasting.

5. Infra-red rays are used for taking photographs during the conditions of fog, smoke, etc.

6. Infra-red rays absorption spectra is used in the study of molecular structure and then to check the purity of the chemicals.

7. Infra-red rays are used for producing dehydrated fruits.

8. Infra-red rays are used to provide electrical energy to satellites by using solar cells.

9. Infra-red rays are used to treat muscular strains.

1.09. ULTRA-VIOLET RAYS

Ultra-violet rays were discovered by Ritter in 1801. The ultra- violet rays are part of solar spectrum. They can be produced by the arcs of mercury and iron. They can also be obtained by passing discharge through hydrogen and xenon.

Properties. 1. Ultra-violet rays are electromagnetic waves and travel with the speed of 3×10^8 m s^{-1}.

2. They also obey the laws of reflection and refraction.

3. They can also undergo interference and can be polarised.

4. When allowed to fall on metals, they cause the emission of photoelectrons.

5. They can affect a photographic plate.

6. Ultra-violet rays can cause flourescence in certain materials.

7. Ultra-violet rays can not pass through glass but quartz, fluorite and rock salt are transparent to them.

8. Ultra-violet rays possess the property of synthesizing vitamin D, when the skin is exposed to the sunlight.

Applications. 1. Ultra-violet rays are used for checking the mineral samples by making use of its property of causing flourescence.

2. Ultra-violet absorption spectra is used in the study of molecular structure.

3. Ultra-violet rays destroy bacteria and hence it is used for sterilizing surgical ruments.

4. As ultra-violet rays can cause photoelectric effect, they are used in burglars m.

1.10. X-RAYS

The discovery of X-rays was accidentally made by a German professor Rontgen 895. In laboratory, X-rays can be produced by using Coolidge X-ray tube.

Properties. X-rays have the following properties :

1. X-rays are electromagnetic waves of very short wavelength ranging from Å to 10 Å.

2. X-rays travel in vacuum with the speed of light $(3 \times 10^8 \text{ m s}^{-1})$, as they are electromagnetic waves.

3. They are not deviated by electric and magnetic fields.

4. They affect the photographic plate very intensely.

5. They ionise the gas through which they pass.

6. They cause fluorescence in substances like zinc sulphide, barium platino-nide, calcium tungstate, etc.

7. Like light, X-rays can also cause photoelectric effect.

8. They travel in straight line and while doing so, they cast the shadows of the ects falling in their path.

9. X-rays can undergo reflection, refraction, interference, diffraction and larisation.

10. X-rays can penetrate the materials that are opaque to visible or ultra-violet ht. They can easily pass through paper, thin sheet of metals, wood, flesh, etc, but ey cannot penetrate denser objects such as bones, heavy metals, etc.

11. They have injurious effect on human bodies. Exposure of human body to rays causes reddening of the skin. The long exposures result into surface sores.

12. When X-rays fall on certain metals, secondary X-rays are produced, which e characteristic of the metal. The secondary X- rays are accompanied by fast oving electrons.

Applications. X-rays have been found to be of great use in variety of fields as ted below :

1. ***Surgery.*** X-rays are used in surgery for the detection of fractures, diseased gans, foreign matter like bullets and formation of bones or stones in the human ody and observing the progress of healing bones. They are also used to diagnose e diseases.

2. ***Radiotherapy.*** Controlled X-ray exposures are used to cure untractable skin iseases and malignant growths. Soft X-rays are used, if the affected parts are uperficial, while hard X-rays are used for deep seated organs.

3. ***Engineering.*** X-rays are used in engineering for detecting faults, cracks, flaws nd gas pockets in finished metal products. They are used for the testing of weldings, astings and moulds. They are also used to detect cracks in the engines of cars and eroplanes.

4. ***Detective departments.*** They are used by detective departments for detection f explosives, opium and other contraband goods and are used by custom epartment for detecting gold and silver in the body of smugglers. They are also sed in mints, where coins are made. They are also used for distinguishing real iamonds, gems, etc from artificial ones.

5. ***Industry.*** X-rays are used in industry for detecting the pearls in oysters, for esting the uniformity of insulating materials and homogeneity of timber. They are lso used to examine the defect in rubber tyres, golf and tennis balls, wood, etc.

6. ***Scientific research.*** X-rays have been used in investigating the structures of rystals, constitution and properties of atoms and arrangement of atoms and nolecules in the complex substance.

In addition to the above mentioned uses, X-rays are also used in detecting hange in old oil paintings.

1.11. GAMMA RAYS

Gamma rays were discovered by Rutherford. They are emitted from the nuclei of some radioactive elements and are electromagnetic waves of very short wave length. Gamma rays can be detected with Geiger Counter.

Properties. 1. γ-rays are electromagnetic waves and have velocity equal to that of light.

2. γ-rays are highly penetrating. They can penetrate through several centimetres thick iron and lead blocks.

3. They have got small ionising power.

4. They can produce fluorescence in a substance like willemite.

5. They can affect a photographic plate.

6. γ-rays are not deflected by electric and magnetic fields.

7. γ-rays knock out electrons from the surface on which they fall.

8. γ-rays produce heating effect in the surface exposed to them.

Applications. 1. γ-rays are used in ***radiotherapy***. In hospitals, γ-rays are used to treat cancer and tumours.

2. In food industry, soft γ-rays are used to kill microorganisms. It helps to preserve the foodstuffs for a prolonged time.

3. γ-rays are used to produce nuclear reactions.

1.12. PROPAGATION OF ELECTROMAGNETIC WAVES IN ATMOSPHERE

The sun is main source of electromagnetic radiation and it sends out electromagnetic waves of different wavelengths towards the earth. As the electromagnetic waves propagate through the earth's atmosphere, a major part of it is absorbed by the atmosphere. Most of the infra-red radiation is absorbed by the atmosphere and the atmosphere gets heated. The visible light is only slightly absorbed. The electromagnetic radiation from the sun is quite rich in ultra-violet radiation. Owing to its small wavelength (high energy), ultra-violet radiation is harmful to plants and living cells. However, the ozone layer absorbs most of the ultra-violet radiation and other harmful radiations of lower wavelengths. The ozone layer converts the ultra-violet radiation to infra-red, which further heats up the atmosphere and the earth's surface.

1.13. GREEN HOUSE EFFECT

The sun is source of energy. It emits energy in the form of visible light, infra-red and ultra-violet radiations. The behaviour of atmosphere is different towards different types of radiations. Whereas the ultra violet radiation and other low wavelength waves are absorbed by the ozone layer, a large part of the infra-red radiation is not allowed by the atmosphere to pass through it. The earth's atmosphere is transparent to visible light. Therefore, only visible light and a part of infra-red radiations reach the earth's surface. These radiations keep the earth's surface warm even at night due to the green house effect of the atmosphere, as explained below :

The earth gets heated to only a low temperature due to the solar energy reaching its surface. At such a low temperature, the energy emitted from the earth lies mostly in the infra-red region. Since earth's atmosphere is not transparent to infra-red radiations, these radiations are reflected back. The low lying clouds and heavy gases like CO_2 present in the atmosphere reflect infra-red radiation back towards the earth's surface. Due to this, the earth's atmosphere becomes richer in infra-red radiation. As this radiation is absorbed by the objects readily, they get heated in this process. This phenomenon is called the ***green house effect.***

It may be pointed out that the ultra-violet radiation and other low wavelength waves coming from sun and stars are absorbed by ozone layer. Had ozone layer not absorbed them, these radiations would have proved damaging to plants and living cells.

Key point ✓

The ozone layer absorbs the ultra-violet rays from the sun and thus prevents them from producing harmful effect on living organisms on the earth. Further, it traps the infra-red rays and prevents them from escaping the surface of earth. It helps to keep the earth's atmosphere warm.

SOLVED NUMERICAL PROBLEMS

TYPE A. On Speed, Frequency and Wavelength of Electromagnetic Waves

Problem 1.01. Green light of mercury has a wavelength $5{\cdot}5 \times 10^{-5}$ cm. (*a*) What is the frequency in MHz and period in μs in vacuum ? (*b*) What is the wavelength in glass, if refractive index of glass is 1·5 ? Given, $c = 3 \times 10^8$ m s^{-1}.

(Text Problem)

Sol. Here, wavelength, $\lambda = 5{\cdot}5 \times 10^{-5}$ cm $= 5{\cdot}5 \times 10^{-7}$ m

velocity of light, $c = 3 \times 10^8$ m s^{-1}

(*a*) If ν is the frequency, then

$$\nu = \frac{c}{\lambda} = \frac{3 \times 10^8}{5{\cdot}5 \times 10^{-7}}\ \text{Hz} = \frac{3 \times 10^8}{5{\cdot}5 \times 10^{-7} \times 10^6}$$

$$= \mathbf{5{\cdot}45 \times 10^8\ MHz}$$

$$\text{Time period, } T = \frac{1}{\nu} = \frac{\lambda}{c} = \frac{5{\cdot}5 \times 10^{-7}}{3 \times 10^8} = 1{\cdot}8 \times 10^{-15}\ \text{s}$$

$$= 1{\cdot}8 \times 10^{-15} \times 10^6 = \mathbf{1{\cdot}8 \times 10^{-19}\ \mu s}$$

(*b*) Now, refractive index,

$$\mu = \frac{\text{velocity of light in vacuum}}{\text{velocity of light in glass}} = \frac{c}{v}$$

Therefore, velocity of light in glass,

$$v = \frac{c}{\mu} = \frac{3 \times 10^8}{1.5} = 2 \times 10^8 \text{ m s}^{-1}$$

The wavelength of light in glass,

$$\lambda' = \frac{v}{\nu} = v \cdot \mathrm{T} \qquad \left(\because \nu = \frac{1}{\mathrm{T}}\right)$$

$$= 2 \times 10^8 \times 1.8 \times 10^{-15}$$

$$= \mathbf{3.6 \times 10^{-7}\ m}$$

Note. The, wavelength of light in glass can also be determined by using the releation, $\lambda' = \dfrac{\lambda}{\mu}$

Problem 1.02. Electromagnetic waves travel in a medium with a speed of 2×10^8 m s^{-1}. The relative permeability of the medium is 1. Find the relative permittivity.

Sol. Here, $v = 2 \times 10^8$ m s^{-1} and $\mu_r = 1$

The speed of electromagnetic waves in a medium is given by

$$v = \frac{1}{\sqrt{\mu\,\varepsilon}}, \qquad \text{...}(i)$$

where μ and ε are absolute permeability and absolute permittivity of the medium.

Now, $\mu = \mu_0\,\mu_r$ and $\varepsilon = \varepsilon_0\,\varepsilon_r$

Therefore, equation (*i*) becomes

$$v = \frac{1}{\sqrt{\mu_0\ \mu_r \times \varepsilon_0\ \varepsilon_r}} = \frac{1}{\sqrt{\mu_0\ \varepsilon_0}} \times \frac{1}{\sqrt{\mu_r \varepsilon_r}} = \frac{c}{\sqrt{\mu_r \varepsilon_r}}$$

$$\text{or} \quad \varepsilon_r = \frac{c^2}{v^2\ \mu_r} = \frac{(3 \times 10^8)^2}{(2 \times 10^8)^2 \times 1} = 2.25$$

Problem 1.03. The electric field of a plane electromagnetic wave in vacuum is represented by

$$\mathbf{E_x = 0,\ E_y = 0.5 \cos\,[2\,\pi \times 10^8\,(t - x/c)]}$$

and $\quad \mathrm{E}_z = 0$.

(*a*) What is the direction of propagation of electromagnetic waves ?

(*b*) Determine the wavelength of the wave.

(*c*) Compute the component of associated magnetic field. (*C.B.S.E. 1992*)

Sol. (*a*) The equation :

$$\mathrm{E}_y = 0.5 \cos\,[2\,\pi \times 10^8\,(t - x/c)] \qquad \text{...}(i)$$

indicates that the electromagnetic waves are propagating along the **positive direction of X-axis.**

(*b*) Comparing the equation (*i*) with the equation in standard form *i.e.*

$$\mathrm{E}_y = \mathrm{E}_0 \cos \omega\,(t - x/c)$$

we have

$$\omega = 2\,\pi \times 10^8 \quad \text{or} \quad 2\,\pi\,\nu = 2\,\pi \times 10^8 \quad \text{or} \quad \nu = 10^8 \text{ s}^{-1}$$

$$\text{Now,} \quad \lambda = \frac{c}{\nu} = \frac{3 \times 10^8}{10^8} = \mathbf{3\ m}$$

(*c*) The associated magnetic field is perpendicular to both the electric field and the direction of propagation. Since wave is propagating along X-axis and electric field is along Y-axis, magnetic field must be along Z-axis. Hence, the components of associated magnetic field are

$$\mathbf{B_x = 0, \quad B_y = 0}$$

$$\text{and} \quad \mathrm{B}_z = \mathrm{B}_0 \cos\,[2\,\pi \times 10^8\,(t - x/c)]$$

$$= \frac{\mathrm{E}_0}{c} \cos\,[2\,\pi \times 10^8\,(t - x/c)]$$

$$\text{or} \quad \mathbf{B_z = \frac{0.5}{3 \times 10^8} \cos\,[2\,\pi \times 10^8\,(t - x/c)]}$$

abc TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 1.04. A plane electromagnetic wave propagating in the X-direction has a wavelength of 6 mm. The electric field is in the Y-direction and its maximum magnitude is 33 V m^{-1}. Write suitable equations for the electric and magnetic fields as a function of *x* and *t*. (*Text Problem*)

Sol. For the electromagnetic wave propagating along X-direction, electric and magnetic fields will be along Y-direction and Z-direction and are given by

$$\mathrm{E}_y = \mathrm{E}_0 \sin \omega\,(t - x/c)$$

$$\text{and} \quad \mathrm{B}_z = \mathrm{B}_0 \sin \omega\,(t - x/c)$$

$$\text{Here,} \quad \lambda = 6 \text{ mm} = 6 \times 10^{-3} \text{ m} \quad \text{and} \quad \mathrm{E}_0 = 33 \text{ V m}^{-1}$$

$$\text{Now,} \quad \omega = 2\,\pi\,\nu = \frac{2\,\pi\,c}{\lambda} = \frac{2\,\pi \times 3 \times 10^8}{6 \times 10^{-3}} = \pi \times 10^{11} \text{ rad s}^{-1}$$

$$\text{and} \quad \mathrm{B}_0 = \frac{\mathrm{E}_0}{c} = \frac{33}{3 \times 10^8} = 1.1 \times 10^{-7}\ \mathrm{T}$$

Hence, $\mathbf{E_y = 33 \sin \pi \times 10^{11}\,(t - x/c)}$

and $\mathbf{B_z = 1.1 \times 10^{-7} \sin \pi \times 10^{11}\,(t - x/c)}$

Problem 1.05. Find the amplitude of the electric field in a parallel beam of light of intensity 8 W m^{-2}.

Sol. The intensity of a plane electromagnetic wave is given by

$$\mathrm{I} = \frac{1}{2}\,\varepsilon_0\,\mathrm{E}_0^{\,2}\,c$$

$$\text{or} \quad \mathrm{E}_0 = \sqrt{\frac{2\mathrm{I}}{\varepsilon_0\,c}} = \sqrt{\frac{2 \times 8}{8.85 \times 10^{-12} \times 3 \times 10^8}} = \mathbf{77.6\ N\ C^{-1}}$$

Problem 1.06. The wave emitted by any atom or molecule must have some finite total length. For sodium light, this length (called coherence length) is 2.4 cm. Deduce (*i*) the number of oscillations in this length (*ii*) the coherence time. Given, $\lambda = 5.9 \times 10^{-7}$ cm, $c = 3.0 \times 10^8$ m s^{-1}. (*Text Problem*)

Sol. Here, the coherence length, $l = 2.4$ cm $= 0.024$ m

wavelength, $\lambda = 5.9 \times 10^{-7}$ cm $= 5.9 \times 10^{-9}$ m

(*i*) Therefore, the number of oscillations in coherence length *l* is given by

$$\nu = \frac{l}{\lambda} = \frac{0.024}{5.9 \times 10^{-9}} = \mathbf{4.068 \times 10^6\ Hz}$$

(*ii*) The coherence time,

$$t = \frac{l}{c} = \frac{0.024}{3 \times 10^8} = \mathbf{8 \times 10^{-11}\ s}$$

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. Is displacement current, like conduction current, a source of magnetic field ?

Ans. Yes, the displacement current is also a source of magnetic field like the conduction current.

Q. 1.02. The charging current for a capacitor is 0·25 A. What is the displacement current across its plates ? *(C.B.S.E. 1996)*

Ans. The displacement current is always equal to conduction current and therefore it is also equal to 0·25 A.

Q. 1.03. State modified Ampere's circuital law.

Ans. The modified Ampere's circuital law states that

$$\oint \vec{B} \cdot \vec{dl} = \mu_0 (I_C + I_D) = \mu_0 \left(I_C + \varepsilon_0 \frac{d\phi_E}{dt} \right)$$

Here, the letters have their usual meanings.

Q. 1.04. Write down Maxwell's equation for steady electric field. *(H.S.S.C.E. 1993)*

Ans. Maxwell's equation for steady electric field are

(*i*) $\oint \vec{E} \cdot \vec{dS} = \frac{q}{\varepsilon_0}$ (*ii*) $\oint \vec{E} \cdot \vec{dl} = 0$

Q. 1.05. What are electromagnetic waves ?

Ans. *The transverse time varying electric and magnetic fields propagating in space in a direction perpendicular to the directions of both the electric and magnetic fields are said to constitute electromagnetic waves.*

Q. 1.06. Write an expression for speed of electromagnetic waves in free space. *(H.S.S.C.E. 1998)*

Ans. The speed of electromagnetic waves in free space is given by

$$c = \frac{1}{\sqrt{\mu_0 \, \varepsilon_0}}$$

Q. 1.07. Write the relationship between amplitudes of electric and magnetic fields in free space for an electromagnetic wave. *(C.B.S.E. 1995, 1994)*

Ans. The amplitudes of the electric and magnetic fields in free space are related by $E/B = c$, where c is speed of electromagnetic waves in free space.

Q. 1.08. Give the ratio of velocities of light rays of wavelengths 4000 Å and 8000 Å in vacuum. *(C.B.S.E. 1997)*

Ans. Velocity of light rays of different wavelength in vacuum is same and hence the ratio of their velocities is 1.

Q. 1.09. The wavelength of electromagnetic radiation is doubled. What will happen to the energy of the photon ? *(C.B.S.E. 1993)*

Ans. The frequency and hence energy will become half, when the wavelength of the electromagnetic radiation is doubled.

Q. 1.10. State the properties of electromagnetic waves. *(P.S.S.C.E. 2002)*

Ans. Refer to section 1.04.

Q. 1.11. What is electromagnetic spectrum ? *(H.S.S.C.E. 1997)*

Ans. *The orderly distribution of electromagnetic waves in the form of distinct groups having widely differing properties is called electromagnetic spectrum.*

Q. 1.12. Name the main parts of electromagnetic spectrum.

Ans. Gamma rays, X-rays, ultra-violet rays, visible light, infra-red rays, heat radiations, microwaves, radio waves.

Q. 1.13. Which of the following belong to the electromagnetic spectrum :

α-rays, β-rays, γ-rays, cathode rays, X-ray, ultra-violet rays, microwaves, ultrasonic waves, radiowaves, infra-red rays ? Arrange them in order of increasing frequency. *(I.S.C.E. 1995)*

Ans. The following belong to electromagnetic spectrum and are arranged in order of increasing frequency :

Radiowaves, microwaves, infra-red rays, ultra-violet rays, X-rays and γ-rays.

Q. 1.14. Name any six electromagnetic waves in increasing order of their frequencies. *(H.S.S.C.E. 2002)*

Ans. Radiowaves, infra-red rays, visible light, ultra-violet rays, X-rays and γ-rays.

Q. 1.15. Arrange the given electromagnetic radiations in the descending order of their frequencies : Infra-red, X-rays, ultra-violet and gamma rays. *(C.B.S.E. 2002)*

Ans. Gamma rays, X-rays, ultra-violet and infra-red.

Q. 1.16. Write the following radiations in an ascending order in respect of their frequencies : X-rays, microwaves, ultra-violet rays and radiowaves. *(C.B.S.E. 1998)*

Ans. Radiowaves, microwaves, ultra-violet rays and X-rays.

Q. 1.17. Rewrite the following radiations in a descending order of wavelength values : Infra-red rays, radiowaves, γ-rays, microwaves. *(C.B.S.E. 1998)*

Ans. Radio waves, microwaves, infra-red rays and γ-rays.

Q. 1.18. Write the following radiations in a descending order of frequencies : red light, X-rays, microwaves, radiowaves. *(C.B.S.E. 1998)*

Ans. X-rays, red light, microwaves and radiowaves.

Q. 1.19. Arrange the following radiations in the descending order of wavelength : X-ray, infra-red ray, red light, yellow light, radio waves. *(H.P.S.S.C.E. 1995)*

Ans. Radio waves, infra-red ray, red light, yellow light, γ-rays.

Q. 1.20. What is common between different types of e.m. radiations ?

Ans. All types of e.m. radiations are transverse in nature and travel with the same speed (= 3×10^8 m s^{-1}) in vacuum.

Q. 1.21. Which of the following has the lowest frequencies : microwaves, ultra-violet rays and X-rays ? *(C.B.S.E. 1996)*

Ans. Microwaves.

Q. 1.22. Write the frequency limit of visible range of electromagnetic spectrum in kHz. *(C.B.S.E. 1998, 1990)*

Or

What is the approximate range of visible spectrum ? *(H.S.S.C.E. 1999 S)*

Ans. The wavelength range of visible part of electromagnetic spectrum is 3900 Å to 7600 Å.

The corresponding frequency range of visible spectrum $\times 10^{14}$ Hz to $7{\cdot}7 \times 10^{14}$ Hz.

Q. 1.23. What is the ratio of speed of infra-red rays and ra-violet rays in vacuum ? (*C.B.S.E. 2001*)

Ans. It is 1.

Q. 1.24. What is the ratio of speed of gamma rays and diowaves in vacuum ? (*C.B.S.E. 2001*)

Ans. It is 1.

Q. 1.25. Radiowaves and gamma rays both are trans-rse in nature and electromagnetic in character and have the me speed in vacuum. In what respects are they different ? (*I.S.C.E. 1997*)

Ans. Radiowaves have atomic orgin, while the γ-rays are nuclear origin. Further, owing to their very small wave ngth, γ-rays are highly peneterating in comparison to diowaves.

Q. 1.26. What is the main difference between charac-ristic X- rays and γ-rays ? (*I.S.C.E. 1994*)

Ans. X-rays are emitted, when orbital electron jumps om some outer shell to the inner shell in case of an atom of heavy element (Z = high), while γ-rays are emitted by dioactive nuclei.

Q. 1.27. How does the frequency of a beam of ultra-iolet light change, when it goes from air into glass ? (*C.B.S.E. 2001*)

Ans. There is no effect on the frequency of ultraviolet light.

Q. 1.28. Why are microwaves used in RADAR ? (*C.B.S.E. 1999*)

Or

Which part of the electromagnetic spectrum is used in operating a RADAR ? (*C.B.S.E. 1996*)

Ans. Microwaves are e.m. waves of very short wavelength. Such waves are used in RADAR due to the reason that they can travel in a particular direction in the form of a beam.

Q. 1.29. Name the electromagnetic radiations used for viewing objects through haze and fog. (*H.S.S.C.E. 1997*)

Ans. Infra-red rays.

Q. 1.30. State two applications of X-rays. (*P.S.S.C.E. 2002*)

Ans. Refer to section 1.10.

Q. 1.31. The small ozone layer on the top of strato-sphere is crucial for human survival. Why ? (*P.S.S.C.E. 2000 ; H.P.S.S.C.E. 2000 ; C.B.S.E. 1996*)

Ans. The ultraviolet radiation from the sun is harmful to living cells and plants. The ozone layer absorbs ultraviolet radiation and prevents it from reaching the earth. It also keeps the earth warm by trapping infra-red radiation.

FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. What is Maxwell's displacement current ? (*H.S.S.C.E. 1994 ; C.B.S.E. 1994*)

Ans. The displacement current is produced, when in an lectric circuit (say across the plates of a charged capacitor), he electric field changes with time. Mathematically,

$$I_D = \varepsilon_0 \frac{d\phi_E}{dt}$$

Q. 1.02. A variable-frequency a.c. source is connected o a capacitor. Will the displacement current increase or decrease with increase in frequency ?

Ans. If we increase ω, the reactance of the capacitor will decrease and consequently conduction current will increase. Since displacement current is equal to conduction current, the displacement current will increase with increase in frequency of a.c. source.

Q. 1.03. Why is it that induced electric fields due to changing magnetic flux are more readily observable than the induced magnetic fields due to changing electric fields ?

Ans. The induced magnetic fields produced due to displacement currents are of magnitude too small to be observed. The effect can be increased by increasing the displacement current. For example, in an a.c. circuit, it can be increased by increasing ω. On the other hand, the induced electric fields due to changing magnetic flux can be easily increased by simply taking a coil of large turns and hence, it is readily observable.

Q. 1.04. What does an electromagnetic wave constist of ? On what factors does its velocity in vacuum depend ? (*P.S.S.C.E. 1994, 1992*)

Ans. An electromagnetic wave consists of electric and magnetic fields varying both in space and time. The two fields are perpendicular to each other and to the direction of propagation of wave. The velocity of electromagnetic wave in vacuum depends upon the values of its absolute permeability (μ_0) and permittivity (ε_0).

Q. 1.05. State the principle of production of e.m. waves. What is the value of velocity of these waves ? (*P.S.S.C.E. 1996*)

Ans. The accelerated charge produces electric and magnetic fields, which vary both in space and time. These varying electric and magnetic fields give rise to electromagnetic waves.

The velocity of e.m. waves in free space is 3×10^8 m s^{-1}.

Q. 1.06. State any four properties of electromagnetic waves. (*P.S.S.C.E. 2000, 1999, 1997, 1996 S ; C.B.S.E. 1995*)

Ans. The e.m. spectrum consists of a number of distinct parts. But the radiations from all the parts possess the following common properties :

1. They are transverse in nature.

2. They do not require any material medium for propagation.

3. They travel with the same speed of 3×10^8 m s^{-1} in vacuum.

4. They consist of mutually transverse varying electric and magnetic fields.

Q. 1.07. What is the wave length of a television station, which transmits vision on 500 MHz ? Given $c = 3 \times 10^8$ m s^{-1}. (*I.S.C.E. 1993*)

Ans. Here, $\nu = 500$ MHz $= 500 \times 10^6$ Hz ; $c = 3 \times 10^8$ m s^{-1}

Now,
$$\lambda = \frac{c}{\nu} = \frac{3 \times 10^8}{500 \times 10^6} = 0{\cdot}8 \text{ m}$$

Q. 1.08. Why can light travel in vacuum, whereas sound can not do so ?

Ans. Light waves are electromagnetic in nature. They do not require a material medium for propagation and can travel in vacuum. On the other hand, sound waves require a material medium for propagation. They are mechanical waves and cannot travel in vacuum.

Q. 1.09. Radio waves diffract pronouncedly around building; while light waves, which are also electromagnetic waves, do not. Why ?

Ans. For a wave to suffer diffraction, the wavelength should be of the order of size of the obstacle. The wavelength of radio waves (short radio waves) is of the order of the size of the building and the other obstacles coming in their path and hence they easily get diffracted. The wavelength of light waves is very small and they are not diffracted by the buildings.

Q. 1.10. Give one use of each of the following :

(*i*) infra-red rays (*ii*) gamma rays (*iii*) microwaves and (*iv*) ultraviolet radiations. *(C.B.S.E. 1992)*

Ans. (*i*) Infra-red rays photographs are used for weather forecasting.

(*ii*) Gamma rays are used in nuclear reactions.

(*iii*) Microwaves are used in RADAR.

(*iv*) Ultra-violet rays are used for sterilizing surgical instruments.

Q. 1.11. What are microwaves ? Give their any one use *(H.S.S.C.E. 1998)*

Ans. Microwaves are electromagnetic in nature and thei wavelength ranges from 10^{-3} m to 0·3 m. These waves are used in radars and in the study of atomic and molecula structure.

Q. 1.12. If the earth did not have atmosphere, would its average surface temperature be higher or lower than what it is now ? *(P.S.S.C.E. 1993 ; C.B.S.E. 1990)*

Ans. The infrared radiation emitted by earth are retained by the earth's atmosphre due to the green house effect and this keeps the earth warm. If the earth did not have atmosphere, its average temperature would have been low.

Q. 1.13. Discuss the significance of green house effect in the atmosphere. *(C.B.S.E. 1999 S)*

Or

What do you know about green house effect ? *(H.P.S.S.C.E. 1993)*

Or

Explain the green house effect. *(P.S.S.C.E. 1999 ; H.P.S.S.C.E. 1999, 1994)*

Or

What do you understand by green house effect ? Explain it. *(H.S.S.C.E. 1995)*

Ans. Refer to section 1.13.

TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 1.01. Static crashes are heard on radio, when a lightning flash occurs-even if the lightning occurs far away. Why does this happen ?

Ans. A lightning flash involves tremendous electrical fields and currents, which oscillate between the earth and the clouds or between two groups of clouds. In this electrical activity, many charges oscillate and produce a wide variety of electromagnetic waves. The flashes of light we see are emitted by atoms during this intense activity. Those electromagnetic waves, which have frequencies in radio-wave range, interfere with radio waves. Since light and radiowaves travel with the same speed, they arrive at the same time as does the light.

Q. 1.02. What would be the order of magnitude of the minimum frequency of electromagnetic waves that could be used to detect the presence of (*a*) the planet Venus, (*b*) an aircraft 50 m long (*c*) a bird 0·1 m long ? From what sources of electromagnetic radiation, would you be able to generate radiation of these wavelengths ?

Ans. In order to use a wave phenomenon to detect the presence of some object, the wavelength of the waves used must be comparable to or smaller than the dimensions of the object to be detected.

(*a*) Venus is about 10^7 m in diameter. The frequency of electromagnetic waves of wavelength 10^7 m is given by

$$\nu = \frac{c}{\lambda} = \frac{3\times10^8}{10^7} = 30\text{ Hz}$$

The waves of frequency 30 Hz correspond to very low andio-frequency radio waves. Practically, it will not be possible to detect Venus by employing such waves, because of the following reasons :

1. It would be almost impossible to get much power into such a low frequency wave.

2. Such a radio wave would be absorbed completely in the upper atmosphere.

3. Even if we could send such a radiowave to Venus and receive an echo, its beam would be so broad that we will not be able to pinpoint the direction of the Venus.

(*b*) The waves of wavelength 50 m required to detect an aircraft possess frequency,

$$\nu = \frac{c}{\lambda} = \frac{3\times10^8}{50} = 6\times10^6\text{ Hz} = 6\text{ MHz}$$

This frequency is higher than the frequency of radiowaves used by A.M. broadcasting stations. Primitive radars operated at frequencies about 20 times this.

(*c*) A 0·1 m long bird will require frequency,

$$\nu = \frac{c}{\lambda} = \frac{3\times10^8}{0\cdot1} = 3000\text{ MHz}$$

It is very close to the popular radar frequency. Indeed, radars occasionally detect birds.

Q. 1.03. Suggest reasons, why (*a*) food in metal containers cannot be cooked in a microwave oven, (*b*) an empty glass container does not get hot in a microwave oven.

Ans. In a microwave oven, the frequency of microwaves is selected to match the resonance frequency of water molecules, so that the energy from the waves is transferred efficiently to the kinetic energy of the molecules. This raises the temperature of any food containing water.

(*a*) The atoms of the metallic container are set into forced vibrations by the microwaves. Due to this, energy of the microwaves is not efficiently transferred to the metallic container. Owing to this, food in metallic containers cannot be cooked in a microwave oven.

(*b*) The molecules of the glass container do not respond ne frequency of microwaves. Due to this, energy from the rowaves is not transferred to the glass container and hence oes not get hot in a microwave oven.

Q. 1.04. Optical and radio telescopes are built on the ground, but X-ray astronomy is possible only from llites orbiting the earth. Why ?

Ans. The earth's atmosphere is transparent to visible light radio waves, but absorbs X-rays. Therefore, X-ray onomy is possible only from satellites orbiting the earth.

Q. 1.05. Some scientists have predicted that a global nuclear war on the earth would be followed by a severe 'nuclear winter' with a devastating effect on life on earth. What might be the basis of this prediction ?

Ans. Scientists estimate that in case of global nuclear war, the clouds produced will cover probably whole of the sky. In that case, solar radiation would be prevented from reaching the earth and it will result in, what they call as *nuclear winter* on the earth.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Why did Maxwell introduce the concept of displacement current ? Explain. (*H.S.S.C.E. 1992*)
2. Give a brief history of electromagnetic waves. (*P.S.S.C.E. 2001, 1999 S, 1991 ; H.S.S.C.E. 1997*)
3. What are electromagnetic waves ? Explain in brief.
4. What do you understand by electromagnetic waves ? Give its properties. (*H.P.S.S.C.E. 2002*)
5. What are electromagnetic waves ? Give its any four properties. (*P.S.S.C.E. 2001*)
6. Write down the important properties of electromagnetic waves.
7. What is meant by electromagnetic spectrum ? Give its four uses. (*P.S.S.C.E. 1999 S*)
8. Write one property and one use each of infra-red rays, ultra-violet rays and radiowaves. (*H.S.S.C.E. 2002*)
9. Give two uses each of the following : (*i*) Gamma rays (*ii*) Infra-red rays (*iii*) Ultra-violet radiation. (*P.S.S.C.E. 2001*)
10. Write down some important applications of different parts of electromagnetic spectrum.
11. Show that electromagnetic waves are transverse in nature. (*H.S.S.C.E. 2001*)
12. Explain the 'green house effect' of earth's atmosphere. (*H.S.S.C.E. 2002, 2001 ; P.S.S.C.E. 1991*)
13. What do you understand by green house effect ? (*H.S.S.C.E. 2002*)
14. What is the role of ozone layer in the atmosphere ? (*H.S.S.C.E. 2002*)

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. What are electromagnetic waves ? What is the principle of their production ? Give a brief account of the history of electromagnetic waves and write down the important properties of electromagnetic waves.
2. What is electromagnetic spectrum ? Name the main parts of the electromagnetic spectrum giving the frequency range and the source of production in each case.
3. How are infra-red rays, ultra-violet rays and X-rays produced ? Give their important properties and applications.

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

pe A. On Speed, Frequency and Wavelength of Electromagnetic waves

1. The wavelength of X-rays is 1 Å. Calculate its frequency. [**Ans.** 3×10^{18} Hz]
2. A radar transmitter generates waves, whose frequency is 3×10^9 Hz. What is the wavelength of the waves ? [**Ans.** 0·1 m]
3. Electromagnetic waves of frequency 5×10^{14} Hz are passed through a liquid. The wavelength of the waves in liquid is measured to be $4{\cdot}5 \times 10^{-7}$ m. Calculate (*i*) the wavelength of e.m. waves in vacuum, (*ii*) velocity of e.m. waves in the liquid and (*iii*) refractive index of the liquid. Given, velocity of e.m. waves in vacuum = 3×10^8 m s^{-1}. [**Ans.** (*i*) 6×10^{-7} m, (*ii*) $2{\cdot}25 \times 10^8$ m s^{-1} and (*iii*) 1·33]
4. If absolute permittivity and permeability of free space are $\varepsilon_0 = 8{\cdot}85 \times 10^{-12}$ C^2 N^{-1} m^{-2} and $\mu_0 = 4\pi \times 10^{-7}$ N s^2 C^{-2}. Calculate the velocity of electromagnetic waves. [**Ans.** 3×10^8 m s^{-1}]
5. In a plane e.m. wave, the electric field oscillates sinusoidally with a frequency of 2×10^{10} Hz and amplitude 48 V m^{-1}.
   (*a*) What is the wavelength of the wave ? (*C.B.S.E. 1990*)
   (*b*) What is the amplitude of the oscillating magnetic field ? [**Ans.** (*a*) $1{\cdot}5 \times 10^{-2}$ m (*b*) $1{\cdot}6 \times 10^{-7}$ T]

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. $\nu = \frac{c}{\lambda} = \frac{3 \times 10^8}{1 \times 10^{-10}} = 3 \times 10^{18}$ Hz

2. $\lambda = \frac{c}{\nu} = \frac{3 \times 10^8}{3 \times 10^9} = 0{\cdot}1$ m

3. (*i*) $\lambda_{vacuum} = \frac{c}{\nu} = \frac{3 \times 10^8}{5 \times 10^{14}} = 6 \times 10^{-7}$ m

(*ii*) $v = \nu \lambda_{liquid} = 5 \times 10^{14} \times 4{\cdot}5 \times 10^{-7}$

$= 2{\cdot}25 \times 10^8$ m s^{-1}

(*iii*) $\mu = \frac{c}{v} = \frac{3 \times 10^8}{2{\cdot}25 \times 10^8} = 1{\cdot}33$

4. Now, $c = \frac{1}{\sqrt{\mu_0 \varepsilon_0}}$

$\therefore \quad c = \frac{1}{\sqrt{4\pi \times 10^{-7} \times 8{\cdot}85 \times 10^{-12}}} = 3 \times 10^8$ m s^{-1}

5. $\lambda = \frac{c}{\nu} = \frac{3 \times 10^8}{2 \times 10^{10}} = 1{\cdot}5 \times 10^{-2}$ m

$B_0 = \frac{E_0}{\;} = \frac{48}{\;} = 1{\cdot}6 \times 10^{-7}$ T

Competitive Examination File (Unit V)

REVISION AT A GLANCE

Chapter 1. Electromagnetic waves

☐ **Conduction current.** *It is the current, which arises due to flow of electrons through the connecting wires in an electric circuit.*

☐ **Displacement current.** *It is the current, which arises due to time rate of change of electric flux (ϕ_E) in some part of the electric circuit.* It is given by

$$I_D = \varepsilon_0 \frac{d\phi_E}{dt},$$

where ε_0 is absolute permittivity of free space.

When a capacitor is charged or a charged capacitor is allowed to discharge, the electric flux between the plates of the capacitor changes with time and it gives rise to displacement current between the plates. The current that flows through the connecting wires is called the conduction current.

☐ **Modified Ampere circuital law.** It states that *the line integral of magnetic field $\vec{B}$ over a closed path is equal to μ_0 times the sum of the conduction current (I_C) and displacement current (I_D) threading the closed path.*

Mathematically : $\oint \vec{E} \cdot \vec{dl} = \mu_0 \left(I_C + \varepsilon_0 \frac{d\phi_E}{dt} \right)$

It is also known as ***Ampere-Maxwell's circuital law.***

☐ **Maxwell's equations.** Following four equations, which describe the laws of electromagnetism are called Maxwell's equation :

1. $\oint \vec{E} \cdot \vec{dS} = \frac{q}{\varepsilon_0}$ ***(Gauss's law in electrostatics)***
2. $\oint \vec{B} \cdot \vec{dS} = 0$ ***(Gauss's law in magnetism)***
3. $\oint \vec{B} \cdot \vec{dl} = -\frac{d\phi_B}{dt}$ ***(Faraday's law of electromagnetic induction)***
4. $\oint \vec{B} \cdot \vec{dl} = \mu_0 \left(I_C + \varepsilon_0 \frac{d\phi_B}{dt} \right)$ ***(Ampere-Maxwell's circuital law)***

☐ **Electromagnetic waves.** *The electric and magnetic fields varying in space and time and propagating through space, such that the two fields are perpendicular to each other and perpendicular to the direction of propagation, constitute electromagnetic waves.*

1. The electromagnetic waves are transverse in nature.

2. The velocity of electromagnetic waves in free space is given by

$$c = \frac{1}{\sqrt{\mu_0 \varepsilon_0}} = 3 \times 10^8 \text{ m s}^{-1}$$

3. The ratio of the amplitudes of electric and magnetic fields is constant and it is equal to velocity of electromagnetic waves in free space.

4. The electric vector of an electromagnetic wave is responsible for its optical effect. For this reason, the electric vector is also called ***light vector.***

☐ **Electromagnetic spectrum.** *The orderly distribution of electromagnetic waves (according to wavelength or frequency) in the form of distinct groups having widely differing properties is called electromagnetic spectrum.*

The main parts of electromagnetic spectrum are namely : γ-rays, X-rays, ultra-violet rays, visible light, infra-red rays, heat radiation, microwaves and radio waves.

☐ **Green house effect.** *The infra-red radiation trapped by the atmosphere, so as to keep the earth's surface warm, is called green house effect.*

NUMERICAL PROBLEMS FROM COMPETITIVE EXAMINATIONS

Problem 1.01. A capacitor of 2 μF is charged to 20 V and then suddenly short-circuited by a coil of negligible resistance and of inductance 8 μH. Calculate (*i*) the maximum amplitude and (*ii*) the frequency of the resulting oscillation.

Sol. Here, 2 mF = 2×10^{-6} F, L = 8 mH = 8×10^{-6} H and E = 20 V

(*i*) Maximum charge on capacitor, $q_0 = \text{C E}$

$$= 2 \times 10^{-6} \times 20 = 40 \times 10^{-6} \text{ C}$$

When a capacitor is discharged through an inductance, the oscillatory discharge is described by the equation,

$$q = q_0 \sin \omega t$$

The current in LC-circuit during oscillatory discharge is given by

$$\text{I} = \frac{dq}{dt} = \frac{d}{dt}(q_0 \sin \omega t) = q_0\, \omega \cos \omega t$$

Therefore, maximum amplitude of current during oscillatory discharge,

$$\text{I}_0 = q_0\, \omega\, q_0 \times \frac{1}{\sqrt{\text{LC}}} = \frac{40 \times 10^{-6}}{\sqrt{8 \times 10^{-6} \times 2 \times 10^{-6}}} = \mathbf{10\ A}$$

(*ii*) Frequency of oscillations,

$$f = \frac{1}{2\pi\sqrt{\text{LC}}} = \frac{1}{2\pi\sqrt{8 \times 10^{-6} \times 2 \times 10^{-6}}}$$

$$= \mathbf{3{\cdot}98 \times 10^4\ Hz}$$

MULTIPLE CHOICE QUESTIONS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Electromagnetic Waves

PART I. TEXT-BASED QUESTIONS

1. **The SI unit of displacement current is**
(A) H (B) A
(C) F m^{-1} (D) C

2. **An electromagnetic radiation of frequency ν, wavelength λ, travelling with velocity c in air, enters a glass slab of refractive index μ. The frequency, wavelength and velocity of light in the glass slab will be respectively :**
(A) $\frac{\nu}{\mu}, \frac{\lambda}{\mu}$ and $\frac{c}{\mu}$ (B) $\nu, \frac{\lambda}{\mu}$ and $\frac{c}{\mu}$
(C) $\nu, 2\lambda$ and $\frac{c}{\mu}$ (D) $\frac{2\nu}{\mu}, \frac{\lambda}{\mu}$ and c
(C.B.S.E. 1997)

3. **The speed of electromagnetic waves is independent of**
(A) wavelength (B) frequency
(C) intensity (D) medium, in which it travels.

4. **Electromagnetic waves are produced due to**
(A) a charge at rest. (B) a moving charge.
(C) an accelerating charge.
(D) none of the these.

5. **The speed of electromagnetic waves in vacuum is equal to**
(A) $\frac{1}{\sqrt{\varepsilon_0 \mu_0}}$ (B) $\sqrt{\varepsilon_0 \mu_0}$
(C) $\varepsilon_0 \mu_0$ (D) $\frac{1}{\varepsilon_0 \mu_0}$

6. **Dimensions of $\varepsilon_0 \mu_0$ is**
(A) $L T^{-1}$ (B) $L^{-1} T$
(C) $L^2 T^{-2}$ (D) $L^{-2} T^2$

7. **The dimensions of $\frac{1}{2} \varepsilon_0 E^2$ (ε_0 : permittivity of free space ; E : electric field) is**
(A) $M L T^{-1}$ (B) $M L^2 T^{-2}$
(C) $M L^{-1} T^{-2}$ (D) $M L^2 T^{-1}$ *(I.I.T. 2000)*

8. **If ε_0 and μ_0 are the electric permittivity and magnetic permeability in free space, ε and μ are the corresponding quantities in a medium, then index of refraction of the medium is**
(A) $\sqrt{\frac{\varepsilon_0 \mu}{\varepsilon \mu_0}}$ (B) $\sqrt{\frac{\varepsilon}{\varepsilon_0}}$
(C) $\sqrt{\frac{\varepsilon_0 \mu_0}{\varepsilon \mu}}$ (D) $\sqrt{\frac{\varepsilon \mu}{\varepsilon_0 \mu_0}}$ *(C.B.S.E. 1997)*

9. **An electric charge in uniform motion produces**
(A) an electric field only.
(B) a magnetic field only.
(C) both electric and magnetic fields.
(D) no such field at all.
(C.P.M.T. 1990, 1983 ; M.N.R. 1988)

10. **Which of the following statements is a wrong one ? Electromagnetic waves**
(A) are produced by accelerating charges.
(B) are transverse in nature.
(C) travel with the same speed irrespective of the nature of the medium.
(D) travel with velocity of light in vacuum.

11. **If $\vec{E}$ and $\vec{B}$ represent electric and magnetic field vectors of the electromagnetic waves, then the direction of propagation of the electromagnetic waves is that of**
(A) $\vec{E}$ (B) $\vec{B}$
(C) $\vec{E} \times \vec{B}$ (D) $\vec{B} \times \vec{E}$ *(C.B.S.E. 2002)*

12. **Among the following, longest wave is**
(A) radio wave. (B) γ-ray.
(C) microwave. (D) X-ray. *(C.P.M.T. 1982)*

13. **Which of the following has minimum wavelength ?**
(A) X-rays (B) Ultraviolet rays
(C) γ-rays (D) Cosmic rays *(C.B.S.E. 2002)*

14. **Which has the longest wavelength ?**
(A) Radio waves (B) X-rays
(C) Ultra-violet rays (D) Infra-red rays

15. **Infrared spectrum lies between**
(A) radio wave and microwave region.
(B) microwave and visible region.
(C) visible and ultra-violet region.
(D) ultra-violet and X-ray. *(C.E.T. 1998 ; N.C.E.R.T. 1980)*

16. **The frequency of γ-rays, X-rays and ultraviolet rays are a, b and c respectively. Then,**
(A) $a > b > c$ (B) $a < b < c$
(C) $a = b = c$ (D) $a > c > b$ *(C.B.S.E. 2000)*

17. **Red light differs from blue light in its**
(A) speed. (B) frequency.
(C) intensity. (D) amplitude.

18. **Which of the following statements is wrong ?**
(A) Ultra-violet rays have a wavelength longer than infra-red rays.
(B) Infra-red rays travel with the same velocity as visible light.
(C) Infra-red can be focussed by a lens and can be reflected by a mirror just as visible light.
(D) Infra-red rays have more heating power than visible light rays. *(N.C.E.R.T. 1976)*

19. **Which of the following represents an infra-red wavelength ?**
(A) 10^{-4} cm (B) 10^{-5} cm
(C) 10^{-6} cm (D) 10^{-7} cm *(N.C.E.R.T. 1975)*

CHAPTER

1

Refraction of Light

1.01. REFRACTION

In a homogeneous medium, light travels along a straight path. But when a ray of light travels from one transparent medium into another, it bends while crossing the surface separating the two media.

The phenomenon of change in path of light as it goes from one medium to another is called refraction.

When the ray of light passes from an optically rarer medium to a denser medium, it bends towards the normal and when it travels from a denser medium to a rarer medium, it bends away from the normal. Fig. 1.01 shows a surface XY separating two transparent media – air (a) and glass (b). The ray of light travelling along AO in air (optically rarer medium) enters glass (optically denser medium) at point O. From its straight path AO, it bends towards the normal NON′ and travels along the path OB. The rays AO and OB are called ***incident ray*** and ***refracted ray*** respectively. The angle between the incident ray and the normal denoted by i is called ***angle of incidence,*** while the angle between refracted ray and the normal denoted by r is called ***angle of refraction.***

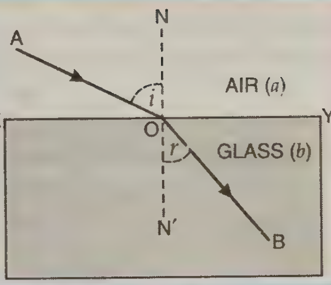

Fig. 1.01

1.02. LAWS OF REFRACTION

The phenomenon of refraction takes place according to the following two laws :

1. *The incident ray, the normal to the refracting surface at the point of incidence and the refracted ray – all lie in the same plane.*

2. *The ratio of the sine of the angle of incidence to the sine of the angle of refraction is constant for the two given media.* This constant is denoted by and is called the ***relative refractive index*** of medium b (in which refracted ray travels) *w.r.t.* medium a (in which incident ray travels).

$$\therefore \qquad \frac{\sin i}{\sin r} = {}^a\mu_b \qquad \text{...(1.01)}$$

This law is also called **Snell's law** of refraction.

The value of relative refractive index of a medium b *w.r.t.* a depends on

(*i*) *the nature of the pair of media a and b* and

(*ii*) *the wavelength* (colour) *of the light*. The refractive index of a medium is greater for violet light (shorter wavelength) than that for red light (longer wavelength).

If medium a is vacuum (or air), then the constant ratio given by equation (1.01) is called the ***absolute refractive index*** of medium b.

The absolute refractive index of a medium can be defined in another way also. It is found that light travels with maximum velocity c ($= 3 \times 10^8$ m s^{-1}) in vacuum and in any other transparent medium, light travels with velocity v, such that $v < c$.

The ratio of the velocity of light in vacuum to the velocity of light in a medium is called absolute refractive index of the medium.

Thus, absolute refractive index of the medium,

$$\mu = \frac{\text{velocity of light in vacuum } (c)}{\text{velocity of light in medium } (v)} \qquad \text{...(1.02)}$$

A medium having a larger value of refractive index is called ***optically denser,*** while the one having a smaller value is said to be ***optically rarer.***

Note. The refractive index of a medium is also denoted by the letter 'n'.

Key point ✓

When light travels from air to a medium of refractive index μ, its wavelength decreases by a factor μ *i.e.* becomes λ/μ, while the frequency remains the same.

1.03. PRINCIPLE OF REVERSIBILITY OF LIGHT

It states that *if light after suffering any number of reflections and refractions has its final path reversed, it travels back along the same path in the opposite direction.*

Explanation. Consider a ray of light incident along AO at point O on the interface XY separating rarer medium a (air) from the denser medium b (water). After refraction, the ray of light proceeds along path OB. Let i and r be angle of incidence and angle of refraction respectively. If a plane mirror M is placed so that the refracted ray OB is normal to it, then it will be reflected back along BO. At point O, it will suffer refraction, so as to emerge along OA as shown in Fig. 1.02. Thus, if the path of light is reversed, it retraces its whole path in the opposite direction.

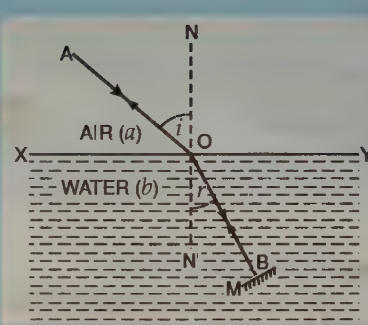

Fig. 1.02

The principle of reversibility of light leads to a very useful result as obtained below :

When light travels from medium a to medium b, then the relative refractive index of medium b *w.r.t.* medium a is given by

$$^{a}\mu_{b} = \frac{\sin i}{\sin r} \qquad \text{...(1.03)}$$

On reversing the path, the light travels from medium b to medium a and likewise r is the *angle of incidence* and i is the corresponding angle of refraction. Therefore, relative refractive index of medium a *w.r.t.* medium b is given by

$$^{b}\mu_{a} = \frac{\sin r}{\sin i} \qquad \text{...(1.04)}$$

Multiplying the equations (1.03) and (1.04), we have

$$^{a}\mu_{b} \times {}^{b}\mu_{a} = \frac{\sin i}{\sin r} \times \frac{\sin r}{\sin i} = 1$$

or
$$^{a}\mu_{b} = \frac{1}{^{b}\mu_{a}} \qquad \text{...(1.05)}$$

It follows that *the refractive index of the medium b w.r.t. the medium a is equal to the reciprocal of the refractive index of the medium a w.r.t. the medium b.*

1.04. LATERAL SHIFT

Consider a glass slab bounded by parallel faces XY and X′Y′ and of thickness t as shown in Fig. 1.03. A ray of light travelling in air along the path AO gets incident on the face XY at the angle of incidence i. On refraction into glass (denser medium), it bends towards normal NON′ and travels along the path OQ inside the glass, such that r is the angle of refraction.

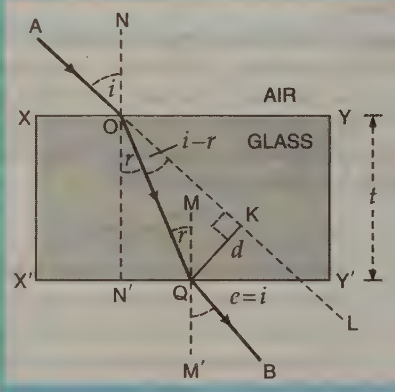

Fig. 1.03

Key point

When white light passes through a glass slab having parallel faces, it is dispersed into its constituent colours also, as it undergoes refraction at the first face. However, the constituent colours recombine to produce white light, when refraction takes place at the second face of the glass slab.

Since the two faces of the glass slab are parallel, the refracted ray OQ strikes the surface X′Y′ at the angle of incidence r. On refraction into air, the ray of light bends away from the normal MOM′ and travels along the path QB in the air, such that i is the angle of refraction. Obviously, the emergent ray QB is parallel to the incident ray AOL. From the point Q, drop QK perpendicular to the initial path AOL. Then, QK = d, is called the ***lateral shift*** produced by the glass slab in the path of the light.

Thus, *the perpendicular distance between the incident ray and the emergent ray, when the light is incident obliquely on a parallel sided refracting slab, is called lateral shift.*

In right angled ΔOKQ, $\angle KOQ = i - r$

$$\therefore \qquad \sin(i-r) = \frac{QK}{OQ} = \frac{d}{OQ}$$

or
$$d = OQ \sin(i-r)$$

From right angled ΔON′Q, we have

$$\cos r = \frac{ON'}{OQ} = \frac{t}{OQ}$$

or
$$OQ = \frac{t}{\cos r}$$

Substituting for OQ, we have

$$d = \frac{t}{\cos r}\sin(i-r) \qquad \text{..(1.06)}$$

It may be pointed out that the lateral shift produced by a glass slab increases with

(*i*) *increase in the thickness of the glass slab,*
(*ii*) *increase in the value of the angle of incidence* and
(*iii*) *increase in the refractive index of the slab.*

1.05. REFRACTION THROUGH MULTIPLE REFRACTING MEDIA

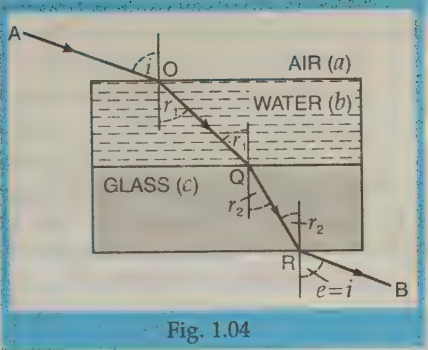

Fig. 1.04

Consider a compound plate of two media *b* (water) and *c* (glass) bounded by parallel faces and placed in the medium *a* (air) as shown in Fig. 1.04. Suppose that a ray of light AO travelling in medium *a* is incident at point O on the surface separating the two media *a* and *b*. It is refracted along OQ in medium *b*, such that *i* is the angle of incidence and r_1, the angle of refraction. Then,

$$ {}^a\mu_b = \frac{\sin i}{\sin r_1} \qquad \text{...(1.07)}$$

Now, the ray of light OQ meets the surface separating the two media *b* and *c* at angle of incidence r_1. It is, then, refracted along QR in medium *c*, such that r_2 is the angle of refraction. Then,

$$ {}^b\mu_c = \frac{\sin r_1}{\sin r_2} \qquad \text{...(1.08)}$$

Finally, the ray of light QR strikes the surface separating the media *c* and *a* at point R, such that r_2 is the angle of incidence. The ray of light, then emerges along path RB in medium *a*. As the various interfaces are parallel, the angle of emergence will be equal to *i*. Therefore,

$$ {}^c\mu_a = \frac{\sin r_2}{\sin i} \qquad \text{...(1.09)}$$

Multiplying the corresponding sides of the equations (1.07), (1.08) and (1.09), we have

$$ {}^a\mu_b \times {}^b\mu_c \times {}^c\mu_a = \frac{\sin i}{\sin r_1} \times \frac{\sin r_1}{\sin r_2} \times \frac{\sin r_2}{\sin i} = 1$$

or $$ {}^a\mu_b \times {}^b\mu_c = \frac{1}{{}^c\mu_a} \qquad \left(\because \frac{1}{{}^c\mu_a} = {}^a\mu_c \right)$$

or $$ {}^a\mu_c = {}^a\mu_c \times {}^b\mu_c \qquad \text{...(1.10)}$$

1.06. REAL AND APPARENT DEPTHS (NORMAL SHIFT)

As a consequence of refraction, the depth of an object lying inside an optically denser medium appears to be less than its real depth.

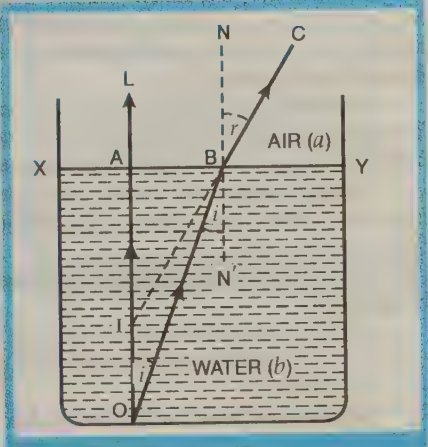

Fig. 1.05

Suppose that the surface XY separates medium *a* (air) and medium *b* (water or any other transparent liquid). Let O be a point object lying inside the liquid [Fig. 1.05]. A ray of light OA incident along normal to the surface of the liquid, will be refracted as such along AL. Another ray of light OB, on refraction into air, bends away from the normal along BC. The two refracted rays appear to come from the point I. Therefore, the object, though lying at depth AO, appears to be at depth AI. Accordingly, AO the ***real depth*** and AI is called ***apparent depth*** of the object O.

Suppose that ∠ OBN′ = *i* and ∠ NBC = *r*. Then, refractive index of medium *a* (air) *w.r.t.* medium *b* (water) is given by

$$ {}^b\mu_a = \frac{\sin i}{\sin r}$$

Since $$ {}^a\mu_b = \frac{1}{{}^b\mu_a}, \text{ we have}$$

$$ {}^a\mu_b = \frac{\sin r}{\sin i} \qquad \text{...(1.11)}$$

Now, ∠ AOB = ∠ OBN′ = *i*

Therefore, from the right angled Δ OAB, we have

$$ \sin i = \frac{AB}{OB}$$

Also, ∠ AIB = ∠ NBC = *r*

Therefore, from the right angled Δ IAB, we have

$$ \sin r = \frac{AB}{IB}$$

Substituting for sin *i* and sin *r* in equation (1.11), we have

$$ {}^a\mu_b = \frac{AB/IB}{AB/OB} = \frac{OB}{IB}$$

Since the aperture of the eye is very small, the two rays AL and BC will enter the eye only, if point B lies very close to the point A. In such a situation,

OB ≈ OA, the real depth of the object

and IB ≈ IA, the apparent depth of the object

Therefore, $${}^a\mu_b = \frac{OA}{IA} = \frac{\text{real depth}}{\text{apparent depth}} \qquad ...(1.12)$$

The object appears to be raised from its real position O to its apparent position I. The distance OI through which the position of the object appears to be raised, is called ***normal shift*** and it is denoted by *d*. Therefore,

normal shift, $$d = OA - IA$$

$$= OA\left(1 - \frac{IA}{OA}\right) = OA\left(1 - \frac{1}{OA/IA}\right)$$

or $$d = t\left(1 - \frac{1}{{}^a\mu_b}\right) \qquad ...(1.13)$$

It may be pointed out that the normal shift in the position of the object depends upon

(*i*) *the real depth of the object i.e. the thickness of the refracting medium* and

(*ii*) *the refractive index of the refracting medium.*

Key point

The apparent shift (*d*) in the position of an object placed in a denser medium depends upon the value of its refractive index (μ). The higher is the value of μ, greater is the apparent shift *d*.

1.07. TOTAL INTERNAL REFLECTION

Consider a surface XY separating the rarer medium *a* (air) from the denser medium *b* (water) as shown in Fig. 1.06. A ray of light OA from the object O in denser medium incident normally on the surface of separation, gets refracted into the rarer medium as such along AL. Another ray of light incident along the oblique path OA_1 is refracted away from the normal along the path A_1B_1 in the rarer medium. As the angle of incidence is increased, the angle of refraction (in air) also goes on increasing, till for a certain angle of incidence C, called the ***critical angle***, the refracted ray grazes along the surface of separation *i.e.* angle of refraction becomes just 90°.

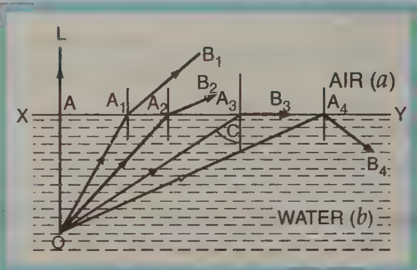

Fig. 1.06

If the angle of incidence is further increased, there will be no refracted ray. A ray, such as OA_4 incident at an angle greater than the critical angle, gets reflected along A_4B_4 according to the laws of reflection. This phenomenon is called ***total internal reflection.***

Therefore, *total internal reflection may be defined as the phenomenon of reflection of light that takes place, when a ray of light travelling in a denser medium gets incident at the interface of the two media at an angle greater than the critical angle for that pair of media.*

Critical angle. *The critical angle for a pair of media may be defined as the angle of incidence in the denser medium, for which the angle of refraction in the rarer medium is 90°.*

Thus, for the total internal reflection to take place, following conditions should be obeyed :

1. *The ray incident on the interface should travel in optically denser medium.*
2. *The angle of incidence should be greater than the critical angle for the given pair of media.*

Key point

For total internal reflection to take place, the ray of light should travel from optically denser to rarer medium and the angle of incidence must be greater than the value of critical angle for the pair of two media.

Relation between refractive index and critical angle. According to Snell's law, refractive index of rarer medium (*a*) *w.r.t.* denser medium (*b*),

$${}^b\mu_a = \frac{\sin i}{\sin r} \qquad ...(1.14)$$

When the ray of light is incident at critical angle *i.e.*

when $i = C, r = 90°$

Setting the above condition, equation (1.14) becomes

$${}^b\mu_a = \frac{\sin C}{\sin 90°} = \sin C$$

But $${}^b\mu_a = \frac{1}{{}^a\mu_b}$$

Therefore, refractive index of medium *b w.r.t.* medium *a* is given by

$${}^a\mu_b = \frac{1}{\sin C} \qquad ...(1.15)$$

It may be pointed out that there is practically no loss of light in total reflection ; vhile in reflection from a mirror, a small part of light is absorbed. In view of this, otally reflecting prisms* are used in optical instruments in order to change the path of light, whenever required.

1.08. PRACTICAL APPLICATIONS OF TOTAL INTERNAL REFLECTION

The phenomenon of total internal reflection is made use of in a number of ptical instruments. Moreover, it can be used in explaining many daily life bservations as discussed below :

1. Totally reflecting prisms. An isosceles right angled glass prism having angles 45°-90°- 45° can be used to deviate a ray of light through 90° or 180°. Such a glass prism deviates the ray of light through 90° or 180° making use of the phenomenon of total internal reflection and likewise such prisms are called ***totally reflecting prisms.***

For glass ($^a\mu_g = 1{\cdot}5$), the value of critical angle is about 42°. When a ray of light is incident normally on its any refracting surface, it passes through that face as such and comes to incident on the other face of the prism at a angle of incidence of 45°. Since the value of the angle of incidence is greater than 42°, the ray of light undergoes total internal reflection. By making light to fall on a *side face* or the *hypotenuse face*, the ray of light can be deviated through 90° or 180° as explained below :

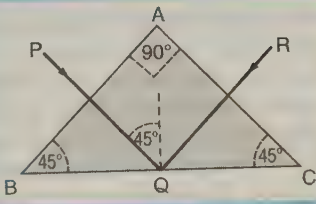

Fig. 1.07

(a) To deviate a ray of light through 90°. Consider that a ray of light from point P is incident normally on the side face AB of an isosceles right angled glass prism [Fig. 1.07]. The ray of light passes into the glass prism along PQ as such** and comes to meet the hypotenuse face BC of the prism at point Q. Since the angle of incidence is 45° *i.e.* greater than the critical angle for glass-air interface, it suffers total internal reflection at point Q on face BC. After total internal reflection, the ray of light comes to meet the side face AC at right angle and is refracted out of the prism as such along QR. It follows that the path of the ray has been deviated by the prism through 90°.

A totally reflecting prism is used to deviate the path of the ray of light through 90°, when it is inconvenient to view the direct light. In Michelson's method to find velocity of light, the direct light from the octagonal mirror is avoided from direct viewing by making use of totally reflecting prism.

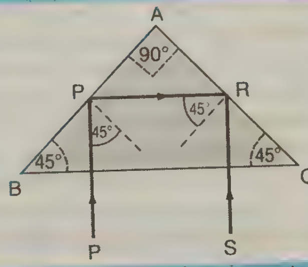

Fig. 1.08

(b) To deviate a ray of light through 180°. Fig. 1.08 shows a ray of light incident normally on the hypotenuse face BC of the 45°-90°-45° glass prism. The ray of light is refracted into the prism as such along PQ, suffers total internal reflection firstly at point Q on side face AB and then at point R on the second side face AC of the prism. When the ray of light comes to meet the hypotenuse face BC at right angles to it, it is refracted out of the prism as such along the path RS. The path of the ray of light has been turned through 180° due to two total internal reflections.

By deviating a ray of light through 180°, totally reflecting prisms are used in prism binoculars to produce an erect image† or to correct for lateral inversion.

The totally reflecting prisms have following advantages over the silvered plane mirrors :

(i) A reflecting prism does not require any silvering.

(ii) A silvered plane mirror always absorbs some light. In a good mirror, the reflection of light is about 90-95%. However, in a reflecting prism, almost 100% reflection is secured.

(iii) A thick plane mirror causes multiple reflections. Therefore, alongwith the image produced due to the first reflection at the silvered surface, several other images are produced due to subsequent multiple reflections. Obviously, the image formed is not very bright. Since in a totally reflecting prism, only one image is formed, hence the image obtained is very bright.

(iv) With the constant use of the mirror, its silvered surface may go bad. Then, the mirror will produce an image of a very poor quality. A reflecting prism is free from such a trouble.

(v) Due to imperfect and non-uniform silvering of the mirror, the image obtained with a mirror is often a distorted one.

---

* Refer to Section 1.08.

**When a ray of light is incident normally, $i = 0°$. According to Snell's law, r is also $0°$.

†For details, refer to SAQ 1.18.

2. Mirage. It is an optical illusion observed in deserts and coal-tarred roads on a hot day. The object such as a tree appears inverted and the observer gets the impression as if the inverted image has been formed by a pool of water. This phenomenon is known as mirage.

Due to intense heat, the surface of earth becomes quite hot and the temperature of air near the surface of earth is maximum. The temperature of the other layers of the air goes on decreasing as one goes up. Therefore, density as well as refractive index of the air increases slightly for higher layers. Thus, a ray of light travelling from point O of a tree [Fig. 1.09], passes through air of gradually decreasing refractive index and is therefore refracted more and more away from the normal and accordingly the angle of incidence goes on increasing. At a layer, when the angle of incidence becomes greater than the critical angle, total internal reflection takes place. Then, the ray of light starts traversing layers of increasing refracting indices and goes on bending more and more towards the normal. Ultimately, when the ray reaches the eye of the observer, it appears to be coming from the point I. Hence, the inverted image of the tree produces the impression of reflection from a pool of water.

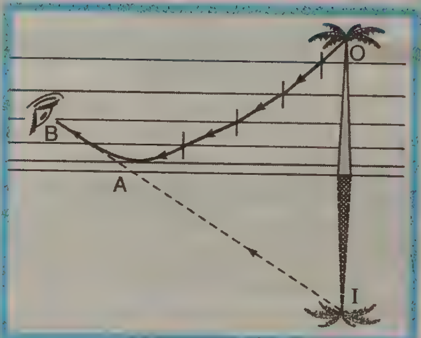

Fig. 1.09

3. The brilliance of diamonds and other precious stones. The refractive index of diamond is 2·47 and the critical angle for diamond-air interface is 23° only. Due to the low value of critical angle, a diamond can be cut so as to have a large number of faces, such that a ray of light on entering it from one face undergoes repeated total internal reflections from other faces. As a result, the faces through which the light emerges, shine very brilliantly.

4. Optical fibres. In 1870, John Tyndall, a British physicist, demonstrated that light could be made to follow curved path along a thin stream of water coming out of a water tank. This effect was made use of in illuminated fountains. The light follows curved path as it suffers a series of total internal reflections.

Optical fibres are used to transmit light from one place to the other along curved path in a more effective manner. The optical fibres consist of thousands of strands of a very fine quality glass or quartz of refractive index about 1·7 or so. The thickness of a strand is about 10^{-6} cm. The strands are coated with a layer of some material of lower refractive index (about 1·5). The ends of the strands are polished and clamped firmly after aligning them carefully.

When light is incident at a small angle at one end, it gets refracted into the strands (or fibres) and gets incident on the interface of the fibres and the coating. The angle of incidence being greater than the critical angle, the ray of light undergoes total internal reflections [Fig. 1.10]. It suffers the internal reflections again and again*, till the angle of incidence remains greater than the critical angle for the fibre material *w.r.t.* coating. Each fibre acts as a pipe and such a bundle of fibres can be used to convey images along paths of any shape. It may be pointed that the optical fibre does not bend light. Instead, light follows the zig-zag path through the fibres.

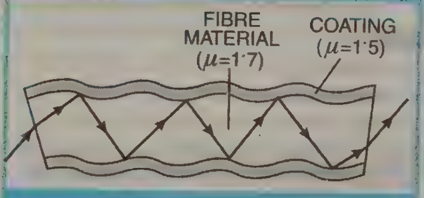

Fig. 1.10

Uses. Optical fibres have been found to be of great use. A few applications of optical fibres are as listed below :

(i) The optical fibres are used in the field of communication and the computers. They are used for transmitting and receiving electrical signals, which are converted into light.

(ii) The optical fibres are used for transmitting the optical signals and the two dimensional pictures.

(iii) The optical fibres are used for making medical investigations. Using an optical fibre, a doctor can visually examine the inside of the stomach, intestine, etc. It is called ***endoscopy*** in medical science.

(iv) The optical fibres in the form of photometric sensors are used for measuring the blood flow in the heart.

(v) The optical fibres in the form of refractometers are used to determine the refractive indices of liquids.

(vi) The optical fibre sensors have been used to measure temperature and pressure.

1.09. SPHERICAL REFRACTING SURFACE

The portion of a refracting medium, whose curved surface forms the part of a sphere, is called spherical refracting surface.

---

*A ray of light inclined at 30° to the axis of the fibres undergoes 22700 reflections per metre.

The spherical refracting surfaces are of two types :

(*a*) **Convex spherical refracting surface.** The spherical refracting surface convex towards the rarer medium is called convex spherical refracting surface [Fig. 1.11].

(*b*) **Concave spherical refracting surface.** The spherical refracting surface concave towards the rarer medium is called concave spherical refracting surface [Fig. 1.12].

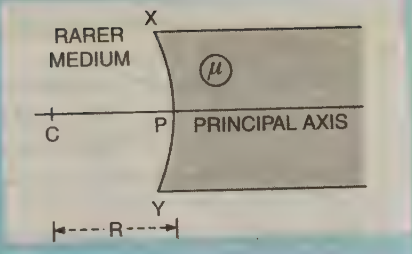

Fig. 1.11

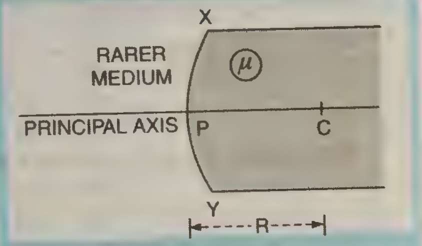

Fig. 1.12

Following terms are related to the study of refraction from spherical refracting surfaces :

1. Pole. *The centre of the spherical refracting surface is called its pole.* It is denoted by P.

2. Centre of curvature. *The centre of the sphere of which the curved surface forms a part is called its centre of curvature.* It is denoted by C.

3. Radius of curvature. *The radius of the sphere of which the curved surface forms a part is called its radius of curvature.* It is denoted by R.

4. Aperture. *The diameter of the spherical refracting surface is called its aperture.* The line joining the points X and Y represents the aperture of the spherical refracting surface.

5. Principal axis. *The line passing through the pole and the centre of curvature of the spherical refracting surface is called its principal axis.*

1.10. NEW CARTESIAN SIGN CONVENTIONS AND ASSUMPTIONS

As in the case of spherical mirrors, the refraction from spherical refracting surfaces will be discussed using the *new* ***Cartesian sign conventions.***

New Cartesian sign conventions. 1. *All the distances are measured from the pole of the spherical refracting surface.*

2. *The distances measured in the direction of the incident light are taken positive and those measured in the direction opposite to the direction of incident light are taken as negative.*

To study refraction from the spherical refracting surfaces, we make the following assumptions :

Assumptions. 1. The aperture of the refracting surface is small.

2. The object is a point object situated on the principal axis.

3. The incident and the refracted rays make small angles with the principal axis.

1.11. REFRACTION AT CONVEX SPHERICAL SURFACE

Consider a convex spherical refracting surface of absolute refractive index μ_2 placed in an optically rarer medium of absolute refractive index μ_1, such that the convex surface is towards the rarer medium. Let P be its pole, C the centre of curvature and PC, the principal axis of the convex spherical refracting surface.

(*a*) When object lies in the rarer medium and image formed is real. Let O be a point object in the rarer medium and situated on the principal axis. A ray of light OP incident normally on the refracting surface along the principal axis, passes undeviated into the denser medium. Another ray of light OA incident at point A at an angle of incidence i, gets refracted towards the normal CAN′. Let r be the angle of refraction. The two rays meet at a point I on the principal axis and therefore I is the real image of the point object O as shown in Fig. 1.13.

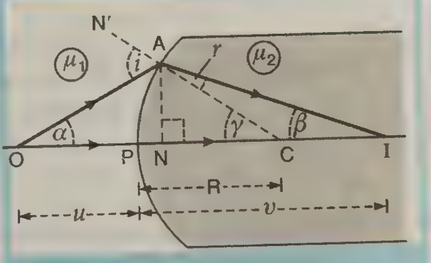

Fig. 1.13

Let $\angle AOP = \alpha$; $\angle AIP = \beta$ and $\angle ACP = \gamma$

From the point A, drop AN perpendicular to the principal axis of the spherical refracting surface. From triangle AOC, we have

$$i = \alpha + \gamma \qquad \text{...(1.16)}$$

Since aperture of the spherical refracting surface is small, the point A will be close to the point P and hence angles α, β and γ will be small. As such, these angles may be replaced by their tangents.

Therefore, equation (1.16) may be written as

$$i = \tan\alpha + \tan\gamma \qquad \text{...(1.17)}$$

From right angled triangles ANO and ANC, we have

$$\tan\alpha = \frac{AN}{NO} \quad \text{and} \quad \tan\gamma = \frac{AN}{NC}$$

Substituting for tan α and tan α in equation (1.17), we have

$$i = \frac{AN}{NO} + \frac{AN}{NC} \qquad \text{...(1.18)}$$

Again, as aperture of the refracting surface is small, point N will be close to point P, the pole of the refracting surface. Therefore,

$NO \approx PO$ and $NC \approx PC$

Therefore, equation (1.18) becomes

$$i = \frac{AN}{PO} + \frac{AN}{PC} \qquad ...(1.19)$$

Now, from triangle ACI, $\gamma = r + \beta$

or $$r = \gamma - \beta$$

Since angles β and γ are small, we have

$$r = \tan\gamma - \tan\beta \qquad ...(1.20)$$

From right angled triangles ANC and ANI, we have

$$\tan\gamma = \frac{AN}{NC} \approx \frac{AN}{PC}$$

and $$\tan\beta = \frac{AN}{NI} \approx \frac{AN}{PI}$$

Substituting for $\tan\beta$ and $\tan\gamma$ in equation (1.20), we have

$$r = \frac{AN}{PC} - \frac{AN}{PI} \qquad ...(1.21)$$

If μ is relative refractive index of the denser medium (μ_2) *w.r.t.* the rarer medium (μ_1), then

$$\mu = \frac{\mu_2}{\mu_1} = \frac{\sin i}{\sin r}$$

or $$\mu_1 \sin i = \mu_2 \sin r$$

Since the angles i and r are also small, the above equation becomes

$$\mu_1 i = \mu_2 r$$

From equations (1.19) and (1.21), substituting the values of i and r, we have

$$\mu_1\left(\frac{AN}{PO} + \frac{AN}{PC}\right) = \mu_2\left(\frac{AN}{PC} - \frac{AN}{PI}\right)$$

or $$\frac{\mu_1}{PO} + \frac{\mu_1}{PC} = \frac{\mu_2}{PC} - \frac{\mu_2}{PI}$$

or $$\frac{\mu_1}{PO} + \frac{\mu_2}{PI} = \frac{\mu_2 - \mu_1}{PC} \qquad ...(1.22)$$

Applying new cartesian sign conventions :

$PO = -u$ (∵ distance of object is *against* incident light)

$PI = +v$ (∵ distance of image is *along* incident light)

$PC = +R$

(∵ distance of centre of curvature is *along* incident light)

Therefore, equation (1.22) becomes

$$\frac{\mu_1}{-u} + \frac{\mu_2}{+v} = \frac{\mu_2 - \mu_1}{+R}$$

or $$-\frac{\mu_1}{u} + \frac{\mu_2}{v} = \frac{\mu_2 - \mu_1}{R} \qquad ...(1.23)$$

The equation (1.23) connects u, v and R to the absolute refractive indices of the material of the refracting surface and that of the rarer medium.

The above formula can be expressed in another form as given below :

Dividing both sides of equation (1.23) by μ_1, we have

$$-\frac{1}{u} + \frac{\mu_2/\mu_1}{v} = \frac{\mu_2/\mu_1 - 1}{R}$$

Since $\mu_2/\mu_1 = \mu$, we have

$$-\frac{1}{u} + \frac{\mu}{v} = \frac{\mu_1 - 1}{R}$$

***(b)* When object lies in the rarer medium and image formed is virtual.** When an object is situated in rarer medium very close to the convex spherical refracting surface, its virtual image is formed in the rarer medium.

Let O be a point object in rarer medium and situated on the principal axis and close to the pole of the refracting surface. A ray of light OP incident normally on the refracting surface along the principal axis, passes undeviated into the denser medium. Another ray of light OA incident at point A at an angle of incidence i, gets refracted towards the normal CAN′. Let r be the angle of refraction. The two rays do not meet but appear to come from the point I on the principal axis, and therefore I is the virtual image of the point object O [Fig. 1.14].

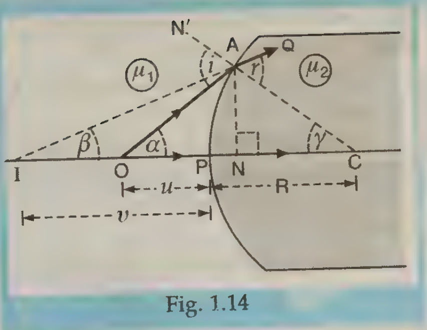

Fig. 1.14

Let $\angle AOP = \alpha$; $\angle AIP = \beta$ and $\angle ACP = \gamma$

From the point A, drop AN perpendicular to the principal axis of the spherical refracting surface.

From triangle AOC,

$$i = \alpha + \gamma$$

or $$i = \tan\alpha + \tan\gamma = \frac{AN}{NO} + \frac{AN}{NC}$$

As aperture of the refracting surface is small, it follows that

$$NO \approx PO \,;\, NC \approx PC$$

$$\therefore \quad i = \frac{AN}{PO} + \frac{AN}{PC} \qquad \text{...(1.24)}$$

From triangle AIC, $r = \beta + \gamma$

Now, angles β and γ are small. Therefore, we may write

$$r = \tan\beta + \tan\gamma = \frac{AN}{NI} + \frac{AN}{NC}$$

Again, as the aperture of the refracting surface is small,

$$NI \approx PI \,;\, NC \approx PC$$

$$\therefore \quad r = \frac{AN}{PI} + \frac{AN}{PC} \qquad \text{...(1.25)}$$

If μ is relative refractive index of the denser medium (μ_2) *w.r.t.* the rarer medium (μ_1), then

$$\mu = \frac{\mu_2}{\mu_1} = \frac{\sin i}{\sin r}$$

or $$\mu_1 \sin i = \mu_2 \sin r$$

Since the angles i and r are small, we have

$$\mu_1 i = \mu_2 r$$

From equations (1.24) and (1.25), substituting the values of i and r in the above equation, we have

$$\mu_1\left(\frac{AN}{PO} + \frac{AN}{PC}\right) = \mu_2\left(\frac{AN}{PI} + \frac{AN}{PC}\right)$$

or $$\frac{\mu_1}{PO} - \frac{\mu_2}{PI} = \frac{\mu_2 - \mu_1}{PC} \qquad \text{...(1.26)}$$

From new cartesian sign conventions :

$PO = -u$ ($\because$ distance of object is *against* incident light)

$PI = -v$ ($\because$ distance of image is *against* incident light)

$PC = +R$

($\because$ distance of centre of curvature is *along* incident light)

Therefore, equation (3.26) becomes

$$\frac{\mu_1}{-u} - \frac{\mu_2}{-v} = \frac{\mu_2 - \mu_1}{+R}$$

or $$-\frac{\mu_1}{u} + \frac{\mu_2}{v} = \frac{\mu_2 - \mu_1}{R} \qquad \text{...(1.27)}$$

The above relation can be expressed in another form as follows :

Dividing both sides of equation (1.27) by μ_1, we have

$$-\frac{1}{u} + \frac{\mu_2/\mu_1}{v} = \frac{\mu_2/\mu_1 - 1}{R}$$

or $$-\frac{1}{u} + \frac{\mu}{v} = \frac{\mu - 1}{R}$$

(c) When object lies in denser medium. Let O be a point object in denser medium and situated on the principal axis. A ray of light incident normally on the refracting surface along the principal axis, passes undeviated. Another ray of light OA incident at point A at an angle of incidence i ; after refraction, bends away from the normal CAN′, such that r is angle of refraction. The two rays appear to come from point I on the principal axis and therefore I is the virtual image of the point object O as shown in Fig. 1.15.

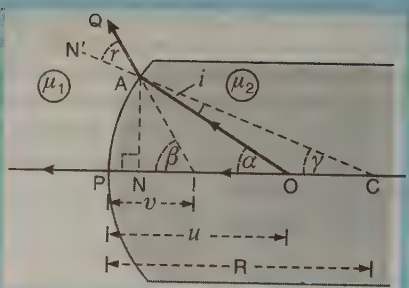

Fig. 1.15

Let $\angle AOP = \alpha$; $\angle AIP = \beta$

and $\angle ACP = \gamma$

From the point A, drop AN perpendicular to the principal axis of the spherical refracting surface. From triangle AOC, we have

$$\alpha = i + \gamma$$

or $$i = \alpha - \gamma$$

Since angles α and γ are small, we may write

$$i = \tan \alpha - \tan \gamma = \frac{AN}{NO} - \frac{AN}{NC}$$

Again, as aperture of the refracting surface is small, NO ≈ PO and NC ≈ PC. Therefore, the above equation becomes

$$i = \frac{AN}{PO} - \frac{AN}{PC} \qquad ...(1.28)$$

Now, from triangle ACI, $\beta = r + \gamma$ or $r = \beta - \gamma$

As said earlier, as the angles β and γ are small, they can be replaced by their tangents.

$$\therefore \qquad r = \tan \beta - \tan \gamma = \frac{AN}{NI} - \frac{AN}{NC} \qquad ...(1.29)$$

Since NI ≈ PI and NC ≈ PC, we have

$$r = \frac{AN}{PI} - \frac{AN}{PC}$$

If μ is relative refractive index of denser medium (μ_2) *w.r.t.* rarer medium (μ_1), then

$$\mu = \frac{\mu_2}{\mu_1} = \frac{\sin r}{\sin i} \quad \text{or} \quad \mu_2 \sin i = \mu_1 \sin i$$

Since i and r are also small, we have

$$\mu_2 i = \mu_1 r$$

From equations (1.28) and (1.29), substituting for i and r in the above equation, we have

$$\mu_2 \left(\frac{AN}{PO} - \frac{AN}{PC} \right) = \mu_1 \left(\frac{AN}{PI} - \frac{AN}{PC} \right)$$

or $$\frac{\mu_2}{PO} - \frac{\mu_2}{PC} = \frac{\mu_1}{PI} - \frac{\mu_1}{PC}$$

or $$\frac{\mu_2}{PO} - \frac{\mu_1}{PI} = \frac{\mu_2 - \mu_1}{PC} \qquad ...(1.30)$$

Applying new cartesian sign conventions :

PO = − u (∵ distance of object is *against* the incident ray)

PI = − v (∵ distance of image is *against* the incident ray)

PC = − R

(∵ distance of centre of curvature is *against* incident ray)

Therefore, equation (1.30) becomes

$$\frac{\mu_2}{-u} - \frac{\mu_1}{-v} = \frac{\mu_2 - \mu_1}{-R}$$

or $$-\frac{\mu_2}{u} + \frac{\mu_1}{v} = \frac{\mu_1 - \mu_2}{R} \qquad ...(1.31)$$

The above relation may be expressed in another form as given below :

Dividing both sides of the equation (1.31) by μ_1 and replacing $\frac{\mu_2}{\mu_1}$ by μ, we have

$$-\frac{\mu_2/\mu_1}{u} + \frac{1}{v} = \frac{1 - \mu_2/\mu_1}{R}$$

$$-\frac{\mu}{u} + \frac{1}{v} = \frac{1 - \mu}{R}$$

Note. 1. In case, the object is situated in rarer medium so that the incident ray travels in rarer medium and the refracted ray travels in denser medium, then as obtained in section 1.11 (*a*) and 1.11 (*b*), the relation between u, v, R, μ_1 and μ_2 is

$$-\frac{\mu_1}{u}+\frac{\mu_2}{v}=\frac{\mu_2-\mu_1}{R} \qquad ...(1.32)$$

2. In case, the object is situated in denser medium, so that the incident ray travels in denser medium and refracted ray in rarer medium, then as obtained in section 1.11 (*c*), the relation between u, v, R, μ_1 and μ_2 is

$$-\frac{\mu_2}{u}+\frac{\mu_1}{v}=\frac{\mu_1-\mu_2}{R} \qquad ...(1.33)$$

It may be noted that the equation (1.33) can be obtained from equation (1.32) by simply interchanging μ_1 and μ_2.

3. The factor $\frac{\mu_2-\mu_1}{R}$ is called power of the spherical refracting surface. It gives the measure of the degree to which the refracting surface can converge or diverge the rays of light passing through it.

1.12. REFRACTION AT CONCAVE SPHERICAL SURFACE

Consider a concave spherical refracting surface of absolute refractive index μ_2 placed in an optically rarer medium of absolute refractive index μ_1. Let P be pole ; C, the centre of curvature and PC, the principal axis of the spherical refracting surface.

Let O be a point object in the rarer medium and situated on the principal axis. A ray of light OP incident normally on the refracting surface along the principal axis, passes undeviated into the denser medium. Another ray of light OA incident at the point A at an angle of incidence i is refracted towards the normal CAN′. Let r be the angle of refraction. The two rays AQ and OP appear to come from the point I on the principal axis and therefore I is the virtual image of the point object O as shown in Fig. 1.16.

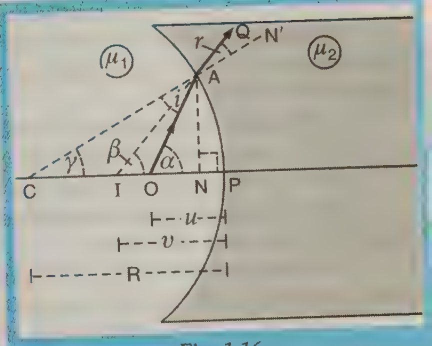

Fig. 1.16

From triangle AOC, $\alpha=i+\gamma$

or $\quad i=\alpha-\gamma$

Since angles α and γ are small, they can be replaced by their tangents. Therefore

$$i=\tan\alpha-\tan\gamma=\frac{AN}{NO}-\frac{AN}{NC}$$

As aperture of the spherical refracting surface is small, NO ≈ PO and NC ≈ PC.

$$\therefore \qquad i=\frac{AN}{PO}-\frac{AN}{PC} \qquad ...(1.34)$$

From triangle AIC, $\beta=r+\gamma$

or $\quad r=\beta-\gamma$

Again angles β and γ are small. Therefore,

$$r=\tan\beta-\tan\gamma=\frac{AN}{NI}-\frac{AN}{NC}$$

As aperture of the spherical refracting surface is small, NI = PI and NC ≈ PC.

$$\therefore \qquad r=\frac{AN}{PI}-\frac{AN}{PC} \qquad ...(1.35)$$

If μ is the relative refractive index of the denser medium (μ_2) *w.r.t.* the rarer medium (μ_1), then

$$\mu=\frac{\mu_2}{\mu_1}=\frac{\sin i}{\sin r} \quad \text{or} \quad \mu_1\sin i=\mu_2\sin r$$

Since the angles i and r are small, we have

$$\mu_1 i=\mu_2 r$$

From equations (1.34) and (1.35), substituting the values of i and r in the above equation, we have

$$\mu_1\left(\frac{AN}{PO}-\frac{AN}{PC}\right)=\mu_2\left(\frac{AN}{PI}-\frac{AN}{PC}\right)$$

or

$$-\frac{\mu_1}{PO}+\frac{\mu_2}{PI}=\frac{\mu_2-\mu_1}{PC} \qquad ...(1.36)$$

From new cartesian sign conventions :

$$PO=-u,\ PI=-v,\ PC=-R$$

Therefore, equation (1.36) becomes

$$-\frac{\mu_1}{-u}+\frac{\mu_2}{-v}=\frac{\mu_2-\mu_1}{-R}$$

or
$$-\frac{\mu_1}{u}+\frac{\mu_2}{v}=\frac{\mu_2-\mu_1}{R} \qquad ...(1.37)$$

The above relation can be expressed in another form as given below :

Dividing both sides of equation (1.37) by μ_1 and setting $\frac{\mu_2}{\mu_1}=\mu$, we have

$$-\frac{1}{u}+\frac{\mu}{v}=\frac{\mu-1}{R}$$

Note. In case, the object is situated in the denser medium so that the incident ray travels in the denser medium and the refracted ray travels in the rarer medium, then the relation between u, v, R, μ_1 and μ_2 can be obtained by interchanging μ_1 and μ_2 and the relation will be same as given by equation (1.33).

1.13. LENS MAKER'S FORMULA

The lens maker's formula relates the focal length of a lens to the refractive index of its material and the radii of curvature of its two surfaces. This formula is used to manufacture a lens of particular focal length from the glass of given refractive index. For this reason, it is called ***lens maker's formula.***

To derive lens maker's formula, we make the following assumptions and adopt new Cartesian sign conventions :

Assumptions. 1. *The lens is thin, so that the distances measured from the poles of two surfaces of the lens can be taken as to be the same as the distances measured from the optical centre of the lens.*

2. *The aperture of the lens is small.*

3. *The object is a point object situated on the principal axis.*

4. *The incident and refracted rays make small angles with the principal axis.*

New cartesian sign conventions. 1. All the distances are to be measured from the optical centre of the lens.

2. *The distances measured in the direction of the incident ray are taken as positive and those measured in the direction opposite to the incident ray are taken as negative.*

Consider a convex lens made of material of absolute refractive index μ_2 and placed in an optically rarer medium of absolute refractive index μ_1. Let P_1 and P_2 be the poles ; C_1 and C_2, the centres of curvature and R_1 and R_2, the radii of curvature of the two surfaces XP_1Y and XP_2Y of the lens respectively. Let C be the optical centre of the lens.

Suppose that O is a point object placed on the principal axis of the lens [Fig. 1.17].

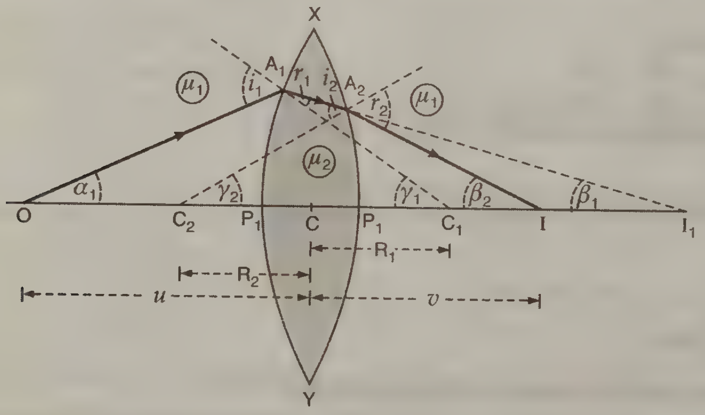

Fig. 1.17

The surface XP_1Y forms the real image I_1 (assuming that material of the lens extends beyond the face XP_1Y as such). It can be obtained* that

$$\frac{\mu_1}{P_1O}+\frac{\mu_1}{P_1I_1}=\frac{\mu_2-\mu_1}{P_1C_1} \qquad ...(1.38)$$

---

*Refer to section 1.11. The equation (1.38) is same as the equation (1.22) obtained in section 1.11.

Since lens is thin, the point P_1 lies very close to the optical centre C of the lens. herefore, we may write

$$P_1O \approx CO\,;\, P_1I_1 \approx CI_1$$

and $$P_1C_1 \approx CC_1$$

Therefore, equation (1.38) becomes

$$\frac{\mu_1}{CO} + \frac{\mu_2}{CI_1} = \frac{\mu_2 - \mu_1}{CC_1} \qquad \text{...(1.39)}$$

Let us now consider refraction from the other surface XP_2Y of the convex lens. Actually, material of lens does not extend beyond the surface XP_2 Y. Therefore, before he refracted ray from point A_1 could meet the principal axis, it will suffer refraction t the point A_2 on the second surface XP_2 Y and the ray of light will actually come o meet the principal axis at the point I. Thus, point I may be considered as the real mage of the virtual object I_1 (placed in the material of the lens) as formed due to efraction from the surface XP_2Y of the lens. It can be deduced that

$$-\frac{\mu_2}{P_2I_1} + \frac{\mu_1}{P_2I} = \frac{\mu_2 - \mu_1}{P_2C_2} \qquad \text{...(1.40)}$$

Again as the lens is thin, we may write

$$P_2I_1 \approx CI_1,\; P_2I \approx CI \quad \text{and} \quad P_2C_2 \approx CC_2$$

Therefore, equation (1.40) may be written as

$$-\frac{\mu_2}{CI_1} + \frac{\mu_1}{CI} = \frac{\mu_2 - \mu_1}{CC_2} \qquad \text{...(1.41)}$$

Adding equations (1.39) and (1.41), we have

$$\frac{\mu_1}{CO} + \frac{\mu_2}{CI_1} - \frac{\mu_2}{CI_1} + \frac{\mu_1}{CI} = \frac{\mu_2 - \mu_1}{CC_1} + \frac{\mu_2 - \mu_1}{CC_2}$$

or $$\frac{\mu_1}{CO} + \frac{\mu_1}{CI} = (\mu_2 - \mu_1)\left(\frac{1}{CC_1} + \frac{1}{CC_2}\right) \qquad \text{...(1.42)}$$

Applying new cartesian sign conventions :

$CO = -u$ (∵ distance u is *against* the incident ray)

$CI = +v$ (∵ distance v is *along* the incident ray)

$CC_1 = +R_1$

(∵ radius of curvature R_1 is *along* the incident ray)

and $CC_2 = -R_2$

(∵ radius of curvature R_2 is *against* the incident ray)

Therefore, equation (1.42) becomes

$$\frac{\mu_1}{-u} + \frac{\mu_1}{+v} = (\mu_2 - \mu_1)\left(\frac{1}{+R_1} + \frac{1}{-R_2}\right)$$

or $$-\frac{\mu_1}{u} + \frac{\mu_1}{+v} = (\mu_2 - \mu_1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

Dividing both sides of the above equation by μ_1, we have

$$-\frac{1}{u} + \frac{1}{v} = \left(\frac{\mu_2}{\mu_1} - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

Since $\frac{\mu_2}{\mu_1} = \mu$, we have

$$-\frac{1}{u} + \frac{1}{v} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) \qquad \text{...(1.43)}$$

First principal focus and the focal length. *First principal focus is the position of the object on the principal axis of the lens, for which the image is formed at infinity.* It is denoted by point F_1 [Fig. 1.18].

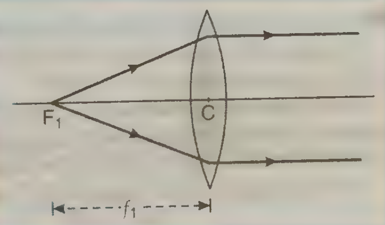

Fig. 1.18

The distance between optical centre and first principal focus is called ***first principal focal length*** *of the lens.* It is denoted by f_1. Thus,

if $$u = CF_1 = -f_1,\ \text{then } v = \infty$$

Setting the above condition in equation (1.43), we have

$$-\frac{1}{-f_1} + \frac{1}{\infty} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

or $$\frac{1}{f_1}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right) \qquad ...(1.44)$$

Second principal focus and the focal length. *Second principal focus is the position of the image on the principal axis of the lens, when the object lies at infinity.* It is denoted by point F_2 as shown in Fig. 1.19.

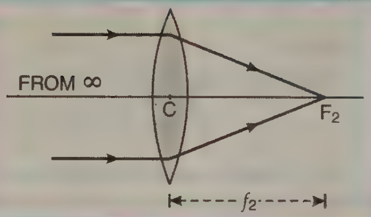

Fig. 1.19

The distance between optical centre and second principal focus is called ***second principal focal length*** *of the lens.* It is denoted by f_2.

Thus, if $u=\infty, v=CF_2=+f_2$

Setting this condition in equation (1.43), we have

$$-\frac{1}{\infty}+\frac{1}{+f_2}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

or $$\frac{1}{f_2}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right) \qquad ...(1.45)$$

From the equations (1.44) and (1.45), it follows that two principal focal lengths of a lens are equal *i.e.*

$$f_1=f_2=f \text{ (say)}$$

Therefore, the equation (1.44) or (1.45) may be written as

$$\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right) \qquad ...(1.46)$$

The equation (1.46) is called ***lens maker's formula.***

Note. 1. The lens maker's formula deduced for a convex lens is applicable to both the convex and the concave lenses.

2. The focal length of a convex lens is taken as positive and that of a concave lens as negative.

3. For a convex lens, $R_1=+$ ve and $R_2=-$ ve ; while for a cocave lens, $R_1=-$ ve and $R_2=+$ ve.

Key point ✓

The focal length of a lens depends upon the value of refractive index of its material and radii of curvative of its two surfaces.

Key point ✓

1. Focal length of a lens (made of material having refractive index μ) increases, when it is placed in a medium of refractive index μ' ($\mu'<\mu$) and it still behaves as the lens of same type.

2. In case lens is placed in a medium of refractive index greater than that of the material of lens, the nature of lens changes (a converging lens behaves as a diverging lens and vice-versa).

1.14. GAUSSIAN FORM OF LENS EQUATION (From lens maker's formula)

The relation connecting the distances of the object and image with the focal length of a lens is called ***Gaussian form of lens equation*** or ***simply lens equation.*** Let us obtain this relation directly from the lens maker's formula.

Refer to equation (1.43) obtained while deriving the lens maker's formula. It was obtained that

$$-\frac{1}{u}+\frac{1}{v}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

Also, from lens maker's formula, we have

$$\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

Therefore, from the above two equations, we have

$$-\frac{1}{u}+\frac{1}{v}=\frac{1}{f} \qquad ...(1.47)$$

Note 1. The lens equation and the mirror formula obtained by applying new cartesian sign conventions are not same.

2. In case of a lens, the real image is formed on the other side of the real object ; while the virtual image is formed on the same side the object is. Therefore, in case of a lens, *the distance of the real image from the lens is taken as positive and that of virtual image is taken as negative.*

1.15. TO DERIVE LENS EQUATION (Convex Lens)

In case of a convex lens, the image formed may be real or virtual. Let us derive the lens equation in the two cases :

(a) **When image formed is real.** Consider that an object AB is placed at a point beyond F on the principal axis of a convex lens [Fig. 1.20]. Its real image A′B′ will be formed on the other side of the object as shown in the figure.

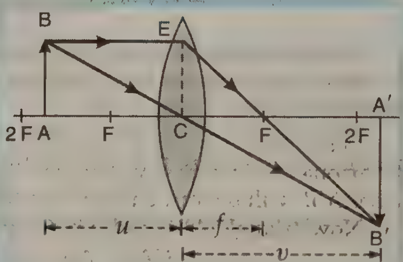

Fig. 1.20

Now, triangles ABC and A′B′C are similar. Therefore,

$$\frac{CA}{CA'}=\frac{AB}{A'B'} \qquad ...(1.48)$$

Also, triangles CEF and A′B′F are similar. Therefore,

$$\frac{CF}{FA'} = \frac{CE}{A'B'}$$

Since CE = AB, the above equation becomes

$$\frac{CF}{FA'} = \frac{AB}{A'B'} \qquad ...(1.49)$$

From equations (1.48) and (1.49), we have

$$\frac{CF}{CA'} = \frac{CF}{FA'}$$

or

$$\frac{CA}{CA'} = \frac{CF}{CA' - CF} \qquad ...(1.50)$$

According to new Cartesian sign conventions :

$$CA = -u\ ; CA' = +v \text{ and } CF = +f$$

Therefore, equation (1.50) becomes

$$\frac{-u}{+v} = \frac{+f}{+v-(+f)} \quad \text{or} \quad -\frac{u}{v} = \frac{f}{v-f}$$

or

$$-uv + uf = vf \quad \text{or} \quad -vf + uf = uv$$

Dividing both sides by $u\,v\,f$, we have

$$-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$$

It is the required relation between u, v and f.

***(b)* When image formed is virtual.** Consider that an object AB is placed between optical centre C and focus F on the principal axis of a convex lens [Fig. 1.21]. Its virtual image A′B′ will be formed on the same side of the object as shown in the figure.

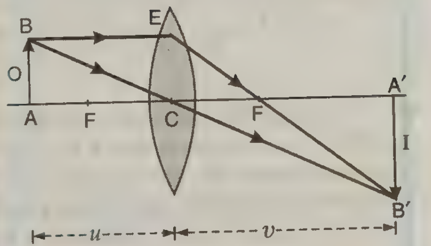

Fig. 1.21

Now, triangles ABC and A′B′C are similar. Therefore,

$$\frac{CF}{CA'} = \frac{AB}{A'B'} \qquad ...(1.51)$$

Also, triangles CEF and A′B′F are similar. Therefore,

$$\frac{CF}{FA'} = \frac{CE}{A'B'}$$

Since CE = AB, the above equation becomes

$$\frac{CF}{FA'} = \frac{CF}{A'B'} \qquad ...(1.52)$$

From equations (1.51) and (1.52), we have

$$\frac{CA}{CA'} = \frac{CF}{FA'}$$

or

$$\frac{CA}{CA'} = \frac{CF}{CA' + CF}$$

According to new Cartesian sign conventions :

$$CA = -u\ ; CA' = -v \text{ and } CF = +f$$

Therefore, equation (1.53) becomes

$$\frac{-u}{-v} = \frac{+f}{-v+(+f)} \quad \text{or} \quad \frac{u}{v} = \frac{f}{-v+f}$$

or

$$-uv + uf = vf \quad \text{or} \quad -vf + uf = uv$$

Dividing both sides by $u\,v\,f$, we have

$$-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$$

It is the required relation between u, v and f.

Key point

When a convex lens produces a real image of an object, the minimum distance between the object and the image is equal to four times its focal length.

It is because, the lens equation gives a real solution for u and v only if focal length f is greater than one-fourth of the distance between the object and image.

16. TO DERIVE LENS EQUATION (Concave lens)

In case of a concave lens, image formed is always virtual in nature. Consider that an object AB is placed on the principal axis of a concave lens [Fig. 1.22]. Its virtual image A′B′ will be formed on the same side of the object as shown in the figure.

Now, triangle ABC and A′B′C are similar. Therefore,

$$\frac{CA}{CA'} = \frac{AB}{A'B'} \qquad ...(1.54)$$

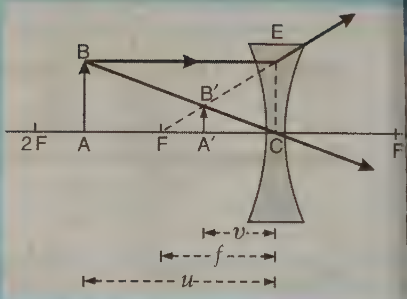

Fig. 1.22

Also, triangles CEF and A′B′F are similar. Therefore,

$$\frac{CF}{FA'}=\frac{CE}{A'B'}$$

Setting CE = AB, the above equation becomes

$$\frac{CF}{FA'}=\frac{AB}{A'B'} \qquad \text{...(1.55)}$$

From equations (1.54) and (1.55), we have

$$\frac{CA}{CA'}=\frac{CF}{FA'}$$

or

$$\frac{CA}{CA'}=\frac{CF}{CF-CA'} \qquad \text{...(1.56)}$$

Applying new cartesian sign conventions : CA = $-u$; CA′ = $-v$ and CF = $-f$

Therefore, equation (1.56) becomes

$$\frac{-u}{-v}=\frac{-f}{-f-(-v)} \quad \text{or} \quad \frac{u}{v}=\frac{f}{-f+v}$$

or $\quad -uf+uv=-vf \quad$ or $\quad -vf+uf=uv$

Dividing both sides by uvf, we have

$$-\frac{1}{u}+\frac{1}{v}=\frac{1}{f}$$

It is the required relation between u, v and f.

1.17. LINEAR MAGNIFICATION

The ratio of the size of the image formed by a lens to the size of the object is called linear magnification produced by the lens. It is denoted by m.

If O and I are the sizes of object and image respectively, then

$$m=\frac{I}{O} \qquad \text{...(1.57)}$$

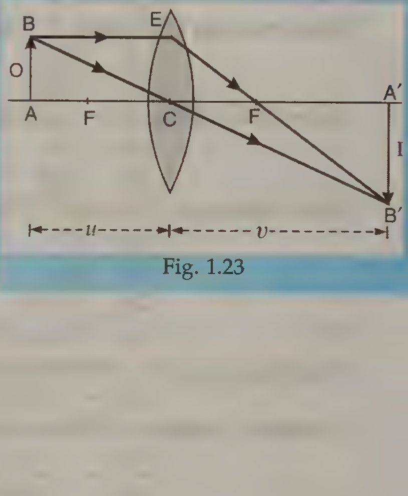

Fig. 1.23

Expression for linear magnification. Consider a convex lens of focal length f. Let C be optical centre and F be its principal focus. Suppose that an object AB is placed on the principal axis of the convex lens. Then, the real image A′B′ of the object AB is formed by the convex lens as shown in Fig. 1.23.

Let u and v be the distances of the object AB and image A′B′ from the optical centre (C) of the lens.

Now, triangles A′B′C and ABC are similar.

Therefore, $$\frac{A'B'}{AB}=\frac{CA'}{CA} \qquad \text{...(1.58)}$$

Applying new cartesian sign conventions, we have

A′B′ = $-$I (∵ height is *downwards*)

AB = +O (∵ height is *upwards*)

CA′ = $+v$ (∵ image distance is *along* incident light)

CA = $-u$ (∵ object distance is *against* incident light)

Therefore, equation (1.58) becomes

$$\frac{-I}{+O}=\frac{+v}{-u} \quad \text{or} \quad \frac{I}{O}=\frac{v}{u} \qquad \text{...(1.59)}$$

From equations (1.57) and (1.58), we have

$$m=\frac{I}{O}=\frac{v}{u} \qquad \text{...(1.60)}$$

Now, for a lens,

$$-\frac{1}{u}+\frac{1}{v}=\frac{1}{f}$$

Multiplying both sides of the lens equation by u, we have

$$-1+\frac{u}{v}=\frac{u}{f} \quad \text{or} \quad \frac{u}{v}=1+\frac{u}{f}=\frac{f+u}{f}$$

or

$$\frac{v}{u}=\frac{f}{f+u} \qquad \text{...(1.61)}$$

Also, multiplying both sides of the lens equation by v, we have

$$-\frac{v}{u}+1=\frac{v}{f} \quad \text{or} \quad \frac{v}{u}=1-\frac{v}{f}$$

or

$$\frac{v}{u}=\frac{f-v}{f} \qquad ...(1.62)$$

From equation (1.60), (1.61) and (1.62), we have

$$m=\frac{\text{I}}{\text{O}}=\frac{v}{u}=\frac{f}{f+u}=\frac{f-v}{f} \qquad ...(1.63)$$

Note. The expression (1.63) also holds for linear magnification produced by a ncave lens.

1.18. IMAGE FORMED BY A CONVEX LENS

(*i*) When object lies at infinity. Consider that an object lies at infinity [Fig. 1.24]. en, $u = \infty$

From the lens equation, we have

$$-\frac{1}{\infty}+\frac{1}{v}=\frac{1}{f} \quad \text{or} \quad v=f \qquad \text{(at focus)}$$

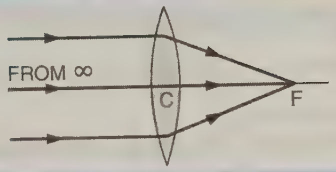

Fig. 1.24

As focal length of the convex lens is positive, v is also positive. Therefore, real nage will be formed at focus on the other side of the lens.

Now, magnification, $m=\frac{v}{u}=\frac{v}{\infty}=0$ (point in size)

Therefore, when object lies *at infinity*, image will be formed *at F* of the lens nd it will be *real, inverted* and *point in size*.

(*ii*) When object lies beyond 2 F. Consider that the object AB lies beyond 2 F s shown in Fig. 1.25. Then distance of the object from the optical centre of the lens s negative and $|u| > 2f$.

Now, $-\frac{1}{u}+\frac{1}{v}=\frac{1}{f}$ or $v=\frac{uf}{u+f}$

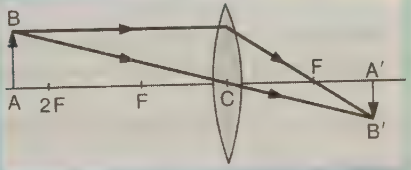

Fig. 1.25

Since $|u| > 2f$, it follows that v will be positive and will have a value between and $2f$ (image between F and 2 F on the other side of lens).

Since $m=\frac{v}{u}$, the value of m will be negative and $|m| < 1$ (real image and maller in size).

Therefore, when object lies *beyond 2 F*, the image will be formed *between F and F* and will be ***real, inverted*** and ***smaller in size***.

(*iii*) When object lies at 2 F. in such a case, $u = -2f$. From the lens equation, we have

$$v=\frac{uf}{u+f}$$

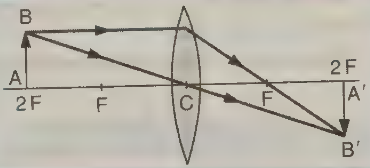

Fig. 1.26

Setting $v = -2f$, we obtain

$$v=2f \qquad \text{(image at 2 F)}$$

Since $m=\frac{v}{u}$, the value of m will be equal to -1 (real image and equal in size).

Therefore, when object lies at *at 2 F*, the image will be formed *at 2 F* and will be *real, inverted and equal in size* [Fig. 1.26].

(*iv*) When object lies between F and 2 F. When object lies between F and 2 F [Fig. 1.27], $f < |u| < 2f$. From the lens equation, we have

$$v=\frac{uf}{u+f}$$

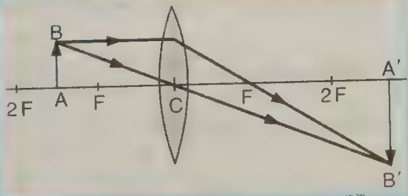

Fig. 1.27

Since $f < |u| < 2f$, v will be positive and will have a value greater then $2f$ (image beyond 2 F on the other side of the lens).

Since $m=\frac{v}{u}$, m will be negative and $|m| > 1$ (real image and larger in size).

Therefore, when object lies *between F and 2 F*, the image will be formed *beyond* 2 F and will be **real, inverted** and **larger in size**.

(v) When object lies at F. When object lies at F, $u = -f$. From the lens equation, we have

$$-\frac{1}{-f}+\frac{1}{v}=\frac{1}{f} \quad \text{or} \quad \frac{1}{v}=0 \quad \text{or} \quad v=\infty \qquad \text{(image at infinity)}$$

Now, $$m=\frac{v}{u}=\frac{\infty}{-f}=-\infty \qquad \text{(real image and highly magnified)}$$

Therefore, when object lies *at F*, the image will be formed *at infinity* and will be *real, inverted* and *highly magnified* [Fig. 1.28].

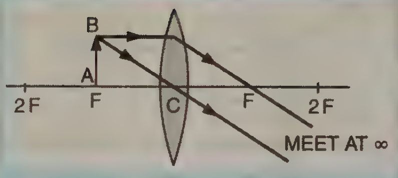

Fig. 1.28

(vi) When object lies between F and C. For object lying between F and C [Fig. 1.29], $|u| < f$. From the lens equation, we have

$$v=\frac{uf}{u+f}$$

Since $|u| < f$, v will be negative and $|v| > f$.

From $m=\frac{v}{u}$, it follows that m will be positive and greater than 1 (virtual and magnified image).

Therefore, when object lies *between F and C*, image will be formed *beyond F* on the same side of the lens. Further, the image will be *virtual, erect* and *magnified*.

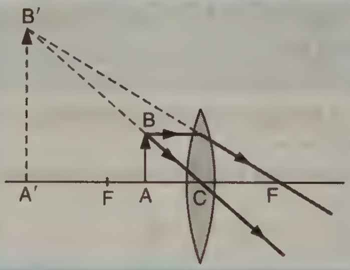

Fig. 1.29

1.19. IMAGE FORMED BY A CONCAVE LENS

Consider that an object AB is placed on the principal axis of a concave lens as shown in Fig. 1.30. For a concave lens, both u and f are negative. From the lens equation, we have

$$v=\frac{uf}{u+f}$$

Since both u and f are negative, it follows that v will be negative and $|v| < |f|$ (image on same side of the lens and between F and C).

From $m=\frac{v}{u}$, it follows that m will be positive and less than 1 (virtual image and smaller in size).

It may be pointed out that irrespective of the position of the object, a concave lens always produces a *virtual* and *erect image on the same side of the lens,* which is *smaller in size*.

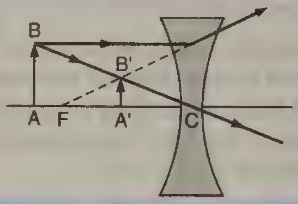

Fig. 1.30

Key point

The image produced by a concave lens is always virtual and smaller in size.

1.20. POWER OF LENS

The ability of a lens, to converge or diverge the rays of light incident on it, is called the **power of the lens.**

The power of a lens is measured as the reciprocal of its focal length in metre.

$$P=\frac{1}{f\text{ (metre)}} \qquad \text{...(1.64)}$$

If $f = 1$ m, then

$$F=\frac{1}{1\text{ m}}=\mathbf{1\ m^{-1}=1\ dioptre\ (D)}$$

The power of a lens is said to be one dioptre, if its focal length is one metre.

The power of a *converging lens* is *positive* and that of a *diverging lens* is *negative.*

Since the power of a lens is just reciprocal of its focal length, it characterises its focal properties (such as the distance at which image is formed, nature and size of the image, etc).

According to the lens maker's formula for a lens,

$$\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

Since $P=\frac{1}{f}$, we have

$$P=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right) \qquad \text{...(1.65)}$$

Here, R_1 and R_2 are to be measured in *metre.*

Key point

The power of a thick lens is greater than that of a thin lens.

1.21. EQUIVALENT LENS (Two thin lenses placed in contact)

A single lens, which will form the image of a given object at the same point as is formed by the component lenses (combination of two or more lenses), is called an equivalent lens.

Consider that two thin lenses L_1 and L_2 of focal lengths f_1 and f_2 are placed in contact with each other. Suppose that a point object O lies on the principal axis of the two lenses. Fig. 1.31 shows the formation of the final image I of the object O in two steps. In the first step, the lens L_1 produces I′ as the real image of the object O. If $C_1 O = u$ and $C_1 I' = v'$, then for lens L_1, we have

$$-\frac{1}{u}+\frac{1}{v'}=\frac{1}{f_1} \qquad \text{...(1.66)}$$

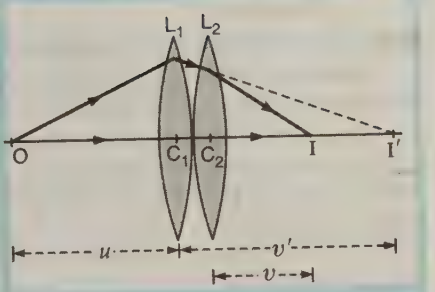

Fig. 1.31

In the second step, the lens L_2 produces the image I of the image I′, which acts as virtual object for it.

As the two lenses are thin,

$$C_2 I' \approx C_1 I' = +v'$$

The positive sign has been taken for the reason that the distance of image I′ (virtual object for lens L_2) from C_2 is measured in the direction of incident ray. If $C_2 I = v$, then the focal length of the lens L_2 is given by

$$-\frac{1}{v'}+\frac{1}{v}=\frac{1}{f_2} \qquad \text{...(1.67)}$$

Adding the equations (1.66) and (1.67), we have

$$-\frac{1}{u}+\frac{1}{v'}-\frac{1}{v'}+\frac{1}{v}=\frac{1}{f_1}+\frac{1}{f_2}$$

or

$$-\frac{1}{u}+\frac{1}{v}=\frac{1}{f_1}+\frac{1}{f_2} \qquad \text{...(1.68)}$$

If a single lens of focal length f produces the image I of the object O exactly as the lenses L_1 and L_2 together do, then

$$-\frac{1}{u}+\frac{1}{v}=\frac{1}{f} \qquad \text{...(1.69)}$$

From the equations (1.68) and (1.69), we have

$$\frac{1}{f}=\frac{1}{f_1}+\frac{1}{f_2} \qquad \text{...(1.70)}$$

Here, f is called ***focal length of the equivalent lens.***

Thus, *reciprocal of the focal length of an equivalent lens is equal to sum of the reciprocals of the focal lengths of the two lenses placed in contact.*

Discussion. 1. If the focal lengths f_1 and f_2 are in metre, then equation (1.70) becomes

$$P = P_1 + P_2 \qquad \text{...(1.71)}$$

Here, P_1 and P_2 are powers of the two lenses and P is the power of the equivalent lens.

In general,

$$P = P_1 + P_2 + P_3 + \ldots\ldots\ldots\ldots,$$

where P_1, P_2, P_3 .... are powers of component lenses placed in contact.

2. When two lenses are placed in contact, then image produced by first lens acts as the object for the second lens, which further produces image of this image. Obviously, if m_1 and m_2 are magnifications produced by the first and the second lens respectively, then total magnification produced by the combination is given by

$$m = m_1 \times m_2 \qquad \text{...(1.72)}$$

In general, if $m_1, m_2, m_3, \ldots\ldots\ldots\ldots\ldots$ are magnifications produced by the component lenses, then magnification produced by the combination is given by

$$m = m_1 \times m_2 \times m_3 \ldots\ldots\ldots$$

3. Two lenses may also be combined by placing them at a finite distance apart. It can be proved that if two lenses of focal lengths f_1 and f_2 are placed at a distance x apart, then focal length of the equivalent lens is given by

$$\frac{1}{f}=\frac{1}{f_1}+\frac{1}{f_2}-\frac{x}{f_1 f_2} \qquad \text{...(1.73)}$$

Key point

When a number of thin lenses are placed in contact,

(*i*) power of the equivalent lens is equal to sum of the powers of the individual lenses and

(*ii*) magnification produced is equal to the product of the magnifications produced by the component lenses.

4. The two lenses may be combined so as :

(*i*) to produce magnified image,

(*ii*) to produce an erect image and

(*iii*) to minimise the lens defects, such as chromatic aberration or spherical aberration.

SPHERICAL ABERRATION IN LENSES

Spherical aberration. *The inability of a lens of large aperture to bring all the rays in a wide beam falling on it, to focus at a single point, is called* ***spherical aberration.***

Cause of spherical aberration. The rays of light travelling parallel to the principal axis after refraction from a convex lens meet at a single point only if a narrow beam of light falls on it or if the lens is of small aperture. In case, a wide beam of light falls on a convex lens of large aperture, the rays after refraction through the lens do not come to focus at a single point. In a wide beam of the light, the rays of light which travel close to the principal axis are called ***paraxial rays,*** while the rays which travel quite away from the principal axis are called ***marginal rays.*** It is found that the marginal rays get focussed relatively close to the optical centre of the lens as compared to the paraxial rays.

Fig. 1.32 shows the focussing of the marginal and paraxial rays in case of a convex lens, while Fig. 1.33 shows the focussing of such rays in case of a concave lens. It follows that the focus for marginal rays (F_m) is closer to the optical centre than the focus for paraxial rays (F_p) is. Therefore, a lens of large aperture is unable to bring a parallel beam of light to a sharp focus at a point on its principal axis.

Thus spherical aberration is a defect in a lens of wide aperture due to its different focal lengths for the light refracted from different portions of its aperture. It follows that focal length of the lens for marginal rays (f_m) is less than that for paraxial rays (f_p). The difference in focal lengths for paraxial and marginal rays gives the measure of ***axial*** or ***longitudinal spherical aberration.*** Thus,

$$\text{longitudinal spherical aberration} = f_p - f_m \qquad ...(1.74)$$

Further, if a screen is moved between the points F_m and F_p, the size of the circular image (focus of parallel beam of light) goes on varying. However, it is minimum in the position AB. This circular image in position AB is called *circle of least confusion*. It gives the best position for the focus of the parallel beam of light. The variation in the size of the circular image is called ***lateral spherical aberration*** and the radius of the circle of least confusion gives the measure of lateral spherical aberration.

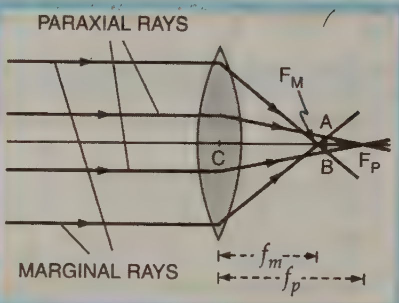

Fig. 1.32

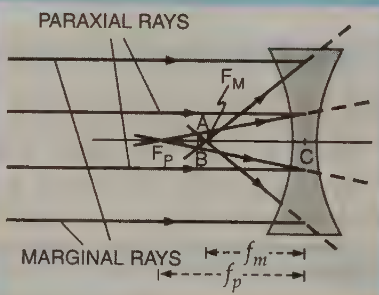

Fig. 1.33

Spherical aberration can be minimised by the following methods :

1. ***By using stops.*** Spherical aberration in a lens of wide aperture can be minimised by using stops so as to either allow paraxial rays or marginal rays to fall on the lens.

2. ***By placing the lens so that the total deviation is shared equally by the two surfaces of the lens.*** For example, in case of a plano-convex lens, spherical aberration is minimum, when its curved surface faces incident or emergent rays, whichever is more parallel to the principal axis.

3. ***By using two plano-convex lenses.*** The spherical aberration can be minimised by using two plano-convex lenses and placing them apart at a distance equal to the difference in their focal lengths.

SOLVED NUMERICAL PROBLEMS

Type A. On Laws of refraction

Problem 1.01. The refractive index of glass is 1·5. What is the speed of light in glass ? Speed of light in vacuum is $3 \cdot 0 \times 10^8$ m s^{-1}.

Sol. Here, $\mu = 1{\cdot}5$; $c = 3{\cdot}0 \times 10^8$ m s^{-1}

$$\text{Speed of light in glass, } v = \frac{c}{\mu} = \frac{3{\cdot}0 \times 10^8}{1{\cdot}5}$$

$$= 2{\cdot}0 \times 10^8 \text{ m s}^{-1}$$

Problem 1.02. Monochromatic light of wavelength 589 nm is incident from air on water surface. What are wavelength, frequency and speed of (*a*) reflected and (*b*) refracted light ? Refractive index of water is 1·33.

Sol. Here, $\mu = 1{\cdot}33$; wavelength of light in air,

$$\lambda_a = 589 \text{ nm} = 589 \times 10^{-9} \text{ m ;}$$

We know, velocity of light in air, $c = 3 \times 10^8$ m s^{-1}

(*a*) Wavelength of light on reflection remains unchanged. Therefore, wavelength of light after reflection,

$$= \mathbf{589 \text{ nm} = 589 \times 10^{-9} \text{ m}}$$

Since after reflection, light travels in the same medium (air),

velocity of light after reflection = $\mathbf{3 \times 10^8}$ **m s^{-1}**

Frequency of light after reflection,

$$\nu = \frac{c}{\lambda_a} = \frac{3\times10^8}{589\times10^{-9}} = \mathbf{5{\cdot}0934\times10^{14}\ Hz}$$

(b) On refraction, wavelength of light changes but its equency remains unchanged.

Therefore, after refraction, frequency of light,

$$\nu = \mathbf{5{\cdot}0934\times10^{14}\ Hz}$$

Let λ_w be the wavelength and v, velocity of light in water fter refraction).

Now, $$v = \frac{c}{\mu} = \frac{3\times10^8}{1\cdot33} = \mathbf{2{\cdot}256\times10^8\ m\ s^{-1}}$$

Also, $$\lambda_w = \frac{v}{\nu} = \frac{2\cdot256\times10^8}{5\cdot0934\times10^{14}}$$

$$= \mathbf{422{\cdot}93\times10^{-19}\ m = 422{\cdot}93\ nm}$$

ype B. On Lateral shift

Problem 1.03. A ray of light is incident at an angle of 0° on one face of a rectangular glass slab of thickness ·1 m and refractive index 1·5. Calculate the lateral shift roduced. *(Karnataka, 1983)*

Sol. Here, $i = 60°\ ;\ \mu = 1\cdot5\ ;\ t = 0\cdot1$ m

Now $$\mu = \frac{\sin i}{\sin r}$$

or $$\sin r = \frac{\sin i}{\mu} = \frac{\sin 60°}{1\cdot5} = \frac{0\cdot866}{1\cdot5} = 0\cdot5773$$

or $$r = 35°16'$$

Now, lateral shift, $$d = \frac{t}{\cos r}\sin(i - r)$$

$$\therefore \quad d = \frac{0\cdot1}{\cos 35°\,16'} = \sin(60° - 35°\,16')$$

$$= \frac{0\cdot1}{\cos 35°\,16'}\sin 24°\,44' = \frac{0\cdot1\times0\cdot4185}{0\cdot8164}$$

$$= \mathbf{0{\cdot}0513\ m}$$

Type C. On Compound refraction

Problem 1.04. Refractive indices of water and glass are 4/3 and 3/2 respectively. A ray of light travelling in water is incident on the water-glass interface at 30°. Calculate the angle of refraction. *(Karnataka, 1983)*

Sol. Here, refractive index of glass, ${}^a\mu_g = 4/3$;
refractive index of water, ${}^a\mu_w = 3/2$
Now, ${}^a\mu_w \times {}^w\mu_g = {}^a\mu_g$
Therefore, refractive index of glass *w.r.t.* water,

$${}^w\mu_g = \frac{{}^a\mu_g}{{}^a\mu_w} = \frac{3/2}{4/3} = 1\cdot125$$

Further, the angle of incidence, $i = 30°$
If r is the angle of refraction, then

$$\frac{\sin i}{\sin r} = 1\cdot125$$

or $$\sin r = \frac{\sin 30°}{1\cdot125} = \frac{0\cdot5}{1\cdot125} = 0\cdot4444$$

or $$\mathbf{r = 26°\ 23'}$$

Type D. On Real and Apparent depths

Problem 1.05. A small pin fixed on a table top is viewed from above from a distance of 50 cm. By what distance would the pin appear to be raised, if it is viewed from the same point through a 15 cm thick glass slab held parallel to the table ? Refractive index of glass = 1·5. Does the answer depend on the location of the slab ? *(Text Problem)*

Sol. The normal shift in the position of the pin is given by

$$d = t\left(1 - \frac{1}{\mu}\right)$$

Here, real thickness of glass slab,

$$d = 15\left(1 - \frac{1}{1\cdot5}\right) = 15\left(\frac{1\cdot5 - 1}{1\cdot5}\right) = \mathbf{5\ cm}$$

The answer **does not depend** upon the location of the slab.

Problem 1.06. Velocity of light in glass is 2×10^8 m s^{-1} and that in air is 3×10^8 m s^{-1}. By how much would an ink dot appear to be rasied, when covered by a glass plate 6·0 cm thick ? *(P.S.S.C.E. 1999, 1997 S)*

Sol. Here, velocity of light in air, $c = 3\times10^8$ m s^{-1}
velocity of light in glass, $v = 2\times10^8$ m s^{-1}
Therefore, refractive index of glass *w.r.t.* air,

$$\mu = \frac{c}{v} = \frac{3\times10^8}{2\times10^8} = 1\cdot5$$

Normal shift in the position of ink dot, $d = t\left(1 - \frac{1}{\mu}\right)$

Here, thickness of the glass plate, $t = 6\cdot0$ cm

$$\therefore\ d = 6\cdot0\left(1 - \frac{1}{1\cdot5}\right) = \frac{6\cdot0\times0\cdot5}{1\cdot5} = \mathbf{2{\cdot}0\ cm}$$

Problem 1.07. A tank is filled with water to a height of 12·5 cm. The apparent depth of a needle lying at the bottom of the tank is measured by a microscope to be 9·4 cm. What is the refractive index of water ? If water is replaced by a liquid of refractive index 1·63 up to the same height, by what distance would the microscope have to be moved to focus on the needle again ? *(H.P.S.S.C.E. 2000 ; Text Problem)*

Sol. ***When tank is filled with water :***

Real depth = 12·5 cm ; apparent depth = 9·4 cm ;

$$\therefore \quad \mu = \frac{\text{real depth}}{\text{apparent depth}} = \frac{12\cdot5}{9\cdot4} = \mathbf{1{\cdot}33}$$

When tank is filled with the liquid :

Real depth = 12·5 cm ; $\mu = 1\cdot63$;

Therefore, apparent depth $$= \frac{\text{real depth}}{\mu} = \frac{12\cdot5}{1\cdot63}$$

$$= 7\cdot67\text{ cm}$$

Therefore, distance through which microscope has to be moved = 9·4 – 7·67 = **1·73 cm**

Problem 1.08. A mark is made at the bottom of a beaker and a microscope is focussed on it. The microscope is then raised through 0·015 m. To what height water must be poured into the beaker to bring the mark again into focus ? Given, ${}^a\mu_w = 4/3$. *(Karnataka, 1984)*

Sol. Here, $${}^a\mu_w = \frac{4}{3}$$

The microscope was focussed directly on the mark over the beaker. On raising the microscope through 0·015 m, the mark no longer remains in focus. It will again come into focus, if the mark gets raised exactly through 0·015 m on pouring water into the beaker. Therefore,

normal shift, $d = 0\cdot015$ m

If t is the height upto which water must be poured into the beaker, then

$$\text{normal shift, } d = t\left(1 - \frac{1}{{}^a\mu_w}\right)$$

or $$0{\cdot}015 = t\left(1 - \frac{1}{4/3}\right) = t\left(1 - \frac{3}{4}\right)$$

or $$t = 0{\cdot}06 \text{ m}$$

Problem 1.09. What is the apparent position of an object below a rectangular block of glass 6 cm thick [Fig. 1.34], if a layer of water 4 cm thick is on top of the glass ? Given, ${}^a\mu_g = 3/2$ and ${}^a\mu_w = 4/3$.

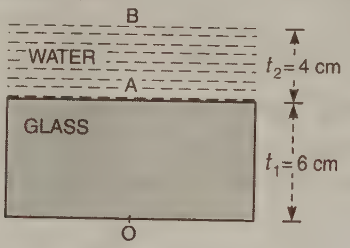

Fig. 1.34

Sol. Here, ${}^a\mu_g = 1{\cdot}5$, ${}^a\mu_w = 1{\cdot}33$

The object O will appear to be raised due to normal shifts produced by water and glass.

The normal shift in the position of the object due to glass,

$$d_1 = t_1\left(1 - \frac{1}{{}^a\mu_g}\right) = 6\left(1 - \frac{1}{3/2}\right) = 2 \text{ cm}$$

The normal shift in the position of the object due to water,

$$d_2 = t_2\left(1 - \frac{1}{{}^a\mu_w}\right) = 4\left(1 - \frac{1}{4/3}\right) = 1 \text{ cm}$$

Therefore, object will appear to be displaced in upward direction through the distance,

$$d = d_1 + d_2 = 2 + 1 = 3 \text{ cm}$$

Type E. On Total internal reflection

Problem 1.10. A glass slab is immersed in water. Find the critical angle at glass-water interface. Given, ${}^a\mu_g = 1{\cdot}5$ and ${}^a\mu_w = 1{\cdot}33$. *(P.S.S.C.E. 1996)*

Or

Find the critical angle for a glass-water interface, if refractive index of glass is 3/2 and that of water is 4/3. *(Karnataka, 1986)*

Sol. Here, refractive index of glass = 1·5 ;
refractive index of water = 1·33

Therefore, the refractive index of glass *w.r.t.* water

$$= \frac{1{\cdot}5}{1{\cdot}33} = 1{\cdot}1278$$

If C is critical angle for glass-water interface, then

$$\frac{1}{\sin C} = 1{\cdot}1278 \text{ or } \sin C = \frac{1}{1{\cdot}1278} = 0{\cdot}8867$$

or $$C = 62°27'$$

Problem 1.11. Calculate the critical angle for a glass-air surface, if a ray of light which is incident in air on the surface is deviated through 15°, when its angle of incidence is 40°. *(I.S.C.E. 1993)*

Sol. Fig. 1.35 shows a ray of light AB incident on a glass-air surface at an angle of incidence, $i = 40°$. The ray is refracted along BC, so that deviation in its path *i.e.* ∠ QBC = 15°.

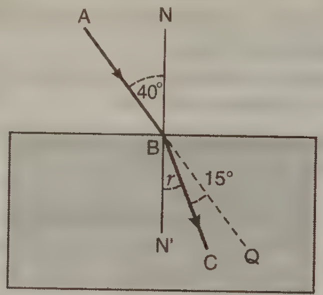

Fig. 1.35

Obviously, angle of refraction,

$$r = \angle CBN' = 40° - 15° = 25°$$

If μ is refractive index of glass *w.r.t.* air, then

$$\mu = \frac{\sin i}{\sin r} = \frac{\sin 40°}{\sin 25°} = \frac{0{\cdot}6428}{0{\cdot}4226} = 1{\cdot}52$$

If C is critical angle for glass-air surface, then

$$\mu = \frac{1}{\sin C} \text{ or } \sin C = \frac{1}{\mu} = \frac{1}{1{\cdot}52} = 0{\cdot}6579$$

or $$C = 41{\cdot}1°$$

Problem 1.12. A liquid of refractive index 1·5 is poured into a cylindrical jar of radius 20 cm upto a height of 20 cm. A small bulb is lighted at the centre of the bottom of the jar. Find the area of the liquid surface through which the light of the bulb passes into air. *(I.S.C.E. 1998)*

Sol. The point L shows the position of bulb at the bottom of jar containing liquid ($\mu = 1{\cdot}5$) up to the height h (= 20 cm). The light will emerge out through the largest area *i.e.* through a circle of maximum radius OA = OB = r, if on refraction at liquid-air interface, it comes out parallel to the surface [Fig 1.36].

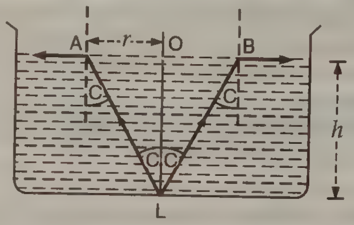

Fig. 1.36

It will happen so, if the angle of incidence for the rays of light incident at the points on the circumference of the circle of radius r is equal to the critical angle for liquid-air interface. If C is the critical angle, then

$$\mu = \frac{1}{\sin C}$$

or $$\sin C = \frac{1}{\mu} = \frac{1}{1{\cdot}5} = 0{\cdot}6667$$

or $$C = 41{\cdot}8°$$

From the right angled Δ AOL, we have

$$\tan C = \frac{OA}{OL} = \frac{r}{h} \quad \text{or} \quad r = h \tan C$$

or $$r = 20 \times \tan 41{\cdot}8° = 20 \times 0{\cdot}8941 = 17{\cdot}882 \text{ cm}$$

Therefore, the required surface area

$$= \pi r^2 = \pi \times (17\cdot882)^2 = \mathbf{1004\cdot6\ cm^2}$$

Problem 1.13. A narrow beam of light is incident normally on one face of an equiangular glass prism of refractive index 1·45. When the prism is immersed in a suitable liquid, the ray makes a grazing emergence along the other face. Find the refractive index of this liquid and draw a diagram showing the path of rays. (*I.S.C.E. 1997*)

Sol. Fig. 1.37 shows an equiangular glass prism ABC, such that ∠A = 60°.

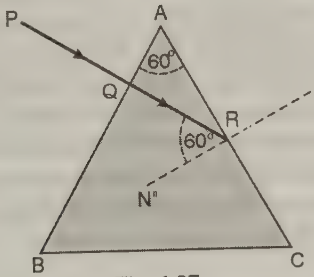

Fig. 1.37

When a narrow beam of light is incident normally on the face AB of the prism along PQ, it will proceed as such. It will come to meet the face AC at point R, so that the angle C of incidence inside the prism *i.e.* ∠ PRN′ = 60°as shown in the figure.

Since the beam of light makes a grazing emergence along the face AC, the ∠PRN′ = 60°corresponds to critical angle C for the material of prism, when placed in the liquid. If $^l\mu_g$ is refractive index of the material of the prism *w.r.t.* liquid, then

$$^l\mu_g = \frac{1}{\sin C} = \frac{1}{\sin 60°} = \frac{1}{0\cdot866} = 1\cdot155$$

Let $^a\mu_l$ be refractive index of the liquid. Then,

$$^l\mu_g = \frac{^a\mu_g}{^a\mu_l}$$

or $$^a\mu_l = \frac{^a\mu_g}{^l\mu_g} = \frac{1\cdot45}{1\cdot155} = \mathbf{1\cdot255}$$

Type E. On optical fibre

Problem 1.14. Fig. 1.38 shows a cross-section of a light pipe made of glass fibre of refractive index 1·68. The outer coating of the pipe is made of a material of refractive index 1·44. What is the range of angles of the incident rays with the axis of the pipe for which total internal reflection inside the pipe takes place as shown ? (*Text Problem*)

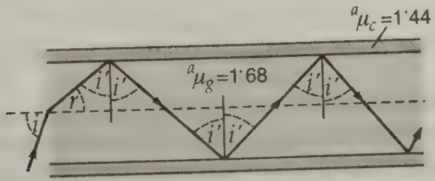

Fig. 1.38

Sol. Here, refractive index of the glass fibre *w.r.t.* air,

$$^a\mu_g = 1\cdot68$$

and refractive index of the outer coating material *w.r.t* air,

$$^a\mu_c = 1\cdot44$$

Let C be the critical angle for the fibre material *w.r.t.* the material of the outer coating. Then, refractive index of glass fibre *w.r.t.* the coating material is given by

$$^c\mu_g = \frac{1}{\sin C} \qquad ...(i)$$

Also, $$^c\mu_g = \frac{^a\mu_g}{^a\mu_c} = \frac{1\cdot69}{1\cdot44} = 1\cdot167 \qquad ...(ii)$$

From equations (*i*) and (*ii*), we have

$$\sin C = \frac{1}{1\cdot67} = 0\cdot8569$$

or $$C = 58\cdot97°$$

Suppose that a ray of light travelling in air makes an angle *i* with the axis of the pipe and is refracted at angle *r* [Fig. 1.38]. Further, suppose that the refracted ray comes to incident on the glass fibre-coating interface at angle *i′*. The total reflection will occur, if angle *i′* is equal to or greater than the critical angle C (= 58·97°) for the glass fibre and coating interface. Thus, *r* will be maximum, when *i′* = C.

Therefore, the maximum value of *r* is given by

$$r = 90° - 58\cdot97° = 31\cdot03°$$

Now, refractive index of glass-fibre *w.r.t.* air is given by

$$^a\mu_g = \frac{\sin i}{\sin 31\cdot03°} = 1\cdot68$$

or $\sin i = 1\cdot68 \times \sin 31\cdot03° = 1\cdot68 \times 0\cdot5155 = 0\cdot8660$

or $i = 60°$

This is the maximum value of *i*. Thus, all rays having ***angle of incidence between* 0° *to* 60°** will suffer total internal reflection.

Type F. On Refraction from Spherical refracting surfaces

Problem 1.15. What curvature must be given to the bounding surface of a refracting medium (μ = 1·5) for the virtual image of an object in the adjacent medium (μ = 1) at 10 cm to be formed at a distance of 40 cm ?

Sol. Let R be the radius of curvature of the refracting surface. When object lies in rarer medium,

$$-\frac{\mu_1}{u} + \frac{\mu_2}{v} = \frac{\mu_2 - \mu_1}{R}$$

Here, $\mu_1 = 1$; $\mu_2 = 1\cdot5$; $u = -10$ cm ; $v = -40$ cm

$$\therefore \quad -\frac{1}{-10} + \frac{1\cdot5}{-40} = \frac{1\cdot5 - 1}{R} \quad \text{or} \quad \frac{0\cdot5}{R} = \frac{1}{10} - \frac{1\cdot5}{40}$$

or **R = + 8 cm (convex)**

Problem 1.16. A small point object is placed in air at a distance of 60 cm from the convex spherical refracting surface of refractive index 1·5. If radius of curvature of the spherical surface is 25 cm, calculate the position of the image and the power of the refracting surface.

Sol. When object is placed in air, the relation between *u*, *v* and R is given by

$$-\frac{\mu_1}{u} + \frac{\mu_2}{v} = \frac{\mu_2 - \mu_1}{R}$$

Here, $u = -60$ cm ; R = + 25 cm ; $\mu_1 = 1$; $\mu_2 = 1\cdot5$

$$\therefore \quad -\frac{1}{-60} + \frac{1\cdot5}{v} = \frac{1\cdot5 - 1}{+25}$$

or $$\frac{1\cdot5}{v} = \frac{0\cdot5}{25} - \frac{1}{60} = \frac{1}{300}$$

∴ $\mathbf{v = +\,450\ cm}$

As *v* is positive, the image will be formed on the *other side* of the object *i.e.* a ***real image*** will be formed inside the refracting denser medium.

Power of the refracting surface, $P=\frac{\mu_2-\mu_1}{R}$

As $\quad R=+25\text{ cm}=+0\cdot25\text{ m}$, we have

$$P=\frac{(1\cdot5-1)}{+0\cdot25}=\frac{0\cdot5}{0\cdot25}=\mathbf{2\ dioptre}$$

Problem 1.17. A spherical surface of radius of curvature R separates air (refractive index 1·0) from glass (refractive index 1·5). The centre of curvature is in the glass. A point object P placed in air is found to have a real image Q in the glass. The line PQ cuts the surface at a point O and PO = OQ. Find the distance of object from the spherical surface. *(I.I.T. 1998)*

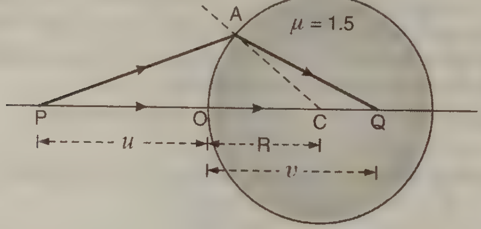

Fig. 1.39

Ans. Here, $\quad \mu=1\cdot5$; PO = OQ = x (say)

As shown in Fig. 1.39, refraction takes place from rarer to denser medium. Therefore,

$$-\frac{1}{u}+\frac{1}{v}=\frac{\mu-1}{R}$$

It follows that

$$u=-x\,;\,v=x$$

$$\therefore \quad -\frac{1}{x}+\frac{1\cdot5}{x}=\frac{1\cdot5-1}{R}$$

or $\quad \frac{0\cdot5}{R}=\frac{2\cdot5}{x}$

or $\quad x=\mathbf{5\,R}$

Problem 1.18. A small piece of paper stuck on a glass sphere of 5 cm radius is viewed through the glass from the position directly opposite. Find the position of the image. Refractive index of glass is 1·5.

Sol. The piece of paper stuck at point O will serve as the object. Its virtual image will be formed by the sphere as shown in the Fig. 1.40.

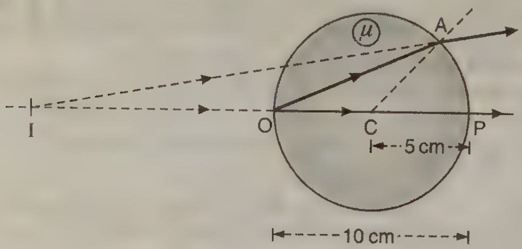

Fig. 1.40

When object lies in denser medium *i.e.* incident ray travels in the denser medium, the relation between u, v and R is given by

$$-\frac{\mu_2}{u}+\frac{\mu_1}{v}=\frac{\mu_1-\mu_2}{R}$$

Here, $\mu_1=1$; $\mu_2=1\cdot5$; $u=-10$ cm and $R=-5$ cm

$$\therefore \quad -\frac{1\cdot5}{-10}+\frac{1}{v}=\frac{1-1\cdot5}{-5}$$

or $\quad \frac{3}{20}+\frac{1}{v}=\frac{1}{10} \quad$ or $\quad \frac{1}{v}=\frac{1}{10}-\frac{3}{20}=-\frac{1}{20}$

or $\quad v=\mathbf{-\,20\ cm}$

The negative sign shows that the image will be formed on the *same side* of the object *i.e.* a ***virtual*** image will be formed in the rarer medium as shown in the figure.

Problem 1.19. Fig. 1.41 shows a solid glass sphere of radius 5 cm that has a small air bubble O trapped at a distance 2 cm from the centre C. The refractive index of the material of glass is 1·5. Find the apparent position of the bubble where it will appear, when seen through the surface of the sphere from an outside point E. *(I.S.C.E. 1998)*

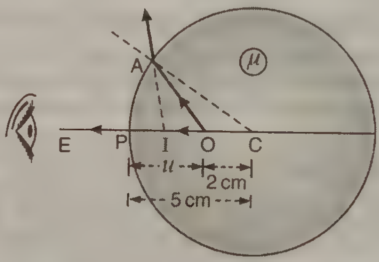

Fig. 1.41

Sol. The course of rays giving the apparent position I of the air bubble O trapped inside the glass sphere will be as shown in the figure.

Here, $\quad \mu=1\cdot5$; $R=-5$ cm ; OC = 2 cm

$\therefore \quad u=-\text{PO}=-(\text{PC}-\text{OC})=-(5-2)=-3$ cm

Let PI = v be the distance of the apparent position of air bubble from the surface of glass sphere.

As the incident ray travels inside the glass, we have

$$-\frac{\mu}{u}+\frac{1}{v}=\frac{1-\mu}{R}$$

$\therefore \quad -\frac{1\cdot5}{-3}+\frac{1}{v}=\frac{1-1\cdot5}{-5} \quad$ or $\quad \frac{1}{2}+\frac{1}{v}=\frac{1}{10}$

or $\quad \frac{1}{v}=\frac{1}{10}-\frac{1}{2}=-\frac{4}{10}$

or $\quad v=\mathbf{-\,2\cdot5\ cm}$

Problem 1.20. A small air bubble within a glass sphere of radius 0·02 m appears to be 0·01 m below the surface, when looked along a diameter containing the bubble. Find the real depth of the bubble along the line of sight. Given, μ = 1·54.

Sol. Let O be the air bubble inside the glass sphere. Due to refraction, it will appear to be at point I as shown in Fig. 1.42.

Here, R = – 0·02 m, μ = 1·54, v = – 0·01 m

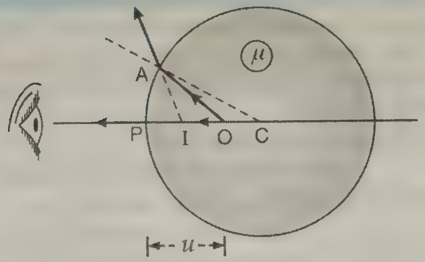

Fig. 1.42

Let u be the real depth of the air bubble.

As the incident ray travels inside the glass, we have

$$-\frac{\mu}{u}+\frac{1}{v}=\frac{1-\mu}{R}$$

or $$-\frac{1\cdot 54}{u}+\frac{1}{-0\cdot 01}=\frac{1-1\cdot 54}{-0\cdot 02}$$

or $$\frac{1\cdot 54}{u}=-27-100=-127$$

or $$u=-\frac{1\cdot 54}{127}=-\mathbf{0\cdot 0121\ m}$$

Problem 1.21. An empty spherical flask of diameter 15 cm is placed in water of refractive index 4/3. A parallel beam of light strikes the flask. Where does it get focussed, when observed from within the flask ?

Sol. Fig. 1.43 shows a spherical flask placed inside water. As such, the flask inside water behaves as a concave spherical surface. The centre of the flask is the centre of curvature of the concave spherical surface. A parallel beam of light striking on the flask will diverge and the beam of light will appear to come from point I as shown in the figure.

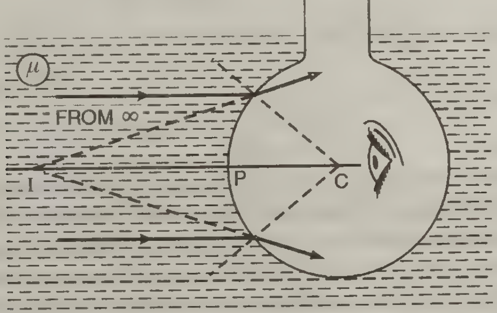

Fig. 1.43

Here, $u=-\infty\,;\ R=+\frac{15}{2}\text{ cm}\,;\ \mu=\frac{4}{3}\,;$

As incident ray travels in denser medium, we have

$$-\frac{\mu}{u}+\frac{1}{v}=\frac{1-\mu}{R}$$

$$\therefore \quad -\frac{4/3}{-\infty}+\frac{1}{v}=\frac{1-4/3}{15/2}$$

or $$v=\frac{-45}{2}=-\mathbf{22\cdot 5\ cm}$$

As v is negative, the image will be formed on the same side of the object *i.e.* the side from which the parallel beam of light is incident on the flask. Therefore, the parallel beam of light will appear to come from point I as shown in the figure.

Type G. On Lens Maker's formula

Problem 1.22. A binoconvex lens with both faces of the same radius of curvature is to be manufactured from a glass of refractive index 1·55. What should be the radius of curvature for the focal length of the lens to be 20 cm ? (*H.S.S.C.E. 2002*)

Sol. Here, μ = 1·55 ; f = + 20 cm ;

Suppose that R_1 = + R. Then, R_2 = – R

Now, $$\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

$$\therefore \quad \frac{1}{+20}=(1\cdot 55-1)\left(\frac{1}{R}-\frac{1}{-R}\right)=0\cdot 55\times\frac{2}{R}$$

or R = 40 × 0·55 = **22·0 cm**

Problem 1.23. Find the radius of curvature of the convex surface of a plano convex lens, whose focal length is 0·3 m and the refractive index of the material of the lens is 1·5. (*I.C.S.E. 1998*)

Ans. Here, μ = 1·5 ; f = 0·3 m

Suppose that radius of curvature of one surface is R_1 = R

Then, radius of curvature of the other surface will be

$R_2 = -\infty$

Now, $$\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

or $$\frac{1}{0\cdot 3}=(1\cdot 5-1)\left(\frac{1}{R}-\frac{1}{-\infty}\right)$$

or $0\cdot 5\left(\frac{1}{R}\right)=\frac{1}{0\cdot 3}$ or **R = 0·15 m**

Problem 1.24. The radius of curvature of either face of a convex lens is equal to its focal length. What is the refractive index of its material ?

Sol. Let f be the focal length of the lens.

Therefore, $$\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

Here $R_1=+f\,;\ R_2=-f$

$$\therefore \quad \frac{1}{f}=(\mu-1)\left(\frac{1}{+f}-\frac{1}{-f}\right)$$

or $2(\mu-1)=1$ or μ = **1·5**

Problem 1.25. A double convex lens has radii 20 cm. The refractive index of glass is 1·5. Compute the focal length of this lens in air and when immersed in carbon disulphide of refractive index = 1·63.

Sol. Here, ${}^a\mu_g$ = 1·5 ; ${}^a\mu_c$ = 1·63 ;

R_1 = + 20 cm, R_2 = – 20 cm

Focal length of the lens in air is given by

$$\frac{1}{f_{air}}=({}^a\mu_g-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

$$=(1\cdot 5-1)\left(\frac{1}{20}-\frac{1}{-20}\right)=0\cdot 5\times\frac{1}{10}=\frac{1}{20}$$

or f_{air} = **20 cm**

If f_c is focal length of the lens, when immersed in carbon disulphide and ${}^c\mu_g$, the refractive index of glass *w.r.t.* carbon disulphide, then

$$\frac{1}{f_c} = ({}^{c}\mu_g - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

Now, $${}^{c}\mu_g = \frac{{}^{a}\mu_g}{{}^{a}\mu_c} = \frac{1\cdot5}{1\cdot63}$$

$$\therefore \quad \frac{1}{f_c} = \left(\frac{1\cdot5}{1\cdot63} - 1\right)\left(\frac{1}{20} - \frac{1}{-20}\right) = -\frac{0\cdot13}{1\cdot63} \times \frac{1}{10}$$

or $$f_c = -\frac{1\cdot63 \times 10}{0\cdot13} = -\mathbf{125{\cdot}4\ cm}$$

Problem 1.26. A convex lens of focal length 0·2 m and made of glass ($\mu = 1{\cdot}50$) is immersed in water ($\mu = 1{\cdot}33$). Find the change in the focal length of the lens.

(C.B.S.E. 1991 ; P.S.S.C.E. 1991)

Sol. Here, $f_{air} = 0{\cdot}2$ m ; ${}^{a}\mu_g = 1{\cdot}50$

Now, $$\frac{1}{f_{air}} = \left({}^{a}\mu_g - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

$$\therefore \quad \frac{1}{0\cdot2} = (1\cdot50 - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) \quad \text{or} \quad \frac{1}{R_1} - \frac{1}{R_2} = 10$$

Let f_w be the focal length of the lens, when immersed in water and ${}^{w}\mu_g$ be refractive index of glass *w.r.t.* water. Then,

$${}^{w}\mu_g = \frac{{}^{a}\mu_g}{{}^{a}\mu_w} = \frac{1\cdot50}{1\cdot33} = 1\cdot128$$

Now, $$\frac{1}{f_w} = ({}^{w}\mu_g - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

$$= (1\cdot128 - 1) \times 10 = 1\cdot28$$

or $$f_w = \frac{1}{1\cdot28} = \mathbf{0{\cdot}78\ m}$$

Therefore, change in focal length,

$$f_w - f_{air} = 0{\cdot}78 - 0{\cdot}2 = \mathbf{0{\cdot}58\ m}$$

Problem 1.27. Explain what happens, when a convex lens of refractive index 1·2 is immersed in a liquid of refractive index 1·3.

Ans. Let f be focal length of lens. Then,

$$\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) = (1\cdot2 - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

$$= 0\cdot2\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

or $$\frac{1}{R_1} - \frac{1}{R_2} = \frac{1}{0\cdot2 \times f} \qquad ...(i)$$

If f' is focal length of lens, when immersed in liquid, then

$$\frac{1}{f'} = (\mu' - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right),$$

where $\mu' = \frac{1\cdot2}{1\cdot3}$ is the refractive index of the material of lens *w.r.t.* liquid.

$$\therefore \quad \frac{1}{f'} = \left(\frac{1\cdot2}{1\cdot3} - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) = \frac{-1}{13}\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

Using equation (*i*), we have

$$\frac{1}{f'} = \frac{-1}{13} \times \frac{1}{0\cdot2 \times f} \quad \text{or} \quad f' = -\mathbf{2{\cdot}6}\,f$$

Type H. On Lens equation

Problem 1.28. A beam of light converges to point P. A lens is placed in the path of the convergent beam 12 cm from P. At what point does the beam converge, if the lens is (*a*) a convex lens of focal length 20 cm (*b*) a concave lens of focal length 20 cm ?

Sol. (*a*) Here, $f = +20$ cm ;

$u = +12$ cm (distance of virtual object)

From the lens equation we, have

$$\frac{1}{v} = \frac{1}{f} + \frac{1}{u} = \frac{1}{+20} + \frac{1}{+12} = \frac{3+5}{60} = \frac{8}{60}$$

or $$v = +7\cdot5 \text{ cm}$$

As v is positive, the beam will still converge (after refraction through the lens) at a point at distant **7·5 cm** from the lens.

(*b*) Here, $f = -20$ cm ; $u = +12$ cm

Again, from the lens equation,

$$\frac{1}{v} = \frac{1}{f} + \frac{1}{u} = \frac{1}{-20} + \frac{1}{+12} = \frac{-3+5}{60} = \frac{2}{60} = +30 \text{ cm}$$

As v is positive, the beam will still converge (after refraction through the lens) at a point at distance **30 cm** from the lens.

Problem 1.29. A convergent beam of light passes through a diverging lens of focal length 0·2 m and comes to focus at distance 0·3 m behind the lens. Find the position of the point at which the beam would converge in the absence of the lens. *(C.B.S.E. Question Paper)*

Sol. Here, $f = -0\cdot2$ m (diverging lens)

$v = +0\cdot3$ m

($\because$ image distance is along the incident light)

From the lens equation,

$$-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$$

or $$\frac{1}{u} = \frac{1}{v} - \frac{1}{f} = \frac{1}{+0\cdot3} - \frac{1}{-0\cdot2} = \frac{1}{0\cdot3} + \frac{1}{0\cdot2} = \frac{50}{6}$$

or $$u = +0\cdot12 \text{ m}$$

In the absence of lens, the beam would converge at a point at a distance **0·12 m** from the present position of the lens.

Problem 1.30. A needle 10 cm long is placed along the axis of a convex lens of focal length 10 cm such that the middle point of the needle is at a distance of 20 cm from the lens. Find the length of the image of the needle.

(Karnataka, 1992)

Sol. Here, the focal length of the lens, $f = +10$ cm

Suppose that the needle AB of length 10 cm is placed along the axis of the lens [Fig. 1.44], so that the distance of the centre of the needle from the lens *i.e.* CO = 20 cm

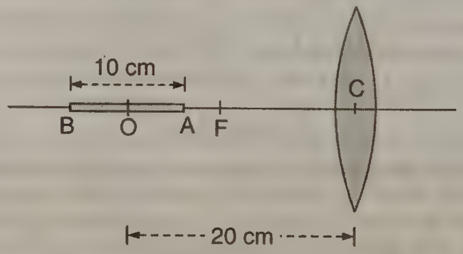

Fig. 1.44

For the end of the needle A :

$$u = -CA = -(CO - OA)$$
$$= -(20 - 5) = -15 \text{ cm}$$

Let v_1 be the distance, at which the image of the end A is formed. Then,

$$\frac{1}{v_1} = \frac{1}{f} + \frac{1}{u} = \frac{1}{10} + \frac{1}{-15}$$

or $\quad v_1 = 30$ cm

For the end of the needle B :

$$u = -CB = -(CO + OB) = -(20 + 5) = -25 \text{ cm}$$

Let v_2 be the distance at which the image of the end B is formed. Then,

$$\frac{1}{v_2} = \frac{1}{f} + \frac{1}{u} = \frac{1}{10} + \frac{1}{-25}$$
$$v_2 = 16 \cdot 67 \text{ cm}$$

Therefore, length of the image of the needle,

$$v_1 - v_2 = 30 - 16 \cdot 67 = \mathbf{13{\cdot}33 \text{ cm}}$$

Problem 1.31. A double convex lens has 10 cm and 15 cm as its two radii of curvatures. The image of an object, placed 30 cm from the lens, is formed at 20 cm from the lens on the other side. Find the refractive index of the material of the lens. What will be the focal length ? What will be the focal length of the lens, if it is immersed in water of refractive index 1·33 ? *(I.S.C.E. 1995)*

Sol. Here, $u = -30$ cm ; $v = 20$ cm ; $R_1 = 10$ cm ; $R_2 = -15$ cm

If f is focal length of the lens, then

$$\frac{1}{f} = -\frac{1}{u} + \frac{1}{v} = -\frac{1}{-30} + \frac{1}{20} = \frac{1}{30} + \frac{1}{20} = \frac{5}{60}$$
$$f = \frac{60}{5} = \mathbf{12 \text{ cm}}$$

Let ${}^a\mu_g$ be the refractive index of the material of the lens *w.r.t.* air. Then,

$$\frac{1}{f} = ({}^a\mu_g - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

or
$$\frac{1}{12} = ({}^a\mu_g - 1)\left(\frac{1}{10} - \frac{1}{-15}\right)$$
$$= ({}^a\mu_g - 1)\left(\frac{1}{10} + \frac{1}{15}\right) = ({}^a\mu_g - 1) \times \frac{1}{6}$$

or
$${}^a\mu_g = 1 + \frac{6}{12} = \mathbf{1{\cdot}5}$$

If f_w is focal length of the lens, when immersed in water, then

$$\frac{1}{f_w} = ({}^w\mu_g - 1) = \left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

Here, ${}^w\mu_g$ is refractive index of glass *w.r.t.* water.

$$\therefore \quad \frac{1}{f_w} = \left(\frac{{}^a\mu_g}{{}^a\mu_g} - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$
$$= \left(\frac{1 \cdot 5}{1 \cdot 33} - 1\right)\left(\frac{1}{10} - \frac{1}{-15}\right) = \frac{0 \cdot 17}{1 \cdot 33} \times \frac{1}{6}$$

or
$$f_w = \frac{1 \cdot 33 \times 6}{0 \cdot 17} = \mathbf{46{\cdot}94 \text{ cm}}$$

Type I. On Linear magnification

Problem 1.32. A convex lens of focal length 0·12 m produces an image, which is three times as long as the object. Find the distance between the object and the lens for a real image. *(Karnataka, 1986)*

Sol. Here, $f = +0{\cdot}12$ m,

As image formed is real *i.e.* inverted, $m = -3$

Now, $\quad m = \dfrac{f}{u + f}$

$$\therefore \quad -3 = \frac{0 \cdot 12}{u + 0 \cdot 12} \quad \text{or} \quad u + 0{\cdot}12 = -0{\cdot}04$$

or $\quad \mathbf{u = -0{\cdot}16 \text{ m}}$

Problem 1.33. A convex lens is to be used to throw on a screen 10 m from the lens, a magnified image of an object. If the magnification is to be 19, find the focal length of the lens. *(Karnataka, 1984)*

Sol. As the convex lens forms the image on the screen, the image formed is real *i.e.* inverted.

$$\therefore \quad m = -19$$

Further, as the image lies on the other side of the object, the distance of the image is positive *i.e.*

$$v = +10 \text{ cm}$$

Now $\quad m = \dfrac{f - v}{f}$

$$\therefore \quad -19 = \frac{f - 10}{f} \quad \text{or} \quad -19f = f - 10$$

or $\quad \mathbf{f = 0{\cdot}5 \text{ m}}$

Problem 1.34. The image obtained with a convex lens is erect and its length is four times the length of the object. If the focal length of the lens is 20 cm, calculate the object and image distance. *(H.S.S.C.E. 1996, 1992 ; P.S.S.C.E. 1996)*

Sol. As the image formed is erect and hence virtual, the magnification produced by the lens is positive *i.e.* $m = +4$

Also $\quad f = +20$ cm

Now, $\quad m = \dfrac{f}{u - f}$

$$\therefore \quad 4 = \frac{20}{u + 20} \quad \text{or} \quad u + 20 = 5$$

or $\quad \mathbf{u = -15 \text{ cm}}$

Again, $\quad m = \dfrac{f - v}{f} \quad \therefore \quad 4 = \dfrac{20 - v}{20}$

or $\quad v = 20 - 80 = \mathbf{-60 \text{ cm}}$

Problem 1.35. A needle placed 45 cm from a lens forms an image on a screen placed 90 cm on the other side of the lens. Identify the type of the lens and determine its focal length. What is the size of the image, if the size of needle is 15·0 cm ? *(P.S.S.C.E. 2000, 1999, 1996 S ; C.B.S.E. 1990)*

Sol. Here, O = 5 cm ; $u = -45$ cm ; $v = +90$ cm

Now, for a lens, $\quad -\dfrac{1}{u} + \dfrac{1}{v} = \dfrac{1}{f}$

$$\therefore \quad -\frac{1}{-45} + \frac{1}{90} = \frac{1}{f} \quad \text{or} \quad \frac{1}{f} = \frac{1}{90} + \frac{1}{45} = \frac{3}{90}$$

or $\quad \mathbf{f = +30 \text{ cm}}$

As f is positive, it is a **convex lens**.

Also, $m = \frac{I}{O} = \frac{v}{u}$

∴ $\frac{I}{5} = \frac{+90}{-45}$ or $I = -10$ cm

The negative sign shows that the image formed is *inverted*.

Problem 1.36. An object of size 3·0 cm is placed 14 cm in front of a concave lens of focal length 21 cm. Describe the image produced by the lens. What happens, if the object is moved farther from the lens ?

Sol. Here, $O = +3{\cdot}0$ cm ; $u = -14$ cm ; $f = -21$ cm

Now, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$

∴ $\frac{1}{v} = \frac{1}{f} + \frac{1}{u} = \frac{1}{-21} + \frac{1}{-14} = -\frac{1}{21} - \frac{1}{14}$

or $v = -8{\cdot}4$ **cm**

As v is negative, the image is **formed on the same side of the object** and like wise, the image is **virtual**.

Now, $m = \frac{I}{O} = \frac{v}{u}$

∴ $I = O \times \frac{v}{u} = 3{\cdot}0 \times \frac{-8{\cdot}4}{-14} = +1{\cdot}8$ **cm**

The positive sign shows that the image formed is *erect*.

When *the object is moved away* from the lens, *the virtual image moves away from the lens and towards the focus of the lens* (but never beyond the focus) and progressively *decreases in size*.

Type J. On Power of lens

Problem 1.37. A convex lens is made of glass of refractive index 1·5. If radius of curvature of the each of its two surfaces is 20 cm, find the ratio of the power of the lens, when placed in air to its power, when immersed inside a liquid of refractive index 1·25.

Sol. Here, $R_1 = 20$ cm $= 0{\cdot}20$ m ; $R_2 = -20$ cm $= -0{\cdot}2$ m,

When lens is placed in air : If P_1 is power of the lens when placed in air, then

$$P_1 = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) = (1{\cdot}5 - 1)\left(\frac{1}{0{\cdot}2} - \frac{1}{-0{\cdot}2}\right)$$
$$= 0{\cdot}5\,(5 + 5) = 5\text{ D}$$

When lens is placed inside the liquid : If μ' is refractive index of the material of the lens *w.r.t.* the liquid, then power of the lens, when placed inside the liquid is given by

$$P_2 = (\mu' - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

Here, $\mu' = \frac{1{\cdot}5}{1{\cdot}25} = 1{\cdot}2$

∴ $P_2 = (1{\cdot}2 - 1)\left(\frac{1}{0{\cdot}2} - \frac{1}{-0{\cdot}2}\right) = 0{\cdot}2\,(5 + 5) = 2\text{ D}$

Hence, $\frac{P_1}{P_2} = \frac{5}{2} = 2{\cdot}5$

Type K. On Equivalent lens

Problem 1.38. Two thin converging lenses of focal lengths 15 cm and 30 cm are held in contact with each other. Calculate power and focal length of the combination.

(C.B.S.E. 1994)

Sol. Here, $f_1 = 15$ cm ; $f_2 = 30$ cm

Let f be the focal length of the combination. Then,

$$\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2} = \frac{1}{15} + \frac{1}{30} = \frac{1}{10}$$

or $f = 10$ cm $=$ **0·1 m**

Power, or combination, $P = \frac{1}{f\text{ (in metre)}} = \frac{1}{0{\cdot}1} = $ **10 D**

Problem 1.39. Two lenses of powers – 1·5 and + 2·75 D are kept in contact. Find the focal length of the combination.

(Karnataka 1986)

Sol. Here, $P_1 = -1{\cdot}5$ D ; $P_2 = +2{\cdot}75$ D

Now, power of the combination, $P = P_1 + P_2$

∴ $P = -1{\cdot}5 + 2{\cdot}75 = 1{\cdot}25$ D

Therefore, focal length of the combination (in metre),

$$f = \frac{1}{P} = \frac{1}{1{\cdot}25} = \mathbf{0{\cdot}8\ m}$$

abc TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For **a**mbitious, **b**rilliant & **c**urious Students

Problem 1.39. A transparent cube of side 210 mm contains a small air bubble. Its apparent distance, when viewed through one face of the cube, is 100 mm and when viewed through the opposite face is 40 mm. What is the actual distance of the bubble from the second face and what is the refractive index of the material of the cube ?

(Karnataka, 1982)

Sol. Let O be the air bubble inside the transparent cube. The side of the cube is 210 mm. If the distance of the bubble from the face I is x, then its distance from the face II will be $(210 - x)$. Suppose that the bubble appears at I_1, when viewed from the face I and at I_2, when viewed from the face II [Fig. 1.45]. Let μ be the refractive index of the material of the cube.

When viewed from face I :

Here, the real depth$= x$; apparent depth$=100$ mm

$$\therefore \quad \mu = \frac{x}{100} \qquad \ldots(i)$$

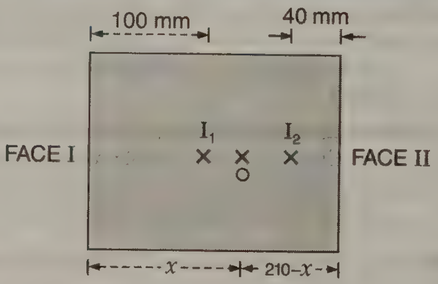

Fig. 1.45

When viewed from face II :

Here, real depth $= (210 - x)$; apparent depth $= 40$ mm

$$\therefore \quad \mu = \frac{210 - x}{40} \qquad \ldots(ii)$$

From equations (*i*) and (*ii*), we have

$$\frac{x}{100} = \frac{210 - x}{40} \quad \text{or} \quad x = 150 \text{ mm}$$

Therefore, distance of the bubble from the face II

$$= 210 - 150 = \mathbf{60\ mm}$$

From equation (*i*), we have

$$\mu = \frac{x}{100} = \frac{150}{100} = \mathbf{1{\cdot}5}$$

Problem 1.40. One face of a glass cube of side 0·06 m is silvered. An object is placed at a distance of 0·07 m from the face opposite to the silvered face. Looking from the object side, the image of the object appears to be 0·11 m behind the silvered face. Calculate the refractive index of the material of glass. (*Karnataka, 1994*)

Sol. Let ABCD be the section of the glass cube of each side 0·06 m. Its face AB is silvered and an object O is placed at a distance of 0·07 m from the face CD, the face opposite to the silvered face AB. Looking from the object side, the silvered face will appear raised, say as A′B′. Let *x* be the depth of the apparent silvered face A′B′ below the face CD [Fig. 1.46.]

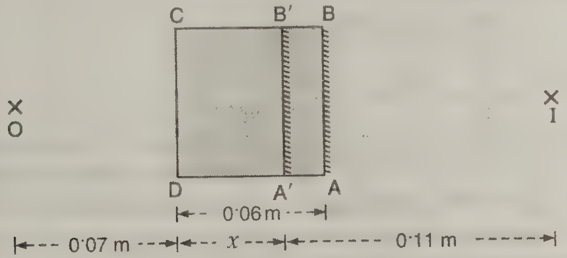

Fig. 1.46

Since the image I of the object appears at a distance of 0·11 m behind the apparent silvered face A′B′,

$$0{\cdot}07 + x = 0{\cdot}11$$

or $$x = 0{\cdot}11 - 0{\cdot}07 = 0{\cdot}04 \text{ m}$$

Thus, the real depth of the silvered face, DA = 0·06 m and the apparent depth of the silvered face,

$$DA' = x = 0{\cdot}04 \text{ m}$$

Therefore, refractive index of the glass,

$$\mu = \frac{DA}{DA'} = \frac{0{\cdot}06}{0{\cdot}04} = \mathbf{1{\cdot}5}$$

Problem 1.41. A ray of light incident on the horizontal surface of a glass slab at 70° just grazes the adjacent vertical surface after refraction. Compute the critical angle and refractive index of the glass. (*Karnataka, 1991*)

Sol. A ray of light PA incident at an angle of 70° on the horizontal surface X_1Y_1 gets refracted along AB into the glass slab at angle of refraction *r* (say) and then comes to incident at the point B on the vertical surface Y_1Y_2. The ray of light will graze along the surface Y_1Y_2, if the angle of incidence at point B on the vertical surface Y_1Y_2 equals the critical angle C for the glass-air interface [Fig. 1.47].

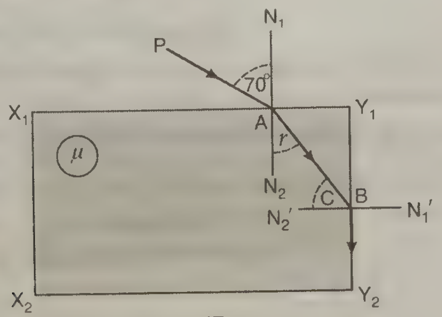

Fig. 1.47

Since N_1N_2 and $N_1'N_2'$ are perpendicular to each other,

$$r + C = 90°$$

or $$r = 90° - C$$

For refraction at point A, we have

$$\frac{\sin 70°}{\sin r} = \mu \quad \text{or} \quad \sin r = \frac{\sin 70°}{\mu}$$

$$\text{or } \sin(90° - C) = \frac{\sin 70°}{\mu}$$

$$\text{or} \quad \cos C = \frac{\sin 70°}{\mu} \qquad \ldots(i)$$

Also, for refraction at point B, we have

$$\frac{1}{\sin C} = \mu$$

$$\text{or} \quad \sin C = \frac{1}{\mu} \qquad \ldots(ii)$$

Dividing equation (*ii*) by equation (*i*), we have

$$\frac{\sin C}{\cos C} = \frac{1}{\mu} \times \frac{\mu}{\sin 70°}$$

$$\text{or} \quad \tan C = \frac{1}{\sin 70°} = \frac{1}{0{\cdot}9397} = 1{\cdot}0642$$

$$\text{or} \quad C = \mathbf{46° 47'}$$

$$\text{Now,} \quad \mu = \frac{1}{\sin C} = \frac{1}{\sin 46°47'} = \frac{1}{0{\cdot}7288} = \mathbf{1{\cdot}372}$$

Problem 1.42. A right angle prism (45°-90°-45°) of refractive index *μ* has a plate of refractive index *μ*, ($\mu_1 < \mu$) cemented to its diagonal face. The assembly is in air. A ray is incident at face AB as shown in Fig. 1.48.

(*a*) Calculate the angle of incidence at face AB for which the ray strikes the diagonal face at critical angle.

(*b*) Assuming $\mu = 1{\cdot}352$, calculate the angle of incidence at face AB for which the refracted ray passes through the diagonal face undeviated. (*I.I.T. 1996*)

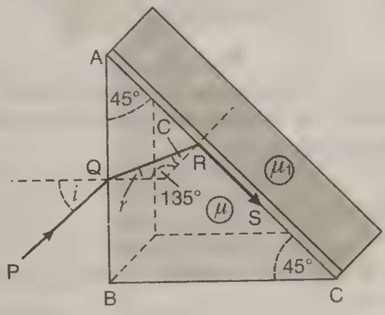

Fig. 1.48

Sol. (*a*) When a ray of light PQ is incident at angle *i* on face AB, it is refracted along QR inside the prism as shown in the figure. If *r* is angle of refraction, then for refraction at point Q,

$$\mu = \frac{\sin i}{\sin r} \qquad \ldots(i)$$

Let C be the critical angle for the ray travelling inside the prism (refractive index = *μ*) along QR to the plate (refractive index = μ_1) cemented to the diagonal face of the prism. Then,

$$\frac{\mu}{\mu_1} = \frac{1}{\sin C}$$

or $\sin C = \frac{\mu_1}{\mu}$ ...(*ii*)

From $\triangle$QRK, it follows that

$$r = 180° - (135° + C) = 45° - C$$

Substituting for r in equation (*i*), we have

$$\mu = \frac{\sin i}{\sin (45° - C)}$$

or $\sin i = \mu \sin (45° - C)$

$$= \mu (\sin 45° \cos C - \cos 45° \sin C)$$

or $\sin i = \mu \left(\frac{1}{\sqrt{2}} \sqrt{1 - \sin^2 C} - \frac{1}{\sqrt{2}} \sin C \right)$

Using equation (*ii*), we have

$$\sin i = \frac{\mu}{\sqrt{2}} \left[\sqrt{1 - \left(\frac{\mu_1}{\mu} \right)^2} - \frac{\mu_1}{\mu} \right] = \frac{\sqrt{\mu^2 - \mu_1^2} - \mu_1}{\sqrt{2}}$$

or $i = \sin^{-1} \left[\frac{\sqrt{\mu^2 - \mu_1^2} - \mu_1}{\sqrt{2}} \right]$

(*b*) The refracted ray QR will pass through the diagonal face AC undeviated, if it comes to be incident on the diagonal face at 90° [Fig. 1.49].

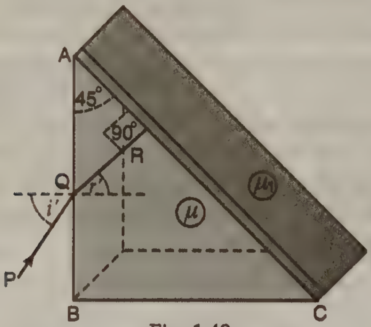

Fig. 1.49

Suppose that it happens so, when the ray of light is incident at angle i' on the face AB. If r' is the corresponding angle of refraction, then

$$r' = 180° - (90° + 45°) = 45°$$

For refraction at face AB,

$$\mu = \frac{\sin i'}{\sin r'} \quad \text{or} \quad \sin i' = \mu \sin r'$$

or $\sin i' = 1{\cdot}352 \sin 45° = 1{\cdot}352 \times \frac{1}{\sqrt{2}} = 0{\cdot}9562$

or $i' = 73°$

Problem 1.43. A beam of light strikes a glass sphere of 20 cm diameter converging towards a point 40 cm behind the pole of the spherical surface. Find the position of the image, if the refractive index of glass is 1·5.

Sol. A beam of light converging at point O is intercepted by the glass sphere of diameter of 20 cm, such that PO = 40 cm. Therefore, point O acts as the virtual object, when image is formed due to refraction by the sphere [Fig. 1.50].

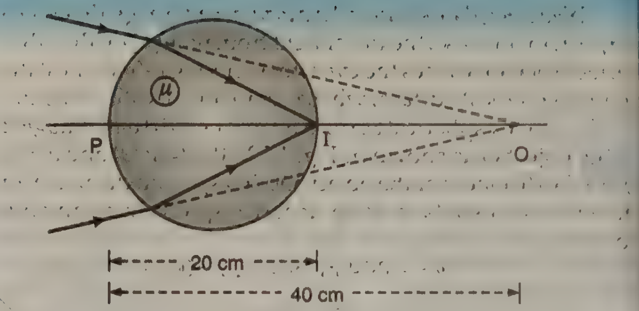

Fig. 1.50

Here, $u = +40$ cm ; $R = +\frac{20}{2} = +10$ cm ;

$$\mu_1 = 1 ; \quad \mu_2 = 1{\cdot}5$$

As the object lies in rarer medium (incident ray travels in rarer medium), we have

$$-\frac{\mu_1}{u} + \frac{\mu_2}{v} = \frac{\mu_2 - \mu_1}{R}$$

$$\therefore \quad -\frac{1}{40} + \frac{1{\cdot}5}{v} = \frac{1{\cdot}5 - 1}{10} = \frac{1}{20}$$

or $\frac{3}{2v} = \frac{1}{20} + \frac{1}{40} = \frac{3}{40}$

or $v = 20$ cm

Since diameter of the sphere is also 20 cm, it will converge the rays of light just at the opposite (other) end of the diameter and hence image will be formed at point I as shown in the figure.

Problem 1.44. The greatest thickness of a plano-convex lens, when viewed normally through its plane surface, appears to be 8/300 m and when viewed normally through its curved surface, appears to be 16/500 m. If the actual thickness is 0·04 m, find its (*i*) refractive index, (*ii*) radius of curvature and (*iii*) focal length.

Sol. *When the plano-convex lens is viewed through its plane surface* : In this case, the ray of light from point P on the other surface (convex) reaches the eye after suffering refraction at the plane surface of the plano-convex lens as shown in Fig. 1.51.

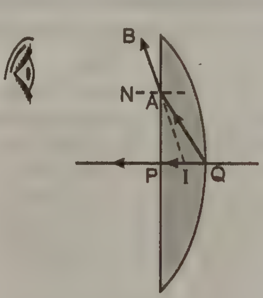

Fig. 1.51

Due to normal shift, the point P appears to be at I. Thus, the actual thickness of the lens, x = PQ = 0·04 m

and the apparent thickness of the lens, $y = \text{IQ} = \frac{8}{300}$ m

If μ is refractive index of the material of the lens, then

$$\mu = \frac{\text{real thickness } (x)}{\text{apparent thickness } (y)} = \frac{0{\cdot}04}{8/300} = 1{\cdot}5$$

When the plano-convex lens is viewed through the curved urface : In this case, the ray of light from point Q on the other urface (plane) reaches the eye after suffering refraction at the onvex spherical surface, whose centre of curvature is point . The convex spherical surface forms the virtual image I f the object Q as shown in Fig. 1.52. If u (= P Q) and v (= P) are the distances of the object and image from the pole P of he spherical surface, then according to Cartesian sign onventions,

$$u = -0{\cdot}04 \text{ m}\ ;\ v = -16/500 \text{ m}$$

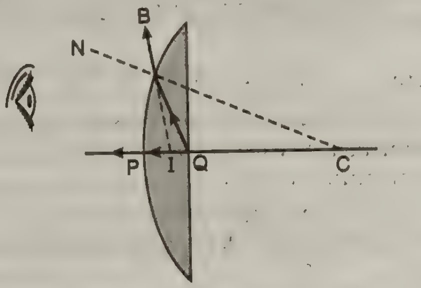

Fig. 1.52

Let R (= P C) be the radius of curvature of the convex spherical surface of the lens.

As the incident ray travels in the denser medium, we have

$$-\frac{\mu}{u} + \frac{1}{v} = \frac{1-\mu}{R}$$

$$\therefore\ -\frac{1{\cdot}5}{-0{\cdot}04} + \frac{1}{-16/500} = \frac{1-1{\cdot}5}{R}$$

or $$\frac{0{\cdot}5}{R} = -\frac{1{\cdot}5}{0{\cdot}04} + \frac{500}{16} = -37{\cdot}5 + 31{\cdot}25 = -6{\cdot}25$$

or $$\mathbf{R = -0{\cdot}08\ m}$$

According to lens maker's formula, we have

$$\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

For the given plano-convex lens,

$$R_1 = \infty\ ;\ R_2 = R = -0{\cdot}08 \text{ m}$$

$$\therefore\ \frac{1}{f} = (1{\cdot}5 - 1)\left(\frac{1}{\infty} - \frac{1}{-0{\cdot}08}\right)$$

$$= 0{\cdot}5 \times \left(0 + \frac{1}{0{\cdot}08}\right) = \frac{1}{0{\cdot}16}$$

or $$\mathbf{f = 0{\cdot}16\ m}$$

Problem 1.45. What is the minimum distance between an object and the real image formed by a convex lens ?

Ans. For a convex lens, we have

$$-\frac{1}{\mu} + \frac{1}{v} = \frac{1}{f} \quad \text{...}(i)$$

Suppose that an object is placed at a distance x from the convex lens and its real image is formed on the other side of the lens at a distance v from it [Fig. 1.53].

Now, $u = -x\ ;\ v = v$ and $f = f$

Therefore, equation (*i*) becomes

$$-\frac{1}{-x} + \frac{1}{v} = \frac{1}{f} \quad \text{or} \quad \frac{1}{v} = \frac{1}{f} - \frac{1}{x} = \frac{x-f}{f\,x}$$

or $$v = \frac{f\,x}{x-f} \quad \text{...}(ii)$$

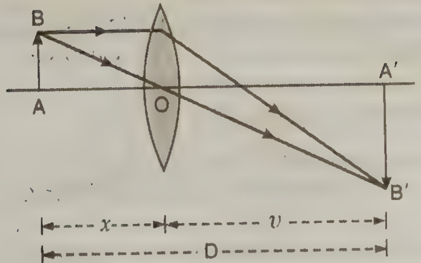

Fig. 1.53

If D is the distance between the object and the image, then

$$v = D - x \quad \text{...}(iii)$$

From equations (*ii*) and (*iii*), we have

$$D - x = \frac{f\,x}{x-f}$$

or $$D = x + \frac{f\,x}{x-f} \quad \text{...}(iv)$$

Differentiating both sides of the equation (*iv*) *w.r.t.* x, we have

$$\frac{dD}{dx} = 1 + \frac{f}{x-f} + f\,x(-1)(x-f)^{-2}$$

$$= 1 + \frac{f}{x-f} - \frac{f\,x}{(x-f)^2}$$

For D to be minimum, $\frac{dD}{dx} = 0$

i.e. $$1 + \frac{f}{x-f} - \frac{f\,x}{(x-f)^2} = 0 \quad \text{or} \quad \frac{x}{x-f} = \frac{f\,x}{(x-f)^2}$$

or $$\frac{f}{x-f} = 1$$

or $$x = 2f$$

Putting $x = 2f$ in equation (*iv*), we have

$$D = 2f + \frac{f \times 2f}{2f - f} = 2f + 2f = 4f$$

Problem 1.46. A screen is placed 90 cm from an object. The image of the object on the screen is formed by a convex lens at two different locations separated by 20 cm. Determine the focal length of the lens.

Sol. Let O and I represent the positions of the object and the image (screen) ; and L_1 and L_2, the two positions of the lens [Fig. 1.54].

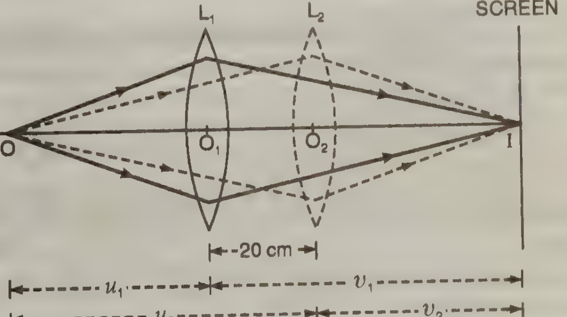

Fig. 1.54

Here, $OI = 90$ cm ; $O_1 O_2 = 20$ cm

When the lens is in position L_1 : Suppose that the distance of the object from the lens is x. Then, the distance of the image from the lens will be $(90 - x)$. If u_1 and v_1 are the distances of the object and image from the point O_1, then according to Cartesian sign conventions,

$$\mu_1 = -x \; ; \; v_1 = +(90 - x)$$

If f is the focal length of the lens, then

$$\frac{1}{f} = -\frac{1}{u_1} + \frac{1}{v_1} = -\frac{1}{-x} + \frac{1}{(90-x)}$$

or $$\frac{1}{f} = \frac{1}{x} + \frac{1}{(90-x)} \qquad ...(i)$$

When the lens is in position L_2 : If u_2 and v_2 are distances of the object and image from the point O_2, then

$$u_2 = -(x+20) \; ; \; v_2 = +\{90 - (x - 20)\} = +(70 - x)$$

From the lens equation, we have

$$\frac{1}{f} = -\frac{1}{u_2} + \frac{1}{v_2} = -\frac{1}{-(x+20)} + \frac{1}{(70-x)}$$

or $$\frac{1}{f} = \frac{1}{(x+20)} + \frac{1}{(70-x)} \qquad ...(ii)$$

From equations (*i*) and (*ii*), we have

$$\frac{1}{x} + \frac{1}{(90-x)} = \frac{1}{(x+20)} + \frac{1}{(70-x)}$$

On solving for x, we get

$$x = 35 \text{ cm}$$

Substituting for x in equation (*i*), we have

$$\frac{1}{f} = \frac{1}{35} + \frac{1}{(90-35)} = \frac{1}{35} + \frac{1}{55} = \frac{55+35}{35 \times 55}$$

or $$f = \frac{55 \times 35}{90} = 21{\cdot}4 \text{ cm}$$

Problem 1.47. An object is placed at a distance of 1·5 m from a screen and a convex lens is interposed between them. The magnification produced is 4. What is the focal length of the lens ? (*Karnataka, 1984*)

Sol. As the image of the object is formed by the convex lens on the screen, the image formed is real and inverted *i.e.* $m = -4$.

Suppose that the object is placed at a distance x from the convex lens. As the distance between the object and the screen is 1·5 m, the distance of the image from the lens is $(1{\cdot}5 - x)$. According to Cartesian sign conventions,

$$u = -x \; ; \; v = +(1{\cdot}5 - x)$$

Now, $$m = \frac{v}{u}$$

$\therefore$ $$-4 = \frac{(1{\cdot}5 - x)}{-x} \quad \text{or} \quad 4x = 1{\cdot}5 - x \quad \text{or} \quad x = 0{\cdot}3 \text{ m}$$

$\therefore$ $$u = -0{\cdot}3 \text{ m} \quad \text{and} \quad v = 1{\cdot}5 - 0{\cdot}3 = 1{\cdot}2 \text{ m}$$

If f is the focal length of the lens, then

$$\frac{1}{f} = -\frac{1}{u} + \frac{1}{v} = -\frac{1}{-0{\cdot}3} + \frac{1}{1{\cdot}2} = \frac{5}{1{\cdot}2}$$

or $$f = 0{\cdot}24 \text{ m}$$

Problem 1.48. Two thin lenses, when in contact, produce a combination of power +10 dioptres. When they are 0·25 m apart, the power reduces to + 6 dioptres. Find the focal lengths of the two lenses. (*I.I.T. 1997*)

Sol. Let f_1 and f_2 (in metre) be the focal lengths of the two lenses and P_1 and P_2 be their respective powers. Then,

$$P_1 = \frac{1}{f_1} \quad \text{and} \quad P_2 = \frac{1}{f_2}$$

When lenses are placed in contact : If f is focal length of the combination of the two lenses, then

$$\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2}$$

If P is the power of the lens, then the above relation becomes

$$P = P_1 + P_2$$

Here, $P = +10$ dioptres

$\therefore$ $$P_1 + P_2 = 10 \qquad ...(i)$$

When lenses are placed some distance apart : If f' is the focal length of the combination of two lenses, when placed a distance x apart, then

$$\frac{1}{f'} = \frac{1}{f_1} + \frac{1}{f_2} - \frac{x}{f_1 f_2}$$

If P′ is power of the combination, then the above relation becomes

$$P' = P_1 + P_2 - x P_1 P_2$$

Here, $P' = +6$ diopters ; $x = 0{\cdot}25$ m

$\therefore$ $$P_1 + P_2 - 0{\cdot}25 P_1 P_2 = 6 \qquad ...(ii)$$

Using equation (*i*), we have

$$10 - 0{\cdot}25 P_1 P_2 = 6$$

or $$P_1 P_2 = \frac{10-6}{0{\cdot}25} = 16 \qquad ...(iii)$$

Now, $$P_1 P_2 = \sqrt{(P_1 + P_2)^2 - 4 P_1 P_2}$$

Using equations (*i*) and (*iii*), we have

$$P_1 - P_2 = \sqrt{10^2 - 4 \times 16} = \sqrt{36}$$

or $$P_1 - P_2 = 6 \qquad ...(iv)$$

From equations (*i*) and (*iv*), we obtain

$$P_1 = 8 \text{ dioptres and } P_2 = 2 \text{ dioptres}$$

$\therefore$ $$f_1 = \frac{1}{P_1} = \frac{1}{8} = \mathbf{0{\cdot}125\ m} \quad \text{and} \quad f_2 = \frac{1}{P_2} = \frac{1}{2} = \mathbf{0{\cdot}5\ m}$$

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. What is refraction ? (*H.S.S.C.E. 2001*)

Ans. *The phenomenon of change in path of light as it goes from one medium to another is called refraction.*

Q. 1.02. Give the ratio of velocities of two light waves travelling in vacuum and having wavelengths 4000 Å and 8000 Å. (*C.B.S.E. 1999 S*)

Ans. In vacuum, light of all the wavelengths travel with the same velocity *i.e.* 3×10^8 m s^{-1}.

Q. 1.03. Is the ratio of frequencies of ultraviolet rays and infra-red rays in glass more than, less than or equal to one ? (*C.B.S.E. 1997*)

Ans. It is one.

Q. 1.04. For the same angle of incidence, the angles of refraction in three different media A, B and C are 15°, 25° and 35° respectively. In which medium will the velocity of light be minimum ? (*C.B.S.E. 1993*)

Ans. For the same value of the angle of incidence i, the refractive indices of three media will be

$$\mu_A = \frac{\sin i}{\sin 15°}\,;\ \mu_B = \frac{\sin i}{\sin 25°} \quad \text{and} \quad \mu_C = \frac{\sin i}{\sin 35°}$$

Since $\mu = \frac{c}{v}$, the velocity of light will be minimum in the medium, whose refractive index is maximum.

As μ_A is maximum, velocity of light will be minimum in medium A.

Q. 1.05. Can absolute refractive index of a medium be less than unity ?

Ans. No. It is because velocity of light is maximum in vacuum (or air).

Q. 1.06. State Snell's law of refraction of light. *(P.S.S.C.E. 2000, 1998 S)*

Ans. Refer to section 1.02.

Q. 1.07. Can relative refractive index of a medium *w.r.t.* another be less than unity ?

Ans. Yes. For example, the relative refractive index of water *w.r.t.* glass is less than 1.

Q. 1.08. For what angle of incidence, the lateral shift produced by parallel sided glass plate is zero ?

Ans. For $i = 0$.

Q. 1.09. For what angle of incidence, the lateral shift produced by a parallel sided glass plate is maximum ?

Ans. For $i = 90°$, lateral shift is maximum and is equal to thickness of the glass plate.

$$\text{For } i = 90°, d = \frac{t}{\cos r} \sin(90° - r) = \frac{t}{\cos r} \times \cos r = t$$

Q. 1.10. What are the factors on which the normal shift depends ?

Ans. Thickness of the refracting medium and its refractive index.

Q. 1.11. Write the conditions for total internal reflection to take place.

(P.S.S.C.E. 2000, 1994, 1991 ; H.S.S.C.E. 1999 S ;
H.P.S.S.C.E. 1998 S ; C.B.S.E. 1994, 1993)

Ans. Conditions for total internal reflection. For total internal reflection to take place, following conditions should be obeyed :

1. *The ray of light incident on the interface of the two refracting media should travel in an optically denser medium.*
2. *The angle of incidence should be greater than the critical angle for the given pair of media.*

Q. 1.12. Define critical angle for total internal reflection. *(P.S.S.C.E. 2000, 1999, 1998 S)*

Ans. *The angle of incidence in denser medium, for which angle of refraction in rarer medium is 90°, is called critical angle.*

Q. 1.13. What is critical angle ? Give one application of total internal reflection. *(H.S.S.C.E. 2002 ; C.B.S.E. 1992 S)*

Ans. Critical angle. Refer to VSQ 1.12.

Applications. Refer to section 1.08.

Q. 1.14. What is critical angle for a material of refractive index $\sqrt{2}$? *(H.P.S.S.C.E. 1993)*

Ans. $\frac{1}{\sin C} = \mu = \sqrt{2}$ or $\sin C = \frac{1}{\sqrt{2}}$ or $C = 45°$

Q. 1.15. A substance has critical angle of 45° for yellow light. What is its refractive index ?. *(H.S.S.C.E. 2000 ; I.S.C.E. 1997)*

Ans. $\mu = \frac{1}{\sin C} = \frac{1}{\sin 45°} = \frac{1}{1/\sqrt{2}} = \sqrt{2}$

Q. 1.16. For glass-air interface, the critical angle is C. Will the critical angle for glass-water interface be greater or less than C ?

Ans. For glass-air interface, $\sin C = \frac{1}{{}^a\mu_g}$

If C′ is critical angle for glass-water interface, then

$$\sin C' = \frac{1}{{}^w\mu_g}$$

Since ${}^w\mu_g < {}^a\mu_g$; $\sin C' > \sin C$ or $C' > C$

Q. 1.17. Can total internal reflection take place, when light travels from rarer to denser medium ?

Ans. No.

Q. 1.18. What is optical fibre ? *(H.S.S.C.E. 1998)*

Ans. Refer to section 1.08.

Q. 1.19. State the principle of optical pipe.

(P.S.S.C.E. 2002, 2000, 1999)

Or

Name the physical principle on which the working of optical fibres is based. *(I.S.C.E. 1995)*

Ans. The working of optical fibre is based on total internal reflection.

Q. 1.20. What is a lens ?

Ans. A lens is a transparent refracting medium bounded by two spherical surfaces (or by one spherical and one plane surface).

Q. 1.21. Define focus and principle focus of a lens. *(P.S.S.C.E. 1998 S)*

Ans. Focus. *The point, at which a parallel beam of light after refraction through the lens, comes to meet or appears to come from, is called focus.*

Principal focus. *The point on the principal axis, at which a parallel beam of light travelling parallel to principal axis after refraction through the lens, comes to meet or appears to come from.*

Q. 1.22. Can a lens be used in the medium of which it is made of ?

Ans. No.

Q. 1.23. What type of lens is an air bubble inside water ?

Ans. An air bubble inside water behaves as a diverging lens.

Q. 1.24. What is the focal length and power of a plane glass plate ?

Ans. The focal length of a glass plate is infinite and its power is zero.

Q. 1.25. A lens made of glass is immersed in water. Will its power increase or decrease ?

Ans. Its power will decrease.

Q. 1.26. What is lens maker's formula ? *(H.P.S.S.C.E. 1999)*

Or

Why is the lens maker's formula called so ?

Ans. The values of the radii of curvature of the two spherical surfaces, which a lens of required focal length should have, can be calculated from this formula. Then, by grinding the two surfaces of a piece of glass, its two surfaces can be given the calculated value of the radii of curvature. Then, the lens so produced will possess the required focal length.

Q. 1.27. An object is placed at the focus of a concave lens. Where will its image be formed ? *(C.B.S.E. 1999 S)*

Ans. The rays will appear to come from infinity. Therefore, a virtual image will be formed at infinity.

Q. 1.28. A convex lens of focal length 10 cm is combined with a concave lens of focal length 15 cm. Find the focal length of the combination. (*Pre-degree Kerala, 1994*)

Ans. $\frac{1}{F}=\frac{1}{f_1}+\frac{1}{f_2}=\frac{1}{10}+\frac{1}{-15}=\frac{1}{30}$ or $F = 30$ cm

Q. 1.29. Why is the power of a lens measured as the reciprocal of its focal length ?

Ans. A lens is said to possess more power, if it can focus the rays of light quite close *i.e.* if its focal length is small. For this reason, the power of the lens is measured as the reciprocal of its focal length.

Q. 1.30. What is the unit of power of a lens ? (*H.P.S.S.C.E. 2002*)

Ans. Dioptre.

Q. 1.31. The image of an object formed by a lens on th screen is not in sharp focus. Suggest a method to get a clea focussing of the image on the screen without disturbing th position of the object, the lens or the screen. (*C.B.S.E. 1998*

Ans. The focal length of a lens depends upon th refractive index of the material of the lens, which in tur depends upon the wavelength of light. Therefore, clear image of the object can be obtained by using light of suitable wavelength.

Q. 1.32. What are the uses of putting two lenses in contact with each other ?

Ans. Uses. 1. To increase the magnification of the image.

2. To produce erect image, if the image formed by a lens is inverted.

3. To minimise spherical aberration.

4. To increase the field of view.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. A light of wavelength 6000 Å in air, enters a medium with refractive index 1·5. What will be frequency and wavelength of light in the medium ? (*I.I.T. 1997*)

Ans. Here, wavelength of light in air,

$$\lambda = 6000\ \text{Å} = 6 \times 10^{-7}\ \text{m};$$

refractive index of medium, $\mu = 1{\cdot}5$

Frequency of the light does not change, when light travels from air to a refracting medium.

$$\therefore \qquad \nu' = \nu = \frac{c}{\lambda} = \frac{3\times10^8}{6\times10^{-7}} = 5 \times 10^{14}\ \text{s}^{-1}$$

Wavelength of the light in medium,

$$\lambda' = \frac{\lambda}{\mu} = \frac{60}{1{\cdot}5} = 4000\ \text{Å}$$

Q. 1.02. A ray of light of frequency of 5 × 10⁴ Hz is passed through a liquid. The wavelength of light measured inside the liquid is found to be 450 × 10⁻⁹ m. Calculate refractive index of the liquid. (*H.P.S.S.C.E. 1998 S*)

Ans. Here, $\nu = 5 \times 10^{14}$ Hz ;

wavelength of light inside liquid, $\lambda = 450 \times 10^{-9}$ m

Therefore, velocity of light in liquid,

$$v = \nu\lambda = 5 \times 10^{14} \times 450 \times 10^{-9} = 225 \times 10^8\ \text{m s}^{-1}$$

Hence, refractive index of liquid,

$$\mu = \frac{c}{v} = \frac{3\times10^8}{2{\cdot}25\times10^8} = 1{\cdot}33$$

Q. 1.03. The refractive index of glass is 1·5 and that of water is 1·3. If the speed of light in water is 2·25 × 10⁸ m s⁻¹, what is the speed of light in glass ? (*I.S.C.E. 1996*)

Ans. Here, ${}^a\mu_g = 1{\cdot}5$; ${}^a\mu_g = 1{\cdot}3$

Let v_1 and v_2 be speeds of light in glass and water respectively. If c is speed of light in air, then

$$\frac{c}{v_1} = 1{\cdot}5 \quad \text{and} \quad \frac{c}{v_2} = 1{\cdot}3$$

$$\therefore \qquad \frac{c}{v_2} \times \frac{v_1}{c} = \frac{1{\cdot}3}{1{\cdot}5}$$

$$\text{or} \qquad v_1 = \frac{1{\cdot}3}{1{\cdot}5} \times v_2 = \frac{1{\cdot}3}{1{\cdot}5} \times 2{\cdot}25 \times 10^8$$

$$= 1{\cdot}95 \times 10^8\ \text{m s}^{-1}$$

Q. 1.04. A ray of monochromatic light travelling in vacuum with speed c, wavelength λ and frequency ν, enters into a medium of refractive index 1·5. What will be its new speed, wavelength and frequency ? (*I.S.C.E. 1995*)

Ans. Let v be speed of light in the medium of refractive index $\mu = 1{\cdot}5$. Then,

$$\mu = \frac{c}{v}$$

$$\text{or} \qquad v = \frac{c}{\mu} = \frac{c}{1{\cdot}5}$$

The frequency of light in the medium will remain ν **(unchanged).**

If λ' is the wavelength of light in the medium, then

$$v = \nu\lambda'$$

$$\text{or} \qquad \lambda' = \frac{v}{\nu} = \frac{v}{c/\lambda} = \frac{\lambda}{c/v} = \frac{\lambda}{\mu}$$

$$\text{or} \qquad \lambda' = \frac{\lambda}{1{\cdot}5}$$

Q. 1.05. A ray of light is incident normally on one of the faces of a prism of apex angle 30° and refractive index $\sqrt{2}$. Find the angle of deviation for the ray of light. (*I.I.T. 1997*)

Ans. When the ray of light PQ is incident normally on the face AB of the prism ABC (∠A = 30°), it travels unrefracted along path QR and comes to incident on the face AC of the prism at an angle of incidence, $i = 30°$ [Fig. 1.55].

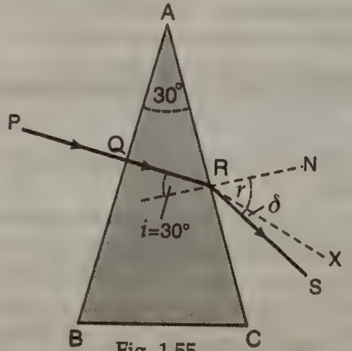

Fig. 1.55

If r is the angle of refraction, then

$$\frac{1}{\mu}=\frac{\sin i}{\sin r} \quad \text{or} \quad \frac{1}{\sqrt{2}}=\frac{\sin 30°}{\sin r}$$

$$\text{or} \quad \sin r=\sqrt{2}\sin 30° \quad \text{or} \quad \sin r=\sqrt{2}\times\frac{1}{2}=\frac{1}{\sqrt{2}}$$

$$\text{or} \quad r=45°$$

The angle of deviation,

$$\delta=\angle NRS-\angle NRX=r-i=45°-30°=15°$$

Q. 1.06. How will you explain twinkling of stars ? (*C.B.S.E. 1992 ; Text Question*)

Ans. The light from stars undergoes refraction continuously before it reaches earth. Due to this, the apparent position of a star is slightly different than its actual position. Due to the variation in atmospheric conditions, (change in temperature and density), this apparent position of the star constantly keeps on changing. The fluctuating apparent positions of the star give rise to the twinkling effect.

Q. 1.07. The sun is seen a little before it rises and for a short while after it sets. Explain, why. (*C.B.S.E. 2002, 2000*)

Or

Watching the sunset on a beach, one can see the sun for several minutes after it has 'actually set'. Explain. (*C.B.S.E. 1992 ; Text Question*)

Or

How does refraction of light affect the length of the day ?

Ans. This effect is due to atmospheric refraction of light. At the time of sunrise or sunset, the sun is just near the horizon. The line XY represents the horizon for an observer O on the surface of the earth as shown in Fig. 1.56. Near the surface of earth, air is a little denser than the outer space. The refractive index of the air near the surface of earth is 1·00029 *w.r.t.* the outer space. Therefore, a ray of light travelling from the sun towards earth, travels through air, which becomes more and more optically denser. Due to this, it undergoes refraction and therefore gradually deviates towards the normal. As a result, to the observer O on the surface of earth, the sun appears at S′. The apparent shift in the direction of the sun is only 0·5° and the time difference between the actual sunset and the apparent sunset is about 2 minutes.

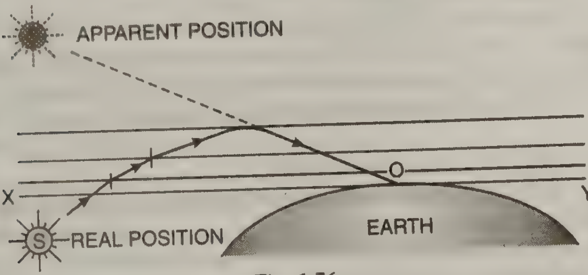

Fig. 1.56

Q. 1.08. Discuss refraction through a glass-slab and show that emergent ray is parallel to the incident ray but displaced. (*H.P.S.S.C.E. 1996*)

Ans. Refer to section 1.04.

Q. 1.09. A coin placed at the bottom of a tank appears to be raised, when water is poured into the tank. Why ?

Or

Why does a tank filled with water appear shallow ?

Or

Does the apparent depth of a tank of water change, if viewed obliquely ? If so, does the apparent depth increase or decrease ? (*Text Question*)

Ans. Refer to Fig. 1.05. It is because of the normal shift in the position of the object due to the phenomenon of refraction. When the rays of light from the coin in the denser medium fall on the interface, the rays of light get away from the normal due to refraction. The point from which the refracted rays appear to come gives the apparent position of the coin. As the rays appear to come from a point above the coin, the coin appears to be raised.

Q. 1.10. A stick partially immersed obliquely under water appears to be bent. Explain, why.

Ans. The different points on the stick, which has been dipped in the water obliquely, are at different depths. Since the normal shift depends upon the depth of the object, the different points on the stick undergo different amounts of normal shifts and hence the stick appears bent.

Q. 1.11. What is total internal reflection ? Under what conditions does it take place ? (*H.S.S.C.E. 2002, 1996 ; P.S.S.C.E. 2000, 1999 ; H.P.S.S.C.E. 1999 S ; C.B.S.E. 1993*)

Ans. Refer to section 1.07.

Q. 1.12. Define critical angle. Write the conditions for total internal reflection to take place. (*H.P.S.S.C.E. 1998 S*)

Ans. Refer to section 1.07.

Q. 1.13. State the conditions for producing total internal reflection. (*C.B.S.E. 2002, 1994 ; P.S.S.C.E. 1994, 1991*)

Ans. Refer to section 1.07.

Q. 1.14. Derive the relation between refractive index of a medium and its critical angle. (*C.B.S.E. 1993*)

Ans. Refer to section 1.07.

Q. 1.15. A ray of light while travelling from a denser to rarer medium undergoes total internal reflection. Derive the expression for the critical angle in terms of the speed of light in the two media. (*C.B.S.E. 1996*)

Ans. Refer to section 1.07. It can be proved that

$$\sin C=\frac{1}{\mu}$$

If c and v are speeds of light in vacuum and the medium, then $\mu=\frac{c}{v}$.

Therefore, $\sin C=\frac{v}{c}$

Q. 1.16. Refractive index of glass is 1·5. Find the speed of light in glass, if its speed in air is 3×10^8 m s^{-1}. Also find critical angle for glass. (*H.S.S.C.E. 1997 ; I.S.C.E. 1995*)

Ans. Speed of light in glass,

$$v=\frac{c}{\mu}=\frac{3\times10^8}{1\cdot5}=2\times10^8 \text{ m s}^{-1}$$

If C is critical angle for glass, then

$$\mu=\frac{1}{\sin C} \quad \text{or} \quad \sin C=\frac{1}{\mu}=\frac{1}{1\cdot5}=0\cdot6667$$

$$\text{or} \quad C=41\cdot8°$$

Q. 1.17. Calculate the speed of light in a medium whose critical angle is 45°. (*C.B.S.E. 2002*)

Ans. Now, $\mu=\frac{1}{\sin C}=\frac{1}{\sin 45°}=\sqrt{2}$

Also, $\mu = \frac{c}{v}$ or $v = \frac{c}{\mu} = \frac{3 \times 10^8}{\sqrt{2}}$

$= 2{\cdot}12 \times 10^8 \text{ m s}^{-1}$

Q. 1.18. Fig. 1.57 shows object PQ in front of a right angled (45°-90°-45°) glass prism. The critical angle of glass is 42°. Redraw this figure tracing the complete path of rays from P and Q into and out of the prism.

(I.S.C.E. 1994 ; Text Question)

Or

Show with a ray diagram, how an image is produced in total reflecting prism. *(I.S.C.E. 1996)*

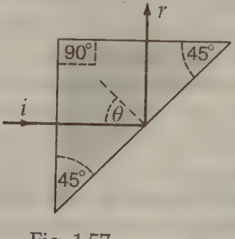

Fig. 1.57

Ans. The path of the two rays from points P and Q travelling normal to the hypotenuse face AC of the 45°-90°-45° glass prism will be as shown in Fig. 1.57. The two rays will undergo total internal reflection, firstly at the side face AB and then at side face BC. As the angle of incidence at the two faces is 45° *i.e.* greater than the critical angle (42°) for the glass, the ray of light undergoes total internal reflection. The detailed description of the total internal reflections at the two side faces has been given in section 1.08. The final image P′ Q′ will be an inverted one as shown in the figure.

Q. 1.19. Fig. 1.58 shows a triangular prism of glass. A ray incident normal on one face is totally reflected. What can you conclude about the minimum value of index of refraction of glass ? *(C.B.S.E. 1995)*

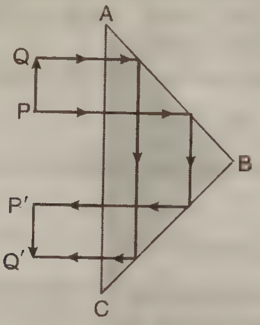

Fig. 1.58

$\theta = 90°/2 = 45°$

Ans. From Fig. 1.58, it follows that

As the light incident at 45° undergoes total internal reflection, the value of critical angle for the material of prism must be less than or equal to 45° *i.e.* maximum value of the critical angle C is 45°.

Since $\mu = \frac{1}{\sin C}$, corresponding to maximum value of C, the value of μ is minimum.

Hence, $\mu_{min} = \frac{1}{\sin 45°} = \frac{1}{1/\sqrt{2}} = \sqrt{2}$

Q. 1.20. Draw ray diagram to show how a right angled isosceles prism can be used to (*a*) deviate the ray through 180°, (*b*) deviate the ray through 90° and (*c*) invert the ray.

Ans. For Q. 1.20. (*a*) and (*b*), refer to section 1.08.

For Q. 1.20. (*c*), refer to SAQ 1.19.

Q. 1.21. What are the advantages of total reflecting prism over a plane mirror ?

Ans. Advantages. 1. It does not require silvering. **2.** The reflection of light is 100%. **3.** Multiple reflections do not take place in a reflecting prism. Due to this, only one image is formed, which is very bright. **4.** A reflecting prism is free from the trouble arising out of vanishing of the silvering of mirror with the passage of time.

Q. 1.22. How do you explain the mirage effect produced in very hot deserts ? *(H.P.S.S.C.E. 1993)*

Or

On a hot summer day in desert, one sees the reflected image of the distant objects. Explain, why.

Ans. It is an optical illusion, called mirage. For details, refer to section 1.08.

Q. 1.23. Show through a labelled diagram the formation of mirage in deserts. *(C.B.S.E. 1991 S)*

Ans. Refer to Fig. 1.09.

Q. 1.24. Why does a diamond sparkle ? Give reasons. *(P.S.S.C.E. 2001)*

Ans. Refer to section 1.08.

Q. 1.25. Why is the diamond brilliant ? Is it a source of light also ? *(P.S.S.C.E. 2002 ; 1998 S)*

Ans. For brilliance of diamond, refer to section 1.08.

No, a diamond is not a source of light.

Q. 1.26. What are optical fibres ? Write in short about optical pipe. *(P.S.S.C.E. 1995)*

Ans. Refer to section 1.08.

Q. 1.27. What are optical fibres ? Give their one use. *(H.S.S.C.E. 2002 ; H.P.S.S.C.E. 2000 ; C.B.S.E. 1992)*

Ans. Refer to section 1.08.

Use. The optical fibres are used in medical investigations. Using an optical fibre, a doctor can examine the inside of the stomach and the intestine. It is called *endoscopy*.

Q. 1.28. What is the main use of optical fibres ? *(H.S.S.C.E. 1999)*

Ans. Refer to section 1.08.

Q. 1.29. Explain with a ray diagram, how optical fibres transmit signals. *(C.B.S.E. 1993)*

Ans. Refer to Fig 1.10.

Q. 1.30. A luminous object is placed below a glass slab of thickness *t*. A circular opaque disc is placed vertically above the object on the surface of the glass-slab. If C is critical angle for glass-air interface, then predict the minimum radius of the opaque disc so that the object cannot be seen from any uncovered portion of the glass-slab.

Ans. The maximum radius of the circle through which the light can be received from the luminous object is given by

$r = t \tan C,$

where C is the critical angle for glass-air interface and t is the thickness of the glass slab. For details, refer to solved problem 1.12 and its Fig. 1.36.

Obviously, if an opaque disc of radius $r\ (= t \tan C)$ is placed on the slab, then the luminous object will not be seen from any uncovered portion of the glass slab.

Q. 1.31. When observed from under water, all the objects above the surface can be seen within a cone of 97°. Explain, why.

Ans. Again, refer to solved problem 1.12. It follows that the objects above the surface will be visible in a cone of semivertical angle C, where C is the critical angle for the water-air interface.

Now, $$\mu = \frac{1}{\sin C}$$

or $$\sin C = \frac{1}{\mu} = \frac{1}{1.33} = 0.7519$$

or $$C = 48.75°$$

Therefore, required angle of the cone = $48.75° \times 2 \approx 97°$

Q. 1.32. A fish in a tank sees the outside world as if it is at the vertex of a cone, such that the circular base of the cone is at the surface of the water. If the depth of the fish is *d* and the critical angle for water-air interface is C, what is the radius of the circle ?

Ans. Refer to solved problem 1.12. The radius of the circular base of the cone is given by

$$r = d \tan C$$

Q. 1.33. For a spherical surface, when refraction takes place from a rarer medium (μ_1) to a denser medium (μ_2), we write

$$-\frac{\mu_1}{u} + \frac{\mu_2}{v} = \frac{\mu_2 - \mu_1}{R},$$

where the symbols have their usual meanings. Now suppose that the object is placed in the denser medium and refraction takes place from the denser to the rarer medium. Then, rewrite the above equation.

Ans. When the object is placed in the denser medium and refraction takes place from the denser to the rarer medium, the equation will be

$$-\frac{\mu_2}{u} + \frac{\mu_1}{v} = \frac{\mu_1 - \mu_2}{R}$$

It can be obtained from the given equation by simply interchanging μ_1 and μ_2.

Q. 1.34. Can a convergent lens in one medium behave as a divergent lens in some other medium ?

Ans. Yes. A convex lens made of glass behaves as a convergent lens when placed in air or water. However, when the same lens is immersed in carbon disulphide ($\mu = 1.63$), it behaves as a divergent lens. In other words, when a convergent lens is placed inside a transparent medium of refractive index greater than that of the material of the lens, it behaves as a divergent lens.

Q. 1.35. A thin converging lens has a focal length *f* in air. If it is completely immersed in a liquid, briefly explain how the focal length of the lens will vary ? (*C.B.S.E. 2001*)

Ans. The focal length of the lens in air is given by

$$\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) \qquad ...(i)$$

If μ' is refractive index of the material of the lens *w.r.t.* liquid, then focal length of the lens, when placed in liquid is be given by

$$\frac{1}{f'} = (\mu' - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) \qquad ...(ii)$$

From equations (*i*) and (*ii*), we have

$$\frac{f'}{f} = \frac{(\mu - 1)}{(\mu' - 1)}$$

Since $\mu' < \mu$, $f' > f$ *i.e.* focal length of the lens will **increase** on immersing it in a liquid.

Q. 1.36. The refractive index of the material of a concave lens is μ_1. It is immersed in a medium of refractive index μ_2. A parallel beam of light is incident on the lens. Trace the path of rays, when $\mu_2 < \mu_1$. (*C.B.S.E. 2001 S*)

Ans. Since the refractive index of the material of the concave lens is greater than that of the medium in which it is placed, it will still behave as a concave lens. Since focal length of the lens increases, its diverging action will decrease. For course of rays, refer to Fig. 1.68.

Q. 1.37. A concave mirror and a convex lens are held in water. What change, if any, do you expect in their respective focal lengths as compared to their values in air ? (*C.B.S.E. 2000, 1995*)

Ans. The focal length of a concave mirror has nothing to do with the medium in which it is placed. Hence, it will remain ***unchanged.***

However, the focal length of a convex lens would change, when held in water. It *increases* due to decrease in the value of relative refractive index of the material of lens *w.r.t.* water.

Q. 1.38. A convex lens (refractive index μ_L) is immersed in a medium (refractive index μ_M). Will it behave as a convergent or divergent lens, if (*i*) $\mu_L > \mu_M$ (*ii*) $\mu_L < \mu_M$? (*Pre-degree Kerala, 1991*)

Ans. (*i*) *When* $\mu_L > \mu_M$: The convex lens will still behave as a convex lens. It is because, ${}^{M}\mu_{L} = \frac{\mu_L}{\mu_M}$ is greater than 1 and the lens maker's formula gives a positive value for the focal length of the lens.

(*ii*) *When* $\mu_L < \mu_M$: The convex lens will behave as a concave lens. It is because, ${}^{M}\mu_{L}$ is less than 1 and hence focal length of the lens has a negative value.

Q. 1.39. Explain, why an air bubble inside a transparent liquid behaves like a diverging lens.

Ans. An air bubble acts as a convex lens made of air and placed inside water. Therefore, the air bubble acts as a lens, whose focal length is given by

$$\frac{1}{f} = ({}^{g}\mu_a - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

Here, ${}^{g}\mu_a < 1$ *i.e.* ${}^{g}\mu_a - 1$ is negative. Since the factor $\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$ is positive, the value of *f* will be negative. Hence, the air bubble inside a transparent liquid behaves as a diverging lens.

Q. 1.40. What changes in the focal length of a (*a*) concave mirror and (*b*) convex lens occur, when the incident violet light on them is replaced by red light ? (*C.B.S.E. 2002*)

Ans. (*a*) No change in the focal length of concave mirror.

(*b*) For a lens, $\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

Since $\mu_r < \mu_v$, the focal length of convex lens will **increase** on the replacing violet light by red light.

Q. 1.41. A single thin lens of focal length 30 cm is placed in front of the lens of a camera, the camera lens is set at

infinity. Where should you place an object to get a clear picture on the film with the extra lens ?

Ans. To get a clear picture with the camera set at infinity, the light entering the camera lens must be in the form of a parallel beam. The extra lens placed in front of camera lens will issue parallel rays, if the object to be photographed is placed at the focus of the extra lens *i.e.* at a distance of 30 cm from the extra lens.

Q. 1.42. A camera lens of focal length 5 cm is mounted on a fine screw thread for adjusting the focus. What range of movement is needed, if the camera is to be able to take sharp photographs at 1 m as well as from great distances ?

Ans. For the camera lens : $-\frac{1}{u}+\frac{1}{v}=\frac{1}{f}$

or $$\frac{1}{v}=\frac{1}{f}+\frac{1}{u}+\frac{1}{5}+\frac{1}{u}$$

For very distant object, $u=\infty$

$$\therefore \qquad \frac{1}{v}=\frac{1}{5}+\frac{1}{\infty}=\frac{1}{5} \quad \text{or} \quad v=5\text{ cm}$$

For an object at 1 m from the camera,

$$u=-1\text{ m}=-100\text{ cm}$$

$$\therefore \qquad \frac{1}{v}=\frac{1}{5}+\frac{1}{-199}=\frac{20-1}{100}=\frac{19}{100} \quad \text{or} \quad v=5{\cdot}26\text{ cm}$$

Since in both the cases, image must be cast on the film, the lens must have a range of movement of 5·26 – 5 *i.e.* **0·26 m.**

Q. 1.43. A concave lens produces a virtual and diminished image independent of the location of the object. Explain, why.

Ans. From the lens equation $-\frac{1}{u}+\frac{1}{v}=\frac{1}{f}$, we have

$$v=\frac{u\,f}{u+f}$$

The focal length of a concave lens is negative. Since distance of a real object from the lens is also negative, it follows that v will also be negative. Therefore, a concave lens forms the image on the same side of the object. In other words, the image formed is always *virtual.*

Again, $$m=\frac{f}{u+f}$$

Since both f and u are negative, the value of m is positiv and always *less than 1.*

Hence, a concave lens produces a virtual and diminishe image independent of the position of the object.

Q. 1.44. Draw a ray diagram showing the formation o image by a concave lens. Discuss the nature of the image. (*C.B.S.E. 1991*

Ans. For ray diagram, refer to Fig. 1.30.

The image is always virtual, erect, diminished and i formed on the same side of the object.

Q. 1.45. Define power of a lens. Give its units. (*H.P.S.S.C.E. 2001 ; H.S.S.C.E. 1994*)

Or

What is meant by power of a lens ? What is one dioptre ? (*H.P.S.S.C.E. 1994 ; H.S.S.C.E. 1994*)

Ans. Refer to section 1.20.

Q. 1.46. Draw a diagram to illustrate spherical aberration in a convex lens. (*I.S.C.E. 1995*)

Ans. Refer to Fig. 1.32.

Q. 1.47. Why do lenses of large aperture suffer from spherical aberration ?

Ans. In case of a lens of large aperture, the behaviour of the paraxial and the marginal rays are markedly different from each other. The two types of rays come to focus at different points on the principal axis of the lens. However, in case of a lens of small aperture, the two types of rays come to focus quite close to each other.

Q. 1.48. Explain, how the spherical aberration can be minimised.

Ans. The spherical aberration can be minimised either by allowing only paraxial rays to fall on the lens or by allowing the marginal rays to fall. The paraxial rays can be obstructed by using a stop *i.e.* circular disc. On the other hand, the marginal rays can be obstructed by using a circular aperture.

Q. 1.49. Red light is incident on a thin converging lens of focal length *f*. Briefly explain how the focal length of the lens will change, if red light is replaced with blue light. (*C.B.S.E. 2001*)

Ans. Refer to SAQ 1·39.

TECHIE STUFF –CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 1.01. When does Snell's law in refraction fail ?

Ans. Snell's law fails, when light is incident normally on the surface of a refracting medium. It is because, when light is incident normally, angle of incidence is zero *i.e.* $i=0$ and hence $r=0$. The ratio $\frac{\sin i}{\sin r}$ no longer remains constant. Instead, it becomes indeterminant.

Q. 1.02. A pile 4 m high stands in the lake, such that it protrudes by 1 m above the surface of water. Determine the length of the shadow of the pile on the bottom of lake, when the sunrays make an angle of 45° with the water surface. Take refractive index of water, $\mu = 4/3$.

Ans. Suppose that the pile AB of height 4 m stands in the lake, such that its portion BQ = 3 m is inside water and the portion AQ = 1 m is above the water. The sunrays making an angle of 45° with the water surface will produce the images BQ′ and Q′ S′ (= QS) of the portions BQ and QA [Fig. 1.59].

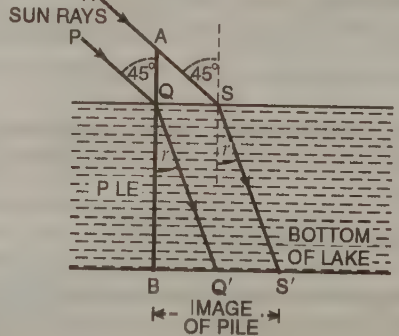

Fig. 1.59

Therefore, total length of the shadow of the pile,

$$BS' = BQ' + Q'S' = BQ' + QS$$

Since in ΔAQS, $\angle QAS = \angle ASQ = 45°$,

$$QS = AQ = 1 \text{ m}$$

If r is angle of refraction, then

$$\mu = \frac{\sin i}{\sin r}$$

or $$\sin r = \frac{\sin i}{\mu} = \frac{\sin 45°}{4/3} = \frac{3}{4} \times 0{\cdot}7071 = 0{\cdot}5303$$

or $$r = 32°\text{-}2'$$

From right angled $\Delta QBQ'$

$$BQ' = BQ \tan r = 3 \times \tan(32°\text{-}2') = 3 \times 0{\cdot}6257$$
$$= 1{\cdot}8771 \approx 1{\cdot}88 \text{ m}$$

Therefore, length of the shadow of the pile on the bottom of lake = 1·88 + 1 = **2·88 m**

Q. 1.03. Does refraction of light mean a change in the direction of light propagation ?

Ans. No. The direction of propagation of light can change on reflection from a mirror also.

The change in direction of light propagation, when light goes from one medium to another, is called refraction.

Q. 1.04. If a plane glass-slab is placed on letters of different colours, then red coloured letters appear more raised up. Why ?

Ans. The refractive index of glass is minimum for red light. Because of this, the normal shift,

$$d = t\left(1 - \frac{1}{\mu}\right)$$

is maximum for red light and the red coloured letters appear more raised up.

Q. 1.05. A beam of light is converging towards a point on a screen. A plane parallel plate of glass is introduced in the path of this converging beam. How will the point of convergence be shifted ? Draw the ray diagram. *(I.I.T. 1974)*

Ans. Fig. 1.60 shows a glass plate introduced in the path of a beam of light converging to point O.

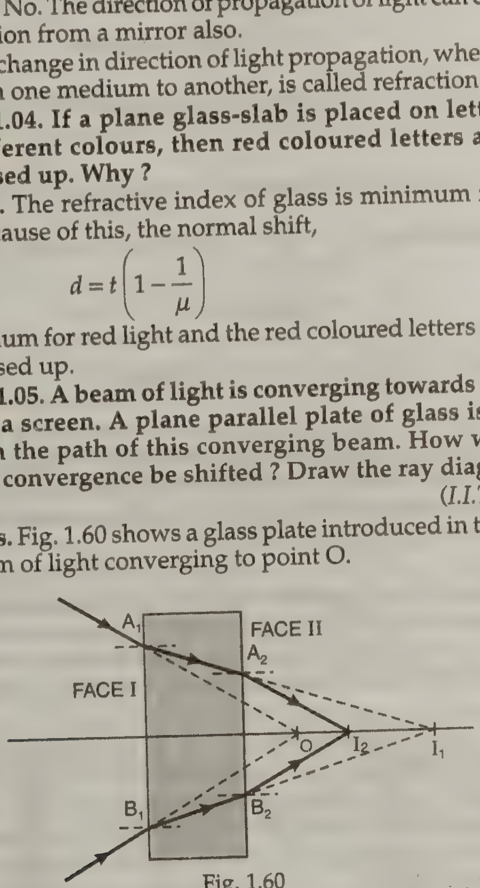

Fig. 1.60

The face I of the glass plate will refract the rays of light at points A_1 and B_1, towards the normal so that the two rays will appear to meet at point I_1. However, due to refraction at the face II of the glass plate at points A_2 and B_2, the rays will be refracted away from the normals so that the beam actually converges to point I_2. The ray $A_2 I_2$ is parallel to A_1O and it is laterally shifted through a distance,

$$d = t\left(1 - \frac{1}{\mu}\right),$$

where t is thickness of the glass plate between the faces I and II.

Q. 1.06. The moon moves across the sky at approximately 0·5° per hour.

(a) When it passes in front of a star, what do you see ? Discuss.

(b) What you would see, if the moon had an atmosphere like the earth ?

Ans. (*a*) Light travels along a straight path from star to the earth through vacuum. Therefore, until the solid edge of the moon cuts off the light, the star will be seen. It will remain fixed *w.r.t.* other stars and its brightness will also remain constant.

(*b*) If the moon had an atmosphere (shown by dotted circle around the moon) and the light from star S traversed its path through it, then light from the star would be refracted as shown in Fig. 1.61 and the star would seem to shift from S to S′. Thus, as the moon will move towards the line of sight of the star, the star would seem to move ahead of the moon. Due to scattering of the blue part of the visible spectrum from moon's atmosphere, it will appear red and dim, before the solid edge of the moon cuts off its light.

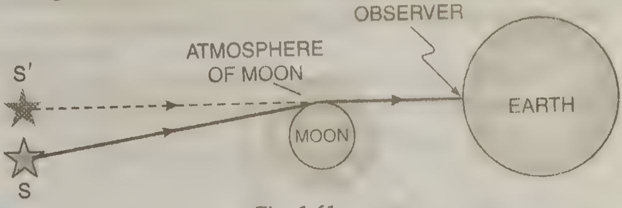

Fig. 1.61

Q. 1.07. The refractive index of diamond is much greater than that of ordinary glass. Is this fact of some use to diamond cutter ?

Ans. The refractive index of diamond ($\mu = 2{\cdot}42$) is much greater than that of the ordinary glass ($\mu = 1{\cdot}5$). Since $\sin C = \frac{1}{\mu}$, the critical angle for diamond is much less and is about 24°. Therefore, if angle of incidence remains between 90° to 24°, the light will undergo internal reflection again and again, till it remains between 24° and 90°. For ordinary glass, due to low value of its refractive index, such a range for angle of incidence is quite small. Because of a large range of angle of incidence available, a diamond cutter is able to cut the diamond, so as to have a large number of faces. Due to a large number of internal reflections taking place from these faces (before the ray of light finally comes out), the diamond exhibits brilliance.

Q. 1.08. An empty test tube dipped into water in a beaker appears silvery, when viewed from a suitable direction. Why ?

Ans. The ray of light incident on the water-air interface suffers total internal reflection, in case the angle of incidence is greater than the critical angle. Therefore, if the tube is viewed from a suitable direction (so that the angle of incidence is greater than the critical angle), the rays of light incident on the tube undergo total internal reflection. As a result, the test tube appears as highly polished *i.e.* silvery.

Q. 1.09. A fish swims in a glass tank. A person, whose eye is above the level of water, sees two fishes. Draw a ray diagram to illustrate this.

Ans. Fig. 1.62 shows a fish O inside the water. A person whose eye is above sea water sees two fishes due to refraction of light taking place from the surface of water and from the vertical wall of the glass tank. The image I_1 of the fish is seen due to refraction of the light at point A on the surface of water and another image I_2 is seen due to refraction at point B on the vertical wall of the glass tank.

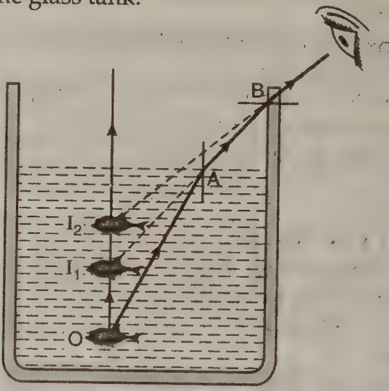

Fig. 1.62

Q. 1.10. To a fish under water viewing obliquely a fisherman standing on the bank of a lake, does the man look taller or shorter than what he actually is ?

(Text Question)

Ans. The man would look taller than what he actually is. Fig. 1.63 shows a man AB standing on the bank of the lake.

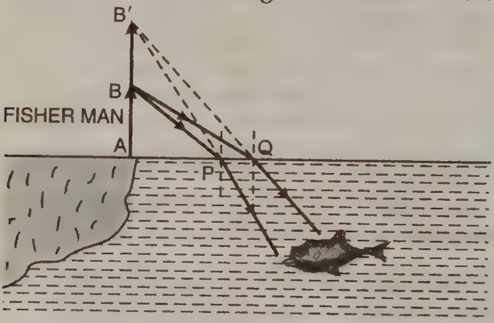

Fig. 1.63

The rays of light BP and BQ from the head (B) of the fisherman, on refraction at the water-air interface, bend towards the normals at points P and Q and appear to come from point B′. Therefore, to the fish, the fisherman will appear as AB′ *i.e.* taller than what he actually is. It may be pointed out that as the aperture of the eye of the fish is very small, the points P and Q will actually be very close to each other.

Q. 1.11. What is the relation between refractive indices μ, μ_1, μ_2, if the behaviour of light rays is as shown in Figs. 1.64 and 1.65 ? *(I.I.T. 1979)*

Ans. In Fig. 1.64 : The focal length of the lens is given by

$$\frac{1}{f}=\left(\frac{\mu}{\mu_1}-1\right)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

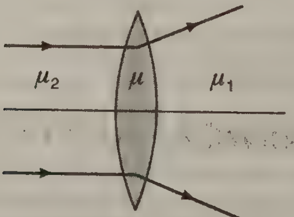

Fig. 1.64

As the rays pass through the lens undeviated, $f=\infty$

$$\therefore \left(\frac{\mu}{\mu_1}-1\right)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)=\frac{1}{\infty}=0$$

Since for a double convex lens, $\frac{1}{R_1}-\frac{1}{R_2}$ is positive, it follows that

$$\frac{\mu}{\mu_1}-1=0$$

or $\quad \frac{\mu}{\mu_1}=1 \quad$ or $\quad \mu=\mu_1$

In Fig. 1.65 : The focal length of the lens is given by

$$\frac{1}{f}=\left(\frac{\mu}{\mu_2}-1\right)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

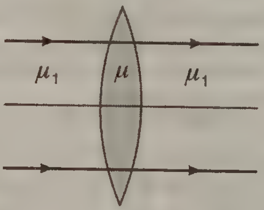

Fig. 1.65

As the lens behaves as a diverging lens, f is negative. Since the factor $\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$ is positive, it follows that

$\frac{\mu}{\mu_2}-1$ is negative *i.e.* $\frac{\mu}{\mu_2}-1<0$

or $\quad \frac{\mu}{\mu_2}<1 \quad$ or $\quad \mu<\mu_2$

Q. 1.12. A concave lens made of a material of refractive index μ_g is immersed in a medium of refractive index μ_1, (*i*) greater than, (*ii*) equal to and (*iii*) less than μ_g. When a parallel beam of light is incident on the lens, trace the path of the emergent rays in each case.

(C.B.S.E. 2000 ; I.I.T. 1973)

Ans. When a parallel beam of light is incident on the lens of refractive index μ_g immersed in a medium of refractive index μ_l, the course of rays will be as shown in Fig. 1.66, Fig. 1.67 and 1.68, when $\mu_g>\mu_l$; $\mu_l=\mu_g$ and $\mu_l<\mu_g$ respectively.

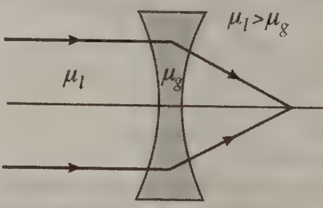

Fig. 1.66

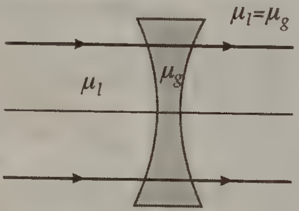

Fig. 1.67

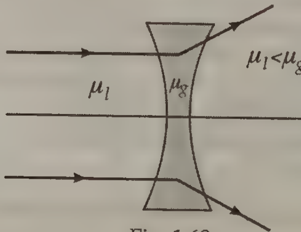

Fig. 1.68

When $\mu_1 > \mu_g$, the lens behaves as converging lens (nature of the lens changes). On the other hand, when $\mu_l = \mu_g$, the lens surface becomes indistinguishable from the medium in which the lens is immersed.

Q. 1.13. The lens shown in Fig. 1.69 is made of two different materials. A point object is placed on the axis. How many images the object will it form ? *(I.I.T. 1975)*

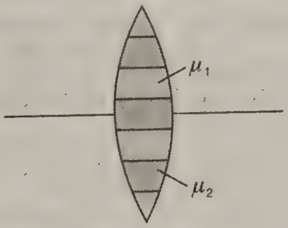

Fig. 1.69

Ans. According to lens maker's formula,

$$\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

If the lens is made of two different materials of refractive indices say μ_1 and μ_2, it will possess two focal lengths given by

$$\frac{1}{f_1} = (\mu_1 - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

and $$\frac{1}{f_2} = (\mu_2 - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

Hence, such a lens will form two images of an object.

Q. 1.14. Although the surfaces of a goggle lens are curved, it does not have any power. Explain, why.

Or

Why is that sun-glasses (goggles), which have curved surfaces, do not have any power ?

Ans. The two surfaces of the goggle lens are parallel *i.e.* possess same radii of curvature. Since one surface is convex and other concave, the powers of the two surfaces is equal but of opposite signs.

The total power of the goggle lens (P′) is the algebraic sum of the powers of the individual surfaces *i.e.*

$$P' = P_1 + P_2 = P + (-P) = 0$$

Q. 1.15. A portion of a lens is broken. Will we get a complete image of an object with such a lens ?

Ans. Yes. But the intensity of the image will be lesser.

Q. 1.16. A virtual image, we always say, cannot be caught on a screen. Yet when we see a virtual image, we are obviously bringing it on to the `screen' (*i.e.* the retina) of our eye. Is there a contradiction ? *(Text Question)*

Ans. The virtual image produced by a spherical mirror or a lens acts as a virtual object for the eye-lens, which produces a real image on the retina. Hence, there is no such contradiction.

Q. 1.17. The image of a small electric bulb fixed at the wall of a room is to be obtained on the opposite wall 3 m away by means of a large convex lens. What is the maximum possible focal length of the lens required for the purpose ? *(Text Question)*

Ans. For a given fixed distance (3 m) between the object and its real image, the lens equation does not give a real solution for u and v, if f is greater than one-fourth of the distance between object and the image.

Therefore, the maximum focal length of the lens

$$= \frac{3 \cdot 0}{4} = \mathbf{0 \cdot 75\ m}$$

Q. 1.18. The image of a candle formed by a convex lens is obtained on a screen. Will the full size of image be obtained, if the lower half of the lens is painted black and completely opaque ? Illustrate your answer with a ray diagram. *(I.I.T. 1977)*

Ans. Yes, the image formed will still be of full size. The ray diagram showing the formation of image is as shown in Fig. 1.70. It may be pointed out that the intensity of the image will be lesser, when the lower half of the lens is painted black. It is because, light gathering power of a lens depends upon its diameter.

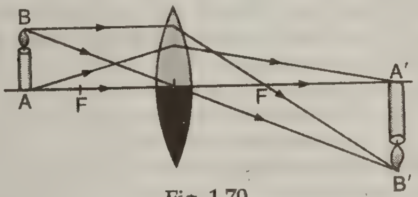

Fig. 1.70

Q. 1.19. An ant is approaching a convex lens with a uniform speed upto first focus. How would the speed of the image of the ant formed by lens change ?

Ans. From the lens equation, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$, we have

or $$v = \frac{u\,f}{u + f}$$

Differentiating both sides *w.r.t.* t, we have

$$\frac{dv}{dt} = \frac{(u + f) \times f\,\frac{du}{dt} - u\,f \times \left(\frac{du}{dt} + 0\right)}{(u + f)^2}$$

or $$\frac{dv}{dt} = \frac{f^2}{(u + f)^2} \cdot \frac{du}{dt} \qquad \ldots(i)$$

If u and u are distances of the ant and its image from the optical centre of the lens, then $\frac{du}{dt}$ and $\frac{dv}{dt}$ represent speed of the ant and its image respectively.

Now, for a convex lens, f is positive and u is negative.

Therefore, the factor $\frac{f^2}{(u + f)^2} > 1$. Then, from equation (*i*), it follows that $\frac{dv}{dt} > \frac{du}{dt}$ *i.e.* the image of the ant moves with a speed greater than that of the ant.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Explain the phenomenon of refraction at a plane surface separating two transparent media and show that $\mu = \frac{c}{v}$, where letters have their usual meanings.
2. Define refractive index of a material. Distinguish between the terms absolute and relative refractive index of a medium. How are they related ? Give the expression for refractive index in terms of velocities of light.

3. Prove the relation : ${}^a\mu_b = \frac{1}{{}^b\mu_a}$
4. What is meant by lateral shift ? Explain. For a given slab, what is the quantity that determines lateral shift ? Obtain the expression for lateral shift for refraction through a parallel sided glass slab.
5. Discuss refraction through a glass-slab and show that emergent ray is parallel to the incident ray but displaced. *(H.P.S.S.C.E. 1996)*
6. State generalized Snell's law for refraction through multiple parallel media. Prove the relation :
$${}^a\mu_c = {}^a\mu_b \times {}^b\mu_c$$
7. Deduce the relation : $\mu = \dfrac{\text{real depth}}{\text{apparent depth}}$
8. What is normal shift ? Explain. Obtain the expression for normal shift. Indicate, how this helps to determine refractive index of a medium.
9. With the help of a ray diagram explain the phenomenon of total internal reflection. Obtain the relation between critical angle and the refractive index of the medium. *(C.B.S.E. 2001 S)*
10. Define total internal reflection and critical angle. Find the relation between critical angle and refractive index. *(P.S.S.C.E. 1993 ; Karnataka, 1989 S)*
11. What do you understand by the phenomenon of total internal reflection ? Give two conditions for it to take place. Derive the relation connecting refractive index and critical angle for a given pair of media. *(C.B.S.E. 2001)*
12. Explain the phenomenon of total internal reflection. What are the conditions of the phenomenon ? Explain the meaning of the critical angle. *(C.B.S.E. 1993)*
13. State the conditions for total internal reflection of light to take place at an interface separating two transparent media. Hence derive the expression for the critical angle in terms of the speeds of light in the two media. *(C.B.S.E. 2000)*
14. What is total internal reflection ? Define critical angle and give its relation with refractive index. Give one application of total internal reflection. *(H.S.S.C.E. 1997 S)*
15. What are optical fibres ? How are light waves propagated in them ? *(C.B.S.E. 1992 S)*
16. How do optical fibres transmit light without significant absorption ? Mention one practical application of optical fibres. *(C.B.S.E. 1991)*
17. Explain the following : (*i*) Brilliance of diamond (*ii*) Optical fibre.
18. What is total internal reflection? How is it applied to optical fibres ? *(H.P.S.S.C.E. 2001)*
19. What are optical fibres? Explain with the help of a diagram. Write their any two uses. *(P.S.S.C.E. 1999 S)*
20. Derive a relation between the focal length of a convex lens and its radii of curvature. *(H.S.S.C.E. 1998)*
21. Derive a relation between the focal length of a lens and its radii of curvature. *(P.S.S.C.E. 1991)*
22. Derive lens formula from curved surface formulae. *(H.S.S.C.E. 1993)*
23. What is lens formula ? Derive it for a convex lens. *(P.S.S.C.E. 1995, 1992, H.S.S.C.E. 1993)*
24. Draw a ray diagram to show how the image is formed, when the object is placed between f and $2f$ distances from a convex lens. Deduce the relation between the distances of the object and the image from the lens and the focal length of the lens under this condition. *(C.B.S.E. 1998)*
25. Draw a ray diagram to show the formation of the image of an object placed between the optical centre and focus of a convex lens. Deduce the relationship between the object distance, image distance and focal length under the conditions stated. *(C.B.S.E. 1998)*
26. Draw a ray diagram to show the formation of image of an object placed between f and $2f$ distances from a thin concave lens. Deduce the relationship between the object distance, image distance and focal length under this condition. *(C.B.S.E. 1998)*
27. Define linear magnification produced by a lens. Hence derive expression for it. Also define the power of a lens and its unit. *(H.P.S.S.C.E. 1998 S)*
28. Define linear magnification produced by a lens. Derive expression for it in terms of (*i*) object and image distance, (*ii*) object distance and focal length and (*iii*) image distance and focal length.
29. Explain the method of obtaining the image of an extended object due to refraction through a thin convex lens. Draw a diagram to indicate the formation of a real diminished image.
30. Give the position and nature of image of an extended object for different distances from a convex lens. How do you explain this from lens formula ?
31. What is power of a lens ? Give and define unit of the power of a lens. How is power of a lens related to the power of its refracting surface ?
32. What is an equivalent lens ? Obtain an expression for the effective focal length of two thin convex lenses placed in contact coaxially with each other. *(Karnataka, 1989)*
33. What is an equivalent lens ? Obtain an expression for the focal length of a combination of two thin lenses placed in contact.

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. What is the total internal reflection ? What are the conditions under which this takes place ? Discuss two important applications of this phenomenon. *(H.S.S.C.E. 2001)*
2. Explaining the 'critical angle of incidence', establish relationship between the critical angle of incidence and refractive index of the denser medium, considering the rarer medium to be air of refractive index unity. How can a right angled prism be used to invert the path of a beam of light ? *(C.B.S.E. Sample Question Paper)*
3. (*a*) How do you explain the 'mirage' effect produced in very hot deserts ?
(*b*) Describe with ray diagrams, the applications of total reflection prisms. *(H.P.S.S.C.E. 1993)*
4. Discuss refraction from a denser to rarer medium at a convex spherical refractive surface. *(H.S.S.C.E. 2001)*
5. Derive the expression :
$$-\frac{\mu_1}{\mu} + \frac{\mu_2}{v} = \frac{\mu_2 - \mu_1}{R},$$
when refraction occurs from rarer to denser medium at convex spherical refracting surface ($\mu_1 < \mu_1$). *(H.S.S.C.E. 2001 ; H.P.S.S.C.E. 2000 ; P.S.S.C.E. 1996 ; Karnataka, 1992)*
6. Prove that when refraction occurs from rarer to denser medium at a convex spherical refracting surface,
$$\frac{-\mu_1}{u} + \frac{\mu_2}{v} = \frac{\mu_2 - \mu_1}{R}$$
(H.P.S.S.C.E. 1997 ; P.S.S.C.E. 1995 S)

7. Derive the equation relating u, v and R in case of refraction of refractive index μ_1 from a medium of refractive index μ_2. State the assumption made in your derivation. *(I.S.C.E. 1993)*
8. Establish a relation for refraction at a single spherical surface, when the ray travels from rarer to denser medium and real image is formed. *(H.S.S.C.E. 1997)*
9. By stating the sign-conventions and assumptions used, derive the relation between distance of object, distance of image and radius of curvature of a convex spherical surface, when refraction takes place from optically denser to optically rarer medium. *(H.S.S.C.E. 1998 S, P.S.S.C.E. 1993)*
10. Derive Lens Maker's formula for convex surface, when ray travels from a rarer to denser medium. *(H.S.S.C.E. 2001)*
11. By stating the sign-conventions and assumptions used, derive the relation between distance of object, distance of image and radius of curvature of convex spherical surface, when refraction takes place from optically rarer to optically denser medium and the image formed is virtual. *(P.S.S.C.E. 1999 S)*
12. Stating the new Cartesian sign conventions, derive the relation between u, v and R, when refraction takes place from a concave spherical refracting surface. *(P.S.S.C.E. 1999 S)*
13. By stating the sign conventions and assumptions used, derive the relation between distance of object, distance of image and radius of curvature of a convex spherical surface, when refraction takes from optically denser to optically rarer medium, when image formed is real. *(P.S.S.C.E. 1999 S ; H.S.S.C.E. 1998 S)*
14. Derive the lens-maker's formula in case of a double convex lens. State the assumptions made and convention of signs used. *(C.B.S.E. 2001 S)*
15. Derive an expression for lens maker's formula. *(P.S.S.C.E. 1998 S)*
16. Derive lens maker's formula for a thin convex lens. *(P.S.S.C.E. 1998 S, 1998)*
17. Derive a relation between focal length of a double convex lens and its radii of curvatures. *(P.S.S.C.E. 2002, 2000)*
18. Derive expression for lens maker's formula *i.e.*

$$\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right),$$

where the letters have their usual meanings. *(H.S.S.C.E. 1996, 1995, C.B.S.E. 1996, P.S.S.C.E. 1991)*

19. Derive lens maker's formula for a thin biconvex lens. *(C.B.S.E. 1996)*
20. Derive lens maker's formula. *(H.S.S.C.E. 1995)*
21. Define power and magnification of a lens. Assuming formula for refraction at a spherical surface, derive lens maker's formula

$$\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$ *(Karnataka, 1991 S)*

22. Draw a ray diagram to show the formation of image of an object placed between the optical centre and focus of a thin convex lens. Write two characteristics of the image formed. Using this diagram, derive the relation between object distance u, image distance v and focal length f of the convex lens. Draw the graph showing the variation of v with u. *(C.B.S.E. 1999 S)*

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Laws of Refraction

1. The refractive index for water is 4/3, for glass it is 3/2. A ray of light travelling in water is incident at an angle of 30° upon a water-glass interface. Calculate the angle of refraction into glass. **[Ans.** 26·4°]

Type B. On Real and Apparent depths

2. Calculate the index of refraction of a liquid from the following into glass :
   Reading for the bottom of an empty beaker : 11·324 cm
   Reading for the bottom of the beaker, when partially filled with the liquid : 11·802 cm
   Reading for the upper level of the liquid in the beaker : 12·895 cm **[Ans.** 1·437]
3. While determining the refractive index of a liquid experimentally, the microscope was focussed at the bottom of a beaker, when its reading was 3·965 cm. On pouring liquid upto a height of 2·537 cm inside the beaker, the reading of the refocussed microscope was 3·348 cm. Find the refractive index of the liquid. **[Ans.** 1·321]
4. The bottom of a container is a 4·0 cm thick glass (μ = 1·5) slab. The container contains two immiscible liquids A and B of depths 6·0 and 8·0 cm. respectively. What is the apparent position of a scratch on the outer surface on the bottom of the glass slab, when viewed through the container ? Refractive indices of A and B are 1·4 and 1·3 respectively. *(Text Problem)* **[Ans.** 4·89 cm (displaced upwards)]

Type C. On Total Internal reflection

5. Find the critical angle for a ray of light going from paraffin oil to air. Given that the refractive index of paraffin oil with respect to air is 1·44. *(H.S.S.C.E. 2002)* **[Ans.** 43·98°]
6. What is the critical angle for a ray going from glass into water ? The refractive indices of glass and water are 1·62 and 1·32 respectively. **[Ans.** 54·6°]
7. Velocity of light in a liquid is $1{\cdot}5\times10^8$ m s^{-1} and in air, it is 3×10^8 m s^{-1}. If a ray of light passes from this liquid to air, calculate the value of critical angle. *(P.S.S.C.E. 1999)* **[Ans.** 30°]
8. A small bulb is placed at the bottom of a tank containing water to a depth of 80 cm. What is the area of the surface of water through which light from the bulb can emerge out ? Refractive index of water is 1·33. Consider the bulb to be a point source. *(Text Problem)* **[Ans.** 26149·3 cm^2]

Type D. On Optical Fibre

9. Monochromatic light is incident on the plane interface AB between two media of refractive indices μ_1 and μ_2 ($\mu_2 > \mu_1$) at an angle of incidence θ (just greater than the critical angle for the two media *i.e.* $\theta \geq$ C) so that total internal reflection takes place. Now, a transparent slab DEFG of uniform thickness and of refractive index μ_3 ($\mu_3 < \mu_2$) is introduced on the interface as shown in Fig. 1.71. Show that for any value of μ_3, all light will ultimately be reflected back into medium of refractive index μ_2.

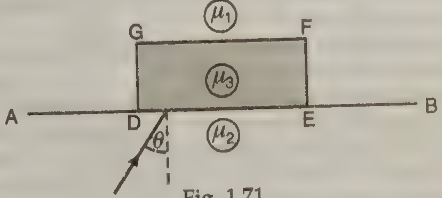

Fig. 1.71

Type E. On Refraction from Spherical refracting surfaces

10. A convex refracting surface of radius of curvature 20 cm separates two media of refractive indices 4/3 and 1·60. An object is placed in the first medium ($\mu = 4/3$) at a distance of 200 cm from the refracting surface. Calculate the position of the image formed. (*P.S.S.C.E. 2001*)
[**Ans.** at 240 cm in rarer medium]

11. The radius of curvature of convex surface is 10 cm and if an object lies at a distance of 20 cm from it in the rarer medium, find the position of the image assuming that refractive index of the rarer medium is 1·0, while that of the denser medium is 2·0.
[**Ans.** at 40 cm (in denser medium)]

12. One end of a cylindrical rod is grounded to a hemispherical surface of radius R = 20 mm. It is immersed in water of refractive index 1·33. If the refractive index of the rod is 1·50, find the position of the image of an object placed on the axis of the rod inside water at 10 cm from the pole.
[**Ans.** at 31·25 cm (inside water)]

13. A small object is enclosed in a sphere of glass 7 cm in radius. It is situated 1 cm from the centre and is viewed from the side to which it is nearest. Where will it appear to be, if refractive index is 1·4 ? Also find the apparent position of the object as seen by an eye looking along diameter through greatest thickness of the glass.
[**Ans.** 5·68 cm, 8·485 cm]

14. A small air bubble is entrapped in a sphere with diameter 6 cm and refractive index 1·5. When looked along the diameter, the bubble appears to be 1 cm inside the sphere. Find true location of the bubble. [**Ans.** 1·286 cm]

15. A point object is placed in air at distance of 40 cm from a concave refracting surface of refractive index 1·5. If radius of curvature of the spherical surface is 20 cm, calculate the position of the image. [**Ans.** at 30 cm (in air)]

16. A concave spherical surface of refractive index 3/2 is immersed in water of refractive index 4/3. If a point object lies in water at a distance of 10 cm from the pole of the refracting surface, calculate the position of the image. Given that radius of curvature of the spherical surface is 18 cm.
[**Ans.** at 10·52 cm (in water)]

17. A small object is 2 cm below the concave meniscus of water in a test tube. The radius of the meniscus is 5 mm and μ for water is 4/3. Find the nature and position of the image. [**Ans.** virtual image, at 0·75 cm (inside water)]

Type F. On Lens Maker's formula

18. The radii of curvature of a double convex lens are 15 cm and 30 cm and its refractive index is 1·5. Calculate its focal length. (*H.S.S.C.E. 1999*) [**Ans.** 20 cm]

19. The radii of curvature of a double convex lens are 30 cm and 60 cm and its refractive index is 1·5. Calculate its focal length. (*C.B.S.E. 1992*) [**Ans.** 40 cm]

20. The radii of curvature of the two faces of a convex lens are 0·1 m and 0·15 m respectively. If the focal length of the lens is 0·12 m, find the refractive index of the material of the lens. (*Karnataka, 1983*) [**Ans.** 1·5]

21. A thin double convex lens has surfaces of radii of curvature 30 cm each. Find the refractive index of the material of lens, if the focal length is 25 cm. [**Ans.** 1·6]

22. A plano-convex lens ($\mu = 1·5$) has a curved surface of radius 15 cm. What is its focal length ? [**Ans.** 30 cm]

23. The radius of curvature of the convex face of a plano-convex lens is 12 cm and the refractive index of its material is 1·5. Find the focal length of the lens. [**Ans.** 24 cm]

24. The radius of curvature of each face of a biconcave lens made of glass of refractive index 1·5 is 30 cm. Calculate the focal length of the lens in air. (*C.B.S.E. 1996*)
[**Ans.** – 30 cm]

25. The radii of curvature of the two surfaces of a convexo-concave lens are 15 cm and 30 cm. Find the focal length of the lens, if the refractive index of its material is 1·6.
[**Ans.** 50 cm]

26. The focal length of a glass convex lens in air is 15 cm. Calculate its focal length, when it is totally immersed in water. Given ${}^a\mu_w = 4/3$ and ${}^a\mu_g = 1·5$. (*P.S.S.C.E. 2001*)
[**Ans.** 60 cm]

27. The focal length of a concavo-convex lens of radii of curvature 5 cm and 10 cm is 20 cm. What will be its focal length in water ($\mu = 4/3$) ? [**Ans.** – 80 cm]

28. If the refractive index from air to glass is 3/2 and that from air to water is 4/3, find the ratio of the focal length of glass lens in water and in air. [**Ans.** 4]

29. A convex lens of refractive index 1·5 is immersed in a liquid of refractive index : (*i*) 1·6 ; (*ii*) 1·3 ; (*iii*) 1·5. What changes happen to the focal length of the lens in the three cases ? (*Pre-degree Kerala, 1992*)
[**Ans.** (*i*) $-8\,f_{air}$; (*ii*) $+3·25\,f_{air}$; (*iii*) ∞]

Type G. On Lens equation

30. An object is placed at 0·06 m from a convex lens of focal length 0·10 m. Calculate the position and nature of the image. (*H.S.S.C.E. 2002*) [**Ans.** At 15 cm, virtual]

31. An object is kept 0·2 m from a convex lens of focal length 0·15 m. Find the position of the image. (*C.B.S.E. 1993*)
[**Ans.** 0·6 m]

32. A converging beam of light forms a sharp image on a screen. A lens is placed in the path of the beam at 10 cm from the screen. It is found that screen has to be moved 8 cm further away from the lens to obtain a sharp image. Find the focal length and nature of the lens.
[**Ans.** – 22·5 cm (concave lens)]

33. An object is placed at a distance of 75 cm from a screen. Where should a convex lens of focal length 12 cm be placed so as to obtain real image of the object on the screen ?
[**Ans.** 15 cm or 60 cm]

34. The image of a needle placed 45 cm from a lens is formed on a screen placed 90 cm on the other side of the lens. Find the displacement of the image, if the object is moved by 5·0 cm away from the lens. (*P.S.S.C.E. 2000*)
[**Ans.** 15 cm (towards the lens)]

35. If the distance between the screen and object is 50 cm and the displacement of the lens is 10 cm, calculate the focal length of the lens. [**Ans.** 12 cm]

Type H. On Linear magnification

36. An object is placed at a distance 5 cm from a convex lens of focal length 10 cm. Calculate the position and magnification of the image. (*C.B.S.E. 1992*) [**Ans.** – 10 cm, 2]

37. Where should an object placed from a converging lens of focal length 20 cm, so as to obtain a real image of magnification 2 ? (*C.B.S.E. 2001*) [**Ans.** at 30 cm]

38. At what distance should an object be placed from a convex lens of a focal length 10 cm, so as to obtain an image twice the size of the object ?
[**Ans.** at 15 cm (for real image), at 5 cm (for virtual image)]

39. At what distance should an object be placed from a convex lens of focal length 15 cm to obtain an image three times the size of the object ?
[**Ans.** at 20 cm (for real image), at 10 cm (for virtual image)]

40. A lens placed at a distance of 20 cm from an object produces a virtual image 2/3 the size of the object. Find the position of image, kind of lens and its focal length.
[**Ans.** at 13·3 cm on the same side as object,
– 40 cm (concave lens)]

41. The image obtained with a convex lens is erect and its length is three times the length of the object. If the focal length of the lens is 15 cm, calculate the object and image distance. (*P.S.S.C.E. 1991*) [**Ans.** – 10 cm, – 30 cm]

42. An object is placed at a distance of 150 cm from a screen and a convex lens placed in between produces an image magnified 4 times on the screen. Calculate the focal length and the position of the lens.
[**Ans.** 24 cm, at 120 cm from screen and 30 cm from the object]

43. A lens of focal length 12 cm produces a virtual image, whose linear dimensions are 1/3 that of the object. What kind of a lens is it ? Determine the position of the object and the image. [**Ans.** diverging, 24 cm, 8 cm]

Type I. On Power of lens

44. A lens has a power of + 5 D in air. If completely immersed in water, what will be its power ? Given, refractive index of glass = 3/2, refractive index of water = 4/3.
[**Ans.** 1·25 D]

45. Find the ratio of the powers of a glass lens in water and in air. Given, refractive index of glass = 1·50, refractive index of water = 1·33. [**Ans.** 0·256]

46. A glass convex lens has a power of + 10 D. When this lens is totally immersed in a liquid, it acts as concave lens of focal length 50 cm. Calculate the refractive index of the liquid. Given ${}^a\mu_g = 1{\cdot}5$. (*P.S.S.C.E. 2001*) [**Ans.** 1·67]

Type J. On Equivalent lens

47. What is the focal length of the combination of a convex lens of focal length 30 cm in contact with a concave lens of focal length 20 cm ? Is the system a converging or a diverging lens ? Ignore thickness of the lenses.
[**Ans.** – 60 cm (diverging)]

48. A concave lens is placed in contact with a convex lens of focal length 25 cm. The combination produces a real image at a distance of 80 cm, when the object is at a distance of 40 cm. What is the focal length of the concave lens ?
(*Pre-degree Kerala, 1992*) [**Ans.** – 400 cm]

49. Two thin lenses of focal lengths + 10 cm and – 5 cm are kept in contact. What is the (*i*) focal length and (*ii*) power of combination ? (*C.B.S.E. 1993*) [**Ans.** – 10 cm, – 10 D]

50. Two lenses of focal lengths 10 cm and – 20 cm are placed in contact. What is the total power of the combination ?
(*P.S.S.C.E. 1999*) [**Ans.** 5 D]

51. A convex lens of focal length 30 cm and a concave lens of focal length 60 cm are placed in contact. Find the power of the combination. (*Karnataka, 1985*) [**Ans.** 1·67 D]

52. Two lenses of powers 15·5 D and – 5·5 D are placed in contact. What is the focal length of the combination.
(*P.S.S.C.E. 1999*) [**Ans.** 0·1 m]

53. Two thin lenses of power + 5 D and – 3 D are in contact. What is the focal length of the combination ?
(*C.B.S.E. 2001 S*) [**Ans.** 0·5 m]

54. A concave lens is kept in contact with a convex lens of focal length 20 cm. The combination works as a convex lens of focal length 50 cm. Find the power of the concave lens.
(*P.S.S.C.E. 2002*) [**Ans.** – 3 D]

55. Two lenses of powers + 15 D and – 5 D are in contact with each other forming a combination lens. (*a*) what is the focal length of this combination ? (*b*) An object of size 3 cm is placed at 30 cm from this combination of lenses. Calculate the position and size of the image formed. (*C.B.S.E. 2002*)
[**Ans.** (*a*) 10 cm (*b*) 15 cm, – 1·5 cm (inverted)]

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. Here, ${}^a\mu_w = \dfrac{4}{3}$ and ${}^a\mu_g = \dfrac{3}{2}$

$$\therefore \quad {}^w\mu_g = \frac{{}^a\mu_g}{{}^a\mu_w} = \frac{3/2}{4/3} = \frac{9}{8}$$

$$\text{Now, } \sin r = \frac{\sin i}{{}^w\mu_g} = \frac{\sin 30°}{9/8} = 0{\cdot}444 \quad \text{or} \quad r = 26{\cdot}4°$$

2. Real depth = 12·895 – 11·324 = 1·571 cm
Apparent depth = 12·895 – 11·802 = 1·093 cm

$$\text{Now, } \mu = \frac{\text{real depth}}{\text{apparent depth}} = \frac{1{\cdot}571}{1{\cdot}093} = \mathbf{1{\cdot}437}$$

3. Proceed as in problem no. 2.

4. Total normal shift, $d = d_1 + d_2 + d_3$

$$\text{or} \quad d = t_1\left(1 - \frac{1}{{}^a\mu_g}\right) + t_2\left(1 - \frac{1}{{}^a\mu_A}\right) + t_3\left(1 - \frac{1}{{}^a\mu_B}\right)$$

$$= 4{\cdot}0\left(1 - \frac{1}{1{\cdot}5}\right) + 6{\cdot}0\left(1 - \frac{1}{1{\cdot}4}\right) + 8{\cdot}0\left(1 - \frac{1}{1{\cdot}3}\right)$$

$= 1{\cdot}33 + 1{\cdot}71 + 1{\cdot}85$

= 4·89 cm (displaced upwards)

5. $\sin C = \dfrac{1}{\mu} = \dfrac{1}{1{\cdot}44} = 0{\cdot}6944$

$\therefore$ $C = \mathbf{43{\cdot}98°}$

6. Proceed as in solved problem no. 1.10.

7. $\mu = \dfrac{3 \times 10^8}{1{\cdot}5 \times 10^8} = 2$

Now, proceed as problem no. 5.

8. Proceed as in solved problem no. 1.12.

9. Let C be critical angle, when light is refracted at the interface AB between two media of refractive indices μ_1 and μ_2. Then,

$$\sin \theta \geq \sin C = \frac{\mu_1}{\mu_2}$$

On introducing slab DEFG :

Case (i) When $\mu_3 < \mu_1$:

$$\text{Then, } \frac{\mu_3}{\mu_2} < \frac{\mu_1}{\mu_2}$$

Since $\dfrac{\mu_3}{\mu_2} < \dfrac{\mu_1}{\mu_2}$, it follows that when light travels from medium of refractive index μ_2 to μ_3, the value of critical angle will be less than C. Therefore, if light is incident at angle θ ($\geq$C), it will go back into medium μ_2 after suffering total internal reflection.

Case (ii) When $\mu_3 > \mu_1$:
Since $\mu_3 > \mu_1$, $\theta <$ C and hence the ray of light will be refracted into medium μ_3 as shown in Fig. 1.72.

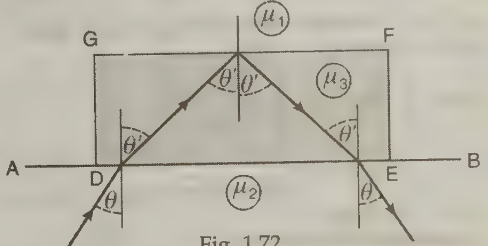

Fig. 1.72

The angle of refraction θ' is given by

$$\frac{\sin \theta}{\sin \theta'} = \frac{\mu_3}{\mu_2} \quad \text{or} \quad \sin \theta' = \frac{\mu_2}{\mu_3} \sin \theta$$

$$\text{or} \quad \sin \theta' \geq \frac{\mu_2}{\mu_3} \cdot \frac{\mu_1}{\mu_2} \quad \text{or} \quad \sin \theta' \geq \frac{\mu_1}{\mu_3}$$

Thus, angle θ' is greater than critical angle for pair of media μ_2 and μ_3 and therefore total internal reflection will take place at face FG. After undergoing refraction at face DE, the ray of light will return back into the medium μ_2.

10. $$-\frac{\mu_1}{u}+\frac{\mu_2}{v}=\frac{\mu_2-\mu_1}{R}$$

$R = 20$ cm, $\mu_1 = 4/3$, $\mu_2 = 1{\cdot}60$, $u = -200$ cm

$$\therefore\ -\frac{4/3}{-200}+\frac{1{\cdot}60}{v}=\frac{1{\cdot}60-4/3}{20}$$

or **$v = 240$ cm (in denser medium)**

11. Proceed as in problem no. 10.

12. $$-\frac{\mu_1}{u}+\frac{\mu_2}{v}=\frac{\mu_2-\mu_1}{R}$$

$R = 20$ mm $= 2$ cm, $\mu_1 = 1{\cdot}33$, $\mu_2 = 1{\cdot}5$ and $u = -10$ cm

$$\therefore\ -\frac{1{\cdot}33}{-10}+\frac{1{\cdot}5}{v}=\frac{1{\cdot}5-1{\cdot}33}{2}$$

or **$v = -31{\cdot}25$ cm (inside water)**

13. ***When object is viewed from the side to which it is nearest*** :

$u = -(7-1) = -6$ cm, $R = -7$ cm, $\mu = 1{\cdot}4$

$$\text{Now, } -\frac{\mu}{u}+\frac{1}{v}=\frac{1-\mu}{R} \quad\text{or}\quad \frac{-1{\cdot}4}{-6}+\frac{1}{v}=\frac{1-1{\cdot}4}{-7}$$

$$\text{or}\quad \frac{1}{v}=\frac{0{\cdot}4}{7}-\frac{1{\cdot}4}{6} \quad\text{or}\quad v=-5{\cdot}68\text{ cm}$$

When object is viewed through the greatest thickness of glass :

$v = -(7+1) = -8$ cm, $R = -7$ cm, $\mu = 1{\cdot}4$ cm

It will be obtained that

$v = -8{\cdot}485$ cm

14. $v = -1$ cm, $R = -6/2 = -3$ cm, $\mu = 1{\cdot}5$

$$-\frac{\mu}{u}+\frac{1}{v}=\frac{1-\mu}{R} \quad\text{or}\quad \frac{-1{\cdot}5}{u}+\frac{1}{-1}=\frac{1-1{\cdot}5}{-3}$$

$$\text{or}\quad \frac{1{\cdot}5}{u}=-1-\frac{0{\cdot}5}{3} \quad\text{or}\quad u=-1{\cdot}286\text{ cm}$$

15. $v = -40$ cm, $R = -20$ cm, $\mu = 1{\cdot}5$

$$-\frac{1}{u}+\frac{\mu}{v}=\frac{\mu-1}{R} \quad\text{or}\quad -\frac{1}{-40}+\frac{1{\cdot}5}{v}=\frac{1{\cdot}5-1}{-20}$$

or **$u = -30$ cm (in air)**

16. $u = -10$ cm, $R = -18$ cm, $\mu_1 = 4/3$ and $\mu_2 = 3/2$

$$\text{Now,}\quad -\frac{\mu_1}{u}+\frac{\mu_2}{v}=\frac{\mu_2-\mu_1}{R}$$

$$\text{or}\quad -\frac{4/3}{-10}+\frac{3/2}{v}=\frac{3/2-4/3}{-18}$$

or **$v = -10{\cdot}52$ cm (in water)**

17. $u = -2$ cm, $R = 5$ mm $= 0{\cdot}5$ cm, $\mu = 4/3$

$$\text{Now,}\quad -\frac{\mu}{u}+\frac{1}{v}=\frac{1-\mu}{R} \quad\text{or}\quad \frac{-4/3}{-2}+\frac{1}{v}=\frac{1-4/3}{0{\cdot}5}$$

or **$v = -0{\cdot}75$ cm (virtual image inside water)**

18. $R_1 = +15$ cm, $R_2 = -30$ cm, $\mu = 1{\cdot}5$

$$\text{Now,}\quad \frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

$$=(1{\cdot}5-1)\left(\frac{1}{15}-\frac{1}{-30}\right)$$

or **$f = 20$ cm**

19. Proceed as in problem no. 18.

20. Proceed as in problem no. 18.

21. Proceed as in problem no. 18.

22. $\mu = 1{\cdot}5$; $R_1 = 15$ cm, $R_2 = -\infty$

$$\text{Now,}\quad \frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

$$=(1{\cdot}5-1)\left(\frac{1}{15}-\frac{1}{-\infty}\right)$$

or **$f = 30$ cm**

23. Proceed as in problem no. 22.

24. $R_1 = -30$ cm ; $R_2 = 30$ cm ; $\mu = 1{\cdot}5$

$$\text{Now,}\quad \frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

$$=(1{\cdot}5-1)\left(\frac{1}{-30}-\frac{1}{30}\right)$$

or **$f = -30$ cm**

25. $R_1 = 15$ cm, $R_2 = 30$ cm, $\mu = 1{\cdot}6$

$$\text{Now,}\quad \frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)=(1{\cdot}6-1)\left(\frac{1}{15}-\frac{1}{30}\right)$$

or **$f = 50$ cm**

26. Proceed as in solved problem no. 1.26.

27. $R_1 = -5$ cm, $R_2 = -10$ cm, $f_{air} = -20$ cm

$$\text{Now,}\quad \frac{1}{f_{air}}=\left({}^a\mu_g-1\right)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

$$\text{or}\quad -\frac{1}{20}=\left({}^a\mu_g-1\right)\left(\frac{1}{-5}-\frac{1}{-10}\right)$$

or ${}^a\mu_g = 1{\cdot}5$

When lens is immersed in water :

$$\frac{1}{f_w}=\left(\frac{{}^a\mu_g}{{}^a\mu_w}-1\right)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

$$=\left(\frac{1{\cdot}5}{4/3}-1\right)\left(\frac{1}{-5}-\frac{1}{-10}\right)$$

or **$f_w = -80$ cm**

28. Proceed as in solved problem no. 1.26 and then find the ratio f_{air}/f_w.

29. $$\frac{1}{f_{air}}=\left({}^a\mu_g-1\right)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

$$=(1{\cdot}5-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$$

$$\text{or}\quad \left(\frac{1}{R_1}-\frac{1}{R_2}\right)=\frac{2}{f_{air}}$$

(i) Here, ${}^a\mu_g = 1{\cdot}6$

$$\frac{1}{f_l}=\left(\frac{{}^a\mu_g}{{}^a\mu_l}-1\right)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)=\left(\frac{1{\cdot}5}{1{\cdot}6}-1\right)\times\frac{2}{f_{air}}$$

or **$f_l = -8\,f_{air}$**

(ii) Here, ${}^a\mu_l = 1{\cdot}3$

$$\frac{1}{f_l}=\left(\frac{{}^a\mu_g}{{}^a\mu_l}-1\right)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)=\left(\frac{1{\cdot}5}{1{\cdot}3}-1\right)\times\frac{2}{f_{air}}$$

or **$f_l = +3{\cdot}25\,f_{air}$**

(iii) Here, ${}^a\mu_l = 1{\cdot}5$

$$\frac{1}{f_l}=\left(\frac{{}^a\mu_g}{{}^a\mu_l}-1\right)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)=\left(\frac{1{\cdot}5}{1{\cdot}5}-1\right)\times\frac{2}{f_{air}}$$

or $f_l = \infty$

30. $u = -0{\cdot}06$ m $= -6$ cm, $f = 0{\cdot}10$ m $= 10$ cm

$$\text{Now,}\quad -\frac{1}{u}+\frac{1}{v}=\frac{1}{f} \quad\text{or}\quad -\frac{1}{-6}+\frac{1}{v}=\frac{1}{10}$$

or **$v = -15$ cm (virtual image)**

31. Proceed as in problem no. 31.

32. $u = +10$ cm, $v = +(10 + 8) = +18$ cm

Now, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$ or $-\frac{1}{10} + \frac{1}{18} = \frac{1}{f}$

or $\quad f = -22{\cdot}5$ **cm (concave lens)**

33. Here, $f = 12$ cm,
distance between object and image (screen) = 75 cm
If v is the distance of image from the lens, then

$$u = -(75 - v)$$

Now, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$ or $-\frac{1}{-(75-v)} + \frac{1}{v} = \frac{1}{12}$

or $v^2 - 75\,v + 900 = 0$

$$\text{or } v = \frac{75 \pm \sqrt{(75)^2 - 4 \times 1 \times 900}}{2}$$

$$= \frac{75 \pm 45}{2} = 60 \text{ cm or } 15 \text{ cm}$$

Therefore, distance of object from the lens,
$|u| = 75 - 60$ or $75 - 15$ *i.e.* **15 cm** or **60 cm**

34. Here, $u = -45$ cm, $\quad v = 90$ cm

Now, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$ or $-\frac{1}{-45} + \frac{1}{90} = \frac{1}{f}$

When object is moved away from the lens by 5 cm :

$u' = -(45 + 5) = -50$ cm

Now, $-\frac{1}{u'} + \frac{1}{v'} = \frac{1}{f}$ or $-\frac{1}{-50} + \frac{1}{v'} = \frac{1}{30}$

or $\quad v' = 75$ cm

Therefore, distance through which image moves,

$v - v' = 90 - 75 =$ **15 cm (towards the lens)**

35. Distance between object and image (screen) = 50 cm

In first position of object : If v is the distance of image from the lens, then

$$u = -(50 - v)$$

Now, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$ or $-\frac{1}{-(50-v)} + \frac{1}{v} = \frac{1}{f}$

$$\text{or} \quad \frac{1}{50-v} + \frac{1}{v} = \frac{1}{f} \qquad \ldots(i)$$

In second position of object : When lens is moved towards the screen through 10 cm, distance of image from the lens becomes $v' = (v - 10)$. Likewise, distance of object from the lens becomes

$$u' = -\{50 - (v - 10)\} = -(60 - v)$$

Now, $-\frac{1}{u'} + \frac{1}{v'} = \frac{1}{f}$ or $-\frac{1}{-(60-v)} + \frac{1}{v-10} = \frac{1}{f}$

$$\text{or} \quad \frac{1}{60-v} + \frac{1}{v-10} = \frac{1}{f} \qquad \ldots(ii)$$

From equations (*i*) and (*ii*), we have

$\frac{1}{50-v} + \frac{1}{v} = \frac{1}{60-v} + \frac{1}{v-10}$ or $v = 30$ cm

Substituting for v in equation (*i*), we get

$$f = \mathbf{12\ cm}$$

36. Here, $u = -5$ cm, $f = 10$ cm

Now, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$ or $-\frac{1}{-5} + \frac{1}{v} = \frac{1}{10}$

or $\quad v = -10$ **cm**

$$m = \frac{v}{u} = \frac{-10}{-5} = \mathbf{2}$$

37. Proceed as in solved problem no. 1.32.

38. ***When image formed is real :***

$m = -2, \quad f = 10$ cm

Now, $m = \frac{f}{u+f}$ or $-2 = \frac{10}{u+10}$ or $u =$ **– 15 cm**

When image formed is virtual :

$m = +2, \quad f = 10$ cm

Now, $m = \frac{f}{u+f}$ or $2 = \frac{10}{u+10}$ or $u =$ **– 5 cm**

39. Proceed as in problem no. 38.

40. Here, $u = -20$ cm, $\quad m = +\frac{2}{3}$ (virtual image)

Now, $m = \frac{f}{u+f}$ or $\frac{2}{3} = \frac{f}{-20+f}$

or $\quad f = -40$ **cm (concave lens)**

Also, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$ or $-\frac{1}{-20} + \frac{1}{v} = \frac{1}{-40}$

or $\quad v = -13{\cdot}3$ **cm**

41. Here, $m = +3, f = 15$ cm

Now, $m = \frac{f}{u+f}$ or $3 = \frac{15}{u+15}$ or $u =$ **– 10 cm**

Also, $m = \frac{f-v}{f}$ or $3 = \frac{15-v}{15}$ or $v =$ **– 30 cm**

42. As the image is produced on the other side of the object, it must be real in nature.

$\therefore \quad m = -4$

Also, distance between object and image (screen) = 150 cm
If v is the distance of image from the lens, then

$$u = -(150 - v)$$

Now, $m = \frac{v}{u}$ or $-4 = \frac{v}{-(150-v)}$

or $\quad v = 120$ cm

$\therefore \quad u = = (150 - 120) = -30$ cm

i.e. lens should be placed at 30 cm from the object and at 120 cm from the screen.

Again, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$ or $-\frac{1}{30} + \frac{1}{120} = \frac{1}{f}$

or $\quad f =$ **24 cm**

43. The virtual image produced by a convex lens is always magnified. Since $m = 1/3$ (diminished), the lens cannot be a convex lens. Hence, it is **diverging** in nature *i.e.*

$$f = -12 \text{ cm}$$

Now, $m = \frac{f}{u+f}$ or $\frac{1}{3} = \frac{-12}{u+(-12)}$

or $\quad u =$ **– 24 cm**

Also, $m = \frac{f-v}{f}$ or $\frac{1}{3} = \frac{-12-v}{-12}$ or $v =$ **– 8 cm**

44. Focal length of lens, $f = \frac{1}{P} = \frac{1}{5} = 0{\cdot}2$ m

Now, $\frac{1}{f} = \left({}^a\mu_g - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

or $\frac{1}{0{\cdot}2} = \left(\frac{3}{2} - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

or $\frac{1}{R_1} - \frac{1}{R_2} = 10$

When lens is immersed in water :

$$\frac{1}{f_{water}} = \left(\frac{{}^a\mu_g}{{}^a\mu_w} - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) = \left(\frac{3/2}{4/3} - 1\right) \times 10$$

or $\quad f_{water} = 0{\cdot}8$ m

Therefore, power of lens, when immersed in water,

$$f_{water} = \frac{1}{0{\cdot}8} = \mathbf{1{\cdot}25\ D}$$

45. $\frac{1}{f_{air}} = \left({}^a\mu_g - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

$= (1\cdot50 - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

or $P_{air} = 0\cdot5\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$ ...(*i*)

Also, $\frac{1}{f_{water}} = \left(\frac{{}^a\mu_g}{{}^a\mu_w} - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

$= \left(\frac{1\cdot50}{1\cdot33} - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

or $P_{water} = 0\cdot128\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$ ...(*ii*)

From equations (*i*) and (*ii*), we have

$\therefore \quad \frac{P_{water}}{P_{air}} = \mathbf{0\cdot256}$

46. Here, P = + 10 D

$\therefore \quad f = \frac{1}{P} = \frac{1}{10} = 0\cdot1 \text{ m} = 10 \text{ cm}$

Now, $\frac{1}{f_{air}} = \left({}^a\mu_g - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

or $\frac{1}{10} = (1\cdot5 - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

or $\frac{1}{R_1} - \frac{1}{R_2} = \frac{1}{5}$

When lens is immersed in liquid : $f_l = -50$ cm

Now, $\frac{1}{f_l} = \left(\frac{{}^a\mu_g}{{}^a\mu_l}\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

or $\frac{1}{-50} = \left(\frac{1\cdot5}{{}^a\mu_g} - 1\right) \times \frac{1}{5}$

or $\mathbf{{}^a\mu_l = 1\cdot67}$

47. Here, $f_1 = 30$ cm, $f_2 = -20$ cm

Now, $\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2} = \frac{1}{30} + \frac{1}{-20}$

or $\mathbf{f = -60 \text{ cm}}$ **(diverging)**

48. ***For the combination :***

$u = -40$ cm ; $v = 80$ cm

Now, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$ or $-\frac{1}{-40} + \frac{1}{80} = \frac{1}{f}$

or $f = 80/3$ cm

Also, $\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2}$ or $\frac{3}{80} = \frac{1}{25} + \frac{1}{f_2}$

or $\mathbf{f_2 = -400 \text{ cm}}$

49. (*a*) $\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2} = \frac{1}{10} + \frac{1}{-5}$ or $\mathbf{f = -10 \text{ cm}}$

(*b*) $P = \frac{1}{f \text{ (in metre)}} = \frac{1}{-0\cdot1} = \mathbf{-10 \text{ D}}$

50. Proceed as in problem no. 49.

51. Proceed as in problem no. 49.

52. Power of combination,

$P = P_1 + P_2 = 15\cdot5 + (-5\cdot5) = 10 \text{ D}$

Therefore, focal length of combination,

$f = \frac{1}{P} = \frac{1}{10} = \mathbf{0\cdot1 \text{ m}}$

53. Proceed as in problem no. 52.

54. Here, $f = 50$ cm, $f_1 = 20$ cm

Now, $\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2}$ or $\frac{1}{50} = \frac{1}{20} + \frac{1}{f_2}$

or $f_2 = -\frac{100}{3} \text{ cm} = -\frac{1}{3} \text{ m}$

Therefore, power of concave lens,

$P_2 = \frac{1}{f_2 \text{(in metre)}} = \frac{1}{-1/3} = \mathbf{-3 \text{ D}}$

55. (*a*) Power of combination,

$P = P_1 + P_2 = 15 + (-5) = 10 \text{ D}$

Therefore, focal length of combination,

$f = \frac{1}{P} = \frac{1}{10} = 0\cdot1 \text{ m} = \mathbf{10 \text{ cm}}$

(*b*) Here, $u = -30$ cm

Now, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$ or $-\frac{1}{-30} + \frac{1}{v} = \frac{1}{10}$

or $\mathbf{v = 15 \text{ cm}}$

Also $m = \frac{f}{u + f} = \frac{10}{-30 + 10} = -\frac{1}{2}$

Therefore, size of image $= 3 \times \left(-\frac{1}{2}\right)$

$= \mathbf{-1\cdot5 \text{ cm}}$ **(inverted)**

CHAPTER

2

Dispersion

2.01. PRISM

A prism is the portion of transparent refracting medium bound by two plane surfaces ieeting each other along a straight edge.

The two plane surfaces are called *refracting faces* and the line along which the wo faces meet is called the *refracting edge* of the prism [Fig. 2.01]. The angle between he two refracting faces is called the *angle of the prism* and is usually denoted by A.

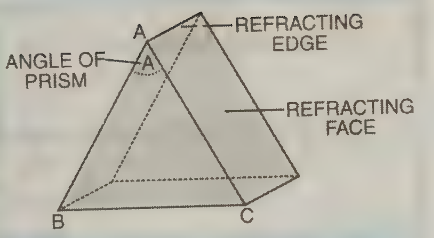

Fig. 2.01

2.02. REFRACTION THROUGH A PRISM

Consider that a ray of light PQ is incident on the refracting face AB of the prism t point Q as shown in Fig. 2.02. According to the laws of refraction, at point Q, the ay of light PQ is refracted along QR towards the normal NQ. The refracted ray QR gain suffers refraction at point R on the second refracting face AC and emerges out f the prism along RS away from the normal N′R drawn at the point R. The rays PQ, QR and RS are called ***incident ray, refracted ray*** and ***emergent ray*** respectively.

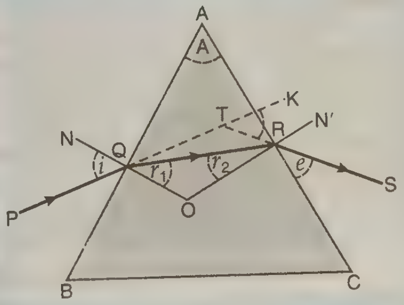

Fig. 2.02

Also, $\angle PQN = i$ (***angle of incidence***), $\angle SRN' = e$ (***angle of emergence***), $\angle RQO = r_1$ (angle of refraction at face AB) and $\angle QRO = r_2$ (angle of refraction at face AC). Produce SR backwards, so as to meet the ray PQ at point T, when produced. Then,

KTS = δ is called ***angle of deviation.***

Since $\angle TQO = i$ and $\angle RQO = r_1$, we have

$$\angle TQR = i - r_1$$

Also, $\angle TRO = e$ and $\angle QRO = r_2$. Therefore,

$$\angle TRQ = e - r_2$$

Now, in triangle TQR, the side QT has been produced outwards. Therefore, the exterior angle δ should be equal to the sum of the interior opposite angles *i.e.*

$$\delta = \angle TQR + \angle TRQ = (i - r_1) + (e - r_2)$$

or

$$\delta = (i + e) - (r_1 + r_2) \qquad \text{...(2.01)}$$

In triangle QRO, the sum of the angles is 180°. Therefore,

$$r_1 + r_2 + \angle QOR = 180° \qquad \text{...(2.02)}$$

In quadrilateral AQOR, each of the angles AQO and ARO is 90°. Since the sum of the four angles of a quadrilateral is four right angles, the sum of the remaining two angles should be 180° *i.e.*

$$A + \angle QOR = 180° \qquad \text{...(2.03)}$$

From the equations (2.02) and (2.03), we have

$$r_1 + r_2 = A \qquad \text{...(2.04)}$$

Substituting for $(r_1 + r_2)$ in equation (2.01), we have

$$\delta = (i + e) - A$$

or

$$A + \delta = i + e \qquad \text{...(2.05)}$$

Thus, when a ray passes through a prism, *the sum of the angle of prism and the angle of deviation is equal to the sum of the angle of incidence and the angle of emergence.*

To prove $\mu = \dfrac{\sin (A + \delta_m)/2}{\sin A/2}$. The deviation produced by a prism depends on :

(*i*) *angle of prism,* (*ii*) *material of prism* and (*iii*) *the angle of incidence.*

If the angle of incidence is increased gradually, the angle of deviation first decreases, attains a minimum value (δ_m) and then again starts increasing [Fig. 2.03]. When angle of deviation is minimum, the prism is said to be in ***minimum deviation position.*** A prism can deviate the incident ray through the same angle δ for two different values i_1 and i_2 of the angle of incidence. But when it is placed in minimum deviation position, there is only one angle of incidence corresponding to the angle

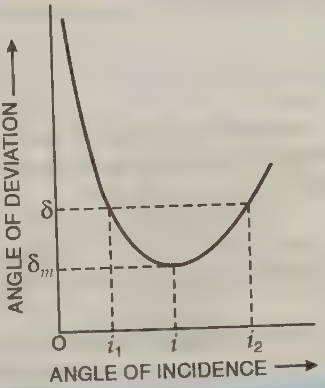

Fig. 2.03

of minimum deviation. In other words, *there is only one angle of incidence, for which the angle of deviation is minimum.*

It can be proved that when the prism is placed in minimum deviation position, the prism lies symmetrically *w.r.t.* incident ray and the emergent ray, *i.e.* the angle of incidence is equal to the angle of emergence. Further, in minimum deviation position, the angle of refraction at the first face and that at the second face are also equal and the refracted ray passes parallel to the base of prism.

Therefore, when $\delta = \delta_m$; (in minimum deviation position),

$$e = i \quad \text{and} \quad r_2 = r_1 = r \text{ (say)}$$

Setting $r_1 = r_2 = r$ in equation (2.04), we obtain

$$r + r = A$$

or $$r = A/2$$

Also, setting $\delta = \delta_m$ and $e = i$ in equation (2.05), we have

$$A + \delta_m = i + i$$

or $$i = (A + \delta_m)/2$$

The refractive index of the material (${}^a\mu_g$ or simply μ) of the prism is given by

$$\mu = \frac{\sin i}{\sin r}$$

$\therefore$ $$\mu = \frac{\sin (A + \delta_m)/2}{\sin A/2} \qquad \text{...(2.06)}$$

Key point

There are two values of the angle of incidence, for which a ray passing through a prism deviates through a given angle.

Key point

When a prism, made of material of refractive index μ is placed in a medium of refractive index μ' ($\mu' < \mu$), the prism still deviates the light towards its base. But the angle of deviation decreases.

2.03. DEVIATION THROUGH A PRISM OF SMALL ANGLE

The deviation produced by a prism depends upon the angle of prism. In case of a prism of small angle, the deviation produced is small.

Refer to Fig. 2.02. When a ray of light PQ is incident on the refracting face AB of the prism at the angle of incidence i, it gets refracted along QR making angle of refraction equal to r_1. If μ is the refractive index of the material of the prism, then from Snell's law

$$\mu = \frac{\sin i}{\sin r_1} \qquad \text{...(2.07)}$$

If the ray of light is incident at a small angle (≈ 10° or less) *i.e.* angle i is small, then r_1 will also be small. When the angles i and r_1 are small, $\sin i \approx i$ and $\sin r_1 \approx r_1$.

Therefore, from equation (2.07), we have

$$\mu = \frac{i}{r_1}$$

or $$i = \mu\, r_1$$

The refracted ray QR comes to be incident on the other refracting face AC of the prism at angle r_1 inside the prism and gets refracted out of the prism along RS, making angle of emergence equal to e.

Therefore, for refraction at face AC, we have

$$\mu = \frac{\sin e}{\sin r_2}$$

If the prism is of small angle, then the angles e and r_2 will also be small. For such a prism, the above equation becomes

$$\mu = \frac{e}{r_2}$$

or $$e = \mu\, r_2$$

Again, for a prism of small angle, angle of deviation δ for a ray of light is practically the same as the angle of minimum deviation. Therefore, for a prism of small angle,

$$A + \delta = i + e$$

or $$\delta = (i + e) - A$$

Substituting for i and e, we have

$$\delta = (\mu\, r_1 + \mu\, r_2) - A = \mu\,(r_1 + r_2) - A$$

When the prism is placed in minimum deviation position,

$$r_1 + r_2 = A$$

$\therefore$ $$\delta = \mu A - A$$

or $$\delta = A\,(\mu - 1) \qquad \text{...(2.08)}$$

The equation (2.08) gives the deviation produced by a prism of small angle, provided the ray of light is incident such that the angle of incidence is small. It may be pointed out that in such a case, *the deviation suffered by the ray is independent of the angle of incidence.*

2.04. DISPERSION

If a beam of white light is made to fall on one face of a prism, the light emerging from the other face of the prism consists of seven colours namely ***violet* (V)**, ***indigo* (I)**, ***blue* (B)**, ***green* (G)**, ***yellow* (Y)**, ***orange* (O)** and ***red* (R)** as shown in Fig. 2.04.

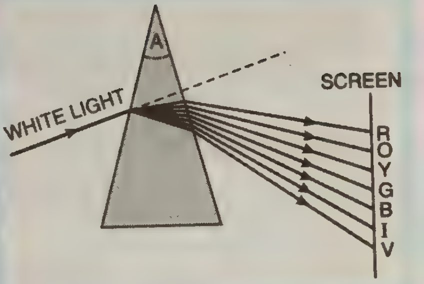

Fig. 2.04

The seven constituent colours of white light can be remembered by the word **VIBGYOR.** The deviation suffered by the violet colour is maximum, while that suffered by the red light is minimum.

This phenomenon of splitting up of white light into its constituent colours is called ***dispersion of light****.*

Further, *the band of seven colours produced on the screen is called* ***spectrum****.*

Cause of dispersion. The different colours of light are due to different wavelengths. The wavelength of violet light is smaller than that of red light.

Cauchy obtained expression for the refractive index of a material in terms of the wavelength of the light. It is given by

$$\mu = a + \frac{b}{\lambda^2} + \frac{c}{\lambda^4}, \qquad \text{...(2.09)}$$

where a, b and c are constants for the material. Since wavelength of violet light is smaller than that of red light; from this formula, it follows that the refractive index of the material for violet light is more than that for red light *i.e.*

$$\mu_v > \mu_r$$

For a small angled prism, we have

$$\delta = \mathrm{A}\,(\mu - 1)$$

Since $\mu_v > \mu_r$, the violet light will suffer greater deviation than that suffered by the red light *i.e.*

$$\delta_v > \delta_r \qquad \text{...(2.10)}$$

The other colours will deviate through angles having values between δ_r and δ_v. Thus, white light consisting of different colours will emerge from the glass prism in different directions due to their different wavelengths, which is termed as dispersion.

Key point ✓

A prism disperses white light into constituent colours due to the fact that light of different wavelengths undergo unequal deviations, while passing through the prism. It is because, refractive index of the material of a prism depends upon the wave length of light.

Note. The refractive index of a material for yellow light (μ) is practically equal to the mean of the refractive indices for the violet and red lights *i.e.*

$$\mu = \frac{\mu_v + \mu_r}{2}$$

For this reason, yellow light is called ***mean light.***

2.05. ANGULAR DISPERSION AND DISPERSIVE POWER

Angular dispersion. The angular dispersion produced in a ray of white light by a prism may be defined for any two colours.

The angular dispersion *for any two colours* may be defined as the *difference in deviations suffered by the two colours in passing through the prism.*

Fig. 2.05 represents the deviations produced in the path of violet, yellow and red rays of light by a prism of small angle. It follows that the constituent colours of white light disperse in an angle θ. The angle θ between the extreme violet and red rays of light is called *angular dispersion* produced by the prism for violet and red lights.

Thus, angular dispersion for violet and red rays is given by

$$\theta = \delta_v - \delta_r$$

Let μ_v and μ_r be the refractive indices of the material of the prism for the violet and red colours.

If A is the angle of prism, then

$$\delta_v = \mathrm{A}\,(\mu_v - 1)$$

and

$$\delta_r = \mathrm{A}\,(\mu_r - 1)$$

∴

$$\delta_v - \delta_r = \mathrm{A}\,(\mu - 1) - \mathrm{A}\,(\mu_v - 1)$$

or

$$\delta_v - \delta_r = \mathrm{A}\,(\mu_v - \mu_r) \qquad \text{...(2.11)}$$

The equation (2.11) gives the angular dispersion for violet and red rays.

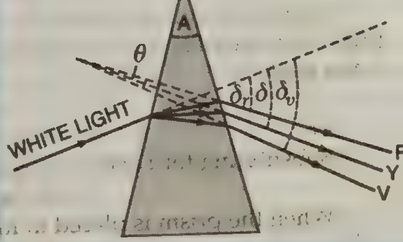

Fig. 2.05

Dispersive power. *The dispersive power of a material for any two colours may be defined as the ratio of the angular dispersion for these two colours to the deviation suffered by mean light.* It is denoted by ω.

If $\delta_v - \delta_r$ is the angular dispersion for violet and red lights and δ, the deviation suffered by mean light, then

$$\omega = \frac{\delta_v - \delta_r}{\delta} \qquad ...(2.12)$$

If μ is the refractive index of the material of the prism for mean light and δ, the deviation suffered by it, then

$$\delta = A(\mu - 1)$$

Substituting for $\delta_v - \delta_r$ and δ in equation (2.12), we have

$$\omega = \frac{A(\mu_v - \mu_r)}{A(\mu - 1)}$$

or

$$\omega = \frac{\mu_v - \mu_r}{\mu - 1} \qquad ...(2.13)$$

The above equation gives dispersive power of the material of the prism for violet and red lights.

Note. 1. It may be pointed out that the violet light, owing to its small wavelength, is harmful to the eyes. Because of this, angular dispersion and the dispersive power of a material are measured for *blue* (in place of violet) and *red lights* in experimental spectroscopy. Therefore,

$$\omega = \frac{\mu_b - \mu_r}{\mu - 1}$$

2. The Fraunhoffer lines F, D and C in the solar spectrum possess wavelengths 4861 Å, 5890 Å and 6563 Å respectively and lie in blue, yellow and red regions of the spectrum. Sometimes, refractive indices of the materials of prisms for blue, mean and red light *i.e.* μ_b, μ and μ_r are respresented by μ_F, μ_D and μ_C respectively.

2.06. DISPERSION WITHOUT DEVIATION

Two prisms of different materials and different suitable angles can be combined so as to produce only dispersion and no deviation in the path of the light of a particular colour.

Condition for no deviation. Suppose that two prisms, one made of crown glass and the other of flint glass are placed together keeping their bases opposite to each other. Let A and A′ be the angles of the crown glass and flint glass prisms respectively. Let $\mu_v{}'$, μ and μ_r be the refractive indices of the crown glass for violet, mean and red lights ; while $\mu_v{}'$, μ and $\mu_r{}'$ be the corresponding values for the flint glass. The angles and materials of the two prisms are chosen, so as to produce dispersion without deviation in the path of mean light as shown in Fig. 2.06.

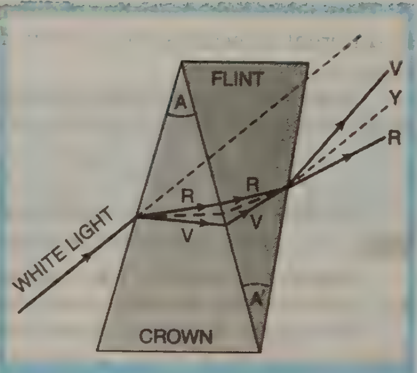

Fig. 2.06

The deviation suffered by mean light through crown glass prism,

$$\delta = A(\mu - 1)$$

Also, the deviation suffered by mean light through flint glass prism,

$$\delta' = A'(\mu - 1)$$

So that the combination does not produce any deviation,

$$\delta + \delta' = 0$$

or $A(\mu' - 1) + A'(\mu' - 1) = 0$

or

$$\frac{A'}{A} = -\frac{\mu - 1}{\mu' - 1} \qquad ...(2.14)$$

The negative sign indicates that the two prisms have to be placed in ***opposite manner***. The equation (2.14) is ***condition for no deviation.***

Key point

When two prisms (of different materials and angles of prism) are combined so as to produce dispersion without deviation, the condition given by equation (2.14) applies to no deviation in the path of mean light.

Net angular dispersion. The angular dispersion produced by the crown glass prism,

$$\delta_v - \delta_r = A(\mu_v - \mu_r)$$

Also, the angular dispersion produced by the flint glass prism,

$$\delta_v{}' - \delta_r{}' = A'(\mu_v{}' - u_r{}')$$

$$\text{Net angular dispersion} = (\delta_v - \delta_r) + (\delta_v{}' - \delta_r{}')$$

$$= A(\mu_v - \mu_r) + A'(\mu_v{}' - \mu_r{}')$$

$$= A\left[(\mu_v - \mu_r) + \frac{A'}{A}(\mu_v{}' - \mu_r{}')\right] \qquad ...(2.15)$$

From equation (2.14), substituting for $\frac{A'}{A}$, we have

$$\text{net angular dispersion} = A\left[(\mu_v-\mu_r)-\frac{(\mu-1)}{(\mu'-1)}\cdot(\mu_v'-\mu_r')\right]$$

$$= A(\mu-1)\left(\frac{\mu_v-\mu_r}{\mu-1}-\frac{\mu_v'-\mu_r'}{\mu'-1}\right)$$

$$= \delta(\omega-\omega') \qquad ...(2.16)$$

The equation (2.15) or (2.16) gives the ***net angular dispersion*** produced.

Discussion. 1. In equation (2.16), since $\omega' > \omega$, the factor $\omega - \omega'$ and hence $(\omega - \omega')$ is negative*. It implies that *the order of the colours in the spectrum due combination is opposite to that due to crown glass prism alone.*

2. Since $(\mu' - 1) > (\mu - 1)$, from equation (2.14), it follows that

$$A > A'$$

. to produce dispersion without deviation, *the angle of crown glass prism is greater an that of flint glass prism.*

Watch out !

When two prisms are combined to as to produce dispersion without deviation, the order of constituent colour in emergent light is opposite to that inside the first prism.

2.07. DEVIATION WITHOUT DISPERSION

When white light passes through a prism, it suffers deviation as well as ispersion. However the two prisms of different material can be combined so as o produce deviation in the path of light, without producing any deviation. The two risms, one made of crown glass and the other of flint glass, are placed together eeping their bases opposite to each other.

Condition for no dispersion. Let A and A′ be the angles of the crown glass nd flint glass prisms respectively. Let μ_v, μ and μ_r be the refractive indices of the rown glass for violet, mean and red light, while μ_v', μ' and μ_r' be the corresponding alues for the flint glass. The angles and the materials of the two prisms are chosen o as to produce deviation without dispersion [Fig. 2.07].

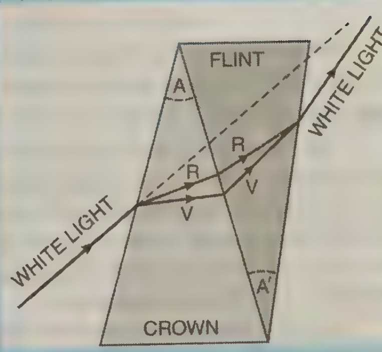

Fig. 2.07

The angular dispersion produced by crown glass prism,

$$\delta_v - \delta_r = A(\mu_v - \mu_r)$$

Also, the angular dispersion produced by flint glass prism,

$$\delta_v' - \delta_r' = A'(\mu_v' - \mu_r')$$

So that the combination does not produce any dispersion,

$$(\delta_v - \delta_r) + (\delta_v' - \delta_r') = 0$$

or $$A(\mu_v - \mu_r) + A'(\mu_v' - \mu_r') = 0 \qquad ...(2.17)$$

or $$\frac{A'}{A} = -\frac{\mu_v - \mu_r}{\mu_v' - \mu_r'} \qquad ...(2.18)$$

The *negative sign* indicates that the two prisms should be placed in *opposite nanner.* The equation (2.18) is called the ***condition for no dispersion*** or ***condition or achromatism.*** It can be put in another form as obtained below :

Multiplying and dividing the first term of the equation (2.17) by $(\mu - 1)$ and he second term by $(\mu' - 1)$, we have

$$A(\mu-1)\cdot\frac{\mu_v-\mu_r}{\mu-1} + A'(\mu'-1)\cdot\frac{\mu_v'-\mu_r'}{\mu'-1} = 0 \qquad ...(2.19)$$

But $\quad A(\mu - 1) = \delta \quad$ and $\quad A'(\mu' - 1) = \delta'$.

the deviations suffered by mean light through crown and flint glass prisms respectively. Also,

$$\frac{\mu_v-\mu_r}{\mu-1} = \omega \quad \text{and} \quad \frac{\mu_v'-\mu_r'}{\mu'-1} = \omega'$$

the dispersive powers of the crown and flint glasses respectively.

Therefore, the equation (2.19) becomes

$$\delta\,\omega + \delta'\,\omega' = 0$$

or $$\frac{\omega}{\omega'} = -\frac{\delta'}{\delta} \qquad ...(2.20)$$

Hence, *for no dispersion, the materials and the angles of the two prisms should be chosen, so that their dispersive powers are in inverse ratio of the deviations suffered by mean light through them.*

---

*The dispersive power of flint glass is greater than that of crown glass *i.e.* $\omega' > \omega$

Net deviation. The deviation suffered by mean light through crown glass prism,

$$\delta = A(\mu - 1)$$

Also, the deviation suffered by mean light through flint glass prism,

$$\delta' = A'(\mu' - 1)$$

$$\text{Net deviation} = \delta + \delta'$$

$$= A(\mu - 1) + A'(\mu' - 1) \qquad \text{...(2.21)}$$

$$= A(\mu - 1)\left[1 + \frac{A'(\mu' - 1)}{A(\mu - 1)}\right]$$

From equation (2.18), substituting the value of $\frac{A'}{A}$, we have

$$\text{net deviation} = A(\mu - 1)\left[1 - \frac{(\mu_v - \mu_r)}{\mu'_v - \mu'_r} \cdot \frac{\mu' - 1}{\mu - 1}\right] = A(\mu - 1)\left(1 - \frac{\omega}{\omega'}\right)$$

or

$$\text{net deviation} = \delta\left(1 - \frac{\omega}{\omega'}\right) \qquad \text{...(2.22)}$$

The equation (2.21) or (2.22) gives *net deviation* produced.

Discussion. 1. In equation (2.22), since $\omega' > \omega$, $1 - \frac{\omega}{\omega'}$ will be positive. Hence, it follows that *the combination will produce deviation in the same direction as produced by the crown glass prism.*

2. Since $\omega' > \omega$, from equation (2.20), it follows that $\delta > \delta'$ *i.e.*

$$A(\mu - 1) > A'(\mu' - 1)$$

Since $\mu' - 1 > \mu - 1$, it follows that $A > A'$ *i.e. to produce deviation without dispersion, the angle of crown glass prism has to be greater than that of the flint glass prism.*

2.08. SCATTERING OF LIGHT

Light travels in the form of electromagnetic radiation. *Emission, absorption* and *scattering* are three processes by which the radiation interacts with the matter. In emission, an accelerated charge radiates energy ; while in absorption, the electric charge gains energy at the expense of the incident electromagnetic radiation. The processes of emission and absorption have been discussed, while studying the emission and absorption spectra.

When an electromagnetic radiation is incident on an electric charge at rest, the charged particle gets accelerated along the direction of the electric field of the incident radiation. Since the electric charge is at rest, it does not experience any force due to the magnetic field of the electromagnetic radiation. On being accelerated by the electric field, the electric charge emits radiation in all the directions, and this process is called ***scattering***.

The light, while passing through atmosphere, is found to scatter also. The amount of scattering suffered by different wavelengths of light is different. Lord Rayleigh studied the scattering of light by the matter in detail. He found that the intensity of a particular wavelength in the scattered light depends greatly on its wavelength and ultimately he formulated the following law :

Key point

The blue light (having smaller wavelength) is scattered more than red light (having larger wavelength), when light travels through the atmosphere.

The intensity of the light corresponding to a wavelength in the scattered light varies inversely as the fourth power of the wavelength. If λ is a wavelength in scattered light, then

$$\text{amount of scattering} \propto \frac{1}{\lambda^4}$$

It is called ***Rayleigh's law of scattering***.

Many optical phenomena can be explained on the basis of Rayleigh's scattering of light.

Illustrations. A few illustrations of Rayleigh's scattering of light are as given below :

1. ***The blue colour of sky.*** When light from the sun travels through the earth's atmosphere, the different wavelengths get scattered from their path through different amounts obeying Rayleigh's law of scattering. Since, the wavelength of the blue colour is approximately half the wavelength of red colour, the scattering

of blue light is about 2^4 times *i.e.* 16 times more than that of red light. Due to this, blue colour predominates and the sky appears blue.

2. ***At sunrise or sunset the sun looks almost reddish.*** The reason is that at the time of sun set or sun rise (when sun is near horizon), the light from the sun has to traverse larger thickness of atmosphere than what it covers, when the sun is overhead as shown in Fig. 2.08.

Due to this, more of the blue light is scattered away and the sun appears reddish.

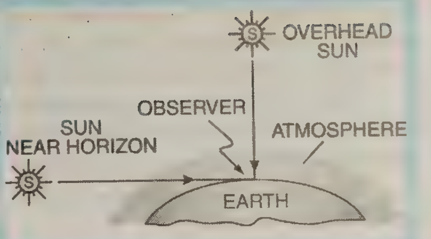

Fig. 2.08

3. ***Red light is used in danger signals.*** So that the danger signals can be seen distinctly upto large distances, the light used in the danger signals should not get scattered much, while passing through the atmosphere. Since, the red colour is scattered through a small amount due to its longer wavelength, the danger signals make use of red light.

4. ***The clouds are generally white.*** It is because of the reason that larger particles like dust and water drops present in the atmosphere do not scatter light according to Rayleigh law of scattering. Dust particles and water drops scatter light of all colours, almost equally and hence clouds are white in colour.

2.09. THE RAINBOWS

Sometimes, during a light drizzle or immediately after rain, concentric coloured arcs are seen in the sky, when the sun is at the back of the observer.

The coloured arcs or the spectrum of white light from the sun in the form of bows seen immediately after rain by an observer with his back towards the sun is called a ***rainbow.***

The formation of rainbows is due the dispersion of white light from the sun due to the phenomenon of total internal reflection from the water droplets suspended in the air. Ordinarily, two rainbows, called the ***primary rainbow*** and the ***secondary rainbow,*** are seen. However, the common centre of both the rainbows lies on the line joining the sun and the observer.

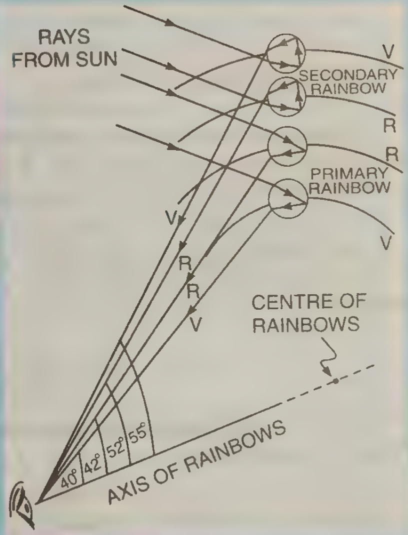

Fig. 2.09

Primary rainbow. The primary rainbow has violet colour on the inner edge and the red colour on the outer edge of the rainbow as shown in Fig. 2.09. It is formed, when the light from the sun after undergoing dispersion from the water droplets reaches the observer after suffering one internal reflection. It can be mathematically proved that an observer receives intense red light in a direction making an angle of 42° and intense violet (or blue) light in a direction making an angle of 40° with the line joining the sun and the observer. This line is called the *axis of the rainbow.*

Secondary rainbow. The secondary rainbow has red colour on the inner edge and the violet colour on the outer edge of the rainbow *i.e.* the sequence of colours in the secondary rainbow is just reverse of that in the primary rainbow. It is formed, when the light from the sun undergoing dispersion from the suspended water droplets, reaches the observer after suffering two internal reflections. The calculations show that the violet light is received by the observer in a direction making an angle of 55° and red light in a direction making an angle of 52° with the axis of the rainbow.

It is found that the region of the sky between the two rainbows is comparatively darker and the regions below the primary rainbow and above the secondary rainbow are comparatively brighter than the rest of the sky.

Two observers cannot see the same rainbow. For a primary rainbow to be seen by an observer, the rays emerging out from water droplets must subtend a mean angle of $41^\circ\left(=\frac{40^\circ+42^\circ}{2}\right)$ at the observer's eye and for a secondary rainbow, a mean angle of $53\cdot5^\circ\left(=\frac{52^\circ+55^\circ}{2}\right)$. The positions of the water droplets, which send such rays, depend upon the position of the observer. Hence, two observers at different positions do not see the rainbow formed by the same set of raindrops.

SOLVED NUMERICAL PROBLEMS

Type A. On Refraction through a prism

Problem 2.01. A ray of light incident at 49° on the face of an equilateral prism passes symmetrically. Calculate the refractive index of the material of the prism.

Sol. As the prism is an equilateral one, A = 60°. Further, as the ray of light passes symmetrically, when incident at 49°, the prism is in minimum deviation position.

We know that when the prism is placed in minimum deviation position,

$$r = \frac{A}{2} = \frac{60}{2} = 30° \;;\text{ Also, } i = 49°$$

$$\therefore \qquad \mu = \frac{\sin i}{\sin r} = \frac{\sin 49°}{\sin 30°} = \frac{0{\cdot}7547}{0{\cdot}5} = \mathbf{1{\cdot}51}$$

Problem 2.02. A ray of light suffers minimum deviation, while passing through a prism of refractive index 1·5 and refracting angle 60°. Calculate the angle of deviation and angle of incidence. *(P.S.S.C.E. 1997)*

Sol. Here, $\mu = 1{\cdot}5 \;;\; A = 60°$

$$\mu = \frac{\sin (A + \delta_m)/2}{\sin A/2}$$

or $$1{\cdot}5 = \frac{\sin (60° + \delta_m)/2}{\sin 60°/2}$$

or $(60° + \delta_m)/2 = 1{\cdot}5 \times \sin 30°$

or $\sin (60° + \delta_m)/2 = 1{\cdot}5 \times 0{\cdot}5 = 0{\cdot}75$

or $(60° + \delta_m)/2 = 48{\cdot}6°$

or $\delta_m = 48{\cdot}6° \times 2 - 60° = \mathbf{37{\cdot}2°}$

Also, angle of incidence,

$$i = (A + \delta_m)/2\; (60° + 37{\cdot}2°)/2 = \mathbf{48{\cdot}6°}$$

Problem 2.03. A prism of refractive index 1·53 is placed in water of refractive index 1·33. If the angle of the prism is 60°, calculate the angle of minimum deviation in water. *(P.S.S.C.E. 1998)*

Sol. Here, $A = 60° \;;\; {}^a\mu_g = 1{\cdot}53 \;;\; {}^a\mu_w = 1{\cdot}33$

Relative refractive index of the material of prism *w.r.t.* water,

$${}^w\mu_g = \frac{{}^a\mu_g}{{}^a\mu_w} = \frac{1{\cdot}53}{1{\cdot}33} = 1{\cdot}15$$

Let δ_m be the angle of minimum deviation on placing the prism in water. Then,

$${}^w\mu_g = \frac{\sin (A + \delta_m)/2}{\sin A/2}$$

$$\therefore \qquad 1{\cdot}15 = \frac{\sin (60° + \delta_m)/2}{\sin 60°/2}$$

or $\sin (60° + \delta_m)/2 = 1{\cdot}15 \times \sin 30°$

or $\sin (60° + \delta_m)/2 = 1{\cdot}15 \times 0{\cdot}5 = 0{\cdot}575$

or $(60° + \delta_m)/2 = 35{\cdot}1°$

or $\delta_m = 35{\cdot}1° \times 2 - 60° = \mathbf{10{\cdot}2°}$

Problem 2.04. An equilateral glass prism (μ = 1·6) is immersed in water (μ = 1·33). Calculate the angle of deviation produced for a ray of light incident at 40° on one face of the prism. *(Karnataka, 1990)*

Sol. Refer to Fig. 2.10. Since it is an equilateral glass prism, A = 60° ;

refractive index of glass, ${}^a\mu_g = 1{\cdot}6$;

refractive index of water, ${}^a\mu_w = 1{\cdot}33$;

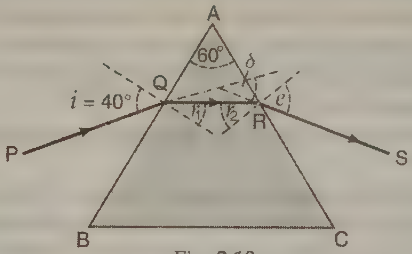

Fig. 2.10

Therefore, refractive index of glass *w.r.t.* water,

$${}^w\mu_g = \frac{{}^a\mu_g}{{}^a\mu_w} = \frac{1{\cdot}6}{1{\cdot}33} = 1{\cdot}203$$

For refraction at face AB :

The angle of incidence, $i = 40°$

Let r_1 be the angle of refraction at face AB.

Then, $${}^w\mu_g = \frac{\sin i}{\sin r_1}$$

or $$1{\cdot}203 = \frac{\sin 40°}{\sin r_1}$$

or $$\sin r_1 = \frac{\sin 40°}{1{\cdot}203} = \frac{0{\cdot}6428}{1{\cdot}203} = 0{\cdot}5343$$

or $r_1 = 32°\,18'$

For refraction at face AC :

Let r_2 be the angle of refraction at the second face AC.

We know, $r_1 + r_2 = A$

$\therefore$ $r_2 = A - r_1 = 60° - 32°\,18' = 27°\,42'$

Let e be the angle of emergence. For refraction at face AC, we have

$${}^w\mu_g = \frac{\sin e}{\sin r_2}$$

or $\sin e = {}^w\mu_g \times \sin r_2 = 1{\cdot}203 \times \sin 27°\,42'$

$= 1{\cdot}203 \times 0{\cdot}4648 = 0{\cdot}5592$

or $e = 34°$

Now, the angle of deviation,

$$\delta = i + e - A = 40° + 34° - 60° = \mathbf{14°}$$

Type B. On Angular dispersion and Dispersive power

Problem 1.05. Find the angle of dispersion between the red and violet colours produced by a flint glass prism of refracting angle 60°. Refractive indices of the prism for red and violet colours are 1·622 and 1·663 respectively. *(P.S.S.C.E. 1991)*

Sol. Here, $A = 60° \;;\; \mu_r = 1{\cdot}622 \;;\; \mu_v = 1{\cdot}663$

Now, angle of dispersion between red and violet colours,

$$\delta_v - \delta_r = A(\mu_v - \mu_r) = 60° \times (1{\cdot}663 - 1{\cdot}622) = \mathbf{2{\cdot}46°}$$

Problem 2.06. A prism with a refracting angle of 60° gives angles of minimum deviation 53°, 51° and 52° for blue, red and yellow light respectively. What is the dispersive power of the material of the prism ? *(I.S.C.E. 1996)*

Sol. Here, $A = 60° \;;\; \delta_b = 53° \;;\; \delta_r = 51° \;;\; \delta = 52°$

Dispersive power of the material of prism,

$$\omega = \frac{\delta_b - \delta_r}{\delta} = \frac{53° - 51°}{52°} = \frac{2°}{52°} = \mathbf{0{\cdot}0385}$$

Problem 2.07. Calculate the dispersive power of crown and flint glass prisms from the following data : For

rown glass : $\mu_b = 1\cdot522$, $\mu_r = 1\cdot514$; for flint glass : $\mu_b = 1\cdot662$, $_r = 1\cdot644$. *(Karnataka, 1991)*

Sol. *For crown glass :* $\mu_b = 1\cdot522$; $\mu_r = 1\cdot514$

Therefore, refractive index for the mean light,

$$\mu = \frac{\mu_b + \mu_r}{2} = \frac{1\cdot522 - 1\cdot514}{2} = 1\cdot518$$

Also, dispersive power of crown glass,

$$\omega = \frac{\mu_b - \mu_r}{\mu - 1} = \frac{1\cdot522 - 1\cdot514}{1\cdot518 - 1} = \mathbf{0\cdot0154}$$

For flint glass : $\mu_b = 1\cdot622$; $\mu_r = 1\cdot644$

$$\therefore \qquad \mu = \frac{\mu_b - \mu_r}{2} = \frac{1\cdot662 + 1\cdot644}{2} = 1\cdot653$$

$$\text{Also,} \quad \omega = \frac{\mu_b - \mu_r}{\mu - 1} = \frac{1\cdot662 - 1\cdot644}{1\cdot653 - 1} = \mathbf{0\cdot0276}$$

Problem 2.08. In a certain spectrum produced by a glass prism of dispersive power 0·031, it was found that the refractive index for the red ray is 1·645, whereas the refractive index for the blue ray is 1·665. What is the refractive index for the yellow ray ? *(I.S.C.E. 1995)*

Sol. Here, $\omega = 0\cdot031$; $\mu_r = 1\cdot645$; $\mu_b = 1\cdot655$

If μ is refractive index of glass for yellow ray, then

$$\omega = \frac{\mu_b - \mu_r}{\mu - 1}$$

$$\text{or} \qquad \mu = 1 + \frac{\mu_b - \mu_r}{\omega} = 1 + \frac{1\cdot665 - 1\cdot645}{0\cdot031}$$

$$= 1 + 0\cdot645 = \mathbf{1\cdot645}$$

Type C. On Dispersion without deviation

Problem 2.09. Determine the angle of flint glass prism, which should be combined with a crown glass prism of 5° so as to give dispersion but no deviation.

Given, for crown glass : $\mu_v = 1\cdot523$, $\mu_r = 1\cdot515$; for flint glass : $\mu_v{}' = 1\cdot688$, $\mu_r{}' = 1\cdot650$.

Sol.

Crown glass — *Flint glass*

$\mu_v = 1\cdot523$; $\mu_r = 1\cdot515$; A = 5° $\mu_v{}' = 1\cdot688$; $\mu_r{}' = 1\cdot650$; A' = ?

So that the combination of the two prisms does not produce any deviation,

$$A' = -\frac{A(\mu - 1)}{\mu' - 1}$$

$$\text{Now,} \qquad \mu = \frac{\mu_v + \mu_r}{2} = \frac{1\cdot523 + 1\cdot515}{2} = 1\cdot519$$

$$\text{and} \qquad \mu' = \frac{\mu_v{}' + \mu_r{}'}{2} = \frac{1\cdot688 + 1\cdot650}{2} = 1\cdot669$$

$$\therefore \qquad A' = -\frac{5(1\cdot519 - 1)}{1\cdot669 - 1} = -\frac{5 \times 0\cdot519}{0\cdot669} = \mathbf{-3\cdot88°}$$

The negative sign shows that the two prisms are to be placed in opposite manner.

Type D. On Deviation without Dispersion

Problem 2.10. Find the angle of a prism of dispersive power 0·021 and refractive index 1·53 to form an achromatic combination with prism of angle 4·2° and dispersive power 0·045 having refractive index 1·65. Find the resultant deviation.

Sol. Here, $\omega = 0\cdot021$; $\mu = 1\cdot53$; $\omega' = 0\cdot045$;
$\mu' = 1\cdot65$; $A' = 4\cdot2°$

For no dispersion, $\omega\,\delta + \omega'\delta' = 0$

or $\omega\,A(\mu - 1) + \omega' A'(\mu - 1) = 0$

$$\text{or} \qquad A = -\frac{\omega' A'(\mu - 1)}{\omega(\mu - 1)} = -\frac{0\cdot045 \times 4\cdot2 \times (1\cdot65 - 1)}{0\cdot021 \times (1\cdot53 - 1)}$$

$$= \mathbf{-11\cdot04°}$$

$$\text{Net deviation,}\ \delta + \delta' = A(\mu - 1) + A'(\mu' - 1)$$

$$= -11\cdot04\,(1\cdot53 - 1) + 4\cdot2\,(1\cdot65 - 1)$$

$$= -11\cdot04 \times 0\cdot53 + 4\cdot2 \times 0\cdot65$$

$$= -5\cdot85 + 2\cdot73 = \mathbf{3\cdot12°}$$

abc TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 2.11. A ray of light is incident on the face AB of a glass prism ABC having the vertex angle A equal to 40°. The face AC is silvered and a ray of light is incident on the face AB, such that it retraces its path. If refractive index of the glass is 1·54, calculate the angle of incidence on the face AB.

Sol. Here, $A = 40°$; $\mu = 1\cdot54$

Suppose that the ray of light PQ is incident on the face AB at angle i, such that the angle of refraction is r_1. The ray will retrace its path, if the refracted ray QR falls on the silvered surface normally, as shown in Fig. 2.11.

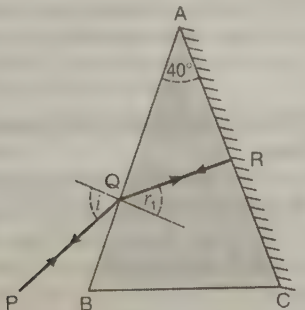

Fig. 2.11.

Since the Δ ARQ is a right angled triangle, it follows that

$$r_1 = 40°$$

$$\text{Now,} \qquad \mu = \frac{\sin i}{\sin r_1}$$

$$\text{or} \qquad \sin i = \mu \sin r_1 = 1\cdot54 \sin 40°$$

$$= 1\cdot54 \times 0\cdot6428 = 0\cdot9899$$

$$\text{or} \qquad \mathbf{i = 81°50'}$$

Problem 2.12. At what angle should a ray of light be incident on the face of a prism of refracting angle 60°, so that it just suffers internal reflection at the other face ? The refractive index of the prism is 1·524.

Sol. A ray of light incident on face AB will just suffer

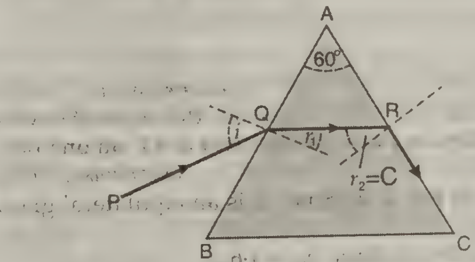

Fig. 2.12.

internal reflection at the other face AC, if it gets incident on face AC at critical angle for the material of the prism [Fig. 2.12]. If critical angle for the material of prism is C, then

$$\sin C = \frac{1}{\mu} = \frac{1}{1{\cdot}524} = 0{\cdot}6562$$

or $\quad C = 41°$

Now, for a prism, we have

$$r_1 + r_2 = A$$

Since $r_2 = C$, we have

$$r_1 + C = A \quad \text{or} \quad r_1 = A - C$$

Setting the values of A and C, we obtain

$$r_1 = 60° - 41° = 19°$$

At face AB : $\quad \dfrac{\sin i}{\sin r_1} = \mu \quad$ or $\quad \dfrac{\sin i}{\sin 19°} = 1{\cdot}524$

or $\quad \sin i = 1{\cdot}524 \times \sin 19° = 1{\cdot}524 \times 0{\cdot}3256 = 0{\cdot}4962$

or $\quad i = 29{\cdot}75°$

Problem 2.13. The dispersive powers of crown and flint glasses are 0·03 and 0·05 respectively. If difference in the refractive indices of blue and red colour is 0·015 for crown glass and 0·022 for flint glass, calculate the angles of the two prisms for a deviation of 2° without dispersion.

Sol.

Crown glass	*Flint glass*
$\mu_b - \mu_r = 0{\cdot}015\ ;\ \omega = 0{\cdot}03$	$\mu_b' - \mu_r' = 0{\cdot}022\ ;\ \omega' = 0{\cdot}05$

Also, net deviation, $\delta + \delta' = 2°$

Now, net deviation, $\delta + \delta' = A(\mu - 1) + A'(\mu' - 1)$

$\therefore \quad 2° = A(\mu - 1) + A'(\mu' - 1)$

or $\quad \dfrac{A(\mu_b - \mu_r)(\mu - 1)}{\mu_b - \mu_r} + \dfrac{A'(\mu_b' - \mu_r')(\mu' - 1)}{\mu_b' - \mu_r'} = 2°$

or $\quad \dfrac{A(\mu_b - \mu_r)}{\omega} + \dfrac{A'(\mu_b' - \mu_r')}{\omega'} = 2°$

or $\quad \dfrac{A \times 0{\cdot}015}{0{\cdot}03} + \dfrac{A' \times 0{\cdot}022}{0{\cdot}05} = 2°$

$$\frac{1}{2}A + \frac{11}{25}A' = 2° \qquad \ldots(i)$$

For no dispersion,

$$A(\mu_b - \mu_r) + A'(\mu_b' - \mu_r') = 0$$

$\therefore \quad A \times 0{\cdot}015 + A' \times 0{\cdot}022 = 0$

or $\quad A = -\dfrac{22}{15}A' \qquad \ldots(ii)$

In equation (*i*), substituting for A, we get

$$\frac{1}{2} \times \left(-\frac{22}{15}A'\right) + \frac{11}{25}A' = 2° \quad \text{or} \quad -\frac{22}{75}A' = 2°$$

or $\quad A' = -\dfrac{2 \times 75}{22} = -\dfrac{75}{11} = -6{\cdot}82°$

The negative sign shows that the two prisms have to be placed in the opposite manner.

From equation (*ii*), we have

$$A = -\frac{22}{15} \times \left(-\frac{75}{11}\right) = 10°$$

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 2.01. Is the angle of minimum deviation produced by a prism different for different wavelengths ?

Ans. Yes.

Q. 2.02. A glass prism is immersed in water. What happens to the value of angle of minimum deviation ?

Ans. When a prism is immersed in water,

$${}^{w}\mu_g = \frac{\sin(A + \delta_m)/2}{\sin A/2}$$

Since the value of ${}^{w}\mu_g$ is less than ${}^{a}\mu_g$ (the refractive index of glass w.r.t. air), the value of angle of minimum deviation decreases on immersing the prism in water.

Q. 2.03. What is dispersion of light ? (*P.S.S.C.E. 1997*)

Ans. The splitting of white light into its constituent colours on passing through a prism is called dispersion of light.

Q. 2.04. Out of red and blue lights, for which colour is the refractive index of glass greater ? (*C.B.S.E. 1999 S*)

Ans. $\mu_b > \mu_r$.

Q. 2.05. Refractive indices of glass for lights of yellow, green and red colours are μ_y, μ_g and μ_r respectively. Rearrange these symbols in an increasing order of values. (*C.B.S.E. 1997*)

Ans. Refractive indices of glass for lights of yellow, green and red colours in the order of increasing values are μ_r, μ_y and μ_g.

Q. 2.06. What is dispersive power ? (*I.S.C.E. 1996*)

Or

What do you mean by dispersive power of the material of a prism ? (*I.S.C.E. 1994*)

Ans. The dispersive power of a material for light of any two colours is defined as the ratio of the angular dispersion for these colours to the deviation suffered by mean light.

Q. 2.07. On what factors does the dispersive power of a prism depend ?

Ans. The refractive index of the material of prism and the choice of the two colours for which the dispersive power is to be measured.

Q. 2.08. What is the effect of high dispersive power of the material of a thin prism on the spectrum ?

Ans. The angular dispersion will be large.

Q. 2.09. Does dispersive power of the material of a prism depend on the shape, size and angle of the prism ? Explain.

Ans. The dispersive power of the material of the prism is independent of the shape (angle of prism) or size of the prism. It depends only on the refractive index of the material of the prism.

Q. 2.10. People usually prefer light coloured dresses during summer and dark dresses during winter. Why ? (*Text Question*)

Or

Explain, why one prefers even in summer a black umbrella to a white one.

Ans. White clothes reflect all the light that falls on it, whereas black (or dark) clothes absorb all the light falling on it. The light absorbed by the dark clothes is converted into heat. For this reason, dark dresses are used in winters to keep warm.

Q. 2.11. Why is a rainbow formed in the sky ?

Ans. Rainbow is formed due to the dispersion of sun s, when they fall on the suspended tiny droplets of water nich act as prisms of small angles). The rainbow will be ble to an observer having sun at his back.

Q. 2.12. What is the essential condition for observing a rainbow ?

Ans. The observer must stand with his back towards the sun.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 2.01. Draw a properly labelled graph between the gle of incidence and the angle of deviation for a prism d show the point of minimum deviation. (*I.S.C.E. 1996*)

Or

For a ray of monochromatic light passing through a ss prism, draw a graph to show the variation of the angle deviation (δ) with the angle of incidence (*i*). When does e ray suffer minimum deviation ? (*I.S.C.E. 1993*)

Or

How does the angle of deivation vary with the angle incidence in case of a prism ? What is the angle of mini- um deviation ? (*C.B.S.E. 1990 S*)

Ans. Refer to Fig. 2.03.

Q. 2.02. A monochromatic ray of light is made to fall a normal 60° prism under minimum deviation condition. hat is the relation between the angle of incidence and the gle of emergence ? (*I.S.C.E. 1998*)

Ans. When light is incident on a prism placed in the inimum deviation position, the refracted ray travels parallel the base of the prism. Consequently, the prism lies mmetrically *w.r.t.* incident and emergent rays. Hence, in inimum deviation position, angle of incidence and angle of nergence are equal.

Q. 2.03. A thin prism of 2° angle gives a deviation of . What is the value of refractive index of the material of e prism ? (*P.S.S.C.E. 1999*)

Ans. Here, $A = 2° \,;\, \delta = 1°$

Now, for a prism of small angle,

$$\delta = A(\mu - 1)$$

or $$\mu = 1 + \frac{\delta}{A} = 1 + \frac{1}{2} = 1{\cdot}5$$

Q. 2.04. A glass prism has a minimum angle of devia- on δ_m in air. State with reason, how the angle of minimum eviation will change, if the prism is immersed in a liquid f refractive index greater than 1. (*C.B.S.E. 2002*)

Ans. We know that for a glass prism placed in air,

$$\mu = \frac{\sin(A + \delta_m)/2}{\sin A/2}$$

When prism is immersed in a liquid of refractive index reater than 1, its refractive index *w.r.t.* liquid will become less han μ. From the above relation, it follows that angle of ninimum deviation will decrease.

Q. 2.05. What is dispersion of light ? Define dispersive ower of a prism. (*P.S.S.C.E. 1997*)

Ans. Refer to sections 2.04 and 2.05.

Q. 2.06. Explain, why white light is dispersed when assing through a prism.

(*H.S.S.C.E. 2002 ; P.S.S.C.E. 2001 ; C.B.S.E. 1995*)

Ans. The velocity of light in a material medium depends upon its colour (wavelength) *i.e.* the refractive index of a material is different for different colours. If we incident a ray of white light on a prism ; on emerging, the different colours are deviated through different angles. Due to this, white light splits into its constituent colours and the phenomenon is called dispersion.

Q. 2.07. Rays of red and blue light are incident on a given prism. Explain, which will have the larger value of δ_m, the angle of minimum deviation. (*I.S.C.E. 1994*)

Ans. For a prism of small angle, the angle of deviation is given by

$$\delta = A(\mu - 1)$$

$$\therefore \quad \delta_r = A(\mu_r - 1) \quad \text{and} \quad \delta_b = A(\mu_b - 1)$$

Since $\mu_b > \mu_r$, it follows that $\delta_b > \delta_r$.

Thus, blue light will have larger value of the angle of minimum deviation.

Q. 2.08. Why does the sky appear blue ?

(*H.P.S.S.C.E. 2002 ; H.S.S.C.E. 2000, 1999 S ; P.S.S.C.E. 2001, 1999 S, 1996 ; A.I.S.S.C.E. 1992 S*)

Ans. According to Rayleigh's scattering law, when the light traverses the atmosphere, the intensity of light scattered is inversely proportional to the fourth power of the wavelength of the light. Therefore the scattering of blue light is prominent due to its small wavelength. Due to this, sky looks blue.

Q. 2.09. Why does sky look blue ? What will it look like on moon ? (*P.S.S.C.E. 1996*)

Ans. For blue colour of sky, refer to SAQ 2.08.

On moon, there is no atmosphere. Therefore, in the absence of scattering of light, the atmosphere will appear white.

Q. 2.10. Sun looks reddish at sunset. Why ?

Or (*C.B.S.E. 2002*)

Why the rising sun is red in colour ? (*P.S.S.C.E. 1999*)

Or

Why the rising sun is red in colour (or at sunset) ?

(*P.S.S.C.E. 2001, 1998 S ; C.B.S.E. 2000 ; H.S.S.C.E. 2000, 1999 S*)

Ans. Refer to illustration no. 2 of section 2.08.

Q. 2.11. Eye is more sensitive to yellow colour. Why are then danger signals red ? (*H.P.S.S.C.E. 2002, 1998*)

Ans. The scattering (Rayleigh scattering) of light is inversely proportional to the fourth power of the wavelength of light. So, the scattering of red light is much less than the yellow light and accordingly, the red light signal can be seen upto a longer distance without much loss in its intensity. For this reason, the danger signals are red in colour.

Q. 2.12. Why are danger signals red in colour ? Give reasons. (*P.S.S.C.E 2001*)

Ans. Refer to SAQ 2.11.

abc TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 2.01. When does a ray incident on a prism deviate away from the base ?

Ans. When the prism is immersed in a transparent liquid of refractive index greater than that of the material of the prism, the incident ray will deviate away from the base of the prism.

Q. 2.02. Two identical prisms are placed in the path of white light, such that their bases are parallel [Fig. 2.13]. What will be the nature of the emergent light ?

Ans. The first prism will disperse the white light into its constituent colours as shown in the figure. If the bases of the two identical prisms (same material and same value of the angles of prisms) are parallel, a broad beam of coloured light will emerge parallel to the incident beam of white light.

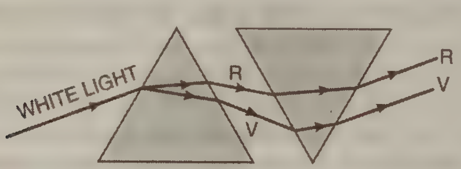

Fig. 2.13

Q. 2.03. Explain the prismatic action of a convex lens.

Ans. A convex lens may be considered to be made of a number of prisms, the prisms being placed one above the other. The bases of all the prisms are towards the centre of the lens.

As the two surfaces of the lens are curved, the angles of all these prisms are not same. The portion of the lens near the edge behaves as the prism having the maximum value of the angle of prism, while the portion at the middle behaves as a prism of zero angle. Since the angle of deviation produced by a prism depends upon the angle of prism, the prismatic part of the lens near its edge deviates the light maximum, while that at the centre does not produce any deviation in the path of the light as shown in Fig. 2.14. The result is that all the rays after refraction from the lens meet at one point, called the focus of the lens. Thus, a convex lens converges light due to the prismatic action of the lens. In addition to produce deviation in the path of light, a thick lens disperses white light in the same manner as the prism does.

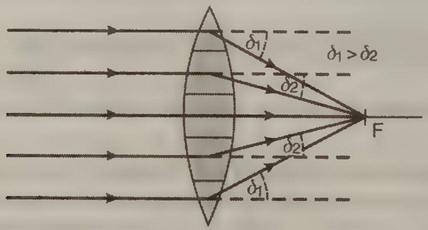

Fig. 2.14

Q. 2.04. Show that the limiting value of the angle of prism is twice its critical angle. (*Karnataka, 1991*)

Ans. Refer to section 2.02 and Fig. 2.03 :

Angle of prism, $A = r_1 + r_2$

Therefore, limiting (maximum) value of angle of prism,

$$A_{max} = (r_1)_{max} + (r_2)_{max} \quad ...(i)$$

Now, for $r_1 = (r_1)_{max},\ i = 90°$

But, when the angle *i* becomes equal to 90°, $(r_1)_{max}$ mu be equal to the critical angle *i.e.*

$$(r_1)_{max} = C$$

Similarly, $(r_2)_{max} = C$

Substituting for $(r_1)_{max}$ and $(r_2)_{max}$ in equation (*i*), we g

$$A_{max} = C + C = 2C$$

i.e. limiting value of the angle of prism is equal to twic the critical angle.

Q. 2.05. A ray of white light shows no dispersion o emerging from a glass plate (slab). Is there n dispersion inside the glass plate as well ?

Ans. The light disperses into different colours on enterin the glass slab *i.e.* dispersion takes place inside a glass slab als But when it emerges from its other parallel face, the differe colours again combine to form white light.

Q. 2.06. A beam of white light passing through hollow prism gives no spectrum. Explain. (*I.I.T. 198*

Ans. Consider a hollow prism as shown in the Fig. 2.1 Here, ABC and A′B′C′ represent the outer and inner surface of the prism. The three faces of the prism simply act as th three glass slabs having parallel faces.

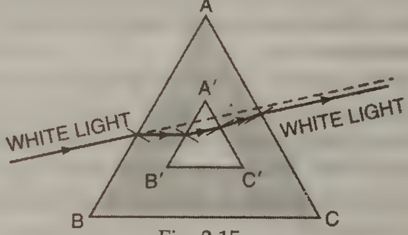

Fig. 2.15

When a ray of light is incident on the face AB, it will pas through a glass slab formed between the surfaces AB an A′B′. A ray of light will not disperse but it will get laterall displaced. The similar effect will take place, when the ray fall on the inner surface A′C′. Thus, the ray of light will come ou of the prism without being dispersed but again gettin laterally displaced.

Q. 2.07. What does a welder protect against, when h wears a mask ? (*Text Question*

Ans. The ultraviolet light coming out of welding arc i harmful to eyes. The mask has a filter that absorbs ultraviole light.

Q. 2.08. Do materials always have the same colou whether viewed by reflected light or throug transmitted light ?

Ans. It is not necessary. A material may reflect one colou strongly and transmit another colour.

Q. 2.09. How would a blue object appear under sodiu lamp light ?

Ans. An object looks blue in white light, because i absorbs all colours except the blue. If it is placed in sodium light (yellow), it will absorb the yellow light. Hence, the objec will appear black.

Q. 2.10. What colour do you observe, when white ligh passes through a blue and yellow filter ? (*Text Question*

Ans. Green colour with a tinge of blue and yellow wil be observed.

Q. 2.11. Occasionally one sees an aircraft in the sky shortly after sunset or shortly before sunrise and is prised to see it appear to be very bright, more like a star planet than like an aircraft as seen in daylight. Explain, y.

Ans. Shortly after sunset or before sunrise, an observer the surface of earth does not receive the sunlight directly m the sun. The light reflected from the aircraft is received the observer as shown in Fig. 2.16. In the reflected sunlight, e spacecraft appears bright against the darkening ckground of the early morning or the evening sky.

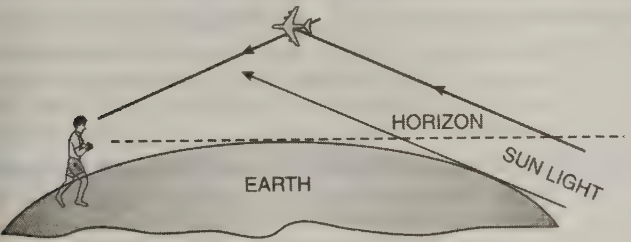

Fig. 2.16

Q. 2.12. Artificial satellites can often be seen as bright objects high in the sky long after sunset. What must the minimum altitude of a satellite moving above the rth's equator to be still visible directly overhead two hours ter sunset ?

Ans. At sunset, the sunlight will be tangent to the earth's rface. Further, in two hours, the earth will rotate through 30°. Therefore, satellite will come in the path of sunlight, if its orbit is at a distance BS = h (say) above the earth's equator [Fig. 2.17]. If OA = OB = R is radius of earth, then from right angled triangle OAB, we have

$$\cos 30° = \frac{OA}{OS} = \frac{OA}{OB + BS} = \frac{R}{R + h}$$

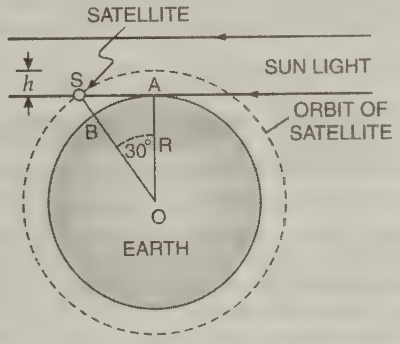

Fig. 2.17

or $$h = \frac{R}{\cos 30°} - R = \frac{R}{0{\cdot}866} - R$$

$$= 0{\cdot}155\ R$$

Q. 2.13. Why are 'haloes' (rings) observed sometimes round the sun or moon ?

Ans. When the sun or the moon is seen through a thin veil of the high cloud, haloes are formed. A large number of icy crystals are present in the clouds. The haloes are formed due to the reflection of light from the icy crystals.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Show that in case of a prism : A + δ = i + e, where the symbols have their usual meanings. *(H.P.S.S.C.E. 1997)*
2. What is meant by angle of minimum deviation ? Explain. Indicate in a graph, how the angle of deviation changes with the angle of incidence. State the condition under which angle of deviation is minimum.
3. Discuss the phenomenon of refraction through a prism. Prove the formula $\delta = A(\mu - 1)$. *(H.S.S.C.E. 1992)*
4. Derive an expression for the angle of deviation of a small prism in terms of the refractive index and the angle of the prism. *(I.S.C.E. 1996)*
5. What is dispersion of light ? Explain it with a ray diagram. Also explain the cause of dispersion of light. *(P.S.S.C.E. 2002, 1999 S)*
6. Explain the meanings of dispersion, angular dispersion and dispersive power. *(P.S.S.C.E. 1997)*
7. What is dispersion of light ? Define dispersive power of a prism. *(P.S.S.C.E. 1997)*
8. What is dispersion and angular dispersion ? Derive expression for the angular dispersion produced by a prism of small angle.
9. Explain the terms angular dispersion and dispersive power. How are the two related ? *(H.S.S.C.E. 2001, P.S.S.C.E. 1997)*
10. Define angular dispersion and dispersive power. Derive an expression for the dispersive power of a material in terms of refractive indices.
11. Explain, how two thin prisms can be combined to produce dispersion without deviation of the mean light. Obtain an expression for the resultant dispersion.
12. What do you understand by deviation without dispersion ? Obtain the condition for it. *(P.S.S.C.E. 1995)*
13. Write a short notes on rainbow. *(H.P.S.S.C.E. 1993)*

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. Derive the expression for the angle of deviation for a ray of light passing through an equilateral prism of refracting angle A. *(C.B.S.E. 1993)*
2. State and prove prism formula. *(H.P.S.S.C.E. 1997 ; H.S.S.C.E. 1993)*
3. Prove the relation A + δ = i + e for a prism. What does this relation become, when prism is placed in minimum deviation ? *(H.S.S.C.E. 2001)*
4. Discuss the phenomenon of refraction through a prism and prove that for a prism :

$$\mu = \frac{\sin (A + \delta_m)/2}{\sin A/2},$$

where A is angle of prism, μ is refractive index of the material of prism and δ_m is the angle of minimum deviation. *(P.S.S.C.E. 2001)*

5. Derive the relation : $\mu = \dfrac{\sin (A + \delta_m)/2}{\sin A/2}$ for refraction through a prism. *(H.S.S.C.E. 2002, 2000, 1993 ; Karnataka, 1993)*
6. Derive an expression for the refractive index of the material of a prism in terms of angle of prism and the angle of minimum deviation. *(Karnataka 1994, 1992, 1990, 1988 ; I.S.C.E. 1993)*

7. Derive the relation for refractive index of the material of prism, when the prism is placed in minimum deviation position. (*P.S.S.C.E. 2002, 2000, 1998 S*)
8. Derive an expression for the refractive index of the material of the prism in terms of the refracting angle and the angle of minimum deviation. (*I.S.C.E. 1993*)
9. Derive the formula used for determining the refractive index of the material of a glass prism using a spectrometer. (*I.S.C.E. 1997*)
10. Discuss the phenomenon of refraction through a prism. Prove that $\delta = A(\mu - 1)$ for a small angled prism, where the symbols have their usual meanings. (*P.S.S.C.E. 2000*)
11. What is rainbow ? Differentiate between a primary rainbow and secondary rainbow with a diagram. Why two observers do not see the same rainbow ? (*P.S.S.C.E. 2001, 1995*)
12. Explain the formation of colours in a rainbow. What is a secondary rainbow ? (*C.B.S.E. 1992 S*)
13. Explain in brief the formation of primary and secondary rainbows.

FAQs FREQUENTLY ASKED NUMERICAL QUESTIONS

For Practice

Type A. On Refraction through a prism

1. A ray of light is inclined to one face of the prism at an angle of 50°. If the angle of the prism is 60° and the ray is deviated through an angle of 42° ; find the angle which the emergent ray makes with the second face of the prism. [**Ans.** 28°]
2. Calculate the refractive index of a prism, if the angle of the prism is 60° and the angle of minimum deviation is 50°. [**Ans.** 1·638]
3. A ray of light incident on an equilateral glass prism shows minimum deviation of 30°. Calculate the speed of light through the glass prism. (*C.B.S.E. 2001*) [**Ans.** $2{\cdot}12 \times 10^8$ m s^{-1}]
4. The refracting angle of a prism is 60° and the refractive index of the material of the prism is 1·632. Calculate the angle of minimum deviation. (*Karnataka, 1983*) [**Ans.** 49·38°]
5. Calculate the value of angle of minimum deviation, which a ray of light, passing through a prism of angle 60° and refractive index 1·5 will suffer. What is the corresponding angle of incidence ? [**Ans.** 37·18° ; 48·59°]
6. A ray of light is incident on the face of a prism placed in minimum deviation position. If the angle of prism is 60° and deviation produced is 34°, find the angle of incidence and refractive index. [**Ans.** 47° ; 1·463]
7. What should be the refracting angle of a prism of refractive index 1·5 in order that the ray incident on the face at an angle of 50° may suffer minimum deviation ? [**Ans.** 61·42°]
8. A ray of light is incident on the glass prism at an angle of 40°. Find the angle of emergence, if the angle of prism is 60° and refractive index is 1·5. [**Ans.** 58·48°]
9. A ray of light passes through an equilateral glass prism, such that the angle of incidence is equal to the angle of emergence. If the angle of emergence is 3/4 times the angle of prism, calculate the refractive index of the glass prism. (*C.B.S.E. 2000*) [**Ans.** 1·414]
10. A prism is made of glass of unknown refractive index. A parallel beam of light is incident on a face of the prism. By rotating the prism, the minimum angle of deviation is measured to be 40°. What is the refractive index of the prism ? If the prism is placed in water (${}^a\mu_w = 1{\cdot}33$), predict the new minimum angle of deviation of a parallel beam of light. The refracting angle of prism is 60°. [**Ans.** 1·532 ; 10·34°]
11. A glass prism is immersed in water. If the angle of prism is 70°, calculate the angle of minimum deviation for a ray of light while passing through the prism in water. Given ${}^a\mu_g = 1{\cdot}62$ and ${}^a\mu_w = 1{\cdot}33$. (*P.S.S.C.E. 2001*) [**Ans.** 18·64°]
12. A ray of light falls normally on the face of a glass prism having a refractive indices of 1·5. Find the angle of prism, if the ray just fails to emerge from the second face. [**Ans.** 41·8°]
13. An equilateral prism of refractive index 1·45 is surrounded by water of refractive index 1·33. A narrow beam of light is incident normally on one face of the prism. Find the direction of the emergent ray. [**Ans.** 70·72°]

Type B. On Angular dispersion and Dispersive power

14. White light is passed through a glass prism of angle 5°. If the refractive indices for red and blue colours are 1·641 and 1·659 respectively, calculate the angle of dispersion between these colours. (*P.S.S.C.E. 1999 S*) [**Ans.** 0·09°]
15. Using a spectrometer, the following data are obtained for a crown glass prism and a flint glass prism :

	Crown glass prism	*Flint glass prism*
Angle of prism :	A = 72·0°	A′ = 60·0°
Minimum deviation angle :		
	$\delta_b = 54{\cdot}6°, \delta_r = 53{\cdot}0°$,	$\delta_b' = 52{\cdot}8°, \delta_r' = 50{\cdot}6°$,
	$\delta = 54{\cdot}0°$	$\delta' = 51{\cdot}9°$

Compare the dispersive powers of the two varieties of glass prisms. (*Text Problem*) [**Ans.** 0·7]

16. The refractive indices of crown and flint glasses for blue and red rays are 1·523, 1·513 and 1·773, 1·743 respectively. Calculate the dispersive powers of the two glasses. (*Pre-degree Kerala, 1992*) [**Ans.** 0·0193, 0·0396]

Type C. On Dispersion without deviation

17. A combination of two prisms, one of flint and other of crown glass produces dispersion without deviation. The angle of the flint glass prism is 15°. Calculate the angle of crown glass prism and the angular separation of the red and violet rays on emergence from the spectroscope. (μ for crown glass = 1·52, μ for flint glass = 1·65, ω for crown glass = 0·02, ω for flint glass = 0·03). [**Ans.** 18·75°, 0·0975°]
18. The refractive indices of crown and flint glass for C, D and F lines are given below :

Glass	μ_C	μ_D	μ_F
Crown	1·527	1·530	1·535
Flint	1·790	1·795	1·806

Calculate the dispersive powers of two glasses. If the angle of crown glass prism is 9°, calculate the angle of the flint glass prism, which is combined with crown glass prism to produce dispersion without deviation. [**Ans.** 0·015, 0·02, 6°]

Type D. On Deviation without dispersion

19. A crown glass prism of refracting angle 6° is to be achromatised for red and blue light using a flint glass prism. Find the angle of the second prism and also the mean deviation from the following data :

Refractive index for crown glass : $\mu_r = 1{\cdot}520$; $\mu_b = 1{\cdot}531$

Refractive index for flint glass : $\mu_r' = 1{\cdot}662$; $\mu_b' = 1{\cdot}684$.

[**Ans.** 3°, 1·134°]

20. The dispersive powers of crown and flint glasses are 0·03 and 0·05 respectively. If difference in the refractive indices of blue and red colour is 0·015 for crown glass and 0·022 for flint glass, calculate the angles of the two prisms for a deviation of 2° without dispersion. **[Ans.** 10·02°, 6·83°]

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. $i = 90° - 50° = 40°$; $A = 60°$, $\delta = 42°$

   Now, $e = A + \delta - i = 60° + 42° - 40° = 62°$

   Therefore, angle which emergent ray makes with the second face of the prism = 90° – 62° = **28°**

2. $$\mu = \frac{\sin (A+\delta_m)/2}{\sin A/2} = \frac{\sin (60° + 50°)/2}{\sin 30°}$$
   $$= \frac{\sin 55°}{\sin 30°} = \frac{0\cdot 8192}{0\cdot 5} = \mathbf{1\cdot 638}$$

3. $$\mu = \frac{\sin (A+\delta_m)/2}{\sin A/2} = \frac{\sin (60° + 30°)/2}{\sin 30°}$$
   $$= \frac{\sin 45°}{\sin 30°} = \frac{0\cdot 707}{0\cdot 5} = 1\cdot 414$$

   Speed of light through glass prism,
   $$v = \frac{c}{\mu} = \frac{3 \times 10^8}{1\cdot 414} = \mathbf{2\cdot 12 \times 10^8\ m\ s^{-1}}$$

4. $$\mu = \frac{\sin (A+\delta_m)/2}{\sin A/2} \quad \text{or} \quad 1\cdot 632 = \frac{\sin (60° + \delta_m)/2}{\sin 30°}$$

   or $\sin (60° + \delta_m)/2 = 1\cdot 632 \times 0\cdot 5 = 0\cdot 816$

   or $(60° + \delta_m)/2 = 54\cdot 69°$

   or $\delta_m = 54\cdot 69° \times 2 - 60° = \mathbf{49\cdot 38°}$

5. To find δ_m, proceed as in problem no. 4. It will be found that $\delta_m = 37\cdot 18°$

   Then, angle of incidence,
   $$i = (A + \delta_m)/2 = (60° + 37\cdot 18°)/2 = \mathbf{48\cdot 59°}$$

6. To find μ, proceed as in problem no. 2.

   Angle of incidence,
   $$i = (A + \delta_m)/2 = (60° + 34°)/2 = \mathbf{47°}$$

7. $(A + \delta_m)/2 = 50°$, $\mu = 1\cdot 5$

   $$\text{Now, } \mu = \frac{\sin (A+\delta_m)/2}{\sin A/2} \quad \text{or} \quad 1\cdot 5 = \frac{\sin 50°}{\sin A/2}$$

   or $\sin A/2 = \dfrac{0\cdot 7660}{1\cdot 5} = 0\cdot 5107$ or $A/2 = 30\cdot 71°$

   or $A = \mathbf{61\cdot 42°}$

8. ***For refraction at first face :***
   $$\mu = \frac{\sin i}{\sin r_1}$$

   or $\sin r_1 = \dfrac{\sin i}{\mu} = \dfrac{\sin 40°}{1\cdot 5} = \dfrac{0\cdot 6428}{1\cdot 5} = 0\cdot 4285$

   or $r_1 = 25\cdot 37°$

   For refraction at second face :

   Now, $A = (r_1 + r_2)$

   or $r_2 = A - r_1 = 60° - 25\cdot 37° = 34\cdot 63°$

   If e is angle of emergence, then
   $$\mu = \frac{\sin e}{\sin r_2} \quad \text{or} \quad \sin e = \mu \sin r_2 = 1\cdot 5 \times \sin 34\cdot 63°$$

   or $\sin e = 1\cdot 5 \times 0\cdot 5683 = 0\cdot 8525$ or $e = \mathbf{58\cdot 48°}$

9. As the angle of incidence is equal to angle of emergence, prism is in minimum deviation position.

   Here, $e = i = \dfrac{3}{4} A = \dfrac{3}{4} \times 60° = 45°$

   Now, $i = (A + \delta_m)/2$

   or $\delta_m = 2i - A = 2 \times 45° - 60° = 30°$

   $$\text{Also, } \mu = \frac{\sin (A+\delta_m)/2}{\sin A/2} = \frac{\sin (60° + 30°)/2}{\sin 30°}$$
   $$= \frac{\sin 45°}{\sin 30°} = \frac{0\cdot 707}{0\cdot 5} = \mathbf{1\cdot 414}$$

10. $${}^a\mu_g = \frac{\sin (A+\delta_m)/2}{\sin A/2} = \frac{\sin (60° + 40°)/2}{\sin 30°}$$
    $$= \frac{\sin 50°}{\sin 30°} = \frac{0\cdot 7660}{0\cdot 5} = \mathbf{1\cdot 532}$$

    When prism is placed in water : Let μ' be refractive index of the material of prism w.r.t. water and δ_m' be angle of minimum deviation. Then,
    $$\mu' = \frac{{}^a\mu_g}{{}^a\mu_w} = \frac{1\cdot 532}{1\cdot 33} = 1\cdot 152$$
    $$\text{Now, } \mu' = \frac{\sin (A + \delta_m')/2}{\sin A/2}$$

    or $1\cdot 152 = \dfrac{\sin (60° + \delta_m')/2}{\sin 30°}$

    or $\sin(60° + \delta_m')/2 = 1\cdot 152 \times 0\cdot 5 = 0\cdot 576$

    or $(60° + \delta_m')/2 = 35\cdot 17°$

    or $\delta_m' = 35\cdot 17° \times 2 - 60° = \mathbf{10\cdot 34°}$

11. Proceed as in problem no. 10.

12. The ray of light incident normally on the face AB of the prism will pass as such and will come to meet the face AB at point R as shown in Fig. 2.18.

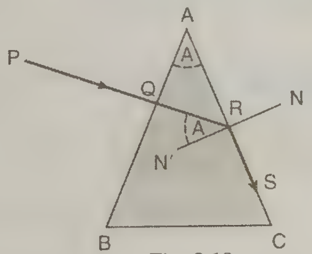

Fig. 2.18

    Obviously, ∠QRN′ = A, angle of prism. Since the ray just fails to emerge from the face AC, angle A equals the critical angle for the material of lens.

    Thus, $\mu = \dfrac{1}{\sin A}$ or $\sin A = \dfrac{1}{1\cdot 5} = 0\cdot 6667$

    or $A = \mathbf{41\cdot 8°}$

13. Let μ' be refractive index of material of prism w.r.t. water.

    Then, $\mu' = \dfrac{1\cdot 45}{1\cdot 33} = 1\cdot 09$

    As explained in problem no. 12, when a ray of light is incident normally on one face of the prism, it comes to incident on the second face at an angle equal to angle of prism. If e is angle of emergence, then,
    $$\mu' = \frac{\sin e}{\sin A} \quad \text{or} \quad \sin e = \mu' \sin A = 1\cdot 09 \times \sin 60°$$

    or $\sin e = 1\cdot 09 \times 0\cdot 8660 = 0\cdot 9439$ or $e = \mathbf{70\cdot 72°}$

14. Angle of dispersion,
    $$\theta = A(\mu_b - \mu_r) = 5° (1\cdot 659 - 1\cdot 641) = \mathbf{0\cdot 09°}$$

15. Dispersive power of crown glass,

$$\omega = \frac{\delta_b - \delta_r}{\delta} = \frac{54\cdot 6^\circ - 53\cdot 0^\circ}{54\cdot 0^\circ} = 0\cdot 0296$$

Dispersive power of flint glass,

$$\omega' = \frac{\delta_b' - \delta_r'}{\delta'} = \frac{52\cdot 8^\circ - 50\cdot 6^\circ}{51\cdot 9^\circ} = 0\cdot 0424$$

$$\therefore \qquad \frac{\omega}{\omega'} = \frac{0\cdot 0296}{0\cdot 0424} = \mathbf{0\cdot 7}$$

16. ***For crown glass :*** $\mu_b = 1{\cdot}523$, $\mu_r = 1{\cdot}513$

Refractive index for mean light,

$$\mu = \frac{\mu_b + \mu_r}{2} = \frac{1\cdot 523 + 1\cdot 513}{2} = 1\cdot 518$$

$$\therefore \qquad \omega = \frac{\mu_b - \mu_r}{\mu - 1} = \frac{1\cdot 523 - 1\cdot 513}{1\cdot 518 - 1} = \mathbf{0\cdot 0193}$$

For flint glass : In the same manner, it can be obtained that $\omega' = \mathbf{0{\cdot}0396}$

17. For no deviation, $A(\mu - 1) = A'(\mu' - 1)$

$$\text{or} \qquad A' = \frac{A(\mu - 1)}{(\mu' - 1)} = \frac{15^\circ(1\cdot 65 - 1)}{(1\cdot 52 - 1)} = \mathbf{18\cdot 75^\circ}$$

$$\text{Net angular dispersion} = \delta(\omega - \omega')$$
$$= A(\mu - 1)(\omega - \omega')$$
$$= 15^\circ(1\cdot 65 - 1)(0\cdot 03 - 0\cdot 02) = \mathbf{0\cdot 0975^\circ}$$

18. ***For crown glass :***

$$\omega = \frac{\mu_F - \mu_C}{\mu_D - 1} = \frac{1\cdot 535 - 1\cdot 527}{1\cdot 530 - 1} = \mathbf{0\cdot 015}$$

For flint glass :

$$\omega' = \frac{\mu_F' - \mu_C'}{\mu_D' - 1} = \frac{1\cdot 806 - 1\cdot 790}{1\cdot 795 - 1} = \mathbf{0\cdot 02}$$

For no deviation,

$$A' = \frac{A(\mu_D - 1)}{(\mu_D' - 1)} = \frac{9^\circ(1\cdot 530 - 1)}{(1\cdot 795 - 1)} = \mathbf{6^\circ}$$

19. For no dispersion, $A(\mu_b - \mu_r) = A'(\mu_b' - \mu_r')$

$$\text{or} \qquad A' = \frac{A(\mu_b - \mu_r)}{(\mu_b' - \mu_r')} = \frac{6^\circ(1\cdot 531 - 1\cdot 520)}{(1\cdot 684 - 1\cdot 662)} = \mathbf{3^\circ}$$

Net deviation $= A(\mu - 1) - A'(\mu' - 1)$

$$= 6^\circ\left[\frac{1\cdot 531 + 1\cdot 520}{2} - 1\right] - 3^\circ\left[\frac{1\cdot 684 + 1\cdot 662}{2} - 1\right]$$

$$= 6^\circ(1\cdot 5255 - 1) - 3^\circ(1\cdot 673 - 1) = \mathbf{1\cdot 134^\circ}$$

20. ***For crown glass :*** $\omega = 0{\cdot}03$, $\mu_b - \mu_r = 0{\cdot}015$

For flint glass : $\omega' = 0{\cdot}05$, $\mu_b' - \mu_r' = 0{\cdot}022$

For no dispersion, $A(\mu_b - \mu_r) = A'(\mu_b' - \mu_r')$

$$\text{or} \qquad A \times 0\cdot 015 = A' \times 0\cdot 022$$

$$\text{or} \qquad A = \frac{22}{15}A' \qquad \ldots(i)$$

Net deviation $= A(\mu - 1) - A'(\mu' - 1)$,

$$= \frac{A(\mu - 1)(\mu_b - \mu_r)}{\mu_b - \mu_r} - \frac{A'(\mu' - 1)(\mu_b' - \mu_r')}{\mu_b' - \mu_r'}$$

$$= \frac{A(\mu_b - \mu_r)}{\omega} - \frac{A'(\mu_b' - \mu_r')}{\omega'}$$

$$\text{or } 2^\circ = \frac{22\,A'}{15} \times \frac{0\cdot 015}{0\cdot 03} - \frac{A' \times 0\cdot 022}{0\cdot 05}$$

$$= 0\cdot 733\,A' - 0\cdot 44\,A'$$

or $A' = \mathbf{6{\cdot}83^\circ}$

From equation (*i*), we have

$$A = \frac{22}{15} \times 6\cdot 83^\circ = \mathbf{10\cdot 02^\circ}$$

CHAPTER 3

Optical Instruments

3.01. SIMPLE MICROSCOPE

A convex lens of *short focal length* can be used to see magnified image of a small object and is called ***a magnifying glass*** or a ***simple microscope***.

Principle. When a small object is placed between optical centre and focus of a convex lens, its *virtual, erect and magnified* image is formed on the *same side* of the lens. The lens is held close to eye and the distance of the object is adjusted, till the image is formed at *the least distance of distinct vision* from the eye. For a normal eye, the least distance of distinct vision is 25 cm.

Working. Let AB be an object placed between the points F and C. Its virtual image A′B′ will be formed on the same side of the object. If the distance of the object is changed from the lens, then the distance of the image also changes. The position of object AB is so adjusted that the image A′B′ is formed at the least distance of distinct vision (D) as shown in Fig. 3.01.

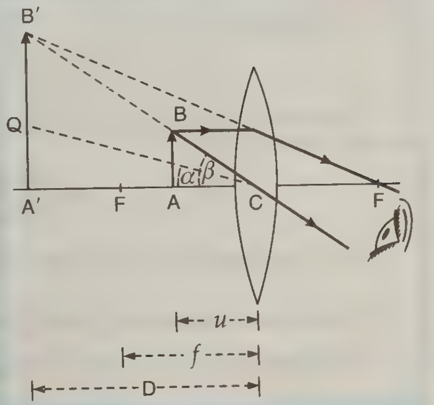

Fig. 3.01

Key point

A simple microscope is a convex lens of short focal length.

Magnifying power (*When image is formed at D*). *It is defined as the ratio of the angle subtended by the image at the eye and the angle subtended by the object seen directly, when both lie at the least distance of distinct vision.* It is also called *angular magnification* produced by the simple microscope. It is denoted by M.

Let $\angle A'CB' = \beta$ be the angle subtended by the image at the eye. Cut A′Q equal to AB and join QC. Then, $\angle A'CQ' = \alpha$ is the angle subtended by the object at the eye, when it is placed at the least distance of distinct vision.

By definition, magnifying power of the simple microscope is given by

$$M = \frac{\beta}{\alpha}$$

In practice, angles α and β are small. Therefore, angles α and β can be replaced by their tangents *i.e.*

$$M = \frac{\tan\beta}{\tan\alpha} \qquad ...(3.01)$$

From right angled Δ CA′Q, $\tan\alpha = \frac{A'Q}{CA'} = \frac{AB}{CA'}$ $\qquad (\because A'Q = AB)$

Also, from right angled Δ CAB, $\tan\beta = \frac{AB}{CA}$

Substituting for $\tan\alpha$ and $\tan\beta$ in equation (3.01), we have

$$M = \frac{AB/CA}{AB/CA'} = \frac{CA'}{CA} \qquad ...(3.02)$$

If CA = u, the distance of object AB from the lens and CA′ = v, the distance of image A′B′ from the lens, then

$$M = \frac{v}{u} \qquad ...(3.03)$$

If f is focal length of the lens acting as simple microscope, then

$$-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$$

or

$$\frac{v}{u} = 1 - \frac{v}{f} \qquad ...(3.04)$$

From equations (3.03) and (3.04), we have

$$M = 1 - \frac{v}{f}$$

Applying new cartesian sign conventions :

$$v = -D\,;\ f = +f$$

$\therefore$ $$M = 1 - \frac{-D}{+f}$$

or $$M = 1 + \frac{D}{f} \qquad ...(3.05)$$

From equation (3.05), it follows that *lesser is the focal length of the convex lens used as simple microscope, greater is the value of the magnifying power obtained.*

Further, the ***positive*** value of magnifying power of a simple microscope tells that image formed is *erect and hence* virtual.

Magnifying power (*When image is formed at infinity*). *It is defined as the ratio of the angle formed by the image (situated at infinity) at the eye to the angle formed by object at the eye, when situated at least distance of distinct vision. It is denoted by M.*

Draw a line A′B′ = AB and perpendicular to principal axis at a distance CA′ = D (least distance of distinct vision). Join B′C′. Then ∠B′CA′ = α is the angle formed by object at the eye, when situated at distance D [Fig. 3.02].

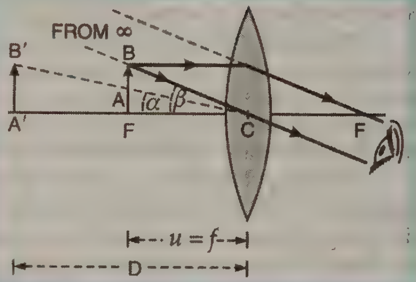

Fig. 3.02

The angle formed by the image situated at infinity at the eye is same as the angle formed by the object AB at the eye. Thus, ∠BCA = β is the angle formed by the image at the eye,

By definition,

$$M = \frac{\beta}{\alpha}$$

In practice, angles α and β are small. Therefore, angles α and β can be replaced by their tangents *i.e.*

$$M = \frac{\tan\beta}{\tan\alpha} \qquad ...(3.06)$$

From right angled Δ B′ AC, $\tan\alpha = \frac{A'B'}{CA'} = \frac{AB}{CA'}$ $\quad (\because A'B' = AB)$

Also, from right angled Δ BAC, $\tan\beta = \frac{AB}{CF}$

Substituting for tan α and tan β in equation (3.06), we have

$$M = \frac{AB}{CF} \times \frac{CA'}{AB} = \frac{CA'}{CF}$$

Applying new cartesian sign conventions :

$$CF = -f\,;\, CA' = -D$$

$\therefore$ $$M = \frac{-D}{-f}$$

or $$M = \frac{D}{f} \qquad ...(3.07)$$

The above equation gives magnifying power of a simple microscope, when image is formed at infinity.

Uses. 1. Jewellers and watch makers make use of convex lens of short focal length to obtain a magnified view of the fine jewellery work and the small components of the watches.

2. In science laboratories, a magnifying glass is used to see slides and to read the vernier scales attached to the instruments.

3. The use of magnifying glass enables us to place the object close to eye, making it appear bright and yet clearly visible. In position AB, object lies close to the eye. In absence of lens, the object will not be clearly visible.

Note. 1. The equation (3.05) gives magnifying power of a simple microscope, when the image is formed at least distance of distinct vision *i.e.* when the image is seen distinctly. If the object is brought closer to the lens, the image also moves closer to the eye. No doubt, the magnifying power of the simple microscope increases, but the image can not be seen distinctly. On the other hand, if the object is moved away from the lens (up to its focus), the magnifying power decreases. The virtual image of the object can be seen, till the distance of the object does not increase the focal length of the lens. When the object lies at the focus, the image is formed at infinity and the magnifying power of the simple microscope is given by equation (3.07). From equations (3.05) and (3.07), it follows that magnifying power of the simple microscope is one less, when the image is formed at infinity. However, the viewing of the image is more comfortable.

2. The magnification produced by a lens is given by

$$m = \frac{I}{O} = \frac{v}{u}$$

The magnifying power of the simple microscope and the magnification produced by the lens are different from each other. The two become equal, only when the image is formed at the least distance of distinct vision.

3.02. COMPOUND MICROSCOPE

A compound microscope is used to see extremely small objects.

It consists of two lenses. A lens of ***short aperture*** and ***short focal length*** facing the object is called ***object lens**** and another lens of ***short focal length*** but ***large aperture*** is called ***eye lens***†. The two lenses are placed coaxially at the two ends of a tube. To focus over an object, the distance of the object lens from the object is adjusted with the help of rack and pinion arrangement.

Key point

In a compound microscope, object lens is of short focal length and short operature, while eye lens has short focal length and large operature.

Principle. When a small object is placed just outside the focus of the object lens, its real, inverted and magnified image is produced on the other side of the lens between F and 2 F. The image produced by object lens acts as object for the eye lens. The distance of object from the object lens is so adjusted that the final image is formed at the least distance of distinct vision from the eye.

Working. When a small object is placed just outside the focus of the object lens, its real, inverted and magnified image is produced on the other side of the lens between F and 2 F. The image produced by object lens acts as object for the eye lens. The distance of object from the object lens is so adjusted that the final image is formed at the least distance of distinct vision from the eye.

Let AB be an object placed just outside the focus F_o of the object lens. Its virtual image A′B′ is formed on the other side of the lens. The image A′B′ lies between focus F_e and optical centre C′ of the eye lens [Fig. 3.03] and it acts as object for the eye lens. Using the rack and pinion arrangement, the distance between object lens and the object AB is adjusted, till its virtual and magnified image A′′B′′ is formed on the same side at the least distance of distinct vision.

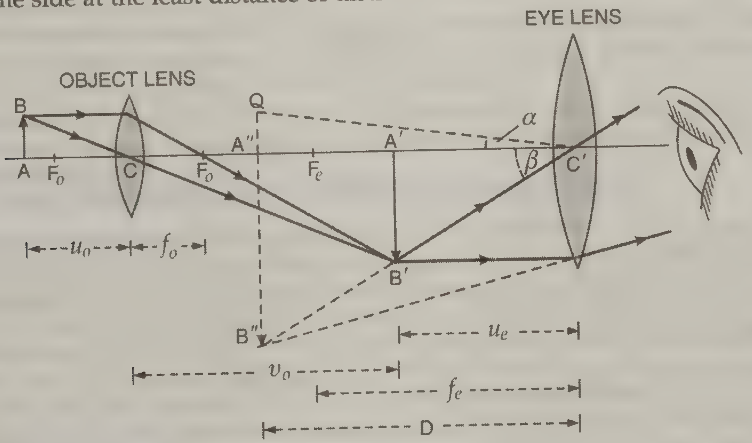

Fig. 3.03

Magnifying power (***When image is formed at D***). *It is defined as the ratio of the angle subtended by the final image at the eye to the angle subtended by the object seen directly, when both are placed at the least distance of distinct vision.*

Let $\angle A''C'B'' = \beta$ be the angle subtended by the final image at the eye. Cut A′′Q equal to AB and join QC′. Then, $\angle A''C'Q = \alpha$, the angle subtended by the object at the eye, when situated at the least distance of distinct vision. By definition, magnifying power of the compound microscope,

$$M = \frac{\beta}{\alpha}$$

Since the angles α and β are small, they can be replaced by their tangents *i.e.*

$$M = \frac{\tan \beta}{\tan \alpha} \qquad \text{...(3.08)}$$

---

*In practice, to eliminate chromatic aberration, a combination of two lenses in contact is used. It is called *objective*.

†In place of an eye lens, a combination of two lenses at certain distance apart satisfying certain conditions (to minimize chromatic and spherical aberrations) is used. It is called *eye piece*.

From the right angled Δ C′A″Q, $\tan\alpha = \frac{A''Q}{C'A''} = \frac{AB}{C'A''}$ $\quad (\because A''Q = AB)$

Also, from the right angled D C′A″B″, $\tan\beta = \frac{A''B''}{C'A''}$

Substituting the values of tan α and tan β in equation (3.08), we have

$$M = \frac{A''B''/C'A''}{AB/C'A''} = \frac{A''B''}{AB}$$

Multiplying and dividing by A′B′, we have

$$M = \frac{A''B''}{AB} \times \frac{A'B'}{A'B'} = \frac{A'B'}{AB} \times \frac{A''B''}{A'B'}$$

or
$$M = m_o \times m_e, \qquad ...(3.09)$$

where $\frac{A'B'}{AB} = m_o$, the magnification produced by object lens

and $\frac{A''B''}{A'B'} = m_e$, the magnification produced by eye lens.

To find m_o : Let CA = u_o, the distance of object AB from object lens ; and CA′= v_o, the distance of image A′B′ from object lens.

By definition, linear magnification produced by object lens,

$$m_o = \frac{v_o}{u_o} \qquad ...(3.10)$$

To find m_e : Let C′A′ = u_e, the distance of object A′B′ from eye lens and C′A″ = v_e ,the distance of image A″B″ from eye lens

Again, by definition, linear magnification produced by eye lens

$$m_e = \frac{v_e}{u_e} \qquad ...(3.11)$$

Now, for the eye lens,

$$-\frac{1}{u_e} + \frac{1}{v_e} = \frac{1}{f_e}$$

or
$$\frac{v_e}{u_e} = 1 - \frac{v_e}{f_e} \qquad ...(3.12)$$

From equations (3.11) and (3.12), we have

$$m_e = 1 - \frac{v_e}{f_e}$$

Applying new cartesian sign conventions :

$$v_e = -D ; f_e = +f_e$$

∴
$$m_e = 1 - \frac{-D}{+f_e}$$

or
$$m_e = 1 + \frac{D}{f_e} \qquad ...(3.13)$$

Using equations (3.10) and (3.13), the equation (3.09) becomes

$$M = \frac{v_o}{u_o}\left(1 + \frac{D}{f_e}\right) \qquad ...(3.14)$$

In practice, the focal length of the object lens is very short and the object AB is placed just outside the focus of object lens.

∴
$$u_o \approx f_o \qquad \text{(in magnitude)}$$

So that the final image is formed at least distance of distinct vision from the eye, the image A′B′ must lie between optical centre and focus of the eye lens. Since, the focal length of the eye lens is also small, the distance of the image A′B′ from the object lens is nearly equal to the length of the microscope tube *i.e.*

$$v_o \approx L$$

According to new cartesian sign conventions :

$$u_o \approx -f_o \text{ and } v_o \approx L$$

Key point

In a compound microscope, object lens and eye lens are placed at a fixed distance apart. The microscope is focussed on an object by changing distance of the object lens from it with the help of rack and pinion arrangement.

Substituting for u_o and v_o in equation (*vii*), we have

$$M = -\frac{L}{f_o}\left(1+\frac{D}{f_e}\right) \qquad ...(3.15)$$

From the above expression, it follows that a compound microscope will have large magnifying power, if both the object lens and the eye lens are of small focal length. In practice, focal length of object lens is smaller than that of eye lens *i.e.* $f_o < f_e$. Further the ***negative*** value of magnifying power of compound microscope tells that final image formed is ***inverted.***

Magnifying power (*When image is formed at infinity*). The magnifying power of a compound microscope,

$$M = m_o \times m_e$$

If u_o is distance of object from the object lens and v_o, then distance of image from it, then as obtained earlier,

$$m_o = \frac{v_o}{u_o}$$

Further, as discussed in case of a simple microscope ; it can be obtained that

$$m_e = \frac{D}{f_e},$$

where f_e is focal length of the eye lens.

Therefore, magnifying power of a compound microscope is given by

$$M = \frac{v_o}{u_o} \times \frac{D}{f_e} \qquad ...(3.16)$$

3.03. TELESCOPE

A telescope is an instrument for seeing distant objects clearly and magnified, though apparently. It is of two types :

1. Astronomical telescope. A telescope used to see heavenly bodies is called *astronomical telescope*. It produces a virtual and inverted image. As such bodies are round, the inverted image does not affect the observation.

2. Terrestrial telescope. For observing objects on earth, it would be necessary to have an erect image. A telescope used for observing objects on earth is called a terrestrial telescope.

3.04. ASTRONOMICAL TELESCOPE (Refracting Type)

An astronomical telescope is used to see heavenly objects.

An astronomical refracting telescope consists of two lens systems. The lens system facing the object is called ***objective***. It has large aperture and is of ***large focal length*** (f_o). The other lens system is called ***eye-piece***. It has ***small aperture*** and is ***of short focal length*** (f_e). The objective and the eye-piece are mounted coaxially in two metallic tubes. The tube holding the eye-piece can be made to slide into the tube holding the objective with the help of rack and pinion arrangement.

Key point ✓

In a telescope, object lens is of large focal length and large operature, while eye lens has short focal length and short operature.

Principle. The objective forms the real and inverted image of the distant object at its focal plane. The position of the eye-piece is adjusted, till the final image is formed ***at least distance of distinct vision.*** In case, position of the eye-piece is so adjusted that final image is formed at infinity, the telescope is said to be in ***normal adjustment.*** Let us now discuss the formation of the final image in the two cases :

(*a*) When final image is formed at infinity (Normal adjustment). When a parallel beam of light rays from the distant object falls on the objective, its real and inverted image A′B′ is formed on the other side of the objective [Fig. 3.04]. If the

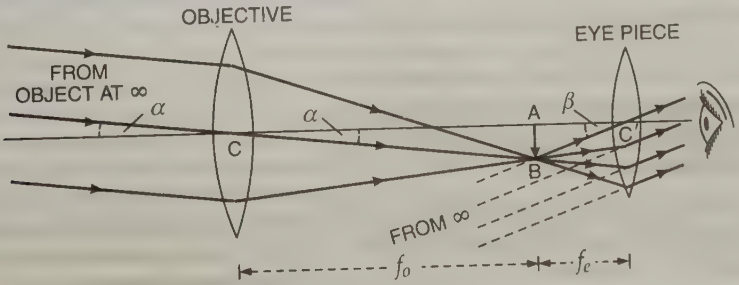

Fig. 3.04

position of eye-piece is adjusted, so that the image A′B′ lies at its focus, then the final highly magnified image will be formed at infinity.

Magnifying power. *Magnifying power of a telescope in normal adjustment is defined as the ratio of the angle subtended by the image at the eye as seen through the telescope to the angle subtended by the object seen directly, when both the object and the image lie at infinity.* It is also called *angular magnification* of the telescope and is denoted by M.

As the object is at a very large distance, the angle subtended by it at the eye is practically the same as that subtended by it at the objective.

Thus, $\angle A'CB' = \alpha$ may be considered as the angle subtended by object at the eye. Let $\angle A'C'B' = \beta$.

Then, by definition, $M = \dfrac{\beta}{\alpha}$

Since the angles α and β are small, $\alpha \approx \tan\alpha$ and $\beta \approx \tan\beta$. Therefore,

$$M = \frac{\tan\beta}{\tan\alpha} \qquad \text{...(3.17)}$$

From right angled $\Delta\, CA'B'$, $\tan\alpha = \dfrac{A'B'}{CA'}$

and from right angled $\Delta\, C'A'B'$, $\tan\beta = \dfrac{A'B'}{C'A'}$

Substituting for $\tan\alpha$ and $\tan\beta$ in equation (3.17), we have

$$M = \frac{A'B'/C'A'}{A'B'/CA'} = \frac{CA'}{C'A'} \qquad \text{...(3.18)}$$

Applying new cartesian sign conventions :

$CA' = +f_o$ ($\because$ distance of A′B′ from object lens is *along* the incident light)

$C'A' = -f_e$ ($\because$ distance of A′B′ from eye lens is *against* incident light)

Substituting for CA′ and C′A′ in equation (3.18), we have

$$M = -\frac{f_o}{f_e} \qquad \text{...(3.19)}$$

It follows that the magnifying power of a telescope in normal adjustment will be large, if objective is of large focal length and the eye-piece is of short focal length.

Further, when telescope is in normal adjustment, the distance between the two lenses is equal to sum of their focal lengths ($f_o + f_e$).

Further, the ***negative*** value of the magnifying power of the telescope tells that final image formed is ***inverted*** **and** ***real.***

(*b*) When final image is formed at least distance of distinct vision. When a parallel beam of light rays from the distant object falls on the objective, its real and inverted image A′B′ is formed on the other side of the objective. The position of eye-piece is adjusted so that the final image A″B″ is formed at least distance of distinct vision. The course of the rays will be as shown in Fig. 3.05.

Key point ✓

When a telescope is in normal adjustment, distance between the object lens and eye lens is equal to the sum of their focal lengths.

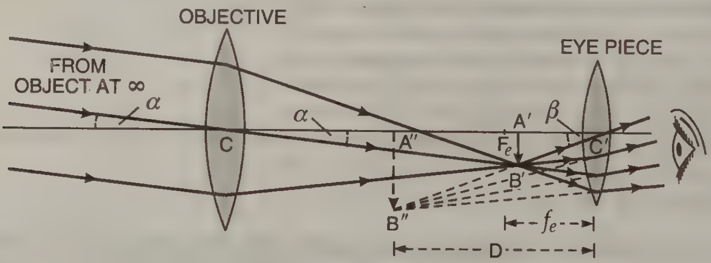

Fig. 3.05

Magnifying power. *Magnifying power of a telescope is defined as the ratio of the angle subtended at the eye by the image formed at the least distance of distinct vision to angle subtended at the eye by the object lying at infinity, when seen directly.*

Again, as the object is at a very large distance, the angle α subtended by it at the objective is practically the same as that subtended by it at the eye. Therefore, if $\angle A''C'B'' = \beta$, then

$$M = \frac{\beta}{\alpha}$$

Again, as angle α and β are small, they can be replaced by their tangents. erefore,

$$M = \frac{\tan\beta}{\tan\alpha} \qquad \text{...(3.20)}$$

From right angledΔ CA′B′, $\tan\alpha = \frac{A'B'}{CA'}$

and from right angled Δ C′A′B′, $\tan\beta = \frac{A'B'}{C'A'}$

In equation (3.20), substituting for tan α and tan β, we have

$$M = \frac{A'B'/C'A'}{A'B'/CA'} = \frac{CA'}{C'A'} \qquad \text{...(3.21)}$$

Now, $\quad CA' = f_o$ and $C'A' = u_e$

In equation (3.21), subsituting for CA′ and C′A′, we get

$$M = \frac{f_o}{u_e} \qquad \text{...(3.22)}$$

For eye lens, we have

$$-\frac{1}{u_e} + \frac{1}{v_e} = \frac{1}{f_e} \quad \text{or} \quad \frac{1}{u_e} = -\frac{1}{f_e} + \frac{1}{v_e}$$

or
$$\frac{1}{u_e} = -\frac{1}{f_e}\left(1 - \frac{f_e}{v_e}\right)$$

Substituting for $\frac{1}{u_e}$ in equation (3.22), we have

$$M = -\frac{f_o}{f_e}\left(1 - \frac{f_e}{v_e}\right)$$

Applying new cartesian sign conventions :

$$f_o = +f_o\,;\ v_e = -D\,;\ f_e = +f_e$$

$\therefore$
$$M = -\frac{+f_o}{+f_e}\left(1 - \frac{+f_e}{-D}\right)$$

or
$$M = -\frac{f_o}{f_e}\left(1 + \frac{f_e}{D}\right) \qquad \text{...(3.23)}$$

Therefore, a refracting telescope will have large magnifying power, if the object ens is of large focal length and eye lens is of short focal length. Further, the ***negative*** alue of magnifying power of the telescope tells that the final image formed is ***nverted*** and ***real.***

Key point ✓

In a telescope, the distance between object lens and eye lens depends upon the position of the object. The telescope is focussed on a distant object by varying the distance between the two lenses with the help of rack and pinion arrangement.

Note. 1. From the equation (3.19) and (3.23), it follows that the magnifying power of a telescope is greater, when the image is formed at least distance of distinct vision than in the case, when the telescope is in normal adjustment.

2. It may be pointed out that the image formed by a telescope is actually not magnified. A telescope is used to increase the ***visual angle***. A distant object, even very large in size forms a very small angle α at the eye. By producing the image close to the eye (at least distance of distinct vision), the telescope increases the angle (β), in which the image appears to be formed.

3.05. REFLECTING TYPE TELESCOPE

An astronomical telescope used to see the distant stars should possess ***large light gathering power*** in order to obtain a bright image of even a faint star and ***high resolving power*** so as to observe its minute and finer details. Both the light gathering power and the resolving power for a telescope will be large, if the objective of the telescope is of large aperture. However, it cannot be achieved in a refracting type astronomical telescope. It is because, a convex lens of large aperture free from spherical and chromatic aberrations cannot be designed.

Watch out !

The image produced by a telescope is inverted laterally also !

Reflecting type telescope was designed by Newton in order to overcome the drawbacks of refracting type telescope. In a reflecting type telescope, a concave mirror of large aperture is used as objective in place of a convex lens. It possesses a large light gathering power and a high resolving power. Due to this, it enables us to see even faint stars and observe their minute details.

Fig. 3.06 shows the various parts of the reflecting type telescope and the course of rays showing the formation of the final image of the distant star. The concave mirror of large aperture and large focal length is fixed at one end of the tube T_1, whose other end is kept open to allow the light from the distant star to fall on the spherical concave mirror. Before the reflected rays of light meet to form the real, inverted and diminished image of the star at the focal plane of the concave mirror, they are intercepted and reflected by a plane mirror (M) inclined at an angle of 45° to the axis of the tube T_1. The plane mirror deviates the rays and the real image is formed in front of the *eye-piece* fitted in a side metal tube T_2 with its axis at a right angle to the axis of the tube T_1. The eye-piece only acts as magnifier and produces the final virtual and magnified image of the star enabling eye to see it distinctly.

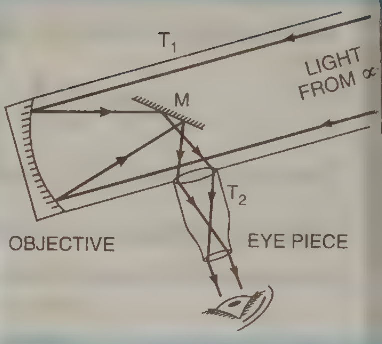

Fig. 3.06

If f_o is focal length of the concave spherical mirror used as objective and f_e, the focal length of the eye-piece, then magnifying power* of the reflecting telescope is given by

$$M = \frac{f_o}{f_e}$$

Further, if D is diameter of the objective and d, the diameter of the pupil of the eye, then brightness ratio is given by

$$B = \frac{D^2}{d^2}$$

A concave mirror of very large diameter can be easily manufactured and such a telescope may be used to observe even very faint stars.

Advantages of a reflecting type telescope. A reflecting type telescope has following advantages over a refracting type telescope.

1. Since objective is not a lens, the image formed is free from chromatic aberration.

2. Spherical aberration can be minimised by making use of a parabolic mirror in place of concave spherical mirror as objective. It enables to produce a very sharp and distinct image.

3. A concave spherical mirror of large aperture can be easily manufactured and hence due to very large light gathering power, it enables to see even very faint stars.

4. Also, in a reflecting type telescope, the objective (a concave spherical mirror) of large aperture provides a very high resolving power so as to see even the minute and fine details of the distant stars.

3.06. SOME IMPORTANT FEATURES OF A TELESCOPE

A telescope should have *high magnifying power, high resolving power* and *large light gathering power* for the reasons explained below :

1. High magnifying power. A telescope having high magnifying power produces apparently a magnified image and hence enables to see the finer details of the distinct object. When in normal adjustment (final image formed at infinity), the magnifying power of a telescope is given by

$$M = \frac{f_o}{f_e},$$

where f_o and f_e are respectively the focal length of objective and eye-piece. Hence, *for high value of magnifying power, objective should be of large focal length, while eye-piece should be of small focal length.*

2. High resolving power. A telescope of high resolving power has ability to show the images of two very near parts of an object as separate. Therefore, a telescope of high resolving power also enables to observe the finer details of the distant object. The angular limit of resolution (reciprocal of resolving power) is given by

$$\theta = \frac{1 \cdot 22\,\lambda}{D},$$

where D is diameter of objective and λ is wavelength of the light used. Hence, *a*

---

* The magnifying power of a reflecting type telescope is also negative. It is because, focal length of a concave mirror (f_o) is negative.

scope will have small value of angular limit of resolution and hence high resolving power, jective of large diameter and light of short wavelength are used to see the distant object.

3. Large light gathering power. A telescope of large light gathering power ects a large amount of light from the distant object and hence the image formed l be very bright. The light gathering power and hence the brightness of the image lirectly proportional to the area of the objective *i.e.*

$$\text{brightness} \propto \frac{\pi D^2}{4},$$

ere D is diameter of the objective of the telescope.

The brightness ratio of a telescope is defined as the ratio of the light gathered by the scope to that gathered by the unaided eye from the distant object.

If D is diameter of the telescope objective and *d*, the diameter of the pupil of eye, then brightness ratio is given by

$$B = \frac{\pi D^2 / 4}{\pi d^2 / 4} = \frac{D^2}{d^2}$$

Therefore, for large light gathering power and hence large brightness ratio, the telescope ective should be of large aperture.

3.07. COMPARISON OF REFRACTING AND REFLECTING TYPE TELESCOPES

There are following points of difference between the two types of telescopes :

Refracting type telescope	Reflecting type telescope
The objective is a converging lens system.	1. The objective is a concave spherical mirror.
It suffers from chromatic aberration and hence the image obtained is multicoloured and blurred.	2. As the objective is not a lens, it is free from chromatic aberration.
It suffers from spherical aberration also. It also results in a blurred image.	3. The spherical aberration is minimised by using a parabolic mirror in place of the concave spherical mirror as objective.
As a lens of large aperture cannot be manufactured easily, its light gathering power is low and hence cannot be used to see faint stars.	4. A concave spherical mirror of large aperture can be easily made. Such a telescope will possess high light gathering power and hence can be used to see even faint stars.
The largest refracting type telescope at Yerkes has objective of diameter 1 m or about 40 inches.	The reflecting type telescope at Mount Polomar, U.S.A. is of 200 inch objective, while one in U.S.S.R. is of 234 inch objective.

The above points of comparison lead to the conclusion that in astronomical esearch, a reflecting type telescope is more advantageous than a refracting type elescope and hence they are widely used all over the world.

3.08. PRISM BINOCULARS

To increase the magnifying power of an astronomical telescope, it is necessary use an objective of large focal length. As a result, it will require a telescope tube f large length.

Prism binoculars is an indigenous arrangement for using a short tube and at ne same time making it possible to use objective of large focal length. The instrument ssentially consists of a pair of astronomical telescopes and totally reflecting prisms Fig. 3.07]. The use of prisms not only cuts short the length of the tube but produces n erect and magnified image free from lateral inversion along with a wide field f view.

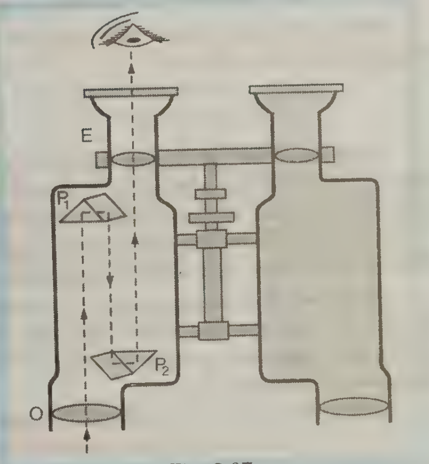

Fig. 3.07

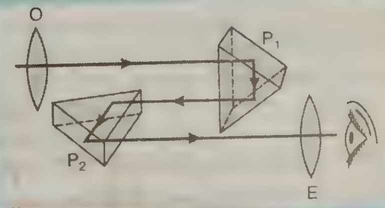

Fig. 3.08

Theory. Two totally reflecting right-angled prisms P_1 and P_2 with their efracting edges perpendicular to each other are arranged between the objective O nd the eye-piece E of each of the two telescopes. The objective produces a real nd inverted image but the prism P_1 renders it erect [Fig. 3.08]. However, the mage becomes laterally inverted. The image is corrected for lateral inversion by he second prism P_2. The reversal of the image by the two internal reflection in each prism is further explained in Fig. 3.09. Here, *a* and *b* represent the incident rays and *'* and *b'* the reflected rays in reverse order. If the incident ray *a* is above *b*, the eflected ray *a'* is below *b'*, so that the image is inverted. If *a* is to the left of *b* as seen rom the direction of the source, then *a'* is to the right of *b'*, when viewed from the same position.

The magnifying power of a telescope can be increased by using an objective of large focal length as the magnification is equal to the ratio of the focal length of the objective to that of the eye-piece. In prism binoculars, the arrangement of prisms enables us to use an objective of large focal length, as the rays of light traverse the distance between the objective and the eye-piece thrice before converging to produce the image. This not only increases the magnification but also makes the telescope short and compact. Further, as the distance between the objectives of the two telescopes is greater than between the two eyes, *the field of view is wider and objects present a better three-dimensional view, when seen through it.*

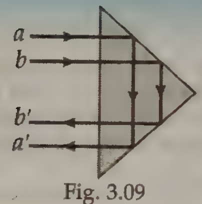

Fig. 3.09

SOLVED NUMERICAL PROBLEMS

Type A. On Simple microscope

Problem 3.01. Calculate the magnifying power of a magnifying glass of 5 cm focal length. Distance of distinct vision = 25 cm.

Sol. Here, $f = 5$ cm, D = 25 cm ;

Now, $$M = 1 + \frac{D}{f} = 1 + \frac{25}{5} = 1 + 5 = 6$$

Problem 3.02. A converging lens of focal length 6·25 cm is used as a magnifying glass. If the near point of the observer is 25 cm from the eye and the lens is held close to the eye, calculate (*i*) the distance of the object from the lens and (*ii*) the angular magnification.

Find the angular magnification, when the final image is formed at infinity. (*I.S.C.E. 1993*)

Sol. Here, $f = 6{\cdot}25$ cm ; $v = -D = -25$ cm

(*i*) Let u be the distance of object from the lens. Then,

$$-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$$

or $$\frac{1}{u} = \frac{1}{v} - \frac{1}{f} = \frac{1}{-25} - \frac{1}{6{\cdot}25} = -\frac{1}{25} - \frac{4}{25} = \frac{-5}{25}$$

or $u = -5$ **cm**

(*ii*) Now, angular magnification,

$$M = 1 + \frac{D}{f} = 1 + \frac{25}{6{\cdot}25} = 1 + 4 = 5$$

When the final image is formed at infinity, the angular magnification is given by

$$M = \frac{D}{f} = \frac{25}{6{\cdot}25} = 4$$

Problem 3.03. A figure divided into squares each of size 1 mm^2 is being viewed at a distance of 9 cm through a magnifying glass of focal length 10 cm held close to the eye.

(*a*) What is the magnification produced by the lens ? How much is the area of each square in the virtual image ?

(*b*) At what distance should the lens be held from the figure in order to view the squares distinctly with the maximum possible magnification ? What is the magnification in this case ? (*Text Problem*)

Sol. Here, size of each square in the figure,

$O = 1$ mm^2 ; $u = -9$ cm ; $f = 10$ cm

(*a*) The magnification produced by the lens, $M = \frac{v}{u}$

For a lens, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$

$$\therefore \quad -\frac{1}{-9} + \frac{1}{v} = \frac{1}{10} \quad \text{or} \quad \frac{1}{v} = \frac{1}{10} - \frac{1}{9}$$

or $v = -90$ cm

$$\therefore \quad M = \frac{-90}{-9} = 10$$

Now, each square in the figure has area 1 mm^2 *i.e.* 1 m × 1mm. Since the lens produces a linear magnification of 1 size of the each square in the image will appear as 10 mm 10 mm *i.e.* **100 mm^2.**

(*b*) Maximum magnifying power is obtained, when th virtual image is formed at the least distance of distinct vision

For a lens, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$

Here $v = -D = -25$ cm ; $f = +10$ cm

$$\therefore \quad -\frac{1}{u} + \frac{1}{-25} = \frac{1}{10} \quad \text{or} \quad \frac{1}{u} = -\frac{1}{25} - \frac{1}{10} = -\frac{7}{50}$$

or $$u = -\frac{50}{7} = -7{\cdot}14 \text{ cm}$$

When the object is placed so that the image is formed a least distance of distinct vision ; magnifying power is given by

$$M = \left(1 + \frac{D}{f}\right) = 1 + \frac{25}{10} = 3{\cdot}5$$

Problem 3.04. Refer to solved problem 3.03 (*a*). At what distance should the lens be held from the figure in order to view the squares distinctly with the maximum possible magnification ?

(*b*) What is the magnification (image size/object size) in this case ?

(*c*) Is the magnification equal to the magnifying power in this case ? Explain. (*Text Problem*)

Sol. (*a*) Maximum magnifying power is obtained, when the virtual image is formed at the least distance of distinct vision.

For a lens, $-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$

Here, $v = -25$ cm ; $f = +10$ cm ;

$$\therefore \quad -\frac{1}{u} + \frac{1}{-25} = \frac{1}{10} \quad \text{or} \quad \frac{1}{u} = -\frac{1}{25} - \frac{1}{10} = -\frac{7}{50}$$

or $$u = -\frac{50}{7} = 7{\cdot}14 \text{ cm}$$

(*b*) Magnification, $m = \frac{v}{u} = \frac{-25}{-50/7} = 3{\cdot}5$

(*c*) When the object is placed, so that the image is formed at least of distinct vision ; magnifying power is given by

$$M = \frac{D}{u} = \left(1 + \frac{D}{f}\right)$$

Since $f = +10$ cm, we have

$$M = \left(1 + \frac{D}{f}\right) = 1 + \frac{25}{10} = 3{\cdot}5$$

Thus, the magnifying power and the magnification of age are equal in this case.

For explanation, refer to the note given in section 3.01.

ype B. On Compound microscope

Problem 3.05. A compound microscope has a magni- ation of 30. The focal length of its eye-piece is 5 cm. ssuming the final image to be formed at least distance of stinct vision (25 cm), calculate the magnification produced the objective. *(C.B.S.E. 1991)*

Sol. Here, $M = -30$; (magnifying power is negative)

$$f_e = 5 \text{ cm} ; D = 25 \text{ cm} ;$$

Now, $$M = m_o \times m_e = m_o \left(1 + \frac{D}{f_e}\right)$$

$$\therefore \quad -30 = m_o \left(1 + \frac{25}{5}\right) \quad \text{or} \quad m_o = -5$$

Problem 3.06. The focal lengths of the objective and ye-piece of a compound microscope are 4 cm and 6 cm espectively. If an object is placed at a distance of 6 cm from e objective, what is the magnification produced by the icroscope ? Distance of distinct vision = 25 cm.

Sol. Here, $f_o = 4$ cm ; $f_e = 6$ cm ; $D = 25$ cm ; $u_o = -6$ cm ;

Suppose that the image of the object is formed by the bject lens at a distance v_o from it. Then, the distance v_o is iven by

$$-\frac{1}{u_o} + \frac{1}{v_o} = \frac{1}{f_o}$$

or $$\frac{1}{v_o} = \frac{1}{f_o} + \frac{1}{u_o} = \frac{1}{+4} + \frac{1}{-6} = \frac{1}{12}$$

or $$v_o = 12 \text{ cm}$$

Now, $$M = \frac{v_o}{u_o}\left(1 + \frac{D}{f_e}\right)$$

$$\therefore \quad M = \frac{12}{-6}\left(1 + \frac{25}{6}\right) = -2 \times \frac{31}{6} = -10{\cdot}33$$

Problem 3.07. The focal length of the eye piece and objective of a compound microscope are 5 cm and 1 cm respectively and the length of the tube is 20 cm. Calculate the magnifying power of the microscope, when the final image is formed at infinity. The value of least distance of distinct vision is 25 cm. *(I.S.C.E. 1998)*

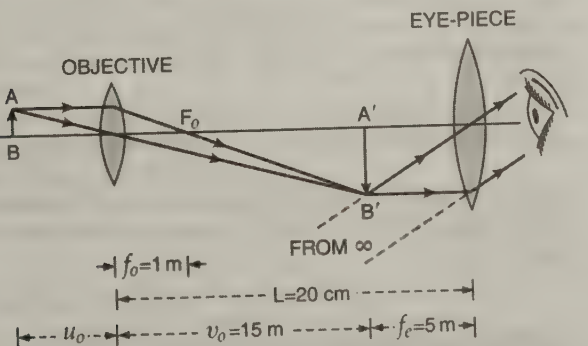

Fig. 3.10

Sol. Fig. 3.10 shows the formation of the final image of the object at infinity. When the object AB is placed at distance CA = u_o from the objective, its real image A′B′ is formed on the other side of the lens at a distance CA′ = v_o from it. The final image will be formed at infinity, if the image lies at distance C′A′ = f_e = 5 cm from the eye lens. Since length of the microscope tube is L = 20 cm, it follows that

$$v_o = L - f_e = 20 - 5 = 15 \text{ cm}$$

For object lens : $$-\frac{1}{u_o} + \frac{1}{v_o} = \frac{1}{f_o}$$

Here, $$f_o = 1 \text{ cm} ; v_o = 15 \text{ cm}$$

$$\therefore \quad \frac{1}{u_o} = \frac{1}{v_o} - \frac{1}{f_o} = \frac{1}{15} - \frac{1}{1} = -\frac{14}{15}$$

or $$u_o = -\frac{15}{14} \text{ cm}$$

When the final image is formed at infinity, the magnifying power of the microscope is given by

$$M = \frac{v_o}{u_o} \times \frac{D}{f_e}$$

Here, $$D = 25 \text{ cm} ; f_e = 5 \text{ cm}$$

$$\therefore \quad M = \frac{15}{-15/14} \times \frac{25}{5} = -70$$

The negative sign shows that the image formed is *inverted* and *real*.

Type C. On Astronomical telescope

Problem 3.08. An astronomical telescope, consists of two thin lenses set 36 cm apart and has a magnifying power 8. Calculate the focal length of the lenses. *(C.B.S.E. 1997)*

Sol. Here, $$f_o + f_e = 36 \text{ cm} \qquad ...(i)$$

$$M = -8 \quad \text{(magnifying power is negative)}$$

Now, $$M = -\frac{f_o}{f_e}$$

$$\therefore \quad -8 = -\frac{f_o}{f_e}$$

or $$f_o = 8 f_e \qquad ...(ii)$$

From equations (*i*) and (*ii*), we have

$$8 f_e + f_e = 36 \quad \text{or} \quad f_e = 4 \text{ cm}$$

Again $$f_o = 8 f_e = 8 \times 4 = 32 \text{ cm}$$

Problem 3.09. The focal length of the objective of an astronomical telescope is 75 cm and that of the eye-piece is 5 cm. If the final image is formed at the least distance of distinct vision from the eye, calculate the magnifying power of the telescope.

Sol. Here, $f_o = 75$ cm ; $f_e = 5$ cm

We know, D = 25 cm

Now, $$M = -\frac{f_o}{f_e}\left(1 + \frac{f_e}{D}\right) = -\frac{75}{5}\left(1 + \frac{5}{25}\right)$$

$$= -15 \times 1{\cdot}2 = -18$$

Problem 3.10. A small telescope has an objective lens of focal length 140 cm and eye-piece of focal length 5·0 cm. What is the magnifying power of the telescope for viewing distant objects, when (*a*) the telescope is in normal adjustment and (*b*) the final image is formed at least distance of distinct vision ?

Sol. Here, $f_o = 140$ cm ; $f_e = 5{\cdot}0$ cm

(*a*) When telescope is in normal adjustment,

$$M = -\frac{f_o}{f_e} = -\frac{140{\cdot}0}{5{\cdot}0} = -28$$

(*b*) When image is formed at least distance of distinct vision, then

$$M = -\frac{f_o}{f_e}\left(1+\frac{f_e}{D}\right) = -\frac{140}{5\cdot0}\left(1+\frac{5\cdot0}{25}\right)$$

$$= -28 \times (1+0\cdot2) = -33\cdot6$$

Problem 3.11. A telescope objective of focal length 1 m forms a real image of the moon 0·92 cm in diameter. Calculate the diameter of the moon taking its mean distance from the earth to be 38 × 10⁴ km. If the telescope uses an eye piece of 5 cm focal length, what would be the distance between the two lenses for (*i*) the final image to be formed at infinity, (*ii*) the final image (virtual) at 25 cm from the eye.

(*I.S.C.E. 1997*)

Sol. Here, $f_o = 1$ m ; $f_e = 5$ cm $= 0\cdot05$ m

Size of the image of the the moon,

$$I = 0\cdot92 \text{ cm} = 0\cdot92 \times 10^{-2} \text{ m}$$

Mean distance of the moon from earth,

$$u_o = 38 \times 10^4 \text{ km} = 38 \times 10^{-7} \text{ m}$$

Let d be the diameter of the moon.

Refer to Fig. 3.05 or 3.06. Both moon and its image form the same angle *i.e.* α at the objective.

Angle subtended by moon at the objective, $\alpha = \frac{d}{u_o}$ ...(*i*)

and angle subtended by image of the moon at the objective,

$$\alpha = \frac{I}{f_o} \qquad \text{...}(ii)$$

From equations (*i*) and (*ii*), we have

$$\frac{d}{u_o} = \frac{I}{f_o}$$

or

$$d = \frac{I}{f_o} \times u_o = \frac{0\cdot92 \times 10^{-2}}{1} \times 38 \times 10^7$$

$$= 3{\cdot}496 \times 10^6 \text{ m} = \mathbf{3496\ km}$$

(*i*) When the final image is formed at infinity, then distance between the two lenses is equal to sum of their focal lengths *i.e.*

$$L = f_o + f_e = 1 + 0\cdot05 = 1\cdot05 \text{ cm} = \mathbf{105\ cm}$$

(*ii*) For the image formed by eye piece :

$$f_e = 5 \text{ cm} ;\ v = -D = -25 \text{ cm}$$

If u_e is the distance of the image of moon formed by objective from eye piece, then

$$-\frac{1}{u_e} + \frac{1}{v_e} = \frac{1}{f_e} \text{ or } \frac{1}{u_e} = \frac{1}{v_e} - \frac{1}{f_e} = \frac{1}{-25} - \frac{1}{5} = -\frac{6}{25}$$

or

$$u_e = -\frac{25}{6} = -4\cdot17 \text{ cm}$$

Therefore, distance between the two lenses,

$$L' = f_o + |\,u_e\,| = 100 + 4\cdot17 = \mathbf{104{\cdot}17\ cm}$$

Type D. On Reflecting type telescope

Problem 3.12. A reflecting type telescope has a concave reflector of radius of curvature 120 cm. Calculate the focal length of eye piece to secure a magnification of 20.

(*H.P.S.S.C.E. 1998*)

Sol. Here, M = –20 (magnifying power is negative),

Here, radius of curvature of concave reflector,

$$R = 120 \text{ cm}$$

Therefore, focal length of concave reflector,

$$f_o = \frac{R}{2} = -\frac{120}{2} = -60 \text{ cm}$$

Now, magnifying power, $M = \frac{f_o}{f_e}$

or

$$f_e = \frac{f_o}{M} = \frac{-60}{-20} = \mathbf{3\ cm}$$

Type E. On Light gathering power of a telescope

Problem 3.13. The lens of our eye has a diameter of 0·8 cm. How much fainter star can be seen through the 508 cm objective telescope at Mount Polomar in U.S.A. ?

Sol. Here, $d = 0\cdot8$ cm ; D = 508 cm

The brightness ratio, $B = \frac{D^2}{d^2} = \frac{(508)^2}{(0\cdot8)^2} = \mathbf{403225}$

The telescope can see a star 403225 times fainter than the faintest star that can be seen with naked eye.

TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 3.14. A compound microscope consists of an objective lens of focal length 2·0 cm and an eye-piece of focal length 6·25 cm separated by a distance of 15 cm. How far from the objective should an object be placed in order to obtain the final image at (*a*) least distance of distinct vision (25 cm) and (*b*) infinity ? (*Text Problem*)

Sol. Here, $f_o = 2\cdot0$ cm ; $f_e = 6\cdot25$ cm ;

(a) To obtain the final image at least distance of distinct vision : Refer to Fig. 3.03. If AB is the object, then final image A″B″ is formed at the distance of distinct vision D.

For eye lens : $-\frac{1}{u_e} + \frac{1}{v_e} = \frac{1}{f_e}$

Here, $v_e = -25$ cm ; $f_e = +6\cdot25$ cm

$$\therefore \quad -\frac{1}{u_e} + \frac{1}{-25} = \frac{1}{6\cdot25}$$

or

$$\frac{1}{u_e} = -\frac{1}{25} - \frac{4}{25} = -\frac{5}{25}$$

or

$$u_e = -5 \text{ cm}$$

For object lens : $-\frac{1}{u_o} + \frac{1}{v_o} = \frac{1}{f_o}$

Now, CC′ = 15 cm ;

$$v_o = CA' = CC' - (u_e) = 15 - |-5| = 10 \text{ cm} ;\ f_o = +2 \text{ cm}$$

$$\therefore \quad -\frac{1}{u_o} + \frac{1}{+10} = \frac{1}{+2}$$

or

$$\frac{1}{u_o} = \frac{1}{10} - \frac{1}{2} = -\frac{4}{10}$$

$$u_o = \mathbf{-2{\cdot}5\ cm}$$

(b) To obtain the final image at infinity : Final image will be formed at infinity, if the object lens forms the image of the object at the focus of eye lens, *i.e.* at a distance of 6·25 cm.

Therefore, $v_o = +(15 - 6{\cdot}25) = +8{\cdot}75$ cm

Now, $$-\frac{1}{u_o}+\frac{1}{v_o}=\frac{1}{f_o}$$

∴ $$-\frac{1}{u_o}+\frac{1}{+8{\cdot}75}=\frac{1}{2{\cdot}0}$$

or $$\frac{1}{u_o}=\frac{1}{8{\cdot}75}-\frac{1}{2{\cdot}0}=\frac{2-8{\cdot}75}{8{\cdot}75\times 2}$$

or $$u_o=-\frac{8{\cdot}75\times 2}{6{\cdot}75}=-2{\cdot}59\text{ cm}$$

Problem 3.15. A refracting telescope has an objective of focal length 1 m and an eye-piece of focal length 0 cm. A real image of the sun 10 cm in diameter is formed n a screen 24 cm from the eye-piece. What angle does the un subtend at the objective ? *(Text Problem)*

Sol. Here, $f_o = 1$ m = 100 cm ; $f_e = 20$ cm ; D = 24 cm ;

Refer to Fig. 3.05 : Final size of the image of the sun,

A′′B′′ = 10 cm

If A′B′ is the size of the image formed by object lens, then ngle formed by the sun at the objective is given by

$$\tan\alpha=\frac{A'B'}{f_o}$$

To find A′B′ : As shown in Fig. 3.04, A′B′ acts as object or eye-piece and its *virtual image* A′′B′′ is formed at a istance of 24 cm. Therefore,

$$\frac{A''B''}{A'B'}=1+\frac{D}{f_e}$$

or $$\frac{10}{A'B'}=1+\frac{24}{20}=\frac{44}{20}\quad\text{or}\quad A'B'=\frac{50}{11}\text{ cm}$$

∴ $$\tan\alpha=\frac{50}{11\times 100}=\frac{1}{22}=\mathbf{0{\cdot}0455\ radian}$$

Problem 3.16. (*a*) A giant refracting telescope at observatory has an objective lens of focal length 15 m. If an eye-piece of focal length 1·0 cm is used, what is the angular magnification of the telescope ?

(*b*) If this telescope is used to view the moon, what is the diameter of the image of the moon formed by the objective lens ? The diameter of the moon is 3·48 × 10⁶ m and the radius of the lunar orbit is 3·8 × 10⁸ m. *(Text Problem)*

Sol. Here, $f_o = 1$ m ; $f_e = 1{\cdot}0$ cm $= 0{\cdot}01$ m ;

(*a*) Angular magnification $= -\dfrac{f_o}{f_e}=\dfrac{-0{\cdot}5}{0{\cdot}01}=\mathbf{-1500}$

(*b*) Angle subtended by the moon,

$$\alpha=\frac{\text{diameter of moon}}{\text{radius of lunar orbit}}$$

or $$\alpha=\frac{3{\cdot}48\times10^6}{3{\cdot}8\times10^8}\qquad\text{...}(i)$$

Angle subtended by the image I of the moon as formed by the objective,

$$\alpha=\frac{\text{size of image}}{f_o}$$

or $$\alpha=\frac{I}{15}\qquad\text{...}(ii)$$

From equations (*i*) and (*ii*), we have

$$\frac{I}{15}=\frac{3{\cdot}48\times10^6}{3{\cdot}8\times10^8}$$

or $$I=\frac{3{\cdot}48\times15}{3{\cdot}8}\times10^{-2}=\mathbf{0{\cdot}137\ m}$$

FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 3.01. Which is the natural optical instrument ?

Ans. Eye is called the natural optical instrument. It is ecause, eye has the capability of automatic adjustment of perture and focussing.

Q. 3.02. What is range of vision for normal eye ?

Ans. Eye can see up to considerably large distance (infinite) without any physical strain. However, if the objects are held close to the eye, strain is felt. The value of least distance of distinct vision for a normal eye is 25 cm.

Q. 3.03. What should be the position of an object relative to a biconvex lens, so that it behaves like a magnifying lens ? *(C.B.S.E. 1990 S)*

Ans. Object should be placed between the optical centre and focus of the lens at such a point that its image is formed at least distance of distinct vision.

Q. 3.04. What is the magnification produced by a single convex lens used as simple microscope in normal use ? *(I.S.S.C.E. 1995)*

Ans. $M = 1+\dfrac{D}{f}$

Q. 3.05. Why do we prefer a magnifying glass of smaller focal length ?

Ans. For a magnifying glass, $M=\left(1+\dfrac{D}{f}\right)$

It will be large, if the focal length of the magnifying lens is small.

Q. 3.06. Name a few uses of magnifying glass.

Ans. Refer to section 3.01.

Q. 3.07. Define magnifying power of compound microscope. *(P.S.S.C.E. 2001)*

Ans. Refer to section 3.02.

Q. 3.08. Why must both the objective and the eye-piece of a compound microscope have short focal lengths ?

Ans. The magnifying power of a compound microscope is given by

$$M=-\frac{L}{f_o}\left(1+\frac{D}{f_e}\right),$$

where the letters have their usual meanings. Obviously, M will have a large value, if both f_e and f_o are small.

Q. 3.09. Two lenses of focal lengths 5 cm and 50 cm are to be used for making a telescope. Which will you use for the objective ? *(I.S.C.E. 1997)*

Ans. In a telescope, objective is a lens of large aperture and large focal length. Therefore, lens of larger focal length *i.e.* 50 cm will be used as objective.

Q. 3.10. What is normal adjustment ?

Ans. A telescope is said to be in normal adjustment, if the final image is formed at infinity.

Q. 3.11. What is the distance between object and eye lens, when the telescope is on normal adjustment ?

Ans. Length of the telescope in normal adjustment

$$= f_o + f_e$$

Q. 3.12. Express the angular magnification of an astronomical telescope in terms of the focal lengths of the objective and the eye-piece. *(I.S.C.E. 1994)*

Ans. $M = -\frac{f_o}{f_e}$ (when final image is formed at ∞)

and $M = -\frac{f_o}{f_e}\left(1 + \frac{f_e}{D}\right)$

(when final image is formed at D)

Q. 3.13. How does magnifying power of a telescope change on decreasing the aperture of its objective lens ? Justify your answer. *(C.B.S.E. 1998)*

Ans. Magnifying power of the telescope is independen of the aperture of the objective lens.

Q. 3.14. If a telescope is inverted, will it serve as a microscope ?

Ans. No.

Q. 3.15. What is a prism binoculars ?

Ans. A prism binoculars basically consists of a pair o astronomical telescopes with relatively quite small length o the telescope tubes in comparison to that of an ordinary telescope. The use of prisms cuts short the length of the telescope tubes.

Q. 3.16. Telescope lens usually has large aperture. Why ?

Ans. The object lens of a large aperture in a telescope provides greater resolving power and produces a bright image due to greater light gathering.

FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 3.01. Draw a labelled diagram showing course of rays for a simple microscope. *(H.P.S.S.C.E. 1998 S)*

Or

Draw a neat labelled diagram for a simple microscope or magnifying glass. *(I.S.C.E. 1996)*

Ans. Refer to Fig. 3.01.

Q. 3.02. Using a ray diagram, show the image formation by a simple microscope. What is the nature of the image formed ? *(C.B.S.E. 1990 S)*

Ans. Refer to Fig. 3.01.

The image formed is virtual in nature.

Q. 3.03. An object is first seen in red light and then in violet light through a simple microscope. In which case is the magnifying power of simple microscope greater ? *(C.B.S.E. 1999 S)*

Ans. The magnifying power of the simple microscope will be greater, when the object is seen in violet light.

For details, refer to conceptual SAQ 3.05 (*a*).

Q. 3.04. Draw a ray diagram to show how an image is formed by a compound microscope.

(C.B.S.E. 2002, 1998, 1997)

Or

Draw the ray diagram of a compound micro-scope.

(H.P.S.S.C.E. 2001 ; P.S.S.C.E. 1999 S ; H.S.S.C.E. 2001, 1998 S)

Or

Draw a labelled ray diagram showing formation of image in a compound microscope.

(C.B.S.E. 2001, 1999, 1992 S, 1990 ; H.P.S.S.C.E. 1995)

Ans. Refer to Fig. 3.03.

Q. 3.05. Show the working of a compound microscope with the help of a ray diagram. *(P.S.S.C.E. 1998 S)*

Ans. Refer to Fig. 3.03.

Q. 3.06. Draw a labelled ray diagram showing the formation of image in a compound microscope. Also define the magnifying power of compound microscope. *(P.S.S.C.E. 2001)*

Ans. Ray diagram. Refer to fig. 3.03.

Magnifying power. Refer to section 3.02.

Q. 3.07. Draw a labelled ray diagram to show the formation of image of an object in a compound microscope. Write the expression for its magnifying power. *(C.B.S.E. 1998 S)*

Ans. For ray diagram, refer to Fig. 3.03.

Magnifying power, $M = -\frac{L}{f_o}\left(1 + \frac{D}{f_e}\right)$,

where the letters have their usual meanings.

Q. 3.08. Draw a labelled ray diagram showing the formation of image of a distant object using an astronomical telescope in the normal adjustment.

(H.S.S.C.E. 2001 ; C.B.S.E. 2000)

Or

Draw a ray diagram to show formation of image by a refracting type astronomical telescope.

(C.B.S.E. 2002, 1999, 1998, 1997, 1996 ; H.S.S.C.E. 1997 S)

Ans. Refer to Fig. 3.04 or 3.05.

Q. 3.09. Draw a ray diagram showing how the final image of a distant object is formed using an astronomical telescope in the near point position. *(C.B.S.E. 2001)*

Ans. Refer to Fig. 3.05.

Q. 3.10. Draw the course of rays in an astronomical telescope, when the final image is formed at infnity. Also define the magnifying power of the astronomical telescope in this position. *(P.S.S.C.E. 2001)*

Ans. Course of rays. Refer to Fig. 3.04

Magnifying power. Refer to section 3.04 (*a*).

Q. 3.11. Draw the course of rays in an astronomical telescope, when the final image is formed at the least distance of distinct vision. Also define the magnifying power of the telescope in this position. *(P.S.S.C.E. 2001)*

Ans. Course of rays. Refer to Fig. 3.05

Magnifying power. Refer to section 3.04 (*b*).

Q. 3.12. Draw the diagram of an astronomical telescope, when the final image is formed at the distance of distinct vision. Write the formula for magnifying power in the above noted case. *(H.S.S.C.E. 1995)*

Ans. Refer to Fig. 3.05.

Magnifying power, $M = -\frac{f_o}{f_e}\left(1 + \frac{f_e}{D}\right)$

Q. 3.13. Draw a ray diagram to illustrate image formation by a Newtonian type reflecting telescope. *(C.B.S.E. 2001, 2000, 1999)*

Or

Draw a neat labelled ray diagram for a simple astronomical telescope using a reflector. *(I.S.C.E. 1994)*

Ans. Refer to Fig. 3.06.

Q. 3.14. List some advantages of a reflecting telescope.

Ans. Advantages. 1. The image formed is free from chromatic aberration.

2. The spherical aberration can also be minimised by using a parabolic mirror as objective.

3. The image formed is very bright due to its large light gathering power. As such, it enables us to see even very faint stars.

Q. 3.15. Distinguish between magnifying power and resolving power of a telescope. *(C.B.S.E. 1992 S)*

Ans. Refer to sections 3.06.

Q. 3.16. On what factors does (*i*) magnifying power and (*ii*) resolving power of a compound microscope depend ? *(C.B.S.E. 1998)*

Ans. (*i*) Magnifying power, $M = -\frac{L}{f_o}\left(1 + \frac{D}{f_e}\right)$

Therefore, magnifying power of a compound microscope depends upon the focal lengths of the objective and eye piece of the microscope.

(*ii*) Resolving power $= \frac{2\mu \sin \theta}{\lambda}$

Therefore, resolving power of a microscope depends upon the wavelength of light used to illuminate the object, refractive index of the glass forming the objective, and the semi-vertical angle of the cone, in which the rays from the object enter the objective.

Q. 3.17. On what factors does (*i*) magnifying power and (*ii*) resolving power of a refracting type astronomical telescope depend ? *(C.B.S.E. 1998)*

Ans. (*i*) Magnifying power, $M = -\frac{f_o}{f_e}$

Therefore, magnifying power of a telescope depends upon the focal lengths of the objective and the eye-piece of the telescope.

(*ii*) Resolving power $= \frac{D}{1 \cdot 22\, \lambda}$

Therefore, resolving power of a telescope depends upon the wavelength of light in which the object is seen and the diameter (aperture) of the objective.

Q. 3.18. How will the magnifying power of a refracting type astronomical telescope be affected on increasing for its eye piece (*i*) the focal length, and (*ii*) the aperture ? Justify your answer. *(C.B.S.E. 1997)*

Ans. (*i*) Refer to SAQ 3.17. Since $M \propto \frac{1}{f_e}$, the magnifying power of the telescope will decrease on increasing the focal length of the eye piece.

(*ii*) The resolving power of the telescope depends on the aperture of its objective. It does not depend on the aperture of the eye-piece.

Q. 3.19. What do you mean by light gathering power of a telescope ?

Ans. Refer to section 3.06.

abc TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 3.01. What for are the optical instruments used ?

Ans. The optical instruments are used (*i*) to produce the image of the close lying objects at the least distance of distinct vision, (*ii*) to increase visual angle and hence to produce magnification and (*iii*) to improve the resolving power of the eye.

Q. 3.02. The angle subtended at the eye by an object is equal to the angle subtended at the eye by the virtual image produced by a magnifying glass. In what sense, then, does a magnifying glass provide angular magnification ? *(Text Question)*

Ans. It is true that the angle subtended at the eye by an object is equal to the angle subtended at the eye by the virtual image produced by a magnifying glass. The angular magnification produced by the magnifying glass lies in the fact as follows :

In case the magnifying glass is not used, the object to be seen has to be placed at a distance of 25 cm, whereas the magnifying glass allows us to place the object much closer to eye. Obviously, the angle formed by the object at the eye, when it is placed closer to eye will be much larger than the angle formed by it when placed at a distance of 25 cm from it. It is in this sense that a magnifying lens produces angular magnification.

Q. 3.03. When observed from the earth, the angular diameter of the solar disc is 32′. Determine the diameter of the image of the sun formed by a convex lens of focal length 25 cm.

Ans. Here, $f = 25$ cm

and angular diameter of the sun,

$$\theta = 32' = \frac{\pi}{180} \times \frac{32}{60} \text{ rad}$$

The image of solar disc will be formed in the focal plane of the lens [Fig. 3.11]. The diameter (D) of the image of solar disc will subtend at the optical centre of the lens an angle equal to the angular diameter of the sun. Therefore,

$$D = f\,\theta = 25 \times \frac{\pi}{180} \times \frac{32}{60}$$

$$= 0 \cdot 233 \text{ cm}$$

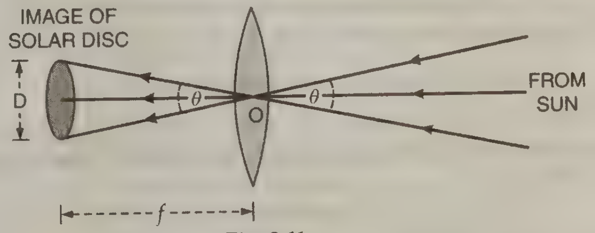

Fig. 3.11

Q. 3.04. In viewing through a magnifying glass, one usually positions one's eye very close to the lens. Does angular magnification change, if the eye is moved back ? *(Text Question)*

Ans. Refer to Fig. 3.01. While viewing through a magnifying glass, the eye has to be placed very close to the lens. It is essential, otherwise the angle subtended at the eye by the object and its virtual image will not be equal.

If the eye is moved back, the angular magnification decreases a little. It is because, now the angle subtended at the eye by the image is less than that subtended by the image at the lens. (The angle subtended by the object at the eye is also less than that subtended at the lens, but the difference is very small).

Q. 3.05. Microscopes in which object is illuminated by ultraviolet light can give higher magnifications than the microscopes that use visible light.

(*a*) How do you explain this ?

(*b*) How are the images seen, if no visible light is used ?

(*c*) Since glass is opaque to ultraviolet light, how can such a microscope be made ?

Ans. (*a*) The magnification produced by a microscope,

$$M = -\frac{L}{f_o}\left(1+\frac{D}{f_e}\right)$$

Focal length of a lens decreases with decrease of wavelength. Since wavelength of ultraviolet light is less than that of visible light, the focal lengths of the object and the eye lenses will be lesser, when ultraviolet light is used. Hence, magnification produced by the microscope will increase on using ultraviolet light.

(*b*) In a microscope using ultraviolet light, the images are produced on a fluorescent screen or on a photographic plate.

(*c*) The lenses used in the microscope must be transparent to the ultraviolet light. Quartz is transparent down to 2100 Å, while fluorite down to about 1200 Å. However, air absorbs electromagnetic waves strongly, whose wavelength is below 1800 Å. Therefore, lenses made of quartz or fluorite may be used in ultraviolet light of wavelength above 1800 Å.

Q. 3.06. What is difference between magnification and angular magnification produced by a lens ?

Ans. The magnification produced by a lens is the ratio of the size of the image to the size of the object. It can be easily seen that it is also equal to the ratio of the distance of the image from the lens to the distance of the object from the lens. Thus,

magnification produced, $m = \frac{v}{u}$

On the other hand, angular magnification produced by a lens is defined as the ratio of the angle subtended by image at the eye to the angle subtended by object seen directly, when both lie at the least distance of distinct vision. It is also called ***magnifying power*** of the lens. It can be easily verified that

angular magnification produced $= \frac{D}{u}$,

where D is least distance of distinct vision. It follows that magnification becomes equal to the angular magnification, when

$$v = D$$

Q. 3.07. Magnifying power of a microscope is inversely proportional to the focal length of the lens. What then stops us from using a convex lens of smaller and smaller focal length and achieving greater and greater magnifying power ? *(Text Question)*

Ans. A lens of short focal length is not easy to manufacture. Further, a lens of short focal length would be quite thick at centre and such a lens (due to its prismatic action) disperses the white light and a multicoloured image is formed. This defect in a lens is called chromatic aberration.

In practice, an ordinary convex lens can be used to produce a magnifying power of 3 or so. However, by designing an achromat (a combination of two lenses having no chromatic aberration), one may get a magnifying power of 10 or so.

Q. 3.08. When viewing through a compound microscope, our eye should be positioned not on the eye-piece but a short distance away from it for best viewing. Why ? How much should be that short distance between the eye and eye-piece ? *(Text Question)*

Ans. The eye-piece produces the image of the object lens itself. This image is called 'eye ring'. An important point about the eye ring is that all the rays from the object and refracted from the object lens pass through it. The eye would receive all the rays from object, if it is placed at the position of the eye ring, provided area of the pupil of the eye is greater than or atleast equal to the area of the eye ring. In case eye is placed close to the eye-piece, then it would not collect all the rays from the object. Moreover, the field of view will be reduced.

Q. 3.09. Why is a reflecting type telescope preferred in astronomy ?

Ans. A lens of large aperture and at the same time free from lens-aberrations cannot be manufactured. Therefore, the lens used cannot be of very large aperture. Obviously, light gathering power of such a telescope will be very low and hence it will not enable us to see faint stars.

The spherical aberration can be eliminated by making use of a parabolic mirror. Since mirrors of large apertures can be easily designed, reflecting type telescope will have large light gathering power.

Q. 3.10. A convex and concave lens having focal lengths of 30 cm and 10 cm respectively are placed at a distance 20 cm from each other. Where should a source of light be placed so that the system of the two lenses will produce a beam of parallel rays ?

Ans. Suppose that convex lens L_1 (f_1 = 30 cm) and concave lens L_2 (f_2 = 10 cm) are placed at a distance 20 cm apart as shown in Fig. 3.12.

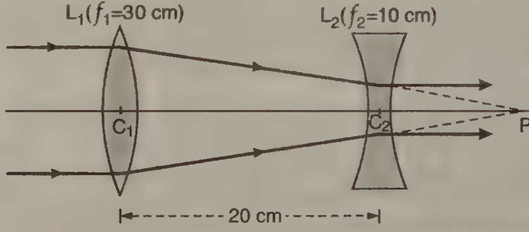

Fig. 3.12

Suppose that the beam of light after falling on thre convex lens converges at point P.

As the beam of light is rendered parallel by the concave lens,point P is focus of the concave lens.

$\therefore \quad C_1P = C_1C_2 + C_2P$

$= 20 + 10 = 30$ cm

Since focal length of the convex lens is also 30 cm, the point P is focus of convex lens. Thus, the beam of light after falling on the convex lens is coverging at its focus. Hence, a parallel beam of light is falling on the vovex lens, which requires that the source of light must be situated at infinity.

Q. 3.11. What is the special point about prism binoculars, though it is a pair of astronomical telescopes ?

Ans. An astronomical telescope will have large magnifying power, only if it makes use of an object lens of large focal length. In that case, the length of the telescope will become very large. Moreover, in a telescope, image formed is laterally inverted.

Prism binoculars is an arrangement, which not only cuts short the length of the tube, but produces an erect and highly magnified image without any lateral inversion.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Explain, how a convex lens held close to an eye may be used as a simple microscope and calculate the magni-fication obtained.
2. Explain the working of a simple microscope and find an expression for its magnifying power. *(H.S.S.C.E. 2002)*
3. Describe a simple microscope and prove that smaller the focal length of the lens forming a simple microscope, greater is its magnifying power.
4. Derive an expression for the angular magnification of a simple microscope. *(H.P.S.S.C.E. 1999 ; I.S.C.E. 1996)*
5. Explain the working of a simple microscope and show that its magnification m is given by $m = 1 + \frac{D}{f}$, where f = focal length and D = distance of distinct vision.*(C.B.S.E. 1992)*
6. Draw a ray diagram to show image formation in a compound microscope. Find an expression for its magnifying power. *(H.S.S.C.E. 2002)*
7. Derive a relation for the magnifying power of a compound microscope. *(P.S.S.C.E. 1997)*
8. Define magnifying power of a compound microscope and derive a relation for it. *(P.S.S.C.E. 1996 S)*
9. Draw a ray diagram to show image formation in an astronomical telescope. Find an expression for its magnifying power. *(H.S.S.C.E. 2002)*
10. Define magnifying power of an astronomical telescope and derive a general relation for it. *(H.S.S.C.E. 1999 S ; P.S.S.C.E. 1996)*
11. Draw a labelled diagram of an astronomical telescope forming the final image at the near point. Write down the formula for its magnifying power. *(C.B.S.E. 1993)*
12. Draw a ray diagram to show image formation by a Newtonian reflecting telescope. Give its two advantages. *(H.S.S.C.E. 2002)*
13. Give the construction and working of a reflecting type telescope. Also trace the course of rays through such a telescope. What are the advantages of the reflecting type telescope over the others ?
14. Draw a labelled ray diagram for a reflecting type telescope. Write four advantages of a reflecting type telescope over a refracting type telescope. On what factors does its resolving power depend ? *(C.B.S.E. 1998, 1997)*
15. Bring out the difference between a refracting and a reflecting type telescope.
16. Describe the working of a prism binocular with a suitable diagram. Discuss its advantages over an ordinary astronomical telescope.

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. With the help of a ray diagram, explain the working principle of a compound microscope. *(P.S.S.C.E. 1996 ; C.B.S.E. 1993)*
2. Draw a ray diagram showing the image formation in a compound microscope. Find an expression for its magnifying power. *(H.S.S.C.E. 1998)*
3. With the help of ray diagram, illustrate the formation of the final image of an object in a compound microscope. Derive an expression for its magnifying power. *(P.S.S.C.E. 1999, 1998 S ; H.S.S.C.E. 1998 ; H.P.S.S.C.E. 1996)*
4. Draw the course of rays through a compound microscope. Obtain an expression for the magnifying power of a microscope. *(H.S.S.C.E. 2002 ; H.P.S.S.C.E. 2002)*
5. You are given two convex lenses of short aperture having focal lengths 4 cm and 8 cm respectively. Which one of these will you use as an objective and which one as an eye piece for constructing a compound microscope ? Draw a ray diagram to show the formation of the image of a small object due to a compound microscope. Derive an expression for its magnifying power. *(C.B.S.E. 2001 S)*
6. Explain the construction and working of a compound microscope. Derive an expression for its magnifying power. *(P.S.S.C.E. 2002, 2000)*
7. Draw a labelled diagram to illustrate the action of a compound microscope in normal use. Define angular magnification and use it to find the magnification, when the final image is formed at the least distance of distinct vision. *(I.S.C.E. 1995)*
8. Define (*i*) magnifying and (*ii*) resolving power of a telescope. Find the magnifying power of a microscope, when final image is formed at the distance of distinct vision. *(H.S.S.C.E. 1995)*
9. Explain the construction and working of an astronomical telescope. Derive the expression for its magnifying power in normal adjustment. *(P.S.S.C.E. 2000)*
10. Describe construction and working of an astronomical telescope. Calculate its magnifying power, when the image is formed at the least distance of distinct vision. *(H.S.S.C.E. 1996)*
11. What is an astronomical telescope ? Give its ray diagram. Find out the expression for its magnifying power, when the final image is formed at the least distance of distinct vision. *(H.P.S.S.C.E. 1999 S)*
12. Draw the course of rays in an astronomical telescope and find a relation for its magnifying power, when the final image is formed at distance of distinct vision. *(P.S.S.C.E. 1994, 1992)*

13. Draw a neat labelled ray diagram to show how the image of a distant object is formed by an astronomical refracting telescope in normal adjustment. Obtain an expression for its magnifying power. *(C.B.S.E. 1999 ; I.S.C.E. 1994)*
14. You are given two convex lenses of focal lengths 80 mm and 800 mm. Which one will you use as an objective and which one as an eye-piece for constructing an astronomical telescope ? Trace the course of rays through the two lenses to show the formation of final image of a distant object. Derive an expression for the magnifying power of the telescope for normal adjustment. *(C.B.S.E. 1995)*
15. Draw a labelled diagram of a telescope and explain its working. Give an expression for its magnifying power. *(C.B.S.E. 1992)*
16. Calculate the magnifying power of compound microscope and astronomical telescope. *(H.P.S.S.C.E. 1993)*

FREQUENTLY ASKED NUMERICAL QUESTIONS

For Practice

Type A. On Simple Microscope

1. A converging lens of power 25 D is used as a simple microscope. Calculate the magnifying power, if the distance of distinct vision is 25 cm. [**Ans.** 7·25]
2. A figure divided into squares each of size 1 mm^2 is being viewed at a distance of 9 cm through a magnifying glass of focal length 10 cm. At what distance should the lens be held from the figure, so that the virtual image of each square in the figure is to have an area of 6·25 mm^2 ? Will you be able to see squares distinctly with your eye very close to the magnifier ? *(Text Problem)* [**Ans.**– 6 cm, No]
3. A man with normal near point (25 cm) reads a book with small print using a magnifying glass – thin convex lens of focal length 5 cm. *(a)* What are the closest and the farthest distances at which he can read the book when viewing through the magnifying glass ? *(b)* What is the maximum and minimum angular magnifications possible using the above magnifying glass ? [**Ans.** *(a)* 4·17 cm, 5 cm *(b)* 6, 5]

Type B. On Compound Microscope

4. The focal lengths of the objective and eye-piece of a compound microscope are 4 cm and 6 cm respectively. If an object is placed at a distance of 6 cm from the objective, find the distance between the objective and the eye-piece. Distance of distinct vision is 25 cm. [**Ans.** 16·84 cm]
5. The total magnification produced by a compound microscope is 20, while that produced by the eye-piece alone is 5. When the microscope is focussed on a certain object, the distance between objective and eye-piece is 14 cm. Find the focal length of objective and eye-piece, if distance of distinct vision is 20 cm. [**Ans.** 2 cm, 5 cm]
6. An angular magnification of 30 X is desired using an objective of focal length 1·25 cm and an eye-piece of focal length 5 cm. How will you set up the compound microscope ? [**Ans.** Placing two lenses 11·67 cm apart and object at a distance of 1·5 cm from objective]

Type C. On Astronomical Telescope

7. In a simple form of an astronomical telescope, the focal length of the objective lens is 75 cm and that of eye-piece 5 cm. Calculate the magnifying power and the distance between the two lenses, when the final image of the distant object is seen at a distance of 25 cm from the eye. [**Ans.** – 18, 79·17]
8. The magnifying power of an astronomical telescope is 5. When it is set for normal adjustment, the distance between the two lenses is 24 cm. Calculate the focal length of its eye-piece and that of its objective. [**Ans.** 4 cm ; 20 cm]
9. A telescope has an objective lens of focal length 140 cm and an eye-piece of focal length 5 cm. If this telescope is used to view a 100 m tall tower 3 km away, what is the height of the image of the tower formed by the objective lens ? Also calculate the height of the final image of the tower, if it is formed at 25 cm. [**Ans.** 4·67 cm, 28 cm]

Type D. On Reflecting type Telescope

10. A reflecting type telescope has a large spherical mirror for its objective with radius of curvature equal to 80 cm. What is the magnifying power of telescope, if eye-piece used has a focal length of 1·6 cm. *(Text Problem)* [**Ans.** – 25]

Type E. On Light gathering power of a Telescope

11. The objective of telescope A has a diameter 3 times that of the objective of telescope B. How much greater amount of light is gathered by A as compared to B ? [**Ans.** 9]
12. The lens of our eye has a diameter of 8 mm. How much fainter objects can be seen through a telescope of 120 cm aperture as compared to the faintest naked eye star ? [**Ans.** 22500]

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. $f=\frac{1}{P}=\frac{1}{25}=0\cdot04\,\text{m}=4\,\text{cm}$

   Now, $m=1+\frac{D}{f}=1+\frac{25}{4}=7\cdot25$

2. Linear magnification, $m=\sqrt{\frac{6\cdot25}{1}}=2\cdot5$

   Now, $m=\frac{f}{u+f}$ or $2\cdot5=\frac{10}{u+10}$ or $u=-6$ **cm**

   Also, $-\frac{1}{u}+\frac{1}{v}=\frac{1}{f}$ or $-\frac{1}{6}+\frac{1}{v}=\frac{1}{10}$

   or $v=-15$ cm

   The image will be found at 15 cm from the lens. Since least distance of distinct vision is 25 cm, the squares will **not be seen distinctly**, when eye is held close to the magnifier.

3. ***(a) The closest distance (u) of book from the*** magnifying lens corresponds to the position, when image is formed at distance of distinct vision.

   From the relation : $-\frac{1}{u}+\frac{1}{v}=\frac{1}{f}$, we have

   $-\frac{1}{u}+\frac{1}{-25}=\frac{1}{5}$ or $u=-4\cdot17$ **cm**

   The farthest distance (u') of the book from the magnifying lens corresponds to the position, when image is formed at infinity.

   From the relation : $-\frac{1}{u}+\frac{1}{v}=\frac{1}{f}$, we have

   $-\frac{1}{u'}+\frac{1}{\infty}=\frac{1}{5}$ or $u'=-5$ **cm**

   (b) Angular magnification $=\frac{D}{u}$

   Thus, maximum angular magnification $=\frac{25}{4\cdot17}=\mathbf{6}$

   and minimum angular magnification $=\frac{25}{5}=\mathbf{5}$

4. Refer to Fig. 3.03. The distance between objective and eye-piece,

$$L = v_o + |u_e| \qquad ...(i)$$

To find v_0:

$u_o = -6$ cm, $f_o = 4$ cm

Now, $-\frac{1}{u_o} + \frac{1}{v_o} = \frac{1}{f_o}$ or $-\frac{1}{-6} + \frac{1}{v_o} = \frac{1}{4}$

or $v_o = 12$ cm

To find u_e: $v_e = -25$ cm, $f_e = 6$ cm

Now, $-\frac{1}{u_e} + \frac{1}{v_e} = \frac{1}{f_e}$ or $-\frac{1}{u_e} + \frac{1}{-25} = \frac{1}{6}$

or $u_e = -4.84$ cm

From equation (*i*), we have

$L = 12 + 4.84 = \mathbf{16.84\ cm}$

5. Magnification produced by a compound microscope,

$$M = \frac{v_o}{u_o}\left(1 + \frac{D}{f_e}\right)$$

Here, $M = -20$ (final image is inverted)
and $m_e = 5$ (magnification produced by eye-piece)
Therefore, magnification produced by objective,

$$m_o = \frac{M}{m_e} = -\frac{20}{5} = -4$$

Now, $m_e = 1 + \frac{D}{f_e}$ or $5 = 1 + \frac{20}{f_e}$ or $f_e = \mathbf{5\ cm}$

Also, $m_e = \frac{f_e}{u_e + f_e}$ or $5 = \frac{5}{u_e + 5}$ or $u_e = -4$ cm

Refer to Fig. 3.03, The distance between objective and eye-piece,

$v_o + |u_e| = 14$ or $v_o + 4 = 14$ or $v_o = 10$ cm

Now, magnification produced by objective,

$$m_o = \frac{v_o}{u_o}$$

or $-4 = \frac{10}{u_o}$ or $u_o = -2.5$ cm

Also, $-\frac{1}{u_o} + \frac{1}{v_o} = \frac{1}{f_o}$ or $-\frac{1}{2.5} + \frac{1}{10} = \frac{1}{f_o}$

or $f_o = \mathbf{2\ cm}$

6. Here, $M = -30$, $f_o = 1.25$ cm $f_e = 5$ cm
Magnification produced by eye-piece,

$$m_e = 1 + \frac{D}{f_e} = 1 + \frac{25}{5} = 6$$

Also, $m_e = \frac{f_e}{u_e + f_e}$ or $6 = \frac{5}{u_e + 5}$

or $u_e = -4.17$ cm

Magnification produced by objective,

$$m_o = \frac{M}{m_e} = \frac{-30}{6} = -5$$

Now, $m_o = \frac{f_o}{u_o + f_o}$ or $-5 = \frac{1.25}{u_o + 1.25}$

or $u_o = \mathbf{-1.5\ cm}$

Also, $m_o = \frac{f_o - v_o}{f_o}$ or $-5 = \frac{1.25 - v_o}{1.25}$

or $v_o = 7.5$ cm

Refer to Fig. 3.03. The distance between objective and eye-piece,

$L = v_o = |u_e| = 7.5 + 4.17 = \mathbf{11.67\ cm}$

Therefore, objective and eye-piece should be placed at 11·67 cm apart and object at a distance of 1·5 cm from the objective.

7. Here, $f_o = 75$ cm, $f_e = 5$ cm

Now, $M = -\frac{f_o}{f_e}\left(1 + \frac{f_e}{D}\right) = -\frac{75}{5}\left(1 + \frac{5}{25}\right) = \mathbf{-18}$

Refer to Fig. 3.05. The distance between the objective and eye-piece,

$$L = f_o + |u_e|$$

Now, $-\frac{1}{u_e} + \frac{1}{v_e} = \frac{1}{f_e}$ or $-\frac{1}{u_e} + \frac{1}{-25} = \frac{1}{5}$

or $u_e = -4.17$ cm

$\therefore$ $L = 75 + 4.17 = \mathbf{79.17\ cm}$

8. Magnification produced by a telescope in normal adjustment,

$$M = -\frac{f_o}{f_e} \quad \text{or} \quad -5 = -\frac{f_o}{f_e}$$

or $f_o = 5 f_e$

Also, distance between two lenses (when telescope is in normal adjustment),

$L = f_o + f_e$ or $24 = f_o + f_e$

or $24 = 5 f_e + f_e$ or $f_e = \mathbf{4\ cm}$

Also, $f_o = 5 \times 4 = \mathbf{20\ cm}$

9. Here, $f_o = 140$ cm, $f_e = 5$ cm
Let α be angle formed by the object at the objective lens. Then,

$$\tan\alpha = \frac{\text{height of the object}}{\text{distance of the object}} = \frac{100}{3 \times 100} = \frac{1}{30}$$

Refer to Fig. 3.05. Let A′B′ be the height of image produced by objective lens. The image is formed at the focus of objective lens and the angle formed by it at the objective lens is also equal to α. Therefore,

$$\tan\alpha = \frac{A'B'}{f_o}$$

or $\tan\alpha = \frac{A'B'}{140}$ ...(*ii*)

From equations (*i*) and (*ii*), we have

$\frac{A'B'}{140} = \frac{1}{30}$ or $A'B' = \frac{140}{30} = \mathbf{4.67\ cm}$

Magnification produced by eye-piece,

$$m_e = 1 + \frac{D}{f_e} = 1 + \frac{25}{5} = 6$$

Therefore, height of final image of the tower,

$A''B'' = m_e \times A'B' = 6 \times 4.67 = \mathbf{28.0\ cm}$

10. Proceed as in solved problem 3.12.

11. $\frac{\text{Light gathered by telescope A}}{\text{Light gathered by telescope B}}$

$$= \left(\frac{\text{diameter of the objective of telescope of A}}{\text{diameter of the objective of telescope of B}}\right)^2$$

$= (3)^2 = \mathbf{9}$

12. Here, $d = 8$ mm $= 0.8$ cm, $D = 120$ cm
The brightness ratio,

$$B = \frac{D^2}{d^2} = \frac{(120)^2}{(0.8)^2} = \mathbf{22{,}500}$$

CHAPTER
4

Huygen's Principle

4.01. WAVEFRONT

According to wave theory of light, a source of light sends out disturbance in all directions. In a homogeneous medium, the disturbance reaches all those particles of the medium in phase, which are located at the same distance from the source of light and hence at any instant, all such particles must be vibrating in phase with each other.

The locus of all the particles of the medium, which at any instant are vibrating in the same phase, is called the ***wavefront****.*

Key point

A spherical wavefront is produced by point source, while a cylindrical wavefron by a line source of light. The plan wavefront is produced, when the source light is situated far-off *i.e.* at infinity.

Depending upon the shape of the source of light, wavefront can be of the following types :

1. Spherical wavefront. A spherical wavefront is produced by a point source of light. It is because, the locus of all such points, which are equidistant from the point source, is a sphere [Fig. 4.01 (*a*)].

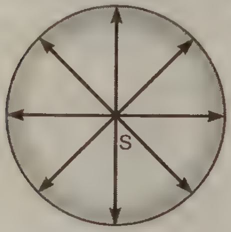

Fig. 4.01 (*a*)

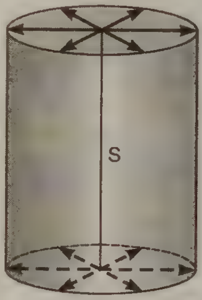

Fig. 4.01 (*b*)

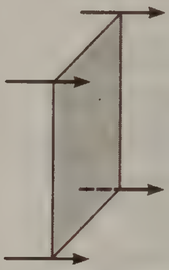

Fig. 4.01 (*c*)

Key point

A ray of light is always normal to th wavefront.

2. Cylindrical wavefront. When the source of light is linear in shape (such as a slit), a cylindrical wavefront is produced. It is because, all the points, which are equidistant from the linear source, lie on the surface of a cylinder [Fig. 4.01 (*b*)].

3. Plane wavefront. A small part of a spherical or a cylindrical wavefront originating from a distant source will appear plane and hence it is called a plane wavefront Fig. 4.01 (*c*).

Ray of light. *An arrow drawn normal to the wavefront and pointing in the direction of propagation of disturbance represents a ray of light.* A ray of light is the path along which light travels. In Fig. 4.01, thick arrows represent the rays of light.

Figs. 4.02 (*a*), 4.02 (*b*) and 4.02 (*c*) represent the wavefronts of a parallel beam, a converging beam and a diverging beam respectively. The wavefront representing a parallel beam is a plane wavefront, while the wavefront representing a converging or a diverging beam of light is spherical in shape.

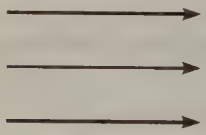

Fig. 4.02 (*a*)

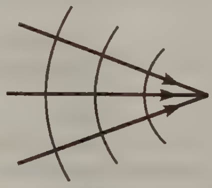

Fig. 4.02 (*b*)

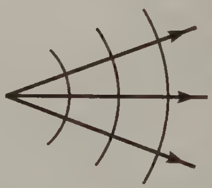

Fig. 4.02 (*c*)

4.02. HUYGENS' PRINCIPLE

Huygens' principle is a geometrical construction, which is used to determine the new position of a wavefront at a later time from its given position at any instant.

In other words, the principle gives a method to know as to how light spreads out in the medium.

Key point

Huygens' principle is simply a geometrical construction to find the position of wavefront at a later time.

Huygens' principle is based on the following assumptions :

1. *Each point on the given or primary wavefront acts as a source of secondary wavelets, sending out disturbance in all directions in a similar manner as the original source of light does.*

2. *The new position of the wavefront at any instant (called secondary wavefront) is the envelope of the secondary wavelets at that instant.*

The above two assumptions are known as ***Huygens' principle*** or ***Huygens' construction.***

Explanation. Consider a point source of light. Let AB be a section of primary spherical wavefront at any time t. In order to find the new position of wavefront at time $t + \Delta t$, consider a number of points a, b, c, d, ... on the primary wavefront [Fig. 4.03]. These points act as the sources of secondary wavelets. In time Δt, light travels a distance $c\,\Delta t$. Taking points a, b, c, d, ... as the centres, draw spheres[*] each of radius $c\,\Delta t$. These spheres are called secondary wavelets originating from points on primary wavefront. Further, draw the envelope of the secondary wavelets. Parts A′B′ and A″B″ of the envelope are termed as forward secondary wavefront and backward secondary wavefront respectively. It may be pointed out that the effective part of the secondary wavelets is the portion which lies on the forward secondary wavefront. Huygens assumed that the portion of the secondary wavelets, which lies on the backward secondary wavefront, does not exist at all. However, many years later, Voigt and Kirchhoff mathematically proved that the contribution of a wavelet in any direction making angle θ with the normal to the wavelet is proportional to $\frac{1}{2}(1+\cos\theta)$. Obviously, for the portion of the wavelet, which lies just on the back of the secondary wave-front, θ is equal to 180° and likewise the factor $\frac{1}{2}(1+\cos\theta)$ is equal to zero. Therefore, the forward secondary wavefront A′B′ is the new position of the wavefront at time $t + \Delta t$.

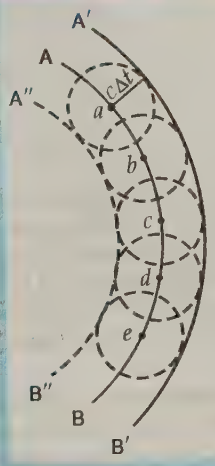

Fig. 4.03

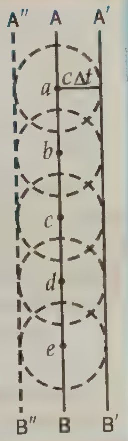

Fig. 4.04

Key point

The effective part of the second wavelets is the front portion of seconda wavefront. The countribution of wavelets on the back of the secondary wavefront is zero.

The same procedure is adopted for finding the new position of a cylindrical or a plane wavefront. In Fig. 4.04, AB represents the primary plane wavefront, while A′B′ represents the new position of wavefront at a time Δt later.

4.03. LAWS OF REFLECTION ON WAVE THEORY

Let XY be a reflecting surface and PA be a plane wavefront just incident on the surface. The normals LA and MP to the wavefront represent incident rays. If AN is normal to the reflecting surface at A, then $\angle$ NAL = i is angle of incidence [Fig. 4.05]. First of all, the plane wavefront[**] reaches point A on the reflecting surface. The wavefront will reach points between A and P′ later in time but in this order, so that it will reach point P′ in the last. When the disturbance from point P just reaches point P′ on the reflecting surface, the secondary wavelet from point A on the reflecting surface will grow into a sphere of radius say AA′, such that AA′ = PP′.

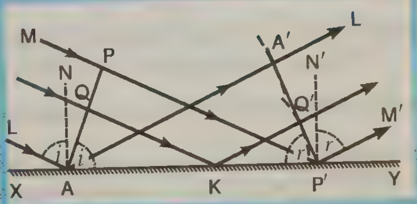

Fig. 4.05

To find the reflected wavefront (new position of wavefront after reflection from the surface XY) ; with point A as centre, draw a sphere of radius AA′ = PP′. From point P′, draw a plane P′A′ tangent to the sphere. Then, P′A′ represents reflected wavefront and normals A′L′ and P′M′ to the reflected wavefront P′A′ represent reflected rays. Draw P′N′ normal to the reflecting surface at point P′. Then, $\angle$ M′P′N′ = r is the angle of reflection.

To prove the laws of reflection : Consider any point Q on the incident wavefront. Suppose that when disturbance from point P on incident wavefront reaches point P′, the disturbance from point Q reaches Q′ via point K on the reflecting surface. Since P′A′ represents the reflected wavefront, the time taken by light to travel from any point on incident wavefront to the corresponding point[†] on the reflected wavefront should always be same. If c is velocity of light, then time taken by light to go from the point Q to Q′ is given by

$$t = \frac{QK}{c} + \frac{KQ'}{c} \qquad \text{...(4.01)}$$

---

[*] A sphere is a three dimensional geometrical figure. On a piece of apper *i.e.* in a plane, spherical wavefronts can be represented by circles only.

[**] To represent the plane wavefront, one will draw a straight line through the point A.

[†] For points A, P and Q on incident wavefront PA, the points A′, P′ and Q′ respectively are the corresponding points on the reflected wavefront P′A′.

In right angled ΔAQK, ∠ PAP′= i

$$\therefore \qquad QK = AK \sin i$$

Also, in right angled ΔKQ′P′, ∠ A′P′A = r

$$\therefore \qquad KQ' = KP' \sin r$$

In equation (4.01), substituting for QK and KQ′, we have

$$t = \frac{AK \sin i}{c} + \frac{KP' \sin r}{c}$$

or
$$t = \frac{AK \sin i + (AP' - AK) \sin r}{c} \qquad (\because KP' = AP' - AK)$$

or
$$t = \frac{AP' \sin r + AK (\sin i - \sin r)}{c} \qquad ...(4.02)$$

For rays from different points on the incident wavefront, the values of AK are different. The rays from different points on incident wavefront will take the same time to reach the corresponding points on the reflected wavefront, if t, given by equation (4.02), is independent of AK. So that the equation (4.02) is independent of AK, it follows that AK (sin i – sin r) should be zero *i.e.*

$$AK (\sin i - \sin r) = 0 \text{ or } (\sin i - \sin r) = 0 \text{ or } \sin i = \sin r$$

or
$$i = r$$

i.e. the angle of incidence is equal to the angle of reflection.

Further, as the incident wavefront (PA), the reflecting surface (XY) and the reflected wavefront (P′A′) are all perpendicular to the plane of the paper, therefore, *the incident ray* (LA or MP′), *normal* (AN) and *the reflected ray* (AA′L′ or P′M′), which are respectively perpendicular to AP, XY and A′P′, *all lie in the same plane.*

Hence, the laws of reflection are proved on the basis of the wave theory.

4.04. REFRACTION ONTHE BASIS OFWAVETHEORY

Let XY be a plane surface separating air from a denser medium and PA be a ne wavefront just incident on it. The normals LA and MP to the incident wavefront represent incident rays. If AN is normal to the refracting surface at point A, then ∠ NAL = i is the angle of incidence as shown in Fig. 4.06.

First of all, the wavefront reaches point A. From the points located between points A to P, the wavefront will reach points between A to P′ later in time but in the same order, so that it will reach point P′ in the last. Thus, different points on the surface XY will become sources of secondary wavelets at different instants of time. When the disturbance from point P on incident wavefront just reaches the point P′on the surface XY, the secondary wavelet from point A on the surface will grow into a sphere (inside the denser medium) of radius say A A′, such that

$$\frac{AA'}{v} = \frac{PP'}{c} \qquad \text{or} \qquad AA' = \frac{v}{c} + PP',$$

where v and c are the velocities of light in denser medium and air respectively.

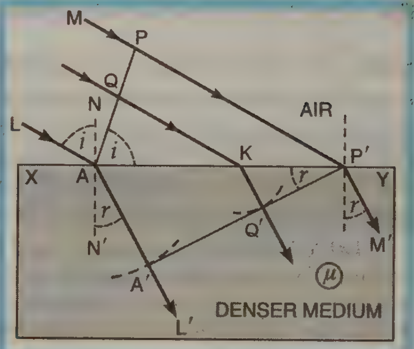

Fig. 4.06

To find the refracted wavefront (new position of the wave point after refraction) ; with point A as centre, draw a sphere of radius $AA' = \frac{v}{c} \times PP'$. From point P′, draw a tangent plane P′A′to the sphere. Then, P′A′ represents refracted wavefront and lines A A′L′ and P′M′ normals to the refracted wavefront represent refracted rays. Also, ∠N′A A′ = r is the angle of refraction.

To prove the laws of refraction : Consider any point Q on the incident wavefront. Suppose that when disturbance from point P on incident wavefront reaches point P′ on the refracted wavefront, the disturbance from point Q reaches point Q′ via point K on the surface of separation of air and denser medium. Since P′A′ represents the refracted wavefront, the time taken by light to travel from a point on incident wavefront to the corresponding point on refracted wavefront should be constant. Now, time taken by light to go from Q to Q′ will be

$$t = \frac{QK}{c} + \frac{KQ'}{v} \qquad ...(4.03)$$

In right angled Δ AQK, ∠ QAK = i

$$\therefore \qquad QK = AK \sin i$$

Also, in right angled Δ P′Q′K, ∠ Q′P′K = r

$$\therefore \qquad KQ' = KP' \sin r$$

In equation (4.03), substituting for QK and KQ′, we have

$$t=\frac{\text{AK}\sin i}{c}+\frac{\text{KP}'\sin r}{v}$$

or
$$t=\frac{\text{AK}\sin i}{c}+\frac{(\text{AP}'-\text{AK})\sin r}{v}\qquad(\because \text{KP}'=\text{AP}'-\text{AK})$$

or
$$t=\frac{\text{AP}'}{v}\sin r+\text{AK}\left(\frac{\sin i}{c}-\frac{\sin r}{v}\right)\qquad\text{...(4.04)}$$

For rays from different points on the incident wavefront, the values of AK are different. The rays from different points on incident wavefront will take the same time to reach the corresponding points on the refracted wavefront, if t, given by equation (4.04), is independent of AK. It will happen so, if

$$\frac{\sin i}{c}-\frac{\sin r}{v}=0\qquad\text{or}\qquad\frac{\sin i}{\sin r}=\frac{c}{v}$$

But $\frac{c}{v}=\mu$ (constant) is called the ***refractive index*** of the denser medium *w.r.t.* air.

$$\therefore\qquad\frac{\sin i}{\sin r}=\mu\text{ (constant)}$$

i.e. when a ray of light is incident on a refracting surface, the ratio of the sine of the angle of incidence to the sine of the angle of refraction is a constant for the given pair of media.

Further, as explained in last section, it follows that *the incident ray* (LA or MP′), *the normal* (AN) *and the refracted ray* (AA′L′ or P′M′) *all lie in the same plane.*

Hence, the laws of refraction are proved on the basis of the wave theory.

4.05. BEHAVIOUR OF A LENS, PRISM AND CONCAVE MIRROR

It is interesting and useful to investigate the behaviour of lenses, prisms and spherical mirrors, when a plane wavefront is incident on them.

1. Behaviour of a prism. Consider a prism ABC of small angle and a plane wavefront PB incident on the prism [Fig. 4.07]. The lines LB and MP (normals to the incident wavefront PB) represent incident rays. It follows that the rays from different parts of the wavefront travel different thicknesses of the material of the prism. Light from point B travels totally inside the material of prism, while light from point P travels totally in the air. The refracted wave front will be the locus of all those points to which light from different points on incident wavefront reaches in phase. Suppose that the light from point B reaches the corresponding point say C on refracted wavefront by travelling along path BC = x (say) inside the material of the prism and the light from point P reaches the corresponding point say Q on the refracted wavefront by travelling in air. Let the length of path between points P and Q *i.e.* PA + AQ be equal to y. As the time taken along the two paths should be same,

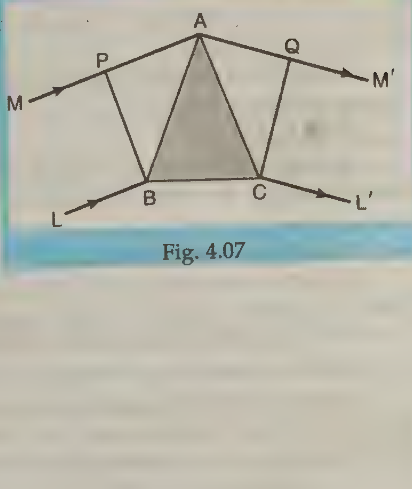

Fig. 4.07

$$\frac{x}{v}=\frac{y}{c}\qquad\text{or}\qquad y=\frac{c}{v}x,$$

where c is velocity of light in air and v is velocity of light in the material of the prism. Since v is less than c, y is greater than x. Out of the total path y, light covers path PA in air before it gets incident at point A and the remaining path (y – PA) *i.e.* AQ is covered after emerging from the prism. Hence, the emerging wavefront is of the shape CQ. The lines CL′ and QM′ (normal to the emergent wavefront CQ) represent emergent rays. It explains, why a ray of light passing through a prism is deviated towards the base of the prism.

2. Behaviour of a lens. Consider a plane wavefront AB incident on a double convex lens. The rays of light from points A and B travel totally inside the air, while the ray of light from point O travels partly in air and partly inside the material of the lens. Again, the refracted wavefront will be the locus of all those points to which light from different points on incident wavefront reaches in phase. As explained in case of behaviour of prism, it can be argued that the refracted wavefront will be a converging wavefront A′P$_2$ B′ [Fig. 4.08], such that

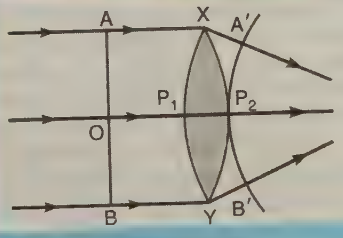

Fig. 4.08

$$\frac{\text{AX}+\text{XA}'}{c}=\frac{\text{OP}_1}{c}+\frac{\text{P}_1\text{P}_2}{v}=\frac{\text{BY}+\text{YB}'}{c}$$

Therefore, the wavefront after refraction through the lens is rendered into a converging wavefront as shown in the figure.

3. Behaviour of a spherical mirror. Consider a plane wavefront AB incident on a concave spherical mirror [Fig. 4.09]. Just as discussed above, the refracted wavefront will be a converging wavefront in nature, such that

$$AX + XA' = OP + PO' = BY + YB'$$

Since distance OP is greater than AX or BY, consequently distance PQ′ is less than XA′or YB′. Therefore, the incident plane wavefront will be rendered into a converging spherical wavefront after reflection from the concave mirror as shown in the figure.

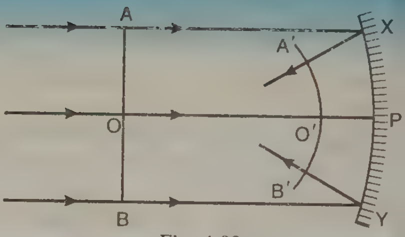

Fig. 4.09

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 4.01. What is ether medium ?

Ans. Ether is a hypothetical medium possessing very low density and very large value of volume elasticity and filling the whole space.

Q. 4.02. What is a wavefront ?

(H.S.S.C.E. 2001 ; P.S.S.C.E. 1997 S)

Or

Define wavefront.

(P.S.S.C.E. 2002 ; H.P.S.S.C.E. 1999 S ; H.S.S.C.E. 1995)

Or

What do you understand by a wavefront ?

(I.S.C.E. 1997, 1996, 1993)

Ans. Refer to section 4.01.

Q. 4.03. What is a ray of light ? *(P.S.S.C.E. 1998)*

Or

Define a ray of light. *(P.S.S.C.E. 1997)*

Ans. An arrow drawn normal to the wavefront and pointing in the direction of propagation of disturbance is called a ray of light.

Q. 4.04. What is the shape of the wavefront diverging from a point of source ? *(I.S.C.E. 1993)*

Ans. Spherical.

Q. 4.05. What is the shape of wavefront emitted by a light source in the form of a narrow slit ?

(H.S.S.C.E. 2002)

Ans. Cylindrical in shape.

Q. 4.06. Name the shape of a wave front originating from (*i*) a point source (*ii*) a line source.

(C.B.S.E. 2000 ; I.S.C.E. 1996)

Ans. (*i*) Spherical wave front (*ii*) Cylindrical wavefront.

Q. 4.07. What is the geometrical shape of the wavefront in each of the following cases ? (*a*) Light diverging from a point source. (*b*) Light emerging out of a convex lens, when a point source is placed at its focus. (*c*) The portion of the wavefront of light from a distant star intercepted by the earth. *(Text Question)*

Ans. (*a*) Spherical in shape. (*b*) Plane wavefront. (*c*) It is also a plane wavefront.

Q. 4.08. Sketch the wavefronts corresponding to converging rays. *(C.B.S.E. 1998)*

Ans. Refer to Fig. 4.02 (*b*).

Q. 4.09. What is the geometrical shape of the wavefront of the light diverging from a point source ?

(C.B.S.E.1999 S)

Or

Sketch the wavefronts corresponding to diverging rays. *(C.B.S.E. 1998)*

Ans. Refer to Fig. 4.02 (*c*).

Q. 4.10. How is a wavefront to the direction of corresponding rays ?

Ans. The wavefront is perpendicular to the direction of rays.

Q. 4.11. State Huygens' principle. *(P.S.S.C.E. 1996 S)*

Ans. Refer to section 4.02.

Q. 4.12. What is the phase difference between any two points on a wavefront ? *(H.S.S.C.E. 1994)*

Ans. Zero.

Q. 4.13. Can the phenomenon of rectilinear propagation, reflection and refraction be explained on the basis of wave nature of light ?

Ans. Yes.

Q. 4.14. What are the drawbacks of wave theory of light ?

Ans. The wave theory of light is based on the existence of all prevading ether medium. However, Michelson and Morley's experiment proved that the ether medium did not exist at all. It led to the failure of the wave theory of light.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 4.01. Why ether was called a hypothetical medium ?

Ans. The two properties of ether *i.e.* very low value of density and very large value of volume elasticity are contradictory in nature. A medium having such properties could not be conceived, when wave theory was profounded. For this reason, ether is called a hypothetical medium.

Q. 4.02. Why is the contribution of the wavelets lying on back of secondary wavefront zero ?

Ans. According to Voigt and Kirchhoff, the contribution of a wavelet in any direction making an angle θ with the normal to the wavelet is proportional to $\frac{1}{2}$ $(1 + \cos\ \theta)$.

For wavelet lying on the back of secondary wavefront, $\theta = 180°$ and like wise the factor

$$\frac{1}{2}(1+\cos\theta)=\frac{1}{2}(1+\cos 180°)=\frac{1}{2}(1-1)=0$$

Q. 4.03. What is the shape of wavefront orginating from (*i*) a point source and (*ii*) a line source ?

(I.S.C.E. 1998 S ; C.B.S.E. 1998)

Ans. (*i*) The wave front originating from a point source is *spherical* in shape. It is because, the locus of all such points, which are equidistant from the point source, is a sphere.

(ii) The wave front originating from a line source is cylindrical in shape. It is because, all the points, which are equidistant from the linear source, lie on the surface of a cylinder.

Q. 4.04. What is meant by a wavefront ? What is the shape of the wavefront of a beam of parallel rays ? *(I.S.C.E. 1998 S)*

Ans. The locus of all the particles of the medium, which at any instant are vibrating in the same phase, is called the wavefront.

Corresponding to a beam of parallel rays of light, the wavefront is plane in shape.

Q. 4.05. What is the geometrical shape of wavefront of light emerging out of a convex lens ; when a point source is placed at its focus ? *(C.B.S.E. 1999 S)*

Ans. When a point source is placed at the focus of a convex lens, it renders the light into the form of a parallel beam. The rays of light are always perpendicular to the wavefront. Therefore, the light emerging out of the convex lens will be in the form of a plane wavefront.

Q. 4.06. Explain, how a plane wavefront gets reflected from a concave mirror.

Ans. Refer to section 4.05.

Q. 4.07. A plane wavefront is incident on a prism. Draw the shape of the refracted wavefront.

Ans. Refer to section 4.05 and Fig. 4.06.

Q. 4.08. Discuss the refraction of a plane wavefront from a convex lens.

Ans. Refer to section 4.05.

TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 4.01. Is the speed of light in glass independent of the colour of light ? If not, which of the two colours (red and violet) travels slower in a glass prism ?

Ans. No, speed of light is not independent of the colour (wavelength) of the light. The violet colour travels slower than the red light in a glass prism.

Q. 4.02. When monochromatic light is incident on a surface separating two media, the reflected and refracted light both have the same frequency as the incident frequency. Explain, why. *(Text Question)*

Ans. Reflection and refraction (scattering in general) are the results of interaction of incident light with the atoms, which may be viewed as oscillators. When incident light falls on the atoms, the forced oscillations of the frequency of incident light are produced. Since, the frequency of light emitted by a charged oscillator is equal to its own frequency of oscillation, the frequency of reflected or refracted light is same as that of incident light.

Q. 4.03. When light travels from a rarer to a denser medium, it loses some speed. Does the reduction in speed imply a reduction in the energy carried by the light waves ? *(Text Question)*

Ans. No, decrease in speed of light does not imply reduction in the energy carried by the light wave. It is because, energy carried by a wave does not depend upon its speed of propagation. Instead, it depends upon its amplitude.

Q. 4.04. In what respects is Huygens' wave theory of light similar to Maxwell's electromagnetic theory ? In what respect are the two theories different ?

Ans. The two theories are similar in the respect that according to both the theories, light is a wave motion. On the other hand, the two theories are different in the respect that whereas according to electromagnetic theory, light does not require any medium for its propagation; a material medium is necessary for the propagation of light waves according to wave theory. For this, Huygens assumed the existence of all prevading ether medium.

Q. 4.05. In the wave picture of light, intensity of light is determined by the square of amplitude of wave. What determines the intensity of light in the photon picture of light ? *(Text Question)*

Ans. In the wave picture of light, intensity of light at a point is determined by the number of photons incident per unit area around that point.

CHAPTER

5

Interference of Light

5.01. INTERFERENCE OF LIGHT

When a source of light emits energy, the distribution of energy is uniform in the medium. But when two sources of light lie close to each other and emit light of *same wavelength* and preferably of *same amplitude*, then due to superposition of waves from the two sources, the distribution of light energy no longer remains uniform.

*The phenomenon of non-uniform distribution of energy in the medium due to superposition of two light waves is called **interference** of light.*

At some points in the medium, the intensity of light is maximum (***constructive interference***); while at some other points, the intensity is minimum (***destructive interference***). In case the two waves are of the same amplitude, then at points of destructive interference, the intensity of the light is zero *i.e.* complete darkness results. Usually, on the interference of the light waves, we obtain alternate bright and dark bands of light called ***interference fringes***.

It may be clearly understood that in interference of light, energy is neither created nor destroyed. The energy that disappears at the points of destructive interference appears at the points of constructive interference and vice-versa. Thus, in interference of light, merely redistribution of light energy takes place.

Key point

Due to interference of two light waves, redistribution of energy takes place in the medium.

5.02. YOUNG'S DOUBLE SLIT EXPERIMENT

In 1801, Thomas Young demonstrated the interference of light experimentally. His experiment gave a deadly blow to the corpuscular theory of light as the experiment led to the conclusion that light has wave nature.

A source of monochromatic light illuminates a rectangular narrow slit S, which acts as the line source for illuminating two narrow slits S_1 and S_2. The two slits lie very close to each other and at equal distances from the source S [Fig. 5.01]. The wave-fronts from the slits S_1 and S_2 spread out in all directions and in the region they superpose on the screen, alternate ***bright and dark fringes*** are observed. At the centre O of screen, the intensity of light is maximum and it is called ***central maximum***.

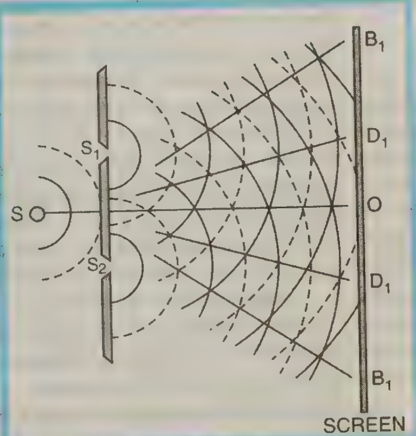

Fig. 5.01

Explanation. According to Huygens' principle, the two slits S_1 and S_2 send out waves of equal wavelengths and of same amplitude in all directions. As the paths S_1O and S_2O are equal, the light waves from the two slits S_1 and S_2 reach point O *in phase i.e.* either crest of one wave falls on the crest of the other wave or trough of one falls on the trough of the other. Hence, intensity of light at point O becomes maximum. It is called ***central maximum***.

As we move above the centre O of the screen (or below the point O), we come across points D_1, B_1, D_2, B_2, ... (the points D_2, B_2, ... are not shown in the figure).

At points D_1, D_2, ... , the crest of one wave falls on the trough of the other and vice-versa. The resultant amplitude and hence the resultant intensity of light becomes minimum at these points due to ***destructive interference*** of light. These points correspond to positions of ***dark fringes*** on the screen.

At points B_1, B_2, the crest of one wave falls on the crest of the other or trough of one on the trough of the other. Due to this, the resultant amplitude and hence resultant intensity of light at these points becomes maximum due to ***constructive interference*** of light. These points correspond to the position of ***bright fringes*** on the screen.

Further, in Young's double slit experiments, the following facts can also be verified :

1. *The interference pattern disappears, if one of the two slits is closed.* It shows that interference pattern is due to superposition of waves from the two slits.

2. *The interference pattern obtained is not a permanent one and the positions of maximum and minimum intensity do not remain fixed, if instead of two slits illuminated with a source, two independent sources are used.* It shows that for producing a sustained interference pattern, two sources should be obtained from a single source. Such sources are called ***coherent sources.***

5.03. SUSTAINED INTERFERENCE

The interference pattern, in which the positions of maximum and minimum of intensity of light remain fixed all along on the screen, is called sustained or permanent interference pattern.

For producing sustained interference, following conditions should be satisfied :

Conditions for sustained interference. 1. *The two sources should emit the light waves continuously.*

2. *The light waves should be of same wavelength.*

3. *The light waves emitted should preferably be of the same amplitude.* If the amplitudes of the waves are equal, the dark fringes are completely dark (zero intensity of light).

4. *The waves emitted by the two sources of light should either be in phase or should have a constant phase difference.*

5. *The two sources of light must lie very close to each other.* If it is not so, then the path difference between the light waves reaching a particular point will be very large. As we shall see, in such a case, maxima and minima will lie very close to each other and may result in overlapping.

6. *The two light sources should be very narrow.* A broad source of light is equivalent to a large number of narrow sources lying together. Each set of two sources will, therefore, give its own interference pattern and their overlapping will result in general illumination.

Key point

The sustained interference is observed only, when two coherent sources of light are used.

5.04. COHERENT SOURCES

In practice, a sustained interference pattern cannot be obtained by using two independent sources of light. It is because of the following reasons :

1. *Two independent sources of light cannot emit waves continuously.*

2. *The waves emitted by two independent sources of light do not have same phase or a constant phase difference.* It is because light is emitted by each excited atom of the source, which are billions in number. An excited atom emits light in a time of the order of 10^{-8} second. Therefore, if we have two independent sources, then the waves from two points in two sources will have a definite phase relationship only for 10^{-8} second and accordingly interference pattern formed by them will last on the screen only for this much time. The next bursts of waves coming from the two points in the two sources may be having an altogether different phase relationship and consequently the interference pattern may get shifted to some other place on the screen. These changes in positions of maxima and minima of intensity of light will occur about 10^8 times in one second. As the changes are too fast to be followed by the human eye, we shall not observe any interference pattern and there will be general illumination over the screen.

In order to obtain sustained interference pattern, the phase difference between the light waves arriving at a point on the screen from the two sources must remain constant with time. This can be made possible only if the two sources are derived from a single source. Such sources are called ***coherent sources.*** A change in phase, if any, will affect the two sources equally. Moreover, light waves from the two coherent sources are of *same wavelength* and *amplitude.*

Therefore, two sources are said to be coherent, if they emit light waves of same frequency or wavelength and of a stable phase difference.

When we make use of two coherent sources, the first four conditions for producing sustained interference pattern automatically get satisfied. In practice, two coherent sources may be two images of a source (both real or both virtual) or a source and its image. In case of a Lloyd's mirror, a source and its image act as the two coherent sources, while in case of a Fresnel's biprism, two virtual images of a source act as the two coherent sources.

5.05. PRINCIPLE OF SUPERPOSITION OF LIGHTWAVES

It states that *when two or more wave trains of light travelling in a medium superpose upon each other, then the resultant displacement at any instant is equal to the vector sum* *the displacements due to individual waves.* If $\vec{y}_1, \vec{y}_2, \vec{y}_3, ...$ be the displacements ue to different waves, then resultant displacement of the particle is given by

$$\vec{y} = \vec{y}_1 + \vec{y}_2 + \vec{y}_3 + ...$$

If crest of one wave falls on the trough of the other, the resultant amplitude will ecrease. However, when crests or troughs of one wave superpose the crests or oughs respectively of the other wave, the resultant amplitude increases. The terference of light waves can be easily explained on the basis of the principle of uperposition of waves.

5.06. CONDITIONS FOR CONSTRUCTIVE AND DESTRUCTIVE INTERFERENCE

A source of monochromatic light S illuminates two narrow slits S$_1$ and S$_2$. The vo illuminated slits act as the two coherent sources. Further, the two slits lie very ose to each other and at equal distance from the source S [Fig. 5.02]. The avefronts from S$_1$ and S$_2$ spread out in all directions and in the region they uperpose on the screen, alternate bright and dark fringes are observed. At the centre of the screen, the intensity of light is maximum and it is called *central maximum*.

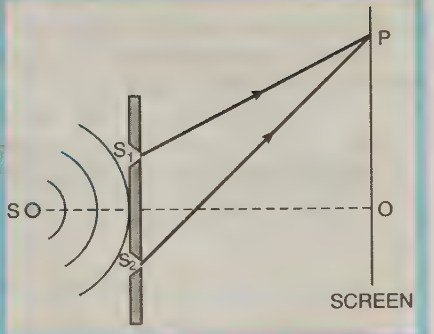

Fig. 5.02

Condition for maximum and minimum. Let the displacements of the waves om the sources S$_1$ and S$_2$ at point P on the screen at any time t be given by

$$y_1 = a_1 \sin \omega t$$

and $y_2 = a_2 \sin (\omega t + \phi)$,

where ϕ is the constant phase difference between the two waves. By the uperposition principle, the resultant displacement at point P is given by

$$y = y_1 + y_2$$

$$= a_1 \sin \omega t + a_2 \sin (\omega t + \phi) = a_1 \sin \omega t + a_2 \sin \omega t \cos \phi + a_2 \cos \omega t \sin \phi$$

or $$y = (a_1 + a_2 \cos \phi) \sin \omega t + a_2 \sin \phi \cos \omega t \quad ...(5.01)$$

Let $$a_1 + a_2 \cos \phi = \mathrm{A} \cos \theta \quad ...(5.02)$$

and $$a_2 \sin \phi = \mathrm{A} \sin \theta \quad ...(5.03)$$

Then, equation (5.01) becomes

$$y = \mathrm{A} \cos \theta \sin \omega t + \mathrm{A} \sin \theta \cos \omega t$$

or $$y = \mathrm{A} \sin (\omega t + \theta)$$

Hence, resultant displacement at point P is simple harmonic wave having mplitude A and phase difference θ with the harmonic wave from the source S$_1$. n order to know the amplitude of the resultant simple harmonic wave, we proceed s below :

Squaring and adding both sides of the equations (5.02) and (5.03), we obtain

$$\mathrm{A}^2 \cos^2 \theta + \mathrm{A}^2 \sin^2 \theta = (a_1 + a_2 \cos \phi)^2 + a_2^2 \sin^2 \phi$$

or $$\mathrm{A}^2 = a_1^2 + a_2^2 (\cos^2 \phi + \sin^2 \phi) + 2\, a_1 a_2 \cos \phi$$

or $$\mathrm{A}^2 = a_1^2 + a_2^2 + 2\, a_1 a_2 \cos \phi$$

The intensity of light is directly proportional to the square of amplitude of the vave. For the sake of simplicity, we assume that intensity of light is equal to the quare of the amplitude. Therefore, intensity of light at point P on the screen is given y

$$\mathrm{I} = a_1^2 + a_2^2 + 2\, a_1 a_2 \cos \phi \quad ...(5.04)$$

Constructive interference. From equation (5.04), it follows that the intensity f light at point P will be maximum, if

$$\cos \phi = +1 \quad \text{or} \quad \phi = 0, 2\pi, 4\pi, ...$$

or $$\phi = 2\,n\pi, \quad \text{where } n = 0, 1, 2, ... \quad ...(5.05)$$

It is the *condition for constructive interference* between the two light waves *n terms of phase difference* between the waves. The two light waves from sources $_1$ and S$_2$ reach point P after covering unequal paths *i.e.* the two waves possess *path ifference*. The above condition for constructive interference can also be expressed n terms of path difference between the two waves.

In a harmonic wave, the time in which the phase of the vibrating particle hanges by 2π, the wave travels a distance equal to wavelength λ. In other words, path difference equal to wavelength λ is equivalent to a phase difference of 2π. herefore, if the two waves from the sources S$_1$ and S$_2$ reaching point P have a path ifference x, then phase difference between the two waves will be

$$\phi = \frac{2\pi}{\lambda} x \quad ...(5.06)$$

Using equation (5.06), the condition for constructive interference *i.e.* equation (5.05) becomes

$$\frac{2\pi}{\lambda}x = 2n\pi$$

or $$x = n\lambda, \quad \text{where } n = 0, 1, 2, 3, \ldots\ldots\ldots \qquad \ldots(5.07)$$

It is the ***condition for constructive interference*** between two light waves ***in terms of path difference*** between them. From equations (5.05) and (5.07), it follows that *the point P will be the seat of maximum intensity of light (bright fringe), if between the two light waves reaching point P, the phase difference is an even integral multiple of π or the path difference is an integral multiple of λ.*

Destructive interference. From equation (5.04), it follows that the intensity of light at point P will be minimum, if

$$\cos\phi = -1 \quad \text{or} \quad \phi = \pi, 3\pi, 5\pi, \ldots\ldots\ldots$$

or $$\phi = (2n+1)\pi, \text{ where } n = 0, 1, 2, \ldots\ldots\ldots \qquad \ldots(5.08)$$

Also, from equations (5.06) and (5.08), we have

$$\frac{2\pi}{\lambda}x = (2n+1)\pi$$

or $$x = (2n+1)\frac{\lambda}{2}, \text{ where } n = 0, 1, 2, \ldots\ldots\ldots \qquad \ldots(5.09)$$

The equations (5.08) and (5.09) are the ***conditions for destructive interference in terms of phase difference*** and ***path difference*** respectively. From these conditions, it follows that *the point P will be seat of minimum intensity of light, if between the two light waves reaching point P, the phase difference is an odd integral multiple of π or the path difference is an odd integral multiple of $\frac{\lambda}{2}$.*

A few important results. The expressions for intensity of light in the following cases are found to be of immense use in the study of the phenomenon of interference of light :

1. ***Ratio of intensity of light at maxima and minima.*** From equation (5.04), it follows that

$$\mathrm{I}_{max} = a_1^2 + a_2^2 + 2a_1a_2 \times 1 = (a_1 + a_2)^2$$

and $$\mathrm{I}_{min} = a_1^2 + a_2^2 + 2a_1a_2 \times (-1) = (a_1 - a_2)^2$$

Therefore, $$\frac{\mathrm{I}_{max}}{\mathrm{I}_{min}} = \frac{(a_1 + a_2)^2}{(a_1 - a_2)^2} \qquad \ldots(5.10)$$

2. ***Ratio of intensity of light due to two sources.*** The intensity of light due to a slit (source of light) is directly proportional to the width of the slit. Therefore, if w_1 and w_2 are widths of the two slits S_1 and S_2 ; and I_1 and I_2 are intensities of light due to the respective slits on the screen, then

$$\frac{w_1}{w_2} = \frac{\mathrm{I}_1}{\mathrm{I}_2} \qquad \ldots(5.11)$$

Since intensity of light is directly proportional to the square of the amplitude of the light wave,

$$\frac{\mathrm{I}_1}{\mathrm{I}_2} = \frac{a_1^2}{a_2^2} \qquad \ldots(5.12)$$

From equations (5.11) and (5.12), we have

$$\frac{w_1}{w_2} = \frac{a_1^2}{a_2^2} \qquad \ldots(5.13)$$

5.07. THEORY OF INTERFERENCE FRINGES

Consider that two coherent sources of light S_1 and S_2 are placed at a distance d apart and a screen is placed at a distance D from the plane of the two sources. Let P be a point on the screen at a distance y from the centre of the screen [Fig. 5.03]. If x is path difference between the light waves reaching point P from the sources S_1 and S_2, then

$$x = S_2P - S_1P$$

In right angled $\Delta\, S_2\,BP$, we have

$$S_2P^2 = S_2B^2 + BP^2 = D^2 + \left(y + \frac{d}{2}\right)^2$$

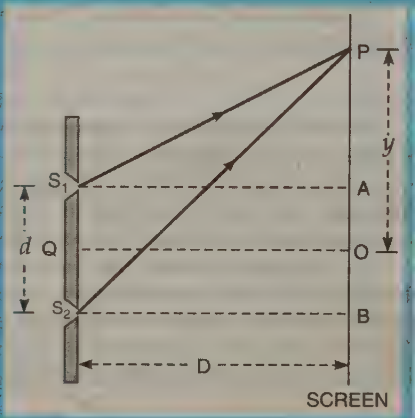

Fig. 5.03

Also, in right angled ΔS_1AP, we have

$$S_1P^2 = S_1A^2 + D^2 + \left(y - \frac{d}{2}\right)^2$$

$$\therefore \quad S_2P^2 - S_1P^2 = \left(D^2 + \left(y + \frac{d}{2}\right)^2\right) - \left(D^2 + \left(y - \frac{d}{2}\right)^2\right)$$

or $(S_2P + S_1P)(S_2P - S_1P) = \left(y + \frac{d}{2}\right)^2 - \left(y - \frac{d}{2}\right)^2$

Since $S_2P - S_1P = x$ (the path difference between the two light waves), the above equation becomes

$$(S_2P + S_1P) \,.\, x = 4y \,.\, \frac{d}{2} = 2\,y\,d \quad \text{or} \quad x = \frac{2\,y\,d}{S_2P + S_1P}$$

In practice, point P lies very close to O. Therefore, $S_2P \approx S_1P \approx D$.

Hence, $$x = \frac{2\,y\,d}{D + D} = \frac{2\,y\,d}{2\,D}$$

or $$x = \frac{y\,d}{D} \qquad \text{...(5.14)}$$

Position of maximum and minimum on the screen. From equations (5.07) and (5.14), it follows that point P will be centre of a bright fringe, if

$$\frac{y\,d}{D} = n\,\lambda$$

or $$y = \frac{n\,D\,\lambda}{d}, \quad \text{where } n = 0, 1, 2, \text{..........} \qquad \text{...(5.15)}$$

Suppose that the values of y for $n = 0, 1, 2, 3,$ .... n are $y_0, y_1, y_2,$ .... y_n respectively. Then, the values of $y_0, y_1, y_2,$ .... y_n can be obtained by putting $n = 0, 1, 2,$.......... n in equation (5.15).

For $n = 0$: $y_0 = 0$, *the distance of central bright fringe from point O*

For $n = 1$: $y_1 = \frac{D\lambda}{d}$, *the distance of first bright fringe from point O*

For $n = 2$: $y_2 = \frac{2D\lambda}{d}$, *the distance of second bright fringe from point O*

... ...

... ...

For $n = n$: $y_n = \frac{nD\lambda}{d}$, *the distance of nth bright fringe from point O*

From the equations (5.09) and (5.14), it follows that point P will be centre of a dark fringe, if

$$\frac{y\,d}{D} = (2\,n + 1)\,\frac{\lambda}{2}$$

or $$y = \frac{(2\,n + 1)\,D\,\lambda}{2\,d}, \quad \text{where } n = 0, 1, 2, \qquad \text{...(5.16)}$$

Suppose that the values of y for $n = 0, 1, 2,$ .... n are $y_0', y_1', y_2',$ .... y_n' respectively. Then, the values of $y_0', y_1', y_2',$ .... y_n' can be obtained by putting $n = 0, 1, 2,$ .... n in equation (5.16).

For $n = 0$: $y_0' = \frac{D\lambda}{2d}$, *the distance of first dark fringe from point O.*

For $n = 1$: $y_1' = \frac{3D\lambda}{2d}$, *the distance of second dark fringe from point O.*

For $n = 2$: $y_2' = \frac{5D\lambda}{2d}$, *the distance of third dark fringe from point O.*

... ...

... ...

For $n = n$: $y_n' = \frac{(2n+1)D\lambda}{2d}$, *the distance of (n + 1)th dark fringe from point O.*

Fringe width. The spacing between any two consecutive bright fringes is equal to the width of a dark fringe. Therefore, width of the dark fringe,

$$y_n - y_{n-1} = \frac{n\,D\,\lambda}{d} - \frac{(n-1)\,D\,\lambda}{d} = \frac{D\,\lambda}{d} \qquad ...(5.17)$$

The spacing between the two consecutive dark fringes is equal to the width of a bright fringe. Therefore, width of the bright fringe

$$y_n' - y_{n-1}' = \frac{(2n+1)\,D\,\lambda}{2d} - \frac{[(2n-1)+1]\,D\,\lambda}{2d} = \frac{D\,\lambda}{d} \qquad ..(5.18)$$

From equations (5.17) and (5.18), it follows that in Young's double slit experiment, the bright and dark fringes are of the same width. The fringe width is denoted by β. Therefore,

$$\beta = \frac{D\,\lambda}{d} \qquad ...(5.19)$$

The width of central bright fringe is equal to the distance between the first dark fringes formed on the two sides of the centre of the screen. Therefore, the width of the central bright fringe,

$$\beta_0 = 2\,y_0' = 2 \times \frac{D\,\lambda}{2\,d}$$

or

$$\beta_0 = \frac{D\,\lambda}{d} \qquad ...(5.20)$$

Key point

In the interference pattern produced by two narrow slits, the fringe width increases

(*i*) on using light of smaller wavelength,

(*ii*) on increasing distance between slits and the screen,

(*iii*) on decreasing distance between the two slits and

(*iv*) on replacing the medium between the slits and the screen by a medium of higher refractive index.

Key point

In the interference pattern produced by two narrow slits, the width of all the fringes (bright, dark and central) is same.

In case, the two sources emit light of same amplitude a, then the bright fringe will be of intensity

$$I_{max} = (a + a)^2 = 4\,a^2$$

On the other hand, the dark fringes will be of intensity

$$I_{min} = (a - a)^2 = 0$$

Therefore, all the interference fringes will be of equal widths, such that the dark fringes will be totally dark and the bright fringes will be of constant intensity ($4\,a^2$) as shown in Fig. 5.04. The bright fringes are formed at points $B_1, B_2, ...$, while the dark fringes are formed at the points $D_1, D_2, ...$ on both the sides of the central bright fringe formed at the centre of the screen.

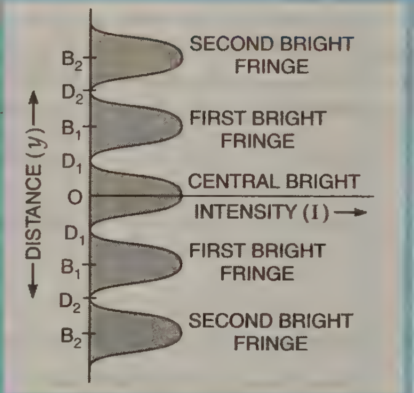

Fig. 5.04

Discussion. 1. As expression for β is independent of n, all the fringes are of same width.

2. As β is directly proportional to λ, the fringes produced by light of shorter wavelength will be narrower as compared to those produced by light of longer wavelength.

3. For appreciable fringe width, D should be large and d small.

4. The positions of nth bright and (n + 1)th dark fringes are respectively given by

$$y_n = \frac{n\,D\,\lambda}{d} \quad \text{and} \quad y_n' = \frac{(2n+1)\,D\,\lambda}{2\,d}$$

The bright and dark fringes will be distinct, if y_n and y_n' are large *i.e.* d is small. For this reason, the two slits should lie very close to each other.

5. As all the dark and bright fringes are of the same width, the angular width of a fringe is given by

$$\theta = \frac{\beta}{D} = \frac{D\,\lambda/d}{D}$$

or

$$\theta = \frac{\lambda}{d}$$

6. On immersing the apparatus in a liquid (say water), the wavelength of light decreases $\left(\lambda' = \frac{\lambda}{\mu}\right)$. From equation (5.19), it follows that when the apparatus is immersed in a liquid, the fringe width will decrease.

Key point

In the interference pattern produced by two narrow slits, the intensity of all the bright fringes is same.

5.08. INTERFERENCE DUE TO THIN FILMS (Qualitative Only)

A thin film of a liquid (soap film or a film of oil spread over water surface) appears bright or dark, when viewed in a monochromatic light.

This effect can be explained in terms of interference phenomenon.

Consider a thin transparent film of thickness t and refractive index μ. A monochromatic ray of light AB incident at angle i on the upper surface X_1Y_1 of the film, is partly reflected along BC and partly refracted into the material of the film along BD, such that r is angle of refraction [Fig. 5.05]. At point D, the ray of light is partly reflected along DF and partly transmitted out of the medium along DE. As the two surfaces of the film are parallel, the transmitted ray DE will be parallel to the incident ray AB. The ray of light will suffer reflections and refractions at points F, H, etc. in a similar manner. When viewed from the same side, the film appears dark or bright due to the interference of the reflected rays BC and FG. The rays BC and FG are said to interfere in *reflected system*. On the other hand, the film appears dark or bright due to interference of the transmitted rays DE and HI. The rays DE and HI are said to interefere in *transmitted system.*

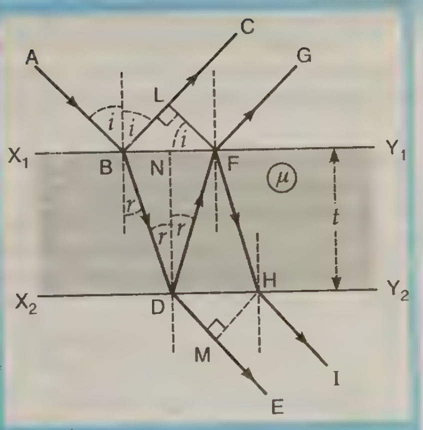

Fig. 5.05

Condition for film to appear bright or dark. The geometrical path difference between the rays BC and FG is given by

$$x = \mu\,(BC + DF) - BL$$

From simple geometry, it can be proved that

$$x = 2\,\mu\,t\cos r \qquad \text{...(5.21)}$$

Reflected system. Due to reflection of the ray of light BC at the surface of denser medium (thin liquid film), an additional phase difference of π or a path difference of $\frac{\lambda}{2}$ is introduced. As a result, the film will *appear dark*, when path difference x is an integral multiple of λ *i.e.* when

$$2\,\mu\,t\cos r = n\,\lambda, \qquad \text{where } n = 1, 2, 3, \text{..........} \qquad \text{...(5.22)}$$

In case film is of negligible thickness *i.e.*, $t << \lambda$, then net path will be just $\frac{\lambda}{2}$ (the path difference introduced due to reflection from denser medium) and hence film will appear dark.

The film will *appear bright*, when

$$2\,\mu\,t\cos r = (2\,n + 1)\,\frac{\lambda}{2}, \qquad \text{where } n = 0, 1, 2, \text{..........} \qquad \text{...(5.23)}$$

Transmitted system. When the film is viewed from the other side *i.e.* in transmitted system, there is no additional path difference between the two rays DE and HI. It is because, both the rays come after reflection at rarer medium at points D and F.

Therefore, the film will *appear bright*, when

$$2\,\mu\,t\cos r = n\,\lambda, \qquad \text{where } n = 1, 2, 3, \text{..........} \qquad \text{...(5.24)}$$

and the film will appear dark, when

$$2\,\mu\,t\cos r = (2\,n + 1)\,\frac{\lambda}{2}, \qquad \text{where } n = 0, 1, 2, \text{..........} \qquad \text{...(5.25)}$$

In case film is of negligible thickness, then there will be no path difference and hence the film will appear bright.

Note. It may be pointed out that conditions for film to appear bright or dark in the reflected light are just reverse of those in the transmitted light. Therefore, the film which appears bright in reflected system will appear dark in transmitted light and vice-versa.

5.09. COLOURS INTHIN FILMS

As discussed in last section ; in monochromatic light, a thin film may appear bright and dark depending upon the path difference between the rays of light coming after reflection from upper and lower surfaces of the film. However, in white light, a soap film or a thin film of oil spread over water surface appears to be coloured as explained below :

The path difference $2\,\mu\,t\cos r$ between the rays of light coming after reflection from the upper and bottom surfaces of a film depends upon μ, t, λ and r.

When a particular part of film is looked from a particular position of the eye, the parameters t and r get fixed. Since μ depends upon λ, the light of only a particular wavelength will satisfy the condition for the film to appear bright.

Hence, only a few wavelengths will be observed with maximum intensity, a few others having values in the neighbourhood will appear with lesser intensity and some others which satisfy the condition for film to appear dark will be missing.

Thus, the particular portion of the film appears of a particular colour, when seen from a particular position of the eye, when instead of monochromatic light, white light is incident on it.

Key point ✓

Thin soap or oil films appear coloured due to the phenomenon of interference, when light falls on such films.

5.10. INTERFERENCE AND CONSERVATION OF ENERGY

Consider that the two sources of light are emitting light waves of amplitude a_1 and a_2 respectively. If there is no interference between the light waves from the two sources, then the intensity of light at any point on the screen will be

$$I = I_1 + I_2$$

or
$$I = a_1^2 + a_2^2 \quad \text{...(5.26)}$$

In case the light from two sources intereferes, then maxima and minima will be formed. The intensities of light at maxima and minima are given by

$$I_{max} = (a_1 + a_2)^2 \quad \text{and} \quad I_{min} = (a_1 - a_2)^2$$

Therefore, average intensity of light on the screen due to interference is given by

$$I_{av} = \frac{I_{max} + I_{min}}{2} = \frac{(a_1 + a_2)^2 + (a_1 - a_2)^2}{2}$$

or
$$I_{av} = a_1^2 + a_2^2 \quad \text{...(5.27)}$$

From equations (5.26) and (5.27), it follows that when the interference takes place, the light energy which disappears at the regions of destructive interference appears at the regions of constructive interference so that the average intensity of light remains the same. In other words, in the phenomenon of interference, neither energy is created at the regions of constructive interference nor it is destroyed at the regions of destructive interference. Hence, the law of conservation of energy is being obeyed in the phenomenon of interference of light.

Key point

The phenomenon of interference does not violate the law of conservation of energy. The light energy, which disapears at the positions of minima appears at the positions of maxima.

SOLVED NUMERICAL PROBLEMS

Type A. On Intensities of maxima and minima

Problem 5.01. If the two slits in Young's experiment have widths in the ratio 4 : 9, then find the ratio of intensity at the maximum to the intensity at the minimum in the interference pattern. *(H.P.S.S.C.E. 2002)*

Sol. The intensity of light due to a slit is directly proportional to the width of the slit. Therefore,

$$\frac{I_1}{I_2} = \frac{w_1}{w_2}$$

Since $\frac{w_1}{w_2} = \frac{4}{9}$, we have

$$\frac{I_1}{I_2} = \frac{4}{9} \quad \text{...(i)}$$

If a_1 and a_2 are amplitudes of the waves from the two slits, then

$$\frac{I_1}{I_2} = \frac{a_1^2}{a_2^2} \quad \text{...(ii)}$$

From equations (*i*) and (*ii*), we have

$$\frac{a_1^2}{a_2^2} = \frac{4}{9} \quad \text{or} \quad \frac{a_1}{a_2} = \frac{2}{3} \quad \text{or} \quad a_2 = 1{\cdot}5\, a_1$$

Now, $$\frac{I_{max}}{I_{min}} = \frac{(a_1 + a_2)^2}{(a_1 - a_2)^2} = \frac{(a_1 + 1{\cdot}5\, a_1)^2}{(a_1 - 1{\cdot}5\, a_1)^2} = \frac{25}{1} = \mathbf{25 : 1}$$

Type B. On Young's double slit experiment

Problem 5.02. In a Young's double slit experiment, the fringe width obtained is 0·6 cm, when light of wavelength 4800 Å is used. If the distance between the screen and the slit is reduced to half, what should be the wavelength of light used to obtain fringes 0·0045 m wide? *(P.S.S.C.E. 1997)*

Sol. Here, $\lambda = 4800 \text{ Å} = 4800 \times 10^{-10}$ m ;
$\beta = 0{\cdot}6 \text{ cm} = 0{\cdot}6 \times 10^{-2}$ m

Now, $$\beta = \frac{D}{d}\lambda$$

or $$\frac{d}{D} = \frac{\lambda}{\beta} = \frac{4800 \times 10^{-10}}{0{\cdot}6 \times 10^{-2}} = 8 \times 10^{-5} \quad \text{...(i)}$$

When the distance between the screen and the slits is reduced to half of its initial value :

Here, $\beta' = 0{\cdot}0045$ m ; $D' = \frac{D}{2}$ and $d' = d$

Let λ' be the wavelength of the light source.

Then, $$\beta' = \frac{D'\lambda'}{d'}$$

or $$\lambda' = \beta' \frac{d'}{D'} = 0{\cdot}0045 \frac{d}{D/2} = 0{\cdot}009 \frac{d}{D} \quad \text{...(ii)}$$

From equations (*i*) and (*ii*), we have

$$\lambda' = 0{\cdot}009 \times 8 \times 10^{-5} = 7{\cdot}2 \times 10^{-7} \text{ m} = \mathbf{7200 \text{ Å}}$$

Problem 5.03. In a Young's double slit experiment, the slits are 1·5 mm apart. When the slits are illuminated by a monochromatic source and the screen is kept 1 m apart from the slits, width of 10 fringes is measured as 3·93 mm. Calculate the wavelength of light used. What will be the width of 10 fringes, when the distance between the slits and the screen is increased by 0·5 m ? The source of light used remains the same. *(Karnataka, 1995)*

Sol. Here, $d = 1{\cdot}5 \text{ mm} = 1{\cdot}5 \times 10^{-3}$ m ; D = 1 m ;
and width of 10 fringes = 3·93 mm

Therefore, fringe width,

$$\beta = \frac{3{\cdot}93}{10} = 0{\cdot}393 \text{ mm} = 0{\cdot}393 \times 10^{-3} \text{ m}$$

Now, $$\lambda = \beta \frac{d}{D} = 0{\cdot}393 \times 10^{-3} \times \frac{1{\cdot}5 \times 10^{-3}}{1}$$
$$= \mathbf{5{\cdot}895 \times 10^{-7} \text{ m}}$$

When the distance between the screen and the slits is changed :

Here, $D' = 1 + 0{\cdot}5 = 1{\cdot}5$ m ; $\lambda = 5{\cdot}895 \times 10^{-7}$ m ;
$d = 1{\cdot}5 \times 10^{-3}$ m ;

Therefore, width of 10 fringes = 10 β

$$= 10 \times \frac{D'}{d}\lambda = 10 \times \frac{1\cdot 5}{1\cdot 5 \times 10^{-3}} \times 5\cdot 895 \times 10^{-7}$$

$$= 5\cdot 895 \times 10^{-3} \text{ m}$$

Problem 5.04. Two slits in Young's experiment are 0·02 cm apart. The interference fringes for light of wavelength 6000 Å are formed on a screen 80 cm away. Calculate the distance of the fifth bright fringe.

Sol. Here, $d = 0\cdot 02$ cm ; D = 80 cm ;
$\lambda = 6000 \times 10^{-8}$ cm $= 6 \times 10^{-5}$ cm ;

For nthe bright fringe, $y_n = \frac{n D \lambda}{d}$

For fifth maximum, $n = 5$

$$\therefore \qquad y_5 = \frac{5 \times 80 \times 6 \times 10^{-5}}{0\cdot 02} = \mathbf{1\cdot 2 \text{ cm}}$$

Problem 5.05. In a Young's double slit experiment, the slits are 0·03 cm apart and the screen is placed 1·5 m away. The distance between the central bright fringe and the fourth bright fringe is measured to be 1 cm. Determine the wavelength of light used. *(H.S.S.C.E. 2002 ; C.B.S.E. 1995, 1993 ; P.S.S.C.E. 1993 ; Roorkee, 1986)*

Sol. Here, $d = 0\cdot 03$ cm $= 3 \times 10^{-4}$ m ; D = 1·5 m ;

Now, distance of fourth bright fringe,

$$y_4 = 1 \text{ cm} = 10^{-2} \text{ m}$$

But $\quad y_4 = \frac{4 D \lambda}{d}$

or $\quad \lambda = \frac{y_4 \times d}{4 D} = \frac{10^{-2} \times 3 \times 10^{-4}}{4 \times 1\cdot 5} = \mathbf{5 \times 10^{7} \text{ m}}$

Note. Alternatively, one may proceed as below :
Distance between central and fourth bright fringe
= width of four dark fringes = 4 β

Problem 5.06. Two slits 0·125 mm apart are illuminated by light of wavelength 4500 Å. The screen is one metre away from the plane of the slits. Find the separation between the second bright fringes on both sides of the central maximum. *(P.S.S.C.E. 1996 S)*

Sol. Here, $d = 0\cdot 125$ mm $= 0\cdot 125 \times 10^{-3}$ m ;
$\lambda = 4500$ Å $= 4500 \times 10^{-10}$ m ; D = 1 m

The distance of nth bright fringe from the central maximum, $y_n = n \frac{D}{d} \lambda$

Therefore, distance of 2nd bright fringe from the central maximum,

$$y_2 = 2 \times \frac{1}{0\cdot 125 \times 10^{-3}} \times 4500 \times 10^{-10} \text{ m} = 7\cdot 2 \times 10^{-3} \text{ m}$$

Hence, separation between the second bright fringes formed on the both sides of the central maximum,

$$2\,y_2 = 2 \times 7\cdot 2 \times 10^{-3} = 14\cdot 4 \times 10^{-3} \text{ m} = \mathbf{144 \text{ m}}$$

Note. Alternatively, one may proceed as below :
Separation between the second bright fringes on both sides of the central maximum
= width of four dark fringes = 4 β

Problem 5.07. In a Young's double slit experiment, the fringes are formed at a distance of 1 m from double slit of separation 0·12 mm. Calculate the distance of 3rd dark band from the centre of the screen. Given, λ = 6000 Å.

Sol. Here, $d = 0\cdot 12$ mm $= 0\cdot 012$ cm ; D = 1 m = 100 cm ;
$\lambda = 6000$ Å $= 6000 \times 10^{-8}$ cm

For $(n + 1)$th dark fringe, $y_n' = (2n + 1)\frac{D\lambda}{2}$

For third dark fringe, $\quad n = 2$

$$\therefore \; y_2' = (2 \times 2 + 1) \times \frac{100}{2 \times 0\cdot 012} \times 6000 \times 10^{-8} = \mathbf{1\cdot 25 \text{ cm}}$$

Problem 5.08. In a Young's double slit experiment, the slits are 0·2 mm apart and the screen is 1·5 m away. It is observed that the distance between the central bright fringe and fourth dark fringe is 1·8 cm. Find the wavelength of light used. *(P.S.S.C.E. 1993, 1992)*

Sol. Here, $d = 0\cdot 2$ mm $= 2 \times 10^{-4}$ m ; D = 1·5 m ;

Now, distance of fourth dark fringe,

$$y_3' = 1\cdot 8 \text{ cm} = 1\cdot 8 \times 10^{-2} \text{ m}$$

But $\quad y_3' = \frac{7 D \lambda}{2 d}$

or $\quad \lambda = \frac{2\, y_3'\, d}{7 D} = \frac{2 \times 1\cdot 8 \times 10^{-2} \times 2 \times 10^{-4}}{7 \times 1\cdot 5}$

$$= \mathbf{6\cdot 86 \times 10^{-7} \text{ m}}$$

Problem 5.09. In a Young's experiment, the width of the fringes obtained with light of wavelength 6000 Å is 2·0 mm. What will be the fringe width, if the entire apparatus is immersed in a liquid of refractive index 1·33 ? *(C.B.S.E. 1991)*

Sol. *In air* : $\beta = 2\cdot 0$ mm $= 2\cdot 0 \times 10^{-3}$ m ;
$\lambda = 6000$ Å $= 6 \times 10^{-7}$ m ;

Now, $\quad \beta = \frac{D\lambda}{d}$

or $\quad \frac{D}{d} = \frac{\beta}{\lambda} = \frac{2\cdot 0 \times 10^{-3}}{6 \times 10^{-7}}$

In liquid : Let λ' be wavelength of light in liquid and β' be the corresponding fringe width. Then,

$$\lambda' = \frac{\lambda}{\mu} = \frac{6 \times 10^{-7}}{1\cdot 33}$$

Now, $\quad \beta' = \frac{D\lambda'}{d} = \frac{2\cdot 0 \times 10^{-3}}{6 \times 10^{-7}} \times \frac{6 \times 10^{-7}}{1\cdot 33} = 1\cdot 5 \times 10^{-3}$ m

$$= \mathbf{1\cdot 5 \text{ mm}}$$

Problem 5.10. A double slit is illuminated by light of wavelength 6000 Å. The slits are 0·1 cm apart and the screen is placed one metre away. Calculate (*a*) the angular position of the 10th maximum in radian and (*b*) separation of the two adjacent minima. *(P.S.S.C.E. 1996)*

Sol. Here, $\quad \lambda = 6000$ Å $= 6000 \times 10^{-10}$m ;
$d = 0\cdot 1$ cm $= 10^{-3}$ m ; D = 1 m ;

(*a*) The angular position of nth maximum,

$$\theta_n = \frac{y_n}{D} = \frac{n D \lambda}{d} \Big/ D = \frac{n\lambda}{d}$$

Therefore, angular position of 10th maximum,

$$\theta_{10} = \frac{10 \times 6000 \times 10^{-10}}{10^{-3}} = \mathbf{0\cdot 006 \text{ radian}}$$

(*b*) Separation between the two adjacent minima *i.e.* fringe width,

$$\beta = \frac{D\lambda}{d} = \frac{1 \times 6000 \times 10^{-10}}{10^{-3}} = 0\cdot 6 \times 10^{-3} \text{ m}$$

$$= \mathbf{0\cdot 6 \text{ mm}}$$

Type C. On Interference due to thin film

Problem 5.11. Using light of wavelength 6000 Å, it is found that in a thin film of air, 7 fringes occur between two points. Deduce the difference of the film thickness between these points. *(H.S.S.C.E. 1997 S)*

Sol. Let t be the difference of thickness of the air film between two points.

Then,

$$2\,\mu\,t\cos r = n\,\lambda$$

Here, for air film, $\mu = 1; n = 7;$

$$\lambda = 6000\text{ Å} = 6000 \times 10^{-10}\text{ m}$$

For normal incidence of light, $r = 0$

$\therefore$ $2 \times 1 \times t\cos 0° = 7 \times 6000 \times 10^{-10}$

or $t = \mathbf{2{\cdot}1 \times 10^{-6}\text{ m}}$

TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 5.12. White light may be considered to have λ from 4000 Å to 7500 Å. If an oil film has thickness 10^{-4} cm, deduce the wavelength in the visible region for which the reflection along the normal direction will be (*i*) weak (*ii*) strong. Take μ of the oil as 1·4.

Sol. Here, $\mu = 1{\cdot}4\,;\, t = 10^{-4}$ cm

For normal incidence (i and hence $r = 0°$), the path difference is given by

$$2\,\mu\,t = 2 \times 1{\cdot}4 \times 10^{-4}\text{ cm}$$
$$= 2{\cdot}8 \times 10^{-4} \times 10^{8} = 28000\text{ Å}$$

(*i*) Condition for weak reflection (destructive interference) is given by

$$2\,\mu\,t = n\,\lambda$$

or

$$\lambda = \frac{2\,\mu\,t}{n} = \frac{28000}{n}$$

The value of n should be such, so that λ lies between 3900 Å and 7600 Å. This will be possible, if

$$\lambda = \frac{28000}{4} = \mathbf{7000\text{ Å}} \qquad (\text{when } n = 4)$$

$$\lambda = \frac{28000}{5} = \mathbf{5600\text{ Å}} \qquad (\text{when } n = 5)$$

$$\lambda = \frac{28000}{6} = \mathbf{4667\text{ Å}} \qquad (\text{when } n = 6)$$

$$\lambda = \frac{28000}{7} = \mathbf{4000\text{ Å}} \qquad (\text{when } n = 7)$$

The other values of n are not allowed as for those values of n, λ does not lie within the given wavelength range from 3900 Å to 7600 Å. Hence, the above values of λ cause weak reflection.

(*ii*) For strong reflection, we have

$$2\,\mu\,t = (2\,n + 1)\,\lambda/2$$

$$\therefore \qquad \lambda = \frac{2(2\,\mu\,t)}{2\,n+1} = \frac{2 \times 28000}{2\,n+1} = \frac{56000}{2\,n+1}$$

Now,

$$\lambda = \frac{56000}{9} = \mathbf{6222\text{ Å}} \qquad (\text{when } n = 4)$$

$$\lambda = \frac{56000}{11} = \mathbf{5091\text{ Å}} \qquad (\text{when } n = 5)$$

$$\lambda = \frac{56000}{13} = \mathbf{4308\text{ Å}} \qquad (\text{when } n = 6)$$

Hence, only the above values of n will cause strong reflection. For other values of n, the wavelength will not be within the given wavelength range.

Problem 5.13. In a certain region A to B in a thin film, we get 10 fringes with light of wavelength 4358 Å. How many fringes will be observed in the same region with wavelength 5893 Å ?

Sol. Let n_1 and n_2 be the number of fringes observed between A and B. If t is the change in thickness of the film and λ_1 and λ_2 are wavelengths, then for normal incidence

$$2\,\mu\,t = n_1\,\lambda_1 = n_2\,\lambda_1$$

$$\therefore \qquad n_2 = \frac{n_1\,\lambda_1}{\lambda_2}$$

Here, $n_1 = 10\,;\, \lambda_1 = 4358\text{ Å} = 4358 \times 10^{-10}\text{ m}\,;$
$\lambda_2 = 5893 \times 10^{-10}\text{ m}$

Hence,

$$n_2 = \frac{10 \times 4358 \times 10^{-10}}{5893 \times 10^{-10}} = \mathbf{7{\cdot}4}$$

FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 5.01. What is inference of light ? *(H.S.S.C.E. 2002)*

Ans. *The phenomenon of non-uniform distribution of energy in the medium due to superposition of two light waves is called interference of light.*

Q. 5.02. Define coherent sources of light. *(P.S.S.C.E. 1998 S)*

Or

What are coherent sources of light ? *(C.B.S.E. 2002, 2001, 1998 ; P.S.S.C.E. 2002, 2000, 1999 S ; H.S.S.C.E. 2002, 2001, 1997 S, 1992 ; I.S.C.E. 1994)*

Ans. Two sources obtained from a single source of light are called coherent sources.

Q. 5.03. Can two independent sources of light be coherent ?

Ans. No.

Q. 5.04. State the essential condition for two light waves to be coherent. *(H.S.S.C.E. 2002)*

Ans. 1. The light waves should be of same wavelength.

2. The two light waves should either be in phase or should have a constant phase difference.

Q. 5.05. What happens to the interference pattern, if the phase difference between the two sources continuously varies ?

Ans. If the phase difference between the two sources continuously varies, the positions of minima and maxima will also vary. Such an interference pattern will not be a sustained one and it will not be observed.

Q. 5.06. Two slits in Young's double slit experiment are illuminated by two different sodium lamps emitting light of same wavelength. Do you observe any interference pattern on the screen ? *(I.I.T. 1984)*

Ans. No. It is because, the phase difference between the light waves from the two independent sources keeps on changing continuously.

Q. 5.07. Why should we have narrow sources to produce good interference fringes ? *(H.S.S.C.E. 1993)*

Ans. It is because, a broad source is equivalent to a large number of narrow sources lying close to each other. Due to overlapping of interference patterns due to different pairs of narrow sources, the interference pattern obtained is not a distinct one.

Q. 5.08. What is the main condition to produce interference of light ? *(H.P.S.S.C.E. 1998 S)*

Or

State the most essential condition for observing interference of light. *(I.S.C.E. 1996)*

Ans. The two sources of light must be coherent sources.

Q. 5.09. What is the principle of superposition of light waves ?

Ans. It states that when two or more wave trains of light travelling in a medium superpose upon each other, then the resultant displacement at any instant is equal to the vector sum of the displacement due to individual waves.

Q. 5.10. What happens to the interference pattern, when one of the slits is closed ?

Ans. The interference pattern will disappear.

Q. 5.11. What is the relation between path difference and phase difference ?

Ans. Phase difference $= \frac{2\pi}{\lambda} \times$ path difference

Q. 5.12. State the condition for constructive inference. *(H.S.S.C.E. 2002 ; H.P.S.S.C.E. 1998)*

Ans. Path difference, $x = n\lambda$, where $n = 0, 1, 2, 3....$

Q. 5.13. State the condition for destructive interference. *(H.S.S.C.E. 2002 ; C.B.S.E. 1992)*

Ans. Path difference, $x = (2n+1)\frac{\lambda}{2}$, where $n = 0, 1, 2....$

Q. 5.14. Widths of two slits in a Young's experiment are in the ratio 4 : 1. What is the ratio of the amplitudes of light waves from them ?

Ans. Here, $\frac{w_1}{w_2} = \frac{4}{1}$

Now, $\frac{a_1^2}{a_2^2} = \frac{w_1}{w_2} = \frac{4}{1}$

Therefore $\frac{a_1}{a_2} = \frac{2}{1}$

Q. 5.15. What is the ratio of slit widths, when the amplitudes of light waves from them have a ratio $\sqrt{2} : 1$?

Ans. Here, $\frac{a_1}{a_2} = \frac{\sqrt{2}}{1}$

Now, $\frac{w_1}{w_2} = \frac{a_1^2}{a_2^2} = \left(\frac{\sqrt{2}}{1}\right)^2 = \frac{2}{1}$

Q. 5.16. If the two slits in Young's double-slit experiment have width ratio 4 : 1, deduce the ratio of intensity at maxima and minima in the interference pattern. *(C.B.S.E. 1999 S)*

Ans. Here, $\frac{w_1}{w_2} = \frac{a_1^2}{a_2^2} = \frac{4}{1}$ or $\frac{a_1^2}{a_2^2} = \frac{2}{1}$ or $a_1 = 2\,a_2$

If I_1 and I_2 are intensities of light at maxima and minima respectively, then

$$\frac{I_1}{I_2} = \frac{(a_1 + a_2)^2}{(a_1 - a_2)} = \frac{(2\,a_2 + a_2)^2}{(2\,a_2 - a_2)^2} = \frac{9}{1}$$

Q. 5.17. If the separation between two slits is decreased in Young's double slit experiment, keeping the screen position fixed, what will happen to the fringe width ? *(I.S.C.E. 1995)*

Ans. We know that $\beta = \frac{D\lambda}{d}$

When the two slits are moved closer (d is decreased), the fringe width will increase.

Q. 5.18. Why is interference pattern not detected, when two coherent sources are far apart ? *(H.S.S.C.E. 2001)*

Ans. As the distance between two sources is increased, the fringe width decreases. When the sources are far apart, the fringe width practically becomes zero.

Q. 5.19. What happens to fringe width, when the separation between the sources is increased ? *(Text Question)*

Ans. We know that $\beta = \frac{D\lambda}{d}$. The fringe width decreases, when the separation d between the two sources in the Young's double slit experiment is increased.

Q. 5.20. What is the effect of slit width and wavelength of light source on fringe width of the fringes formed by Young's double slit experiment ? *(C.B.S.E. 1995 S)*

Ans. Again, $\beta = \frac{D\lambda}{d}$

It follows that when slit width (distance between slits) is increased, fringe width will decrease.

On the other hand, when wavelength is increased, the fringe width will increase.

Q. 5.21. In Young's double slit experiment, the separation of the slits is doubled and the distance between the slits and the screen is halved. How will it affect the fringe width ?

Ans. In the interference pattern, the fringe width is given by

$$\beta = \frac{D\lambda}{d}$$

When D is halved and d is doubled, β becomes one-fourth. *i.e.* the fringe width reduces to one-fourth of its previous value.

Q. 5.22. Is the law of conservation of energy obeyed by the interference ?

Ans. Yes.

Q. 5.23. When a low flying aircraft passes overhead, we sometimes notice a slight shaking of the picture on our TV screen. Suggest a possible explanation. *(H.P.S.S.C.E. 1998 S)*

Ans. A low flying aircraft reflects the TV signal. Due to interference between the direct signal and the reflected signal, the picture on TV screen shows a slight shaking.

Q. 5.24. Can white light produce interference ? What is its nature ?

Ans. Yes, white light can produce interference. However, only first few coloured fringes can be detected and beyond that the fringes of different colours overlap to produce general illumination, white in colour.

Q. 5.25. When a thin transparent film is placed just in front of one of the two slits in the Young's double slit experiment using white light, what change results in the fringe system ? *(I.S.C.E. 1997)*

Ans. The entire fringe pattern will get displaced.

Q. 5.26. Why do the oil films on the surface of water appear to be coloured ?

Ans. The oil films on the surface of water appear to be coloured due to the interference of white light reflected from the two surfaces of the film.

Q. 5.27. Why does an excessively thin film appear black in reflected light ? *(H.S.C.C.E. 1992)*

Ans. In case of an excessively thin film $(t \approx 0)$, the path difference is just $\frac{\lambda}{2}$. The path difference of $\frac{\lambda}{2}$ occurs due to the reason that one of the two rays suffers reflection at denser medium. As the path difference between the two rays is $\frac{\lambda}{2}$, the film appears dark.

Q. 5.28. Bubbles of colourless soap solution appear coloured in sunlight. Why ?

Ans. It is due to interference of white light from the thin film of the soap bubbles.

Q. 5.29. Thin films such as soap bubbles or a thin layer of oil on water show beautiful colours, when illuminated by white light. Explain the observation. *(Text Problem)*

Ans. Light waves reflected from the upper and lower surfaces of a thin film interfere with each other. The coloured interference fringes are produced due to the reason that the conditions for constructive and destructive interference depend on wavelength of the light used.

Q. 5.30. Define the term `coherence' for light waves. *(I.S.C.E. 1998)*

Ans. When the light waves interfering with each other have a phase difference that remains constant with time, they are called coherent.

FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 5.01. What are the conditions for two sources to be coherent ? *(P.S.S.C.E. 1995 ; C.B.S.E. 1990)*

Or

State the conditions, which must be satisfied for two light sources to be coherent. *(H.S.S.C.E. 1998)*

Ans. 1. Two sources should emit light waves continuously.

2. The light waves emitted by the two sources should be of the same wavelength.

3. The phase difference between light waves emitted by the two sources should not change with passage of time.

Q. 5.02. What is the difference between coherent and incoherent sources of light ?

Ans. Two sources of light, which fulfil the conditions given in SAQ 5.01, are called coherent sources. On the other hand, if the two sources emitting light do not fulfil these conditions, they are called incoherent sources.

Q. 5.03. State the necessary conditions for the sustained interference.

(C.B.S.E. 2002, 1998 S ; P.S.S.C.E. 1998 S)

Ans. Refer to section 5.03.

Q. 5.04. State the three conditions for sustained interference to take place. Explain, why these conditions are necessary.

Ans. Refer to section 5.03.

Q. 5.05. Consider interference between waves from two sources of intensities I and 4 I. Find intensities at points, where phase difference is (*i*) $\frac{\pi}{2}$ (*ii*) π. *(Roorkee ; 1987)*

Ans. Here, $I_1 = a_1^2 = I$ and $I_2 = a_2^2 = 4\,I$

Resultant light intensity,

$$I' = a_1^2 + a_2^2 + 2\,a_1\,a_2 \cos\phi$$
$$= I + 4\,I + 2\sqrt{I}\,\sqrt{4\,I}\cos\phi = 5\,I + 4\,I\cos\phi$$

(*i*) When $\phi = \frac{\pi}{2} : I' = 5\,I + 4\,I\cos\frac{\pi}{2} = 5\,I + 4\,I \times 0 = \mathbf{5\,I}$

(*ii*) When $\phi = \pi : I' = 5\,I + 4\,I\cos\pi = 5\,I + 4\,I\,(-1) = \mathbf{I}$

Q. 5.06. Consider interference between two sources of intensities I and 4 I. Obtain intensity at a point, where the phase difference is $\frac{\pi}{2}$. *(C.B.S.E. 1995 S)*

Ans. Refer to SAQ 5.05 (*i*).

Q. 5.07. Find the ratio of intensities at two points X and Y on a screen in Young's double slit experiment, where waves from S_1 and S_2 have path difference of (*i*) 0 and (*ii*) $\lambda/4$. *(C.B.S.E. 1993)*

Ans. Resultant light intensity, $I = a_1^2 + a_2^2 + 2\,a_1\,a_2\cos\phi$

(*i*) Path difference equal to zero at point X corresponds to phase difference $\phi = 0°$ at that point.

$$\therefore \quad I_X = a_1^2 + a_2^2 + 2\,a_1\,a_2\cos 0° = a_1^2 + a_2^2 + 2\,a_1\,a_2$$

(*ii*) Path difference equal to $\frac{\lambda}{4}$ at point Y corresponds to phase difference $\phi = \frac{\pi}{2}$ at that point

$$\therefore \quad I_Y = a_1^2 + a_2^2 + 2\,a_1\,a_2\cos\frac{\pi}{2} = a_1^2 + a_2^2$$

$$\therefore \quad \frac{I_X}{I_Y} = \frac{a_1^2 + a_2^2 + 2\,a_1\,a_2}{a_1^2 + a_2^2}$$

In case, $a_1 = a_2 = a$ (say), then

$$\frac{I_X}{I_Y} = \frac{a^2 + a^2 + 2\,a \times a}{a^2 + a^2} = \frac{2}{1}$$

Q. 5.08. Two light waves of amplitudes a_1 and a_2 interfere with each other. Find the ratio of the intensities of a maxima to that of a minima.

Ans. When two light waves of amplitudes a_1 and a_2 differing in phase by ϕ interfere, the intensity of the resultant light is given by

$$I = a_1^2 + a_2^2 + 2\,a_1\,a_2\cos\phi$$

The intensity of light will be maximum, when $\phi = 0$.

$$\therefore \quad I_{max} = a_1^2 + a_2^2 + 2\,a_1\,a_2\cos 0$$
$$= a_1^2 + a_2^2 + 2\,a_1\,a_2 \times 1 = (a_1 + a_2)^2$$

On the other hand, intensity of light will be minimum, when $\phi = \pi$.

$$\therefore \quad I_{min} = a_1^2 + a_2^2 + 2\,a_1\,a_2 \cos \pi$$
$$= a_1^2 + a_2^2 + 2\,a_1\,a_2 \times (-1) = (a_1 - a_2)^2$$

Hence, $$\frac{I_{max}}{I_{min}} = \frac{(a_1 + a_2)^2}{(a_1 - a_2)^2}$$

Q. 5.09. What will be the intensities of the maxima and ninima, when the light waves interfering with each other re of the same amplitude ? Show that the intensity of the naxima is four times the intensity of light due to each of he two slits.

Ans. In case, the two light waves are of same amplitude *.e.*

$$a_1 = a_2 = a \text{ (say), then}$$
$$I_{max} = (a + a)^2 = 4\,a^2$$
and $$I_{min} = (a - a)^2 = 0$$

Now, intensity of light due to each slit, $I = a^2$

It follows that $I_{max} = 4\,I$ *i.e.* maximum intensity in the interference pattern is four times the intensity of light due to each slit.

Q. 5.10. Show that in Young's experiment, the dark and bright fringes are equally spaced.

Ans. Refer to section 5.07.

Q. 5.11. Draw the graph showing the variation of intensity in the interference pattern in Young's double slit experiment. (*C.B.S.E. 2002, 1998 S*)

Ans. Refer to Fig. 5.04.

Q. 5.12. What is the effect on the interference pattern in Young's double-slit experiment due to each of the following operations ? (*a*) The widths of the slits are increased equally. (*b*) The whole apparatus is kept in a denser medium. (*C.B.S.E. 1998 S*)

Ans. (*a*) As the widths of the slits are increased equally, the fringe width decreases. It is because,

$$\beta \propto \frac{1}{d}$$

(*b*) When the apparatus is immersed in denser medium of refractive index μ, the wavelength of the light used decreases. Since $\beta \propto \lambda$, the fringe width decreases.

Q. 5.13. Why is no interference pattern observed, when two coherent sources are (*i*) infinitely close to each other ? (*ii*) far apart from each other ? (*C.B.S.E. 1998*)

Ans. We know, $\beta = \dfrac{D\,\lambda}{d}$

(*i*) When the two sources are quite close to each other (*d* quite small), sufficiently wide fringes are formed. In case the two sources are infinitely close to each other, general illumination will take place.

(*ii*) When the sources are moved far apart (*d* very large), the fringe width will be very small and they will not be separately visible.

Q. 5.14. What is the effect on the interference fringes in a Young's double slit experiment due to each of the following operations ?

(*a*) The screen is moved away from the plane of the slits. (*C.B.S.E. 2001 S*)

(*b*) The source is replaced by another source of shorter wavelength.

(*c*) The separation between the two slits is decreased. (*C.B.S.E. 2000, 1999*)

(*d*) The monochromatic source is replaced by a source of white light. (*C.B.S.E. 2001 S*)

Ans. We know that $\beta = \dfrac{D\,\lambda}{d}$

(*a*) When the screen is moved away from the plane of slits, D increases. Hence, fringe width will increase.

(*b*) The decrease in λ will decrease fringe width.

(*c*) When separation between the two sources is decreased, *d* decreases. Hence, fringe width will increase.

(*d*) The different colours of white light will produce different interference patterns but the central bright fringes due to all colours are at the same position. Therefore, central bright fringe is white in colour. Since blue colour has the lowest λ, the fringe closest on either side of the central white fringe is blue and the farthest is red. Beyond a few fringes, no clear fringe pattern is visible.

Q. 5.15. How does the central fringe appear, when white light is used in a biprism experiment ? Explain your answer. (*I.S.C.E. 1994*)

Ans. Refer to SAQ 5.14 (*d*)

Q. 5.16. Imagine a situation in which Young's double slit apparatus is completely immersed in water. What will be the change in fringe width as compared to the case, when the apparatus lies in air ?

Ans. When apparatus is in air, $\beta_{air} = \dfrac{D\,\lambda}{d}$

When apparatus is immersed in water, the wavelength of light decreases to $\dfrac{\lambda}{\mu}$.

Therefore, $$\beta_{water} = \frac{D\,\lambda}{\mu\,d}$$

$$\therefore \quad \frac{\beta_{water}}{\beta_{air}} = \frac{D\,\lambda}{\mu\,d} \times \frac{d}{D\,\lambda} = \frac{1}{\mu}$$

Q. 5.17. What will be the effect on the fringes formed in Young's double slit experiment, if (*i*) the apparatus is immersed in water, (*ii*) white light is used instead of monochromatic light ? (*P.S.S.C.E. 1999 S, 1993 ; C.B.S.E. 1999*)

Ans. (*i*) Refer to SAQ 5.16.

(*ii*) Refer to SAQ 5.14 (*d*).

Q. 5.18. Two slits are 1 mm apart and the same slits are 1 m from a screen. Find out fringe separation, when light of wavelength 500 nm is used. (*H.S.S.C.E. 1996*)

Ans. Here, $d = 1\text{ mm} = 10^{-3}\text{ m}$; $D = 1\text{ m}$;

$$\lambda = 500\text{ nm} = 500 \times 10^{-9}\text{ m}$$

$$\therefore \quad \beta = \frac{D\,\lambda}{d} = \frac{1 \times 500 \times 10^{-9}}{10^{-3}} = 0{\cdot}5 \times 10^{-3}\text{ m}$$
$$= 0{\cdot}5\text{ mm}$$

Q. 5.19. In a Young's double slit experiment, the distance between the slits and the screen is 1 m. If the distance between the slits is 5 mm, the fringe width is found to be 0·1 mm. Calculate the wavelength of the light used. (*H.S.S.C.E. 1998*)

Ans. Here, $d = 5\text{ mm} = 5 \times 10^{-3}$; $\beta = 0{\cdot}1\text{ mm} = 10^{-4}\text{ m}$;

$$D = 1\text{ m}$$

Now, $$\beta = \frac{D\,\lambda}{d}$$

or $$\lambda = \frac{\beta d}{D} = \frac{10^{-4} \times 5 \times 10^{-3}}{1} = 5 \times 10^{-7}\ \text{m}$$

Q. 5.20. Draw a labelled diagram to show how interference can take place in thin transparent films by reflected light. *(I.S.C.E. 1997)*

Ans. Refer to Fig. 5.05.

Q. 5.21. Explain, how the law of conservation of energy is obeyed in the phenomenon of interference of light. *(P.S.S.C.E. 1999 S)*

Ans. Refer to section 5.10.

Q. 5.22. When two light waves interfere at some point to produce darkness, what becomes of the light energy ?

Ans. Refer to section 5.10.

abc TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 5.01. Why is interference pattern not detected, when the two coherent sources are far apart ?

Ans. The fringe width in the interference pattern is inversely proportional to the separation between the sources $\left(\beta \propto \frac{1}{d}\right)$. As the distance between the sources is increased, the fringe width goes on decreasing and at very large separation, it becomes too small to be detected.

Q. 5.02. If the two point-like coherent sources are placed infinitely close to each other, what happens to the interference pattern ?

Ans. The fringe width is inversely proportional to the separation between the sources. Therefore, when the coherent sources are placed very close to each other, the fringe width becomes very large and for infinitely close sources, even a single fringe may occupy the screen. As a result, the interference pattern may not be observed.

Q. 5.03. Can two electric bulbs, point-like and having filaments of the same material placed close together, produce interference ? Explain.

Ans. The two independent sources, such as two electric bulbs, even point-like, cannot act as coherent sources. So the sustained interference cannot be produced. The emission of light in the bulbs is due to millions of atoms in which electrons jump from higher orbit to the lower orbit. This process takes place in a time of about 10^{-8} s. So, the phase difference can remain constant for about 10^{-8} s only. In other words, in one second, the phase will change 10^8 times approximately. Such a fast variation in the interference pattern cannot be detected even with the most superior camera available so far. Therefore, the interference will be produced, but it will go undetected.

Q. 5.04. What change is observed in interference pattern of Young's double slit experiment, if one of the two slits is painted so that it transmits half the light intensity of the other ?

Ans. ***When the slit is not painted*** :

Here, $a_1^2 = a_2^2 = \text{I}$

or $a_1 = a_2 = \sqrt{\text{I}}$

Therefore, $\text{I}_{max} = (\sqrt{\text{I}} + \sqrt{\text{I}})^2 = \mathbf{4\ I}$

and $\text{I}_{min} = (\sqrt{\text{I}} - \sqrt{\text{I}})^2 = \mathbf{0}$

When one of the slits is painted :

Here, $a_1^2 = \text{I}\ ;\ a_2^2 = \frac{\text{I}}{2}$

or $a_1 = \sqrt{\text{I}}$ and $a_2 = \sqrt{\frac{\text{I}}{2}}$

$$\therefore \quad \text{I}_{max} = \left(\sqrt{\text{I}} + \sqrt{\frac{\text{I}}{2}}\right)^2 = \text{I}\left(1 + \frac{1}{\sqrt{2}}\right)^2 = \mathbf{2{\cdot}915\ I}$$

$$\text{and} \quad \text{I}_{min} = \left(\sqrt{\text{I}} + \sqrt{\frac{\text{I}}{2}}\right)^2 = \text{I}\left(1 - \frac{1}{\sqrt{2}}\right)^2 = \mathbf{0{\cdot}086\ I}$$

Therefore, on painting one of the two slits, intensity of maxima will *decrease* from 4 I to 2·915 I and the intensity of minima will *increase* from 0 to 0·086 I.

Q. 5.05. One method of producing two in-phase point sources of light for interference is to form two images of a point source by means of the two halves of a lens, which has been split along a diameter [Fig. 5.06].

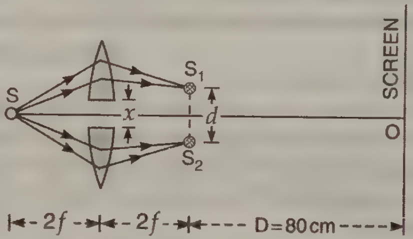

Fig. 5.06

(*a*) How must the two halves of a 5 cm focal length lens be placed to form two real image sources 0·24 cm apart and 20 cm from the source ?

(*b*) A screen is placed perpendicular to the principal axis and 80 cm from the image sources. What is the width of central maxima formed on the screen, if the wavelength of the light used is 5·4 × 10⁻⁵ cm ?

Ans. (*a*) As one lens, the two halves will form a single image on the principal axis of a point source located on the principal axis. As the two halves of the lens are separated, each half will produce an image *w.r.t.* its own principal axis. If the two halves are separated by a distance x, the principal axis of each half is now $x/2$ from the original axis through the source S. The source will then be at a distance $x/2$ off the principal axis of each half of the lens. Since the two images S_1 and S_2 are to be produced at a distance of 20 cm from the source S, $u = v = 20$ cm. As the focal length of the lens 5 cm, the images S_1 and S_2 will be produced at 20 cm from the source, if $u = v = \frac{20}{2} = 10$ cm *i.e.* the two halves should be placed at a distance of 10 cm from the source. As such, the image produced by each half of the lens will be $x/2$ on the other side of its principal axis. If d is distance between the two images S_1 and S_2, then

$$d = 4 \times \frac{x}{2} = 2x$$

Here, $d = 0{\cdot}24$ cm

$\therefore$ $2\,x = 0{\cdot}24$ cm or $x = \mathbf{0{\cdot}12}$ **cm**

(*b*) Now, width of the central maxima, $\beta_0 = \dfrac{D\lambda}{d}$

Here, $D = 80$ cm ; $d = 0{\cdot}24$ cm and $\lambda = 5{\cdot}4 \times 10^{-5}$ cm

$$\therefore \quad \beta_0 = \frac{80 \times 5{\cdot}4 \times 10^{-5}}{0{\cdot}24} = \mathbf{1{\cdot}8 \times 10^{-2}\ cm}$$

Q. 5.06. What will happen to the interference pattern in Young's experiment, if the source is not exactly on he centre line between the slits ?

Ans. In the normal position of the source *w.r.t.* the double slits [Fig. 5.07], the central bright fringe results at point O.

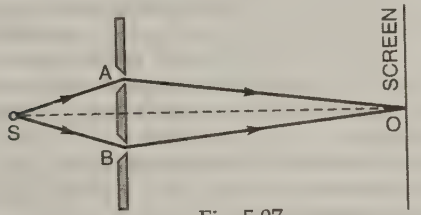

Fig. 5.07

It is because, the paths traversed by light along SAO and SBO are equal.

When the source is moved upward to position S′, the central fringe will occur at the point O′ on the screen [Fig. 5.08], where the paths of light S′AO′ and S′BO′ are equal.

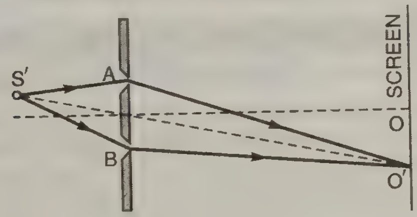

Fig. 5.08

Therefore, when the source of light is not exactly on the centre line and is moved upwards, the central bright fringe will move downwards.

Q. 5.07. Can you suggest reasons, why no interference is seen, when light reflects from the two surfaces of a windowpane ?

Ans. Suppose that the glass window pane is viewed in white light and the glass pane is say 0·2 cm thick. For light of wave-length 6000 Å, the path difference between the light reflected from the two surfaces will be $2\,\mu\,t$ *i.e.* $2 \times 1{\cdot}5 \times 0{\cdot}2 =$ 6·0 cm *i.e.* $\dfrac{0{\cdot}6}{6000 \times 10^{-8}} = 10{,}000$ wavelengths. In reflected system, the light will interfere destructively and will appear dark. It can be calculated that corresponding to light of wavelength 5999·7 Å, the path difference will be 10,000·5 wavelengths. Light of this wavelength will interfere constructively in reflected system. Thus, many wavelengths evenly distributed over the entire spectrum would be reflected and the net result would be, not coloured interference fringes, but a white reflected light.

If monochromatic light were used, we might obtain interference fringes. However, the surfaces of most [illegible] glass are too far from being optically flat to prod interference fringes.

Q. 5.08. Why does the colour of the oil film on the surface of water continuously change ?

Ans. The location of the bright and dark fringes produced by thin oil films depends upon the thickness of the film. The thickness of the oil film on the surface of water continuously varies and as a result, the position of the coloured fringes also varies. This appears as a variation in the colour of the oil films.

Q. 5.09. If a thin soap film is arranged vertically, the coloured horizontal interference bands move downwards and at the same time change their width. After some time, a rapidly growing dark spot appears at the top of the film, which bursts shortly afterwards. Explain, why.

Ans. In a thin soap film, the coloured bands are produced due to interference of light waves reflected from the upper and lower surfaces of the soap film. The path difference between the light waves reflected from the two surfaces depends upon the thickness of the film at the point of reflection and the wavelength of the light waves. Therefore, each of the horizontal interference bands corresponds to some definite thickness of the film.

In a soap film arranged vertically, water flows gradually from upper part to the lower part of the film. Due to this, the lower part gradually grows thicker, while the upper part becomes thinner. The points corresponding to some definite thickness are gradually displaced and the respective interference bands move downwards with them. After some time, the film in the upper part becomes of the thickness equal to one quarter of the shortest wavelength of the incident light. At this point of the film, the light waves of the wavelengths reflected from the two surfaces of the film will interfere destructively and the film will appear dark at that point in the reflected light.

Q. 5.10. Lenses are often coated with a thin film to reduce the intensity of reflected light.

(*a*) If the index of refraction of the coating is 1·3, what is the smallest thickness that will give minimum reflection of yellow light (λ = 5800 Å) ?

(*b*) Such lenses often show a faint purple colour by reflected light. Why ?

Ans. (*a*) When light falls on a lens ($\mu = 1{\cdot}5$) coated with a thin film ($\mu = 1{\cdot}3$), a part of light gets partially reflected from the film and partially from the lens. The path difference between the light rays reflected from film and glass depends upon the thickness of the film. Since in both the cases, reflection takes place from denser medium, no extra path difference (or phase difference) is created. A film of thickness $\lambda/4$ will give a total path difference of $\lambda/2$ and the two reflected light waves will interfere destructively. In this manner, a thin film coated on the lens helps to reduce the intensity of the reflected light.

The wavelength of yellow light inside the film,

$$\lambda = \frac{\lambda_{air}}{\mu_{film}} = \frac{5800}{1{\cdot}3} = 4462\ \text{Å}$$

For minimum reflection of yellow light, the thickness of film is given by

$$t = \frac{\lambda}{4} = \frac{4462}{4} = \mathbf{1115{\cdot}5\text{Å}}$$

(*b*) If the film is of proper thickness to produce destructive interference of yellow light, red light and violet light will be some what reflected. The reflected light will, therefore, have a reddish or purple tinge.

Q. 5.11. An observer sees a green fringe passing through a given point in an oil film. Would other obser-ver looking at the same point necessarily see the green fringe there ? Explain by writing down the necessary relation.

Ans. The path difference between the two rays is $2\mu t \cos r$. Therefore, for the given oil film, μ and t are constant and the path difference depends only on angle of refraction, which in turn depends on angle of incidence. It is not possible that two different observers will look at a point in the same direction and therefore, for the two observers, the path difference will not be same. Hence, the other observer may not necessarily see green fringe there.

FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. What are coherent sources of light ? Two independent sources of light cannot be coherent. Explain. Why ? *(P.S.S.C.E. 2001)*
2. Two sources of intensity I_1 and I_2 undergo interference in Young's double slit experiment. Show that
$$\frac{I_{max}}{I_{min}} = \left(\frac{a_1 + a_2}{a_1 - a_2}\right)^2,$$
where a_1 and a_2 are the amplitudes of disturbance for two sources S_1 and S_2. *(C.B.S.E. 2001 S)*
3. What are coherent sources of light ? Deduce an expression for the intensity at a point on the screen in Young's double slit experiment. *(C.B.S.E. 2001)*
4. Describe Young's double slit experiment. How can it be used to determine the wavelength of a light source ? Give three examples of interference.
5. What do you understand by fringe width ? Derive an expression for fringe width in the interference pattern. *(H.P.S.S.C.E. 1994)*
6. Light after passing through two adjacent narrow slits falls on a screen. Find the expression for fringe width. *(H.S.S.C.E. 1994)*
7. Derive the expression for the fringe width in Young's double slit interference. *(H.S.S.C.E. 2001 ; P.S.S.C.E. 1999 ; C.B.S.E. 1997)*
8. Prove that the fringe width of both the bright and dark fringes in interference is same in Young's double slit experiment. *(H.P.S.S.C.E. 2000, 1999 S)*
9. Prove that the law of conservation of energy is obeyed during interference of light. *(P.S.S.C.E. 2002, 2001, 2000)*
10. Consider a monochromatic ray incident on a film of uniform thickness t and refractive index μ. Derive the condition for a dark fringe, when viewed from the same side of the film. *(I.S.C.E. 1997)*
11. Discuss the conditions for film to appear bright and dark, when viewed from the other side of the film.
12. Explain colour formation in this film. *(H.S.S.C.E. 2001)*

FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. Draw a schematic labelled diagram for the experimental determination of the wavelength of light by Young's interference experiment. Derive the formula used. *(I.S.C.E. 1994)*
2. Deduce the conditions of maxima and minima in Young's double slit experiment and find an expression for fringe width.
3. State the necessary conditions for sustained interference pattern. Derive an expression for fringe width using Young's double slit method for interference of light. *(P.S.S.S.C.E. 2000)*
4. Derive an expression for fringe width using Young's double slit method for interference of light. What will happen, if the distance between the two slits becomes nearly zero ? *(P.S.S.S.C.E. 2002, 2000)*
5. Derive an expression for fringe width in Young's double slit experiment for interference of light. What will be the effect on the fringes formed in this experiment, if whole of the apparatus is immersed in water ? *(P.S.S.C.E. 2001)*
6. A part of Young's double slit experimental set-up has been shown in the Fig. 5.09.

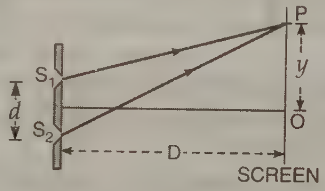

Fig. 5.09

Find the path difference and hence the phase difference of the waves arriving at P from the slits S_1 and S_2. State the condition for the waves arriving at P from the two slits to interfere constructively. Find the fringe width in terms of D, d and the wavelength λ.

FREQUENTLY ASKED NUMERICAL QUESTIONS

For Practice

Type A. On Slit width and Intensities of maxima and minima

1. If the two slits in Young's experiment have width ratio 1 : 4, deduce the ratio of intensity at maxima and minima in interference pattern. *(H.P.S.S.C.E. 1995)* [**Ans.** 9 : 1]
2. Two coherent sources whose intensity ratio is 16 : 1 produce interference fringes. Calculate the ratio of intensity of maxima and minima in the fringe system. *(H.S.S.C.E. 2001)* [**Ans.** 25 : 9]
3. Two coherent sources whose intensity ratio is 81 : 1 produce interference fringes. Calculate the ratio of intensity of maxima and minima in the fringe system. *(C.B.S.E. 1995)* [**Ans.** 25 : 16]
4. In Young's interference experiment, the ratio of intensity at the maxima and minima in the interference pattern is 25 : 9. What will be the ratio of widths of the two slits ? *(P.S.S.C.E. 1999 S)* [**Ans.** 16 : 1]

ype B. On Young's double slit experiment

5. In a Young's double slit experiment, interference fringes were produced on a screen placed at 1·5 m from the two slits 0·3 mm apart and illuminated by light of 6400 Å. Find the fringe width. *(H.S.S.C.E. 2002)* [**Ans.** 3·2 mm]

6. In a Young's double slit experiment, light has a frequency of 6×10^{-14} s^{-1}. The distance between the centres of adjacent bright fringes is 0·75 mm. If the screen is 1·5 m away, what is the distance between the slits ? [**Ans.** 0·1 cm]

7. In Young's double slit experiment, the two slits are 0·5 mm apart. The screen is placed 1 m away from the slits. The distance of 11th fringe from the first fringe is 1·0 cm. Calculate the wavelength of light used. *(H.S.S.C.E. 1999 S)* [**Ans.** 5000 Å]

8. Light of wavelength 5000 Å is incident on a double slit. If the overall separation of 10 fringes on a screen 200 cm away is 10 cm, find the distance between the two slits. *(P.S.S.C.E. 2002)* [**Ans.** 0·1 mm]

9. Green light of wavelength 5100 Å from a narrow slit is incident on a double slit. If the overall separation of 10 fringes on a screen 200 cm away is 2 cm, find slit separation. *(H.P.S.S.C.E. 1993)* [**Ans.** 0·51 mm]

10. In Young's experiment, the distance of screen from the two slits is 1·0 m. When a light of wavelength 6000 Å is allowed to fall on the slits, the width of the fringes obtained on the screen is 2·0 mm. Determine (*i*) distance between the two slits (*ii*) the width of the fringe, if the wavelength of incident light is 4800 Å. [**Ans.** 3×10^{-4} m, $1·6\times 10^{-3}$ m]

11. The fringe width in a Young's double slit interference pattern is $2·4 \times 10^{-4}$ m, when red light of wavelength 6400 Å is used. By how much will it change, if blue light of wavelength 4000 Å is used ? [*H.S.S.C.E. 2002*] [**Ans.** $0·9 \times 10^{-4}$ m (decrease)]

12. In Young's double slit experiment, the fringe width obtained is 0·6 cm, when light of wavelength 4000 Å is used. If the distance between the screen and the slit is reduced to half, what should be the wavelength of light used to obtain fringes 0·5 cm wide ? *(P.S.S.C.E. 1999)* [**Ans.** 6666·7 Å]

13. In Young's double slit experiment, the width of the fringes obtained with light of wavelength 4500 Å is 1·8 mm. If the distance between the two slits is 0·3 mm, find the distance of the screen from the slits. What will be the fringe width, if the entire apparatus is immersed in water of refractive index 4/3. [**Ans.** 1·2 m, 1·35 mm]

14. In Young's double slit experiment, the slits are separated by 0·28 mm and the screen is 1·4 m away. The distance between the central bright fringe and the fourth bright fringe is 1·2 cm. Find the frequency of light used. Use the standard value of velocity of light. *(P.S.S.C.E. 1997 S)* [**Ans.** 5×10^{14} Hz]

15. In a Young's double slit experiment, the slits are separated by 0·56 mm and the screen is placed 2·8 m away. The distance between the central bright fringe and the fifth bright fringe is measured to be 1·5 cm. Determine the wavelength of light used in the experiment. *(H.S.S.C.E. 1998 S)* [**Ans.** 6×10^{-7} m]

16. The two slits in Young's double slit experiment are separated by a distance of 0·03 cm. When light of wavelength 5000 Å falls on the slits, an interference pattern is produced on the screen 1·5 m away. Find the distance of 4th bright fringe from the central maximum. *(C.B.S.E. 1995)* [**Ans.** 1 cm]

17. In Young's double slit experiment, light of wavelength 5000 Å is used. The third bright band on the screen is formed at a distance of 1 cm from the central bright band. If the screen is at a distance of 1·5 m from the centre of the narrow slits, calculate the separation between the slits. *(P.S.S.C.E. 1994)* [**Ans.** $2·25\times 10^{-4}$ m]

18. Two parallel slits used for Young's interference experiment are 0·5 mm apart. The screen on which fringes are projected is 1·5 m from the slits. How far is the third dark fringe from the central bright one ? Wavelength of light used is 6000 Å. [**Ans.** 0·45 cm]

19. In Young's double-slit experiment, two slits are separated by 3 mm distance and illuminated by light of wavelength 480 nm. The screen is at 2 m from the plane of the slits. Calculate the separation between the 8th bright fringe and the 3rd dark fringe observed with respect to the central bright fringe. *(C.B.S.E. 2001)* [**Ans.** 1·76 mm]

20. In a Young's double slit experiment, red light of wavelength 6000 Å is used and the *n*th bright fringe is obtained at a point P on the screen. Keeping the same setting, the source is replaced by green light of 5000 Å and now (*n* + 1)th bright fringe is obtained at the point P. Calculate the value of *n*. *(H.S.S.C.E. 2002)* [**Ans.** 5]

21. Laser light of wavelength 630 nm incident on a pair of slits produces an interference pattern in which the bright fringes are separated by 8·3 mm. A second light produces an interference pattern in which the bright fringes are separated by 7·6 mm. Find the wavelength of the second light. *(I.S.C.E. 1994)* [**Ans.** 576·87 nm]

22. In Young's double slit experiment, light of wavelength 6000 Å is used to get an interference pattern on a screen. The fringe width changes by 1·5 mm, when the screen is brought towards the double slit by 50 cm. Find the distance between the two slits. *(H.S.S.C.E. 2002)* [**Ans.** 0·2 mm]

23. In young's double slit experiment, the slits are 0·2 mm apart. The interference fringes for light of wavelength 6000 Å are formed on a screen distant 1·5 m from the slits. Calculate (*i*) the angular position of the third maxima, (*ii*) the angular position of the fifth minima and (*iii*) the fringe width. [**Ans.** (*i*) 0·009 rad (*ii*) 0·0135 rad (*iii*) 4·5 mm]

Type C. On Colour of thin films

24. Find the minimum thickness of a film which will strongly reflect the light of wavelength 589 nm, when incident normally on it. The refractive index of the material of the film is 1·25. [**Ans.** 117·8 nm]

25. Light of wavelength 6000 Å is incident on a thin film of refractive index 1·5, such that angle of refraction into the film in 60°. Calculate the smallest thickness of the film, which will make it appear dark by reflection. [**Ans.** 4×10^{-7} m]

26. A soap film of refractive index 4/3 is illuminated by white light incident at an angle 45°. The transmitted light is examined in a spectroscope and a bright band is found to be at 6000 Å. Find the minimum thickness of the film. [**Ans.** $2·654 \times 10^{-7}$ m]

MISCELLANEOUS PROBLEMS

27. The width of one of the two slits in a Young's double slit experiment is double of the other slit. Assuming that the amplitude of the light coming from a slit is proportional to the slit width, find the ratio of the maximum to the minimum intensity in the interference pattern. [**Ans.** 9]

28. Two coherent sources of intensity ratio β interfere. Prove that in interference pattern,

$$\frac{I_{max} - I_{min}}{I_{max} + I_{min}} = \frac{2\sqrt{\beta}}{1+\beta}$$

29. Two sources of intensities I and 4 I are used in an interference experiment. Obtain intensities at points, where the waves from two sources superimpose with a phase difference of (*i*) 0 (*ii*) $\pi/2$ and (*iii*) π. (*Roorkee, 1991, 1987*) **[Ans.** (*i*) 9 I ; (*ii*) 5 I ; (*iii*) I]

30. Find the maximum intensity in case of interference of n identical waves each of intensity I_0, if the interference is (*a*) coherent and (*b*) incoherent. (*I.I.T. 1986*) **[Ans.** (*a*) $n^2 I_0$; (*b*) $n I_0$]

31. A double slit arrangement produces interference fringes for sodium light ($\lambda = 5890$ Å) that are 0·40° apart. What is the angular fringe separation, if the entire arrangement is immersed in water ? Given that μ for water= 4/3. (*Rooekee, 1988*) **[Ans.** 0·30°]

32. In a Young's double slit experiment, the angular width of a fringe formed on a distant screen is 0·12°. If the wavelength of light used is 4800 Å, find the distance between the slits. **[Ans.** $2{\cdot}29 \times 10^{-4}$ m]

33. The optical path of a monochromatic light is the same, if it goes through 2·0 cm of glass or 2·25 cm of water. If the refractive index of water is 4/3, what is the refractive index of glass ? **[Ans.** 1·5]

34. Monochromatic light of wavelength 6000 Å is used in a young's double slit experiment. One of the slits is covered by a transparent film of thickness $1{\cdot}2 \times 10^{-5}$ m having refractive index 1·4. How many fringes will shift due to the introduction of the film ? **[Ans.** 8]

35. In Young's double slit experiment, the central bright fringe produced by light of wavelength 5600 Å shifts to the position of 5th bright fringe, when a thin transparent film of refractive index 1·28 is introduced in the path of light from one of the two slits. Find the thickness of the film. **[Ans.** 10^{-5} m]

36. A beam of light consisting of two wavelength 4800 Å and 6000 Å is used to obtain interference fringes in a double slit experiment. The distance between the slits is 1·8 mm and the distance of screen from the plane of slits is 1·2 m. (*a*) Find the distance of the fifth bright fringe from the centre of the screen for the wavelength 6000 Å. (*b*) What is the least distance from the centre of the screen, where the bright fringes due to both the wavelengths coincide ? **[Ans.** (*a*) 2 mm (*b*) 1·6 mm]

37. A double-slit apparatus is immersed in a liquid of refractive index 1·33. It has slit separation of 1 mm and distance between the plane of the slits and screen is 1·33 m. The slits are illuminated by a parallel beam of light, whose wavelength in air is 6300 Å. (*a*) Calculate the fringe-width. (*b*) One of the slits of the appratus is covered by a thin glass sheet of refractive index 1·53. Find the smallest thickness of the sheet to bring the adjacent minimum on the axis. (*I.I.T. 1996*) **[Ans.** (*a*) 0·63 mm ; (*b*) $1{\cdot}579 \times 10^{-6}$ m]

38. Find the ratio of the intensity at the centre of a bright fringe to the intensity at the point one quarter of the distance between two fringes from the centre. **[Ans.** 2]

39. In a Young's double slit experiment, two slits are 1·5 mm apart and a screen is placed at a distance 1·2 m from the plane of the slits. The slits are illuminated with light of wavelength 6000 Å. Find the minimum distance from the central maximum for which the intensity is half of the maximum intensity. **[Ans.** $1{\cdot}2 \times 10^{-4}$ m]

40. A thin film is 4000 Å thick. White light from an extended source falls normally on the film. If the refractive index of film is 1·5, what wavelength within the visible spectrum will be intensified in the reflected beam, if visible range of the spectrum is 3900 Å to 7800 Å ? **[Ans.** 4800 Å]

41. White light is incident on a soap film at an angle $\sin^{-1} 4/5$ and the reflected light on examination by a spectroscope shows dark bands. The consecutive dark bands correspond to wavelengths 6100 Å and 6000 Å. If the refractive index of the film is 4/3, calculate the thickness. **[Ans.** $1{\cdot}716 \times 10^{-5}$ m]

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. Proceed as in solved problem no. 5.01 or VSQ 5.16.

2. Here, $\dfrac{I_1}{I_2} = \dfrac{a_1^2}{a_2^2} = \dfrac{16}{1}$ or $\dfrac{a_1}{a_2} = \dfrac{4}{1}$

$$\therefore \quad \frac{I_{max}}{I_{min}} = \frac{(a_1+a_2)^2}{(a_1-a_2)^2} = \frac{(4+1)^2}{(4-1)^2} = \frac{25}{9}$$

3. Proceed as in problem no. 2.

4. Here, $\dfrac{I_{max}}{I_{min}} = \dfrac{(a_1+a_2)^2}{(a_1-a_2)^2} = \dfrac{25}{9}$ or $\dfrac{a_1+a_2}{a_1-a_2} = \dfrac{5}{3}$

or $\dfrac{(a_1+a_2)+(a_1-a_2)}{(a_1+a_2)-(a_1-a_2)} = \dfrac{5+3}{5-3}$ or $\dfrac{a_1}{a_2} = \dfrac{4}{1}$

Now, $\dfrac{w_1}{w_2} = \dfrac{a_1^2}{a_2^2} = \dfrac{16}{1}$

5. Now, $\beta = \dfrac{D\lambda}{d} = \dfrac{1{\cdot}5 \times 6400 \times 10^{-10}}{0{\cdot}3 \times 10^{-3}}$

$= 3{\cdot}2 \times 10^{-3}$ m = **3·2 mm**

6. Here, $\lambda = \dfrac{c}{v} = \dfrac{3 \times 10^8}{6 \times 10^{14}} = 5 \times 10^{-7}$ m,

$\beta = 0{\cdot}75$ mm $= 0{\cdot}75 \times 10^{-3}$ m

Now, $d = \dfrac{D\lambda}{\beta} = \dfrac{1{\cdot}5 \times 5 \times 10^{-7}}{0{\cdot}75 \times 10^{-3}} = 10^{-3}\text{m} = \mathbf{0{\cdot}1\ cm}$

7. The distance of 11th fringe from the first fringe is equal to width of 10 fringes.

$\therefore$ $10\,\beta = 1{\cdot}0$ cm or $\beta = 0{\cdot}1$ cm $= 10^{-3}$ m,

$d = 0{\cdot}5$ mm $= 0{\cdot}5 \times 10^{-3}$ m, D = 1 m

Now, $\lambda = \dfrac{\beta d}{D} = \dfrac{10^{-3} \times 0{\cdot}5 \times 10^{-3}}{1} = 5 \times 10^{-7}$ m

= **5000 Å**

8. Proceed as in problem no. 7.

9. Proceed as in problem no. 7.

10. (*i*) $d = \dfrac{D\lambda}{\beta} = \dfrac{1{\cdot}0 \times 6000 \times 10^{-10}}{2{\cdot}0 \times 10^{-3}} = \mathbf{3 \times 10^{-4}\ m}$

(*ii*) $\beta = \dfrac{D\lambda}{d} = \dfrac{1{\cdot}0 \times 4800 \times 10^{-10}}{3 \times 10^{-4}} = \mathbf{1{\cdot}6 \times 10^{-3}\ m}$

11. ***When red light is used :***

$\beta = \dfrac{D\lambda}{d}$ or $2{\cdot}4 \times 10^{-4} = \dfrac{D \times 6400 \times 10^{-10}}{d}$

or $\dfrac{D}{d} = \dfrac{2{\cdot}4 \times 10^{-4}}{6400 \times 10^{-10}}$

When blue light is used :

$$\beta' = \frac{D\lambda'}{d} = \frac{2\cdot4\times10^{-4}\times4000\times10^{-10}}{6400\times10^{-10}}$$

$$= 1{\cdot}5\times10^{-4}\text{ m}$$

$$\therefore\quad \beta-\beta' = 2{\cdot}4\times10^{-4}-1{\cdot}5\times10^{-4}$$

$$= \mathbf{0{\cdot}9\times10^{-4}\ m\ (decrease)}$$

12. Proceed as in solved problem no. 5.02.

13. Proceed as in solved problem no. 5.09.

14. Here, $d = 0{\cdot}28\text{ mm} = 0{\cdot}28\times10^{-3}\text{ m}$,

$y_4 = 1{\cdot}2\text{ cm} = 1{\cdot}2\times10^{-2}$,

$D = 1{\cdot}4\text{ m}$

Now, $y_4 = \dfrac{4D\lambda}{d}$ or $\lambda = \dfrac{y_4\times d}{4D}$

or $$\lambda = \frac{1\cdot2\times10^{-2}\times0\cdot28\times10^{-3}}{4\times1\cdot4} = 6\times10^{-7}\text{m}$$

$$\therefore\quad \nu = \frac{c}{\lambda} = \frac{3\times10^{8}}{6\times10^{-7}} = \mathbf{5\times10^{14}\ Hz}$$

15. Proceed as in problem no. 14.

16. $$y_4 = \frac{4D\lambda}{d} = \frac{4\times1\cdot5\times5000\times10^{-10}}{0\cdot03\times10^{-2}}$$

$$= 10^{-2}\text{ m} = \mathbf{1\ cm}$$

17. Proceed as in problem no. 16.

18. $$y_3' = \frac{5D\lambda}{2d} = \frac{5\times1\cdot5\times6000\times10^{-10}}{2\times0\cdot5\times10^{-3}} = 4{\cdot}5\times10^{-3}\text{ m}$$

$$= \mathbf{0{\cdot}45\ cm}$$

19. $$y_8 - y_3' = \frac{8D\lambda}{d} - \frac{5D\lambda}{2d} = \frac{11D\lambda}{2d}$$

$$= \frac{11\times2\times480\times10^{-9}}{2\times3\times10^{-3}} = 1{\cdot}76\times10^{-3}\text{ m}$$

$$= \mathbf{1{\cdot}76\ mm}$$

20. Let y be distance of point P from the centre of screen.

When red light (λ) is used :

As nth bright fringe is formed at point P,

$$y = \frac{nD\lambda}{d} = \frac{nD\times6000\times10^{-10}}{d} \qquad ...(i)$$

When blue light (λ') is used :

As $(n+1)$th bright fringe is formed at point P,

$$y = \frac{(n+1)D\lambda'}{d} = \frac{(n+1)D\times5000\times10^{-10}}{d} \qquad ...(ii)$$

From equations (*i*) and (*ii*), we have

$$\frac{nD\times6000\times10^{-10}}{d} = \frac{(n+1)D\times5000\times10^{-10}}{d}$$

or $6n = 5(n+1)$ or $\mathbf{n = 5}$

21. Now, $\beta = \dfrac{D\lambda}{d}$

When D and d are kept fixed,

$$\frac{\beta}{\beta'} = \frac{\lambda}{\lambda'} \quad\text{or}\quad \lambda' = \frac{\lambda\beta'}{\beta} = \frac{630\times7\cdot6}{8\cdot3} = \mathbf{576{\cdot}87\ nm}$$

22. Now, $\beta = \dfrac{D\lambda}{d}$

Since λ and d are constant, change in fringe width,

$$d\beta = \frac{(dD)\lambda}{d}$$

or $$d = \lambda\frac{dD}{d\beta} = \frac{6000\times10^{-10}\times50\times10^{-2}}{1\cdot5\times10^{-3}}$$

$$= 2\times10^{-4}\text{ m} = \mathbf{0{\cdot}2\ mm}$$

23. (*i*) The angular position of nth maximum,

$$\theta_n = \frac{y_n}{D} = \frac{nD\lambda}{d}\Big/D = \frac{n\lambda}{d}$$

$$\therefore\quad \theta_3 = \frac{3\times6000\times10^{-10}}{0\cdot2\times10^{-3}} = \mathbf{0{\cdot}009\ rad}$$

(*ii*) The angular position of the fifth minima,

$$\theta_5' = \frac{y_5'}{D} = \frac{9D\lambda}{2d}\Big/D = \frac{9\lambda}{2d}$$

$$= \frac{9\times6000\times10^{-10}}{2\times0\cdot2\times10^{-3}} = \mathbf{0{\cdot}0135\ rad}$$

(*iii*) $$\beta = \frac{D\lambda}{d} = \frac{1\cdot5\times6000\times10^{-10}}{0\cdot2\times10^{-3}}$$

$$= 4{\cdot}5\times10^{-3}\text{ m} = \mathbf{4{\cdot}5\ mm}$$

24. In reflected system, film appears bright (strongly reflected), when

$$2\mu t\cos r = (2n+1)\frac{\lambda}{2}$$

For the thickness of film to be minimum, $n = 0$ *i.e.*

$$2\mu t\cos r = \lambda/2$$

For normal incidence, $i = 0$ and consequently $r = 0$.

$$\therefore\quad 2\mu t = \lambda/2$$

or $$t = \frac{\lambda}{4\mu} = \frac{589}{4\times1\cdot25} = \mathbf{117{\cdot}8\ nm}$$

25. For film to appear dark in reflected system,

$$2\mu t\cos r = n\lambda$$

For the thickness of film to be smallest, $n = 1$

i.e. $2\mu t\cos r = \lambda$

or $$t = \frac{\lambda}{2\mu\cos r} = \frac{6000\times10^{-10}}{2\times1\cdot5\cos60^\circ} = \mathbf{4\times10^{-7}\ m}$$

26. In transmitted system, film appears bright, when

$$2\mu t\cos r = n\lambda$$

For the thickness of film to be minimum, $n = 1$

i.e. $2\mu t\cos r = \lambda$

or $$t = \frac{\lambda}{2\mu\cos r} = \frac{\lambda}{2\sqrt{\mu^2\cos^2 r}} = \frac{\lambda}{2\sqrt{\mu^2(1-\sin^2 r)}}$$

$$= \frac{\lambda}{2\sqrt{\mu^2-\sin^2 i}} \qquad (\because\ \mu\sin r = \sin i)$$

$$= \frac{6000\times10^{-10}}{2\sqrt{(4/3)^2-\sin^2 45^\circ}} = \frac{6000\times10^{-10}}{2\sqrt{16/9-1/2}}$$

$$= \mathbf{2{\cdot}654\times10^{-7}m}$$

27. Let $2a$ and a be amplitudes of light from the two slits.

Then, $$\frac{I_{max}}{I_{min}} = \frac{(2a+a)^2}{(2a-a)^2} = \mathbf{9}$$

28. Here, $\dfrac{I_1}{I_2} = \beta$ or $\dfrac{a_1^2}{a_2^2} = \beta$ or $\dfrac{a_1}{a_2} = \sqrt{\beta}$

or $a_1 = \sqrt{\beta}\,a_2$

$$\therefore\quad I_{max} = (a_1+a_2)^2 = (\sqrt{\beta}\,a_2+a_2)^2$$

$$= (\beta+1+2\sqrt{\beta})\,a_2^2$$

$$I_{min} = (a_1-a_2)^2 = (\sqrt{\beta}\,a_2-a_2)^2$$

$$= (\beta+1-2\sqrt{\beta})\,a_2^2$$

$$\therefore \quad \frac{I_{max}-I_{min}}{I_{max}+I_{min}}$$

$$= \frac{(\beta+1+2\sqrt{\beta})\,a_2^2-(\beta+1-2\sqrt{\beta})\,a_2^2}{(\beta+1+2\sqrt{\beta})\,a_2^2+(\beta+1-2\sqrt{\beta})\,a_2^2}$$

$$= \frac{4\sqrt{\beta}}{2(\beta+1)} = \frac{2\sqrt{\beta}}{1+\beta}$$

29. Here, $I_1 = I$, $I_2 = 4I$

Resultant intensity is given by

$$I' = I_1 + I_2 + 2\sqrt{I_1 I_2}\cos\phi$$

(i) When $\phi = 0$:

$$I' = I + 4I + 2\sqrt{I \times 4I}\cos 0 = I + 4I + 4I = 9I$$

(ii) When $\phi = \pi/2$:

$$I' = I + 4I + 2\sqrt{I \times 4I}\cos\pi/2 = I + 4I + 0 = 5I$$

(iii) When $\phi = \pi$:

$$I' = I + 4I + 2\sqrt{I \times 4I}\cos\pi = I + 4I - 4I = I$$

30. ***(a) When interference is coherent :***

When two waves of intensities I_1 and I_2 having a phase difference ϕ interfere, the resultant intensity is given by

$$I = I_1 + I_2 + 2\sqrt{I_1 I_2}\cos\phi \qquad ...(i)$$

The intensity will be maximum, when

$$\phi = 0 \quad \text{or} \quad \cos\phi = 1$$

$$\therefore \quad I_{max} = I_1 + I_2 + 2\sqrt{I_1 I_2} = \left(\sqrt{I_1}+\sqrt{I_2}\right)^2$$

In case, n identical waves each of intensity I_0 interfere,

$$I_{max} = \left(\sqrt{I_0}+\sqrt{I_0}+\sqrt{I_0}+\ldots\ldots n \text{ times}\right)^2 = (n\sqrt{I_0})^2 = n^2 I_0$$

(b) When interference is incoherent :

In such a case, phase difference ϕ between the two waves varies randomly with time. Since the average value of $\cos\phi$ over a complete cycle is zero, the equation (i) becomes

$$I = I_1 + I_2 + 2\sqrt{I_1 I_2} \times 0 = I_1 + I_2$$

In case, n identical waves each of intensity I_0 interfere,

$$I_{max} = I_0 + I_0 + I_0 + \ldots\ldots\ldots n \text{ times} = n\,I_0$$

31. If fringes of width β are produced on a screen held at a distance D from the slits, then angular fringe width

$$\theta = \frac{\beta}{D} = \frac{D\lambda}{d}\Big/ D = \frac{\lambda}{d}$$

When the apparatus is immersed in water :

Wavelength of light inside water,

$$\lambda' = \frac{\lambda}{\mu}$$

Therefore, angular fringe width,

$$\theta' = \frac{\lambda'}{d} = \frac{\lambda}{\mu d} = \frac{\beta\,\theta}{\mu} = \frac{0{\cdot}40^\circ}{4/3} = 0{\cdot}30^\circ$$

32. Angular width, $\theta = \dfrac{\lambda}{d}$

$$\therefore \quad \frac{\lambda}{d} = 0{\cdot}12^\circ = \frac{0{\cdot}12^\circ}{180^\circ} \times \pi \text{ rad}$$

$$\text{or} \quad d = \frac{\lambda \times 180^\circ}{0{\cdot}12^\circ \times \pi} = \frac{4800\times10^{-10}\times180^\circ}{0{\cdot}12^\circ\times\pi}$$

$$= 2{\cdot}29 \times 10^{-4}\text{ m}$$

33. If x_1 and x_2 are distances travelled by light in glass and water respectively, then

$$^{a}\mu_g \times x_1 = {}^{a}\mu_w \times x_2 \quad \text{or} \quad {}^{a}\mu_g \times 2{\cdot}0 = \frac{4}{3}\times 2{\cdot}25$$

$$\text{or} \quad {}^{a}\mu_g = \frac{4\times2{\cdot}25}{3\times2{\cdot}0} = 1{\cdot}5$$

34. Suppose that thickness of the transparent film is t. When the light travels through the film, its optical path is $\mu\,t$ (as air is replaced by material of refractive index μ). Thus, when light travels in the transparent film, the optical path changes by $\mu\,t - t$ *i.e.* $(\mu - 1)\,t$.

One fringe shifts, when optical path changes by one wavelength. Therefore, number of fringes shifted due to introduction of the film,

$$n = \frac{(\mu-1)\,t}{\lambda} = \frac{(1{\cdot}4-1)\times1{\cdot}2\times10^{-5}}{6000\times10^{-10}} = 8$$

35. Proceed as in problem no. 34.

36. **(a)** $$y_5 = \frac{5\,D\lambda}{d} = \frac{5\times1{\cdot}2\times6000\times10^{-10}}{1{\cdot}8\times10^{-3}}$$

$$= 2\times10^{-3}\text{m} = 2\text{ mm}$$

(b) Suppose that n_1th bright fringe of wavelength λ_1 (= 4800 Å) coincides with n_2th bright fringe of wavelength λ_2 (= 6000 Å). Then,

$$\frac{n_1\,D\lambda_1}{d} = \frac{n_2\,D\lambda_2}{d} \quad \text{or} \quad \frac{n_1}{n_2} = \frac{\lambda_2}{\lambda_1}$$

$$\text{or} \quad \frac{n_1}{n_2} = \frac{6000}{4800} = \frac{5}{4}$$

Since n_1 and n_2 are integers, the minimum values of n_1 and n_2 satisfying the above equation are 5 and 4 respectively. The distance of 5th bright fringe for wavelength 4800 Å (or 4th bright fringe for wavelength 6000 Å) is given by

$$y_5 = \frac{5\,D\lambda}{d} = \frac{5\times1{\cdot}2\times4800\times10^{-10}}{1{\cdot}8\times10^{-3}}$$

$$= 1{\cdot}6\times10^{-3}\text{ m} = 1{\cdot}6\text{ mm}$$

37. **(a)** When apparatus is immersed in a liquid of refractive index μ,

$$\beta' = \frac{D\lambda'}{d} = \frac{D}{d}\left(\frac{\lambda}{\mu}\right) = \frac{1{\cdot}33\times6300\times10^{-10}}{1\times10^{-3}\times1{\cdot}33}$$

$$= 0{\cdot}63\times10^{-3}\text{ m} = 0{\cdot}63\text{ mm}$$

(b) Refractive index of glass sheet w.r.t. water,

$$\mu' = \frac{1{\cdot}53}{1{\cdot}33} = 1{\cdot}15$$

Suppose that one of the slit is covered with the glass sheet of thickness t. When light travels through the sheet, the optical path travelled is $\mu' t$ and hence the optical path changes by $\mu'\,t - t$ *i.e.* $(\mu' - 1)\,t$. The adjacent (first) minimum will shift on axis (centre of screen), if the change in optical path is $\dfrac{\lambda'}{2}$. Thus,

$$(\mu'-1)\,t = \frac{\lambda'}{2} \quad \text{or} \quad (\mu'-1)\,t = \frac{\lambda}{2\mu}$$

$$\text{or} \quad t = \frac{\lambda}{2\mu(\mu'-1)} = \frac{6300\times10^{-10}}{2\times1{\cdot}33\,(1{\cdot}15-1)}$$

$$= 1{\cdot}579\times10^{-6}\text{ m}$$

38. If ϕ is phase difference, when two waves of amplitudes a_1 and a_2 superpose each other at a point, then

$$I = a_1^2 + a_2^2 + 2\,a_1\,a_2\cos\phi$$

In case, two waves have same amplitude a,

$$I = a^2 + a^2 + 2\,a^2\cos\phi = 2\,a^2\,(1+\cos\phi)$$

let I_1 be intensity at the centre of a bright fringe. A bright fringe is formed, when ϕ is equal to 0.

$\therefore \quad I_1 = 2a^2(1+\cos 0) = 4a^2$

The points at the centre of the two bright fringes differ in phase by 2π. Therefore, points at distance one quarter of the distance between two bright fringes will differ in phase by $\frac{2\pi}{4}$ *i.e.* $\pi/2$.

If I_2 is intensity at such a point, then

$$I_2 = 2a^2(1+\cos \pi/2) = 2a^2$$

$$\therefore \quad \frac{I_1}{I_2} = \frac{4a^2}{2a^2} = 2$$

39. Refer to problem no. 38.

The intensity at the bright fringe $= 4a^2$

Let ϕ be phase difference between the light waves, when the intensity is one half of the maximum intensity (*i.e.* bright fringe). Then,

$$2a^2(1+\cos\phi) = \frac{1}{2}(4a^2) \quad \text{or} \quad \cos\phi = 0$$

$$\text{or} \qquad \phi = \pi/2$$

The first bright fringe is located at a distance $\frac{D\lambda}{d}$ from the central maximum and their centres differ in phase by 2π. Therefore, distance of the point from the central maximum differing in phase by $\pi/2$ is given by

$$y = \frac{1}{4}\left(\frac{D\lambda}{d}\right) = \frac{1\cdot 2\times 6000\times 10^{-10}}{4\times 1\cdot 5\times 10^{-3}} = \mathbf{1{\cdot}2\times 10^{-4}\ m}$$

40. Since light is incident normally, $r = 0$

For film to appear bright in reflected system,

$$2\mu t\cos r = (2n+1)\frac{\lambda}{2}, \quad \text{where } n = 0, 1, 2 \ldots\ldots$$

$$\text{or} \qquad 2\mu t = (2n+1)\frac{\lambda}{2} \quad \text{or} \quad \lambda = \frac{4\mu t}{2n+1}$$

$$\text{or} \qquad \lambda = \frac{4\times 1\cdot 5\times 4000}{(2n+1)} = \frac{24000}{(2n+1)}\ \text{Å}$$

For $n = 0,\ \lambda = \frac{24000}{2\times 0+1} = 24000$ Å,

For $n = 1,\ \lambda = \frac{24000}{2\times 1+1} = 8000$ Å,

For $n = 2,\ \lambda = \frac{24000}{2\times 2+1} = 4800$ Å,

For $n = 3,\ \lambda = \frac{24000}{2\times 3+1} = 3428{\cdot}6$ Å

Since visible range of spectrum is from 3900 Å to 7800 Å, the light of wavelength **4800 Å** will be intensified.

41. Here, $\sin i = 4/5$

$$\therefore \quad \sin r = \frac{\sin i}{\mu} = \frac{4/5}{4/3} = 0\cdot 6$$

$$\text{or} \quad \cos r = \sqrt{1-\sin^2 r} = \sqrt{1-(0\cdot 6)^2} = 0\cdot 8$$

For film to appear dark in reflected system,

$2\mu t\cos r = n\lambda$, where $n = 1, 2, 3\ldots\ldots$

Suppose that n and $(n+1)$ th dark bands correspond to wavelengths 6100 Å and 6000 Å respectively. Then,

$$2\times\frac{4}{3}\times t\times 0\cdot 8 = n\times 6100\times 10^{-10} \qquad \ldots(i)$$

$$\text{and} \quad 2\times\frac{4}{3}\times t\times 0\cdot 8 = (n+1)\times 6000\times 10^{-10} \qquad \ldots(ii)$$

From equation (*i*) and (*ii*), we have

$$n\times 6100\times 10^{-10} = (n+1)\times 6000\times 10^{-10}$$

$$\text{or} \qquad n = 60$$

Substituting for n in equation (*i*), we have

$$2\times\frac{4}{3}\times t\times 0\cdot 8 = 60\times 6100\times 10^{-10}$$

$$\text{or} \qquad t = \mathbf{1{\cdot}716\times 10^{-5}\ m}$$

CHAPTER
6

Diffraction of Light

6.01. DIFFRACTION OF LIGHT

Light travels in a straight line. As a result, light casts the shadow of the object coming in its path. When a narrow slit AB is placed in the path of the light, only the part A′B′ of the screen should get illuminated and no light should enter the regions A′X and B′Y of the screen as shown in Fig. 6.01. On the other hand, when an obstacle AB is placed, then its distinct geometrical shadow A′B′ would be obtained on the screen [Fig. 6.02.].

It happens so only when the size of the slit or the obstacle is large. However, if the size of the slit or the obstacle is made small, then light enters in the geometrically prohibited regions, showing thereby that the light bends round the corners of the slit or the obstacle.

*The phenomenon of bending of light round the sharp corners and spreading into the regions of the geometrical shadow is called **diffraction**.*

The light waves are diffracted only when the size of the obstacle is comparable to the wavelength of the light.

In principle, all the types of wave motion exhibit diffraction effect. The diffraction of radiowaves and sound waves is readily observed in practice.

Diffraction of light is of two types :

1. Fresnel diffraction. *It is the type of diffraction that takes place at a slit, when the source of light lies at a finite distance from it.* Since the source of light is close to the slit, the wave front is either spherical (in case of point source) or cylindrical (in case of a line source) in nature. The screen is also at a finite distance from the slit.

2. Fraunhofer diffraction. *It is the type of diffraction that takes place at a slit, when a plane wavefront is incident on it and the wavefront emerging from the slit is also plane.* Obviously, both the source and the screen should be at infinite distance from the narrow slit.

However, in the laboratory, to make a plane wave-front incident on the slit, a convex lens is used between the source and the slit. Further, to bring the emergent (diffracted) wave front on the screen, again a convex lens is used between the slit and the screen.

Frensel gave the exact explanation of the phenomenon of diffraction. According to him, diffraction is due to the interference of secondary wavelets originating from the portion of the primary wavefront, which is not blocked by the slit or the obstacle.

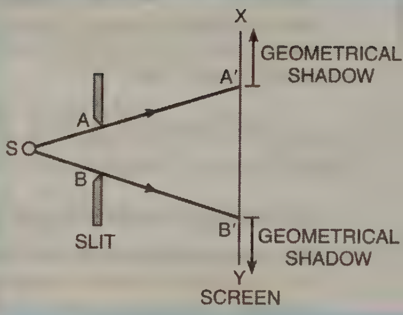

Fig. 6.01

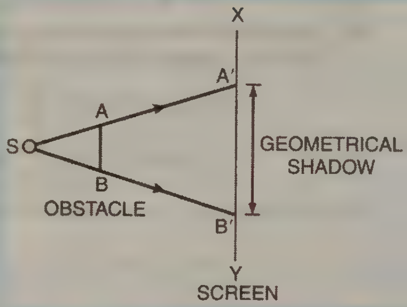

Fig. 6.02

Key point ✓

The diffraction of light is observed, when size of the obstacle is of the order of wavelength of light.

6.02. DIFFRACTION AT A SINGLE SLIT (Fraunhofer Diffraction)

Consider that a monochromatic source of light S, emitting light waves of wavelength λ, is placed at the principal focus of the convex lens L_1. A parallel beam of light *i.e.* a plane wave-front gets incident on a narrow slit AB of width *a* as shown in Fig. 6.03. The diffraction pattern is obtained on a screen lying at a distance D from

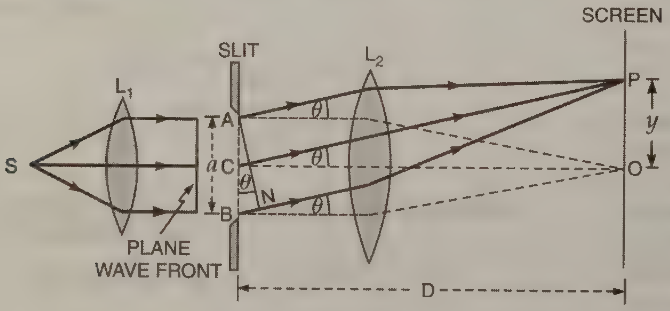

Fig. 6.03

he slit and at the focal plane of the convex lens L_2. The diffraction pattern is found o have central maxima at the centre O of the screen, which is flanked on both the sides by a number of dark and bright bands, called secondary maxima and minima. The diffraction pattern is obtained on the screen, which lies at the focal plane of the convex lens L_2. According to rectilinear propagation of light, a bright image of the slit is expected at the centre O of the screen. But in practice, we get a diffraction pattern *i.e.* a central maximum at the centre O flanked by a number of dark and bright fringes called *secondary maxima* and *minima* on either side of the point O. It is found that

(*i*) *the width of the central maximum is twice as that of a secondary maximum and*

(*ii*) *the intensity of the secondary maxima goes on decreasing with the order of maxima.*

These observations can be explained on the basis of the phenomenon of diffraction as below :

Central maximum. According to Huygens' principle, when light falls on the slit, it becomes a source of secondary wavelets. These wavelets are initially in phase and spread out in all directions. Let C be the centre of the slit AB. The wavelets which fall on the lens in a direction parallel to CO meet at point O in the same phase. This is because, the wavelets are initially in phase and their optical paths between the slit and the point O are also equal. Therefore, the wavelets reinforce each other and give rise to the ***central maximum*** at point O.

Positions and widths of secondary maxima and minima. Consider a point P on the screen at which wavelets travelling in a direction making angle θ with CO are brought to focus by the lens. The wavelets from different parts of the slit do not reach point P in phase, although they are initially in phase. It is because, they cover unequal distances in reaching the point P. The wavelets from points A and B will have a path difference equal to BN. From right angled Δ ANB, we have

$$BN = AB \sin\theta$$

or
$$BN = a \sin\theta \qquad \text{...(6.01)}$$

Suppose that the point P on the screen is at such a distance from the centre of the screen that BN = λ and the angle $\theta = \theta_1$. Then, equation (6.01) gives

$$\lambda = a \sin\theta_1$$

or
$$\sin\theta_1 = \frac{\lambda}{a} \qquad \text{...(6.02)}$$

Such a point on the screen will be the position of ***first secondary minimum***. It is because, if the slit is assumed to be divided into two equal parts, then wavelets from the corresponding points of the two halves of the slit will have a path difference of $\frac{\lambda}{2}$ *i.e.* wavelets from the two halves will reach the point P on the screen in opposite phase so as to produce minimum.

Similarly, if the point P on the screen is at such a distance from the centre of the screen that BN = 2λ and angle $\theta = \theta_2$, then from equation (6.01), we have

$$2\lambda = a \sin\theta_2$$

or
$$\sin\theta_2 = \frac{2\lambda}{a}$$

Such a point on the screen will be the position of ***second secondary minimum***. In this case, the slit may be assumed to be divided into four equal parts and wavelets from the corresponding points of the two adjacent parts of the slit will possess path difference $\frac{\lambda}{2}$. As the wavelets reach in opposite phase, minimum is produced at the point P on the screen.

In general, for *n*th minimum at point P,

$$\sin\theta_n = \frac{n\lambda}{a} \qquad \text{...(6.03)}$$

If y_n is the distance of the *n*th minimum from the centre of the screen and D is the distance between the slit and the screen, then from right angled Δ COP, we have

$$\tan\theta_n = \frac{OP}{CO}$$

or
$$\tan\theta_n = \frac{y_n}{D} \qquad \text{...(6.04)}$$

In case θ_n is small,

$$\sin \theta_n \approx \tan \theta_n$$

Therefore, from equations (6.03) and (6.04), we have

$$\frac{y_n}{D} = \frac{n\lambda}{a} \qquad \text{...(6.05)}$$

or

$$y_n = \frac{n D \lambda}{a}$$

The width of the secondary maximum,

$$\beta = y_n - y_{n-1} = \frac{n D\lambda}{d} - \frac{(n-1) D\lambda}{a}$$

$$\beta = \frac{D\lambda}{a} \qquad \text{...(6.06)}$$

Since β is independent of n, all the secondary maxima are of the same width β.

On the other hand, if point P on the screen is at such a distance from the point O that BN $= \frac{3\lambda}{2}$ and angle $\theta = \theta_1'$, then from equation (6.01), we have

$$\sin \theta_1' = \frac{3\lambda}{2a}$$

Such a point on the screen will be the position of ***first secondary maximum***. In this case, the slit may be assumed to be divided into three equal parts ; the wavelets from the first two parts will reach point P in opposite phase, cancelling the effect of each other. The wavelets from the third part of the slit remain uncancelled and produce the first maximum at point P.

Similarly, corresponding to BN $= \frac{5\lambda}{2}$ and angle $\theta = \theta_2'$, the ***second secondary maximum*** is produced, such that

$$\sin \theta_2' = \frac{5\lambda}{2a}$$

In this case, the slit may be assumed to be divided into five equal parts ; the wavelets from first four parts cancel the effect of each other, while the wavelets from the fifth part produce the second secondary maximum at point P.

In general, for nth maximum at point P,

$$\sin \theta_n' = \frac{(2n+1)\lambda}{2a} \qquad \text{...(6.07)}$$

If y_n' is the distance of nth maximum from the centre of the screen, then the angular position of the nth maximum is given by

$$\tan \theta_n' = \frac{y_n'}{D} \qquad \text{...(6.08)}$$

In case θ_n' is small, $\sin \theta_n' \approx \tan \theta_n'$

Therefore, from equations (6.07) and (6.08), we have

$$y_n' = \frac{(2n+1) D\lambda}{2a} \qquad \text{...(6.09)}$$

Key point

In diffraction pattern produced by a single slit, all secondary maxima and minima are of same width and the central maximum in twice as wide as any other secondary maximum or minimum.

The width of the secondary minimum,

$$\beta' = y_n' - y'_{n-1} = \frac{(2n+1)\lambda}{2a} - \frac{\{2(n-1)-1\}\lambda}{2a}$$

or

$$\beta' = \frac{D\lambda}{a} \qquad \text{...(6.10)}$$

Since β' is independent of n, all the secondary minima are of the same width β'.

Further, from equations (6.06) and (6.10), it follows that $\beta = \beta'$ *i.e. all the secondary maxima and minima are of the same width.*

Width of central maximum. The central maximum extends upto distance y_1 (the distance of first secondary minimum) on both sides of the centre of the screen.

Therefore, width of the central maximum, $\beta_0 = 2\, y_1$

In equation (6.04), setting $n = 1$, we have

$$y_1 = \frac{D\lambda}{a}$$

Therefore, $$\beta_0 = \frac{2\,D\lambda}{a} \qquad \text{...(6.11)}$$

It follows that $\beta_0 = 2\beta$ *i.e. the central maximum is twice as wide as any other secondary maximum or minimum.*

The angular position (θ_1) of the first secondary minimum is called the ***half angular width*** of the central maximum. It is given by equation (6.02).

Therefore, angular spread of light in the form of central maximum takes place in the angle $\pm\,\theta_1$.

From the above discussion, it follows that in diffraction from a single slit, the secondary maxima and minima are of equal width. However, the intensity of light of a secondary maximum goes on decreasing with the order of the maximum. It is because, the intensity of central maximum is due to wavelets from all parts of the slit, the first secondary maximum is due to wavelets from one third part of the slit only (first two parts send wavelets in opposite phase), the second secondary maximum is due to wavelets from the fifth part only (first four parts send wavelets in opposite phase) and so on. Hence, *intensity of secondary maxima goes on decreasing* as shown in Fig. 6.04.

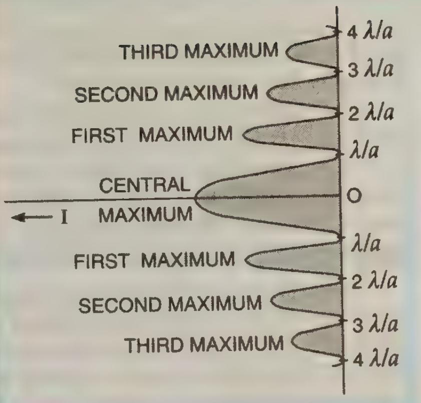

Fig. 6.04

Key point

In the diffraction pattern produced by a single slit, intensity of secondary maxima goes on decreasing with the order of the maximum.

Discussion. 1. From equations (6.06) and (6.11), it follows that the width of a secondary maximum or the central maximum is directly proportional to λ. Therefore, greater the wavelength of the light used, greater is the width of the maximum.

2. From equation (6.06), it follows that the width of a secondary maximum is inversely proportional to a, the width of the slit. Therefore, as the width of the slit is increased, the secondary maximum will become narrower. In case of a sufficiently wide slit, the secondary maxima and minima become invisible and only the central maximum is obtained, which corresponds to the sharp image of the slit. In other words, *the distinct diffraction pattern will be obtained only in the case of a narrow slit.*

6.03. FRESNEL DISTANCE

The distance of the screen from the slit, so that spreading of light due to diffraction from the centre of screen is just equal to size of the slit, is called ***Fresnel distance***. It is denoted by Z_F.

The diffraction pattern of a slit consists of secondary maxima and minima on the two sides of the central maximum. Therefore, one can say that on diffraction from a slit, light spreads on the screen in the form of central maximum. The angular position of first secondary minimum is called *half* ***angular width*** of the central maximum and it is given by

$$\theta_1 = \frac{\lambda}{a} \qquad \text{(provided } \theta_1 \text{ is small)}$$

If the screen is placed at a distance D from the slit, then the linear spread of the central maximum is given by

$$y_1 = D\,\theta_1 = \frac{D\,\lambda}{a}$$

It is, in fact, the distance of first secondary minimum from the centre of the screen. It follows that as the screen is moved away (D is increased), the linear size of the central maximum *i.e.* spread of light on the screen goes on increasing.

From the definition of Fresnel distance,

when $D = Z_F$, $\quad y_1 = a \qquad$ (size of the slit)

Setting this condition in the above equation, we have

$$a = \frac{Z_F\lambda}{a}$$

or $$Z_F = \frac{a^2}{\lambda} \qquad \text{...(6.12)}$$

It follows that if screen is placed at a distance beyond Z_F, the spreading of light due to diffraction will be quite large as compared to the size of the slit.

6.04. INTERFERENCE AND DIFFRACTION (Points of difference)

Following are the main points of difference between interference and diffraction :

1. Interference is the result of interaction of light coming from two different wavefronts originating from two coherent sources, whereas diffraction pattern is the result of interaction of light coming from different parts of the same wavefront.

2. In interference, the fringes may or may not be of the same width, while in diffraction, the fringes are always of varying width.

3. In interference, the fringes of minimum intensity are perfectly dark (provided light waves are of same amplitude), whereas in diffraction, the fringes of minimum intensity are not perfectly dark.

4. In interference, all the bright fringes are of same intensity ; while in diffraction, the bright fringes are of varying intensity.

5. In the interference pattern, there is a good contrast between bright and dark fringes. On the other hand, in diffraction pattern, the contrast between bright and dark fringes is comparatively poor.

6.05. RAYLEIGH'S CRITERION OF LIMITING RESOLUTION

The optical instruments are based on the laws of geometrical optics. Therefore, the image of a point object produced by an optical instrument must be a geometric point. In practice, the image of a bright geometric point produced by a lens is never a geometric point. It is always a circular patch of light with a bright disc at the centre surrounded by alternate dark and bright rings. It arises because of diffraction of light.

If two bright point objects lying very close to each other are seen with a naked eye or with the help of an optical instrument (a microscope or a telescope), then they may or may not be seen as two separate distinct objects due to the overlapping of their diffraction patterns.

Key point

Two objects are said to be just resolved, if the separation between the central maxima of their diffraction patterns is just equal to distance between the central maximum of one object and first secondary minimum of the other object.

The smallest separation (linear or angular) between the two point objects at which they appear just separated is called ***the limit of resolution of an optical instrument*** *and the reciprocal of the limit of resolution is called its* ***resolving power****.*

Whether the two objects are seen as two separate point objects or not, depends on the separation between the centres of the bright discs of the images of the two objects. Therefore, when two objects are seen with a naked eye or with the help of an optical instrument the two objects may be just resolved, well resolved or unresolved as explained below :

1. The two objects are said to be ***just resolved,*** if the separation between the central maxima of the two objects is just equal to the distance between the central maximum and the first minimum of any of the two objects [Fig. 6.05].

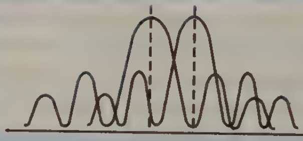

Fig. 6.05

2. The two objects are said to be ***well resolved,*** if the separation between the central maxima of the two objects is greater than the distance between the central maximum and the first minimum of any of the two objects [Fig. 6.06].

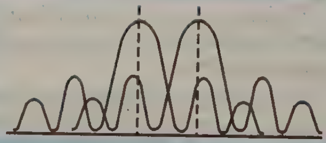

Fig. 6.06

3. The two objects are said to be ***unresolved,*** if the separation between the central maxima of the two objects is less than the distance between the central maximum and the first minimum of any of the two objects [Fig. 6.07].

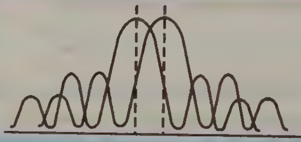

Fig. 6.07

These results are called ***Rayleigh's criterion of limiting resolution.***

Therefore, it follows that diffraction limits the resolving power of an optical instrument.

6.06. RESOLVING POWER OF A MICROSCOPE

Resolving power of a microscope is defined as the reciprocal of the least separation between two close objects, so that they appear just separated, when seen through the microscope.

Consider that a point object is illuminated with the light of wavelength λ and is seen through a microscope. The rays of light scattered from the object enter the objective of the microscope in a cone of semi-vertical angle θ [Fig. 6.08]. The least separation between the two objects, so that they appear just separated is given by

$$d = \frac{\lambda}{2\,\mu \sin \theta}, \qquad \text{...(6.13)}$$

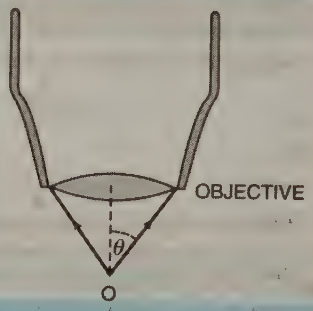

Fig. 6.08

where μ is refractive index of the medium between the objective of the microscope and the object.

The least distance given by equation (6.13) is called the *limit of resolution* of the microscope.

From definition, the resolving power of the microscope is given by

$$\text{resolving power of microscope, } \frac{1}{d} = \frac{2\,\mu \sin \theta}{\lambda} \qquad \text{...(6.14)}$$

From the above expression, the following conclusions can be drawn :

1. The resolving power of a microscope increases with increase in the value of the refractive index of the medium between its objective and the object.

For this reason, ***oil immersion objective microscopes*** are used to achieve high solving power.

2. The resolving power of a microscope increases with decrease in the value the wavelength of the light used to illuminate the object.

Since wavelength of ultraviolet light is less than that of the visible light, the icroscopes employing ultraviolet light for illuminating the objects are used to hieve high resolving power. Such microscopes are called ***ultra microscopes.***

Still higher resolving power is obtained in ***electron microscope.***

6.07. RESOLVING POWER OF A TELESCOPE

Resolving power of a telescope is defined as the reciprocal of the smallest angular paration between two distant objects, so that they appear just separated, when seen through e telescope.

Consider that two distant objects are observed through a telescope, whose jective is of diameter D. Let λ be the wavelength of the light, in which the objects e observed. The smallest angular separation between the two objects, so that they pear just separated is found to be

$$d\theta = \frac{1 \cdot 22\,\lambda}{D} \qquad ...(6.15)$$

From the definition of the resolving power of the telescope, we have

$$\text{resolving power of telescope, } \frac{1}{d\theta} = \frac{D}{1 \cdot 22\,\lambda} \qquad ...(6.16)$$

From the above expression, it follows that the resolving power of a telescope creases, when objective of larger diameter is used or light of smaller wavelength used to see the objects.

Key point

The resolving power of a microscope or a telescope increases, when light of smaller wavelength is used.

SOLVED NUMERICAL PROBLEMS

ype A. On Diffraction from a single slit

Problem 6.01. Light of wavelength 6000 Å from a istant source falls on a slit 0·5 mm wide. What is the istance between the two dark bands on each side of the entral bright band of the diffraction pattern observed on screen placed 2·0 m from the slit ? (*H.S.S.C.E. 2002*)

Sol. Here, $a = 0 \cdot 5 \text{ mm} = 0 \cdot 5 \times 10^{-3} \text{ m}$;

$\lambda = 6000 \text{ Å} = 6000 \times 10^{-10} \text{ m}$; $D = 2 \cdot 0 \text{ m}$;

The distance between the two dark bands on each side the central band is equal to width of the central bright band e. $\frac{2D\lambda}{a}$.

Therefore, required distance

$$= \frac{2D\lambda}{a} = \frac{2 \times 2 \cdot 0 \times 6000 \times 10^{-10}}{0 \cdot 5 \times 10^{-3}}$$

$$= 4 \cdot 8 \times 10^{-3} \text{ m} = 4 \cdot 8 \text{ mm}$$

Problem 6.02. Light of wavelength 5900 ×10^{-10} m falls ormally on a slit of width 11·8 × 10^{-5} cm and the resulting raunhofer diffraction is received on a screen. Calculate the ngular position of the first minimum. Also find the ngular width of the central maximum. (*I.S.C.E. 1997*)

Sol. Here, $\lambda = 5900 \times 10^{-10}$ m ;

$a = 11 \cdot 8 \times 10^{-5} \text{ cm} = 11 \cdot 8 \times 10^{-7} \text{ m}$,

The angular position of first minimum is given by

$$\sin\theta_1 = \frac{\lambda}{a} = \frac{5900 \times 10^{-10}}{11 \cdot 8 \times 10^{-7}} = 0 \cdot 5 \quad \text{or} \quad \theta_1 = 30°$$

The angular width of central maximum,

$$2\theta_1 = 2 \times 30° = 60°$$

Problem 6.03. A slit of width *a* is illuminated by mono-hromatic light of wavelength 650 nm at normal incidence. Calculate the value of *a*, when (*a*) the first minimum falls at an angle of diffraction of 30°, (*b*) the first maximum falls at an angle of diffraction of 30°. (*C.B.S.E. 2002*)

Sol. (*a*) For first minimum at angle θ_1, we have

$$\sin\theta_1 = \frac{\lambda}{a}$$

Here, $\lambda = 650 \text{ nm} = 600 \times 10^{-9} \text{ m}$; $\theta_1 = 30°$

$$\therefore \quad a = \frac{\lambda}{\sin\theta_1} = \frac{650 \times 10^{-9}}{\sin 30°} = \frac{650 \times 10^{-9}}{0 \cdot 5}$$

$$= \mathbf{1 \cdot 3 \times 10^{-6} \text{ m}}$$

(*b*) For first maximum at angle θ_1', we have

$$\sin\theta_1' = \frac{3\lambda}{2a}$$

Here, $\lambda = 650 \times 10^{-9} \text{ m}$; $\theta_1' = 30°$

$$\therefore \quad a = \frac{3\lambda}{\sin\theta_1'} = \frac{3 \times 650 \times 10^{-9}}{2 \sin 30°} = \frac{3 \times 650 \times 10^{-9}}{2 \times 0 \cdot 5}$$

$$= \mathbf{1 \cdot 95 \times 10^{-6} \text{ m}}$$

Type B. On Fresnel distance

Problem 6.04. Light of wavelength 600 nm is incident on an aperture of size 2 mm. Calculate the distance upto which the ray of light can travel, such that its spread is less than the size of the aperture. (*C.B.S.E. 1996*)

Sol. Here, $\lambda = 600 \text{ nm} = 600 \times 10^{-9} \text{ m}$;

$a = 2 \text{ mm} = 2 \times 10^{-3} \text{ m}$

$$\text{Now, required distance, } Z_F = \frac{a^2}{\lambda} = \frac{(2 \times 10^{-3})^2}{600 \times 10^{-9}} = \mathbf{6 \cdot 67 \text{ m}}$$

Type C. On Resolving power

Probelm 6.05. A telescope is used to resolve two stars separated by 4·6 × 10^{-6} radian. If the wavelength of light used is 5460 Å, what should be the aperture of the objective of the telescope ?

Sol. Here, $d\theta = 4{\cdot}6 \times 10^{-6}$ rad ;

$\lambda = 5460$ Å $= 5460 \times 10^{-10}$ m ;

The aperture (D) of the telescope is given by

$$D = \frac{1{\cdot}22\,\lambda}{d\theta} = \frac{1{\cdot}22 \times 5460 \times 10^{-10}}{4{\cdot}6 \times 10^{-6}}$$

$$= \mathbf{0{\cdot}1448\ m}$$

TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 6.06. In a simple slit diffraction experiment, first minimum for red light (660 nm) coincides with first maximum of some other wavelength λ'. Find the value of λ'.

Sol. The angular position of first minimum for red light of wavelength λ_r is given by

$$\sin\theta_1 = \frac{\lambda_r}{a} \qquad ...(i)$$

The angular position of first maximum for light of wavelength λ' is given by

$$\sin\theta_1{}' = \frac{3\,\lambda'}{2\,a} \qquad ...($$

As the first minimum for red light coincides with the fir maximum for wavelength λ',

$$\sin\theta_1 = \sin\theta_1{}'$$

Therefore, from equation (*i*) and (*ii*), we have

$$\frac{3\,\lambda'}{2\,a} = \frac{\lambda_r}{a} \quad \text{or} \quad \lambda' = \frac{2\,\lambda_r}{3}$$

$$\text{or} \qquad \lambda' = \frac{2 \times 660}{3} = \mathbf{440\ nm}$$

FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 6.01. What is diffraction of light ? (*H.S.S.C.E. 2002*)

Ans. *The phenomenon of bending of light round the sharp corners and its spreading into regions of the geometrical shadow is called diffraction.*

Q. 6.02. Does phenomenon of diffraction help us to decide about the longitudinal or transverse nature of light ?

Ans. No.

Q. 6.03. What are the reasons to believe that light is a wave motion ? (*P.S.S.C.E. 2000*)

Ans. The phenomena of interference, diffraction and polarisation establish the wave nature of light.

Q. 6.04. State the condition for diffraction of light to occur. (*C.B.S.E. 2001*)

Ans. The size of the obstacle should be of the order of the wavelength of light used.

Q. 6.05. What should be the approximate slit size to observe light diffraction with it ? (*H.P.S.S.C.E. 1994*)

Ans. The size of the slit should be of the order of the wavelength of the light used.

Q. 6.06. What should be the order of size of obstacle/aperture for diffraction of light ? (*H.S.S.C.E. 1995*)

Ans. The diffraction in light is observed only, when the size of the obstacle is of the same order as the wavelength of the light.

Q. 6.07. Yellow light is used in a single slit diffraction experiment with slit width of 0·6 mm. If yellow light is replaced by X-rays, how will the diffraction pattern be affected ? (*I.I.T. 1999*)

Ans. Since wavelength of X-rays is very small as compared to the size of the slit, no diffraction pattern will be observed.

Q. 6.08. What is the condition for first minimum in cas of diffraction due to a single slit ? (*H.S.S.C.E. 199*

Ans. The angular position of first minimum, $\theta_1 = \dfrac{\lambda}{a}$.

Q. 6.09. What is the basic difference between inte ference and diffraction of light ? (*P.S.S.C.E. 199*

Ans. Interference is the result of superposition of ligh waves from two sources, whereas diffraction takes place du to interference of light waves from the different parts of th same source of light.

Q. 6.10. A diffraction grating has 5000 lines per cm What is its grating element ? (*I.S.C.E. 199*

Ans. Grating element $= \dfrac{1}{5000} = \mathbf{2 \times 10^{-4}\ cm}$

Q. 6.11. Define the resolving power of an optica instrument. (*I.S.C.E. 1994 : C.B.S.E. 199*

Ans. *The smallest separation (linear or angular) between th two points objects at which they appear just separated is called th* ***limit of resolution*** of an optical instrument.

The reciprocal of the limit of resolution is called its ***resolvin power.***

Q. 6.12. Define resolving power of a telescope. (*P.S.S.C.E. 1999 S*

Ans. Refer to SAQ. 6.15.

Q. 6.13. How does resolving power of a telescop change on decreasing the aperture of its object lens ? Justif your answer. (*C.B.S.E. 199*

Ans. Resolving power of a telescope $= \dfrac{D}{1{\cdot}22\,\lambda}$

Therefore, on decreasing aperture (D) of objective len the resolving power of telescope decreases.

FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 6.01. Why is diffraction of sound waves easier to observe than diffraction of light waves ? (*C.B.S.E. 2002, 1997*)

Or

Why can sound waves be diffracted more easily tha light waves ? (*P.S.S.C.E. 1999 S, 1992*

Or

Diffraction is common in sound but not common in light waves. Why ? (*H.S.S.C.E. 1994*)

Ans. For diffraction to take place, the size of the obstacle/aperture should be of the order of the wavelength of the waves. Since the wavelength of light ($\approx 10^{-6}$ m) is very small as compared to the size of the obstacle/aperture around us, light cannot be diffracted readily. On the other hand, as wavelength of sound is of the order of such objects, it gets diffracted easily.

Q. 6.02. Radiowaves diffract pronouncedly around buildings ; while light waves, which are electromagnetic waves, do not. Why ? (*H.P.S.S.C.E. 1998 S*)

Ans. For a wave to undergo diffraction, its wavelength should be of the size of the obstacle. The radiowaves (particularly short radiowaves) have wavelengths of the order of the size of the building and other obstacles coming in their way and hence they easily get diffracted.

Since wavelength of the light waves is very small, they are not diffracted by buildings.

Q. 6.03. Coloured spectrum is seen, when we look through a muslin cloth. Why ? (*H.P.S.S.C.E. 1997*)

Ans. Muslin cloth is made of very fine threads and as such fine slits are formed. White light passing through these slits gets diffracted giving rise to coloured spectrum. The central maximum will be white while the secondary maxima will be coloured. It is because, position of all the secondary maxima (except central) depends upon wavelength of the light.

Q. 6.04. Coloured spectrum is observed, when we see through muslin cloth. But no such spectrum is observed, when we see through coarse cloth. Why ?

Ans. Refer to SAQ 6.03.

In a coarse cloth, the slits formed due to threads are very wide and hence no such spectrum is seen.

Q. 6.05. A slit of width *a* is illuminated by monochromatic light at normal incidence. Draw the intensity distribution curve observed on the screen due to diffraction. (*C.B.S.E. 1993*)

Or

Draw the intensity pattern obtained in a single slit diffraction experiment. (*I.S.C.E. 1994*)

Ans. Refer to Fig. 6.04.

Q. 6.06. What two main changes in diffraction pattern of a single slit will you observe, when the monochromatic source of light is replaced by a source of white light ? (*C.B.S.E. 1997*)

Ans. 1. In each diffraction order, the diffracted image of the slit gets dispersed into component colours of white light.

2. In higher order spectra, the dispersion is more and it results in overlapping of different colours.

Q. 6.07. Prove that the central maxima is twice as wide as any other secondary maxima in the diffraction of a single slit. (*H.P.S.S.C.E. 1999*)

Ans. Refer to section 6.02.

Q. 6.08. In a single slit diffraction pattern, how is the width of central bright maximum changed, when (*a*) the slit width is decreased, (*b*) the distance between the slit and the screen is increased and (*c*) light of smaller wavelength is used. Justify your answer. (*C.B.S.E. 2002, 1994*)

Ans. The width of central maximum is given by

$$\beta_0 = \frac{2\,D\,\lambda}{a}, \qquad \ldots(i)$$

where the letters have their usual meanings.

(*a*) *Effect of slit width.* From equation (*i*), it follows that $\beta_0 \propto \frac{1}{a}$. Therefore, as the slit width is decreased, the width of central maximum will ***increase.***

(*b*) *Effect of distance between slit and screen.* From equation (*i*), it follows that $\beta_0 \propto D$. Therefore, as the distance between slit and the screen is increased, the width of central maximum will also *increase*.

(*c*) *Effect of wavelength of light.* From equation (*i*), it follows that $\beta_0 \propto \lambda$. Therefore, as the light of smaller wavelength is used, the width of central maximum will *decrease*.

Q. 6.09. In the diffraction of a single slit experiment, how would the width of and the intensity of central maximum change, if (*a*) slit width is halved and (*b*) visible light of longer wavelength is used ? (*C.B.S.E. 2001*)

Ans. (*a*) The intensity of central maximum will become one fourth.

(*b*) The intensity of central maximum will decrease.

Q. 6.10. Give two differences between fringes formed in single slit diffraction and Young's double slit experiment. (*C.B.S.E. 1996*)

Ans. 1. In Young's experiment, all the bright fringes formed are of the same intensity, whereas in single slit diffraction experiment, the bright fringes are of varying intensity.

2. In Young's experiment, fringes of minimum intensity are perfectly dark, whereas in slit diffraction experiment, fringes of minimum intensity are not perfectly dark.

Q. 6.11. Give two points of difference between the phenomenon of interference and diffraction of light.
(*H.P.S.S.C.E. 2001 ; P.S.S.C.E. 1999 S, C.B.S.E. 1995*)

Ans. Refer to section 6.04.

Q. 6.12. Give three points of difference between the phenomenon of interference and diffraction of light.
(*P.S.S.C.E. 2002, 2001, 1999 S*)

Or

Distinguish between interference and diffraction of light. (*P.S.S.C.E. 1999 ; H.S.S.C.E. 1999 ; C.B.S.E. 1994 ; H.P.S.S.C.E. 1993 ; P.S.S.C.E. 1993*)

Ans. Refer to section 6.04.

Q. 6.13. Define resolving power of a compound microscope. On what factors does it depend ? (*P.S.S.C.E. 2001*)

Ans. *Resolving power of a microscope is defined as the reciprocal of the least separation between two close objects, so that they appear just separated, when seen through the microscope.*

The resolving power of a microscope depeds upon the wavelength (λ) of the light used and the value of the semi-vertical angle (θ), the object makes at the objective of the microscope. (Refer to Fig. 6.08).

Q. 6.14. How does the resolving power of a compound microscope change on (*i*) decreasing the wave length of light used, and (*ii*) decreasing the diameter of its object lens ? (*C.B.S.E. 1998*)

Ans. Resolving power of microscope $= \dfrac{2\,\mu \sin\theta}{\lambda}$

(*i*) On decreasing wavelength of light, resolving power will increase.

(*ii*) On decreasing diameter of objective lens, semi-vertical angle θ will decrease and hence resolving power will decrease.

Q. 6.15. Define resolving power of a telescope. On what factors does it depend ? (*P.S.S.C.E. 2001*)

Ans. *Resolving power of a telescope is defined as the reciprocal of the smallest angular separation between two distant objects, so that they appear just separated, when seen through the telescope.*

The resolving power of a telescope depends upon the wavelength (λ) of the light used and the diameter or aperture (D) of the objective of the telescope.

Q. 6.16. Define (*i*) resolving power and (*ii*) magnifying power of a telescope. (*C.B.S.E. 1991*)

Ans. (*i*) Resolving power, Refer to SAQ. 6.15.

(*ii*) Magnifying power, Refer to section 3.04 – Chapter 3.

Q. 6.17. How will the resolving power of a compound microscope be affected, when (*i*) the frequency of light used to illuminate the object is increased, and (*ii*) the focal length of the objective is increased. Justify your answer in each case. (*C.B.S.E. 1997*)

Ans. Resolving power of microscope

$$= \frac{2\,\mu \sin\theta}{\lambda} = \frac{2\,\nu\,\mu \sin\theta}{c} \qquad (\because c = \nu\lambda)$$

(*i*) When the frequency of light is increased, resolving power will increase.

(*ii*) When focal length of objective is increased, distance between object and objective will increase. It will lead to a decrease in the value of angle θ and hence resolving power will decrease.

Q. 6.18. Define resolving power of a telescope. How does diffraction limit its resolving power ? (*C.B.S.E. 1998 S*)

Ans. Resolving power. Refer to SAQ 6.15.

For remaining part of SAQ 6.18, refer to section 6.05.

Q. 6.19. Calculate the resolving power of a telescope, whose objective lens has an aperture of 1·0 m for the wavelength of light 500 nm ? (*C.B.S.E. 1998 S*)

Ans. Here, D = 1·0 m ; λ = 500 nm = 500×10^{-9} m

Resolving power of telescope

$$= \frac{D}{1\cdot22\,\lambda} = \frac{1\cdot0}{1\cdot22 \times 500 \times 10^{-9}} = \mathbf{1{\cdot}64 \times 10^6}$$

abc TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 6.01. Why do we fail to observe the diffraction from a wide slit illuminated by monochromatic light ?

Ans. When the size of the slit is large, the central maximum is small in size and the variation in the intensity of the other maxima and minima is so small that they cannot be distinguished. That is why, we fail to observe the diffraction pattern from a wide slit illuminated by monochromatic light.

Q. 6.02. Why are diffraction effects more prominent through a slit formed by two blades than through a slit formed by two fingers ?

Ans. The diffraction pattern can be observed by forming a slit with the help of two blades or two fingers. However, the diffraction pattern will be observed clearly only, if the slit formed is fine and the edges of the blades/fingers are parallel. Since such an adjustment can be nicely done in case of two blades, the diffraction effects are more prominent through the slit formed by two blades than through the slit formed by two fingers.

Q. 6.03. Two students are separated by a 7 m partition wall in a room 10 m high. If both light and sound waves can bend around obstacles, how is it that the students are unable to see each other, even though they can converse easily ? (*C.B.S.E. 1990 ; Text Question*)

Ans. For pronounced diffraction effect, the size of the obstacle should be comparable to wavelength of the waves. The size of partition is very large as compared to the wavelength of light and hence it is not diffracted and the two students cannot see each other.

The wavelength of sound waves is of the order of the height of partition. It causes sound to diffract and hence they can converse with each other.

Q. 6.04. What happens to the diffraction of a single slit, when the slit is turned through angle θ, instead of holding the slit perpendicular to the path of the light ? Explain.

Ans. When the slit is rotated from position AB to A′B′ through angle θ [Fig. 6.09], the path difference between the rays reaching the centre of screen remains zero. It is because, the extra path AA′ covered by the light to travel from source of light to the top edge of the slit is compensated for by the extra path BB′, the light travels from the bottom edge of the slit to the screen. As a result, the central maximum does not move.

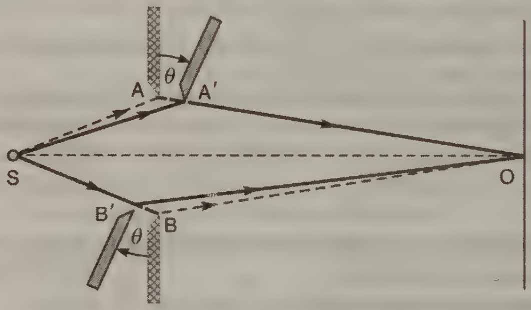

Fig. 6.09

It follows that the effective width of the slit decreases, when the slit is turned through angle θ. If a is the width of the slit, then on rotating through angle θ, its width decreases to $a\cos\theta$. Since the slit becomes narrower, the diffraction pattern becomes wider.

Q. 6.05. In a single slit diffraction experiment, the width of the slit is made double the original width. How does this affect the size and intensity of the central diffraction band ? (*C.B.S.E. 2001 S ; Text Question*)

Ans. The width of central maximum $= \dfrac{2\,D\,\lambda}{a}$

If the width of the slit (a) is made double of the original, the width of central diffraction band will reduce to half.

The intensity of the central diffraction band will become four times.

Q. 6.06. When a tiny circular obstacle is placed in the path of light from a distance source, a bright spot is een at the centre of the shadow of the obstacle. Explain, hy. *(Text Question)*

Ans. The central bright spot is produced due to the onstructive interference of waves from the edge of the ircular obstacle.

Q. 6.07. In what way is diffraction from each slit related to the interference pattern in Young's double slit xperiment ?

Ans. The intensity of interference fringes in Young's ouble slit experiment is superposed by the diffraction attern of each slit.

Q. 6.08. Stars are often photographed through a blue filter. What is the advantage of this ?

Ans. The resolving power of a telescope

$$= \frac{1 \cdot 22\,D}{\lambda},$$

where D is diameter of the telescope's objective.

If light of a shorter wavelength is used, the resolving power of the telescope will be more and like wise the stars which subtend a smaller angle at the earth, will also be resolved and seen distinctly as separate ones. The use of blue filter allows only blue light (shorter wavelength) from the star to enter the telescope.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Explain diffraction of light due to a single slit and formation of pattern of fringes. *(H.S.S.C.E. 1997)*
2. Discuss the formation of maxima and minima by diffraction at a single slit. *(H.S.S.C.E. 1997 S)*
3. What is diffraction of light ? Explain with a diagram the intensity distribution in the diffraction pattern due to a single slit. *(Karnataka, 1994)*
4. Explain Fraunhoffer diffraction at a single slit and derive relation for linear width of central maximum. *(P.S.S.C.E. 1999 S, 1999, 1998)*
5. Prove that in diffraction from a slit, the secondary maxima and minima are of same width.
6. Derive an expression for the width of the central maxima for diffraction of light at a single slit. How does this width change with increase in width of the slit ? *(C.B.S.E. 1998)*
7. Show that the central maximum in the single slit diffraction is twice as wide as the secondary maximum and the pattern becomes narrow as the width of the slit is increased.
8. How does diffraction limit the resolving power of an optical instrument ? *(C.B.S.E. 1990)*
9. Explain with reasons, how the resolving power of a compound microscope will change, when (*i*) frequency of the incident light on the objective lens is increased (*ii*) focal length of the objective lens is increased and (*iii*) aperture of the objective lens is increased. *(C.B.S.E. 2002)*
10. Explain with reason, how the resolving power of an astronomical telescope will change when (*i*) frequency of the incident light on the objective lens is increased, (*ii*) focal length of the objective lens is increased and (*iii*) aperture of the objective lens is halved. *(C.B.S.E. 2002)*

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. What is meant by diffraction ? Draw a graph to show the relative intensity distribution for a single slit diffraction pattern. Obtain an expression for the diffraction of the first minimum in the diffraction pattern. *(I.S.C.E. 1993)*
2. Discuss Fraunhoffer diffraction at a single slit. Also derive the relation for linear width of central maximum. *(P.S.S.C.E. 2001)*
3. Explain diffraction at a single slit and derive relation for linear width of maxima. *(P.S.S.C.E. 2000)*
4. What is diffraction of light ? Explain the formation of maxima and minima due to diffraction from a rectangular narrow slit. Show that the intensity of the central maximum is inversely proportional to the width of the slit.
5. What is a diffraction grating ? Explain, how does it produce diffraction spectrum.

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Diffraction from a slit

1. A slit of width 0·15 cm is illuminated by light of wavelength 5×10^{-5} cm and a diffraction pattern is obtained on a screen 2·1 m away. Calculate the width of the central maxima. [**Ans.** 1·4 mm]
2. The light of wavelength 600 nm is incident normally on a slit of width 3 mm. Calculate the linear width of central maximum on a screen kept 3 m away from the slit. *(C.B.S.E. 2001)* [**Ans.** 1·2 mm]
3. Light of wavelength 600 nm is incident on a single slit of width 0·5 mm at normal incidence. Calculate the separation between two dark bands on either side of the central maximum, if the diffraction pattern is observed on a screen placed at 2 m from the slit. *(C.B.S.E. 2002)* [**Ans.** 4·8 mm]
4. Red light of wavelength 6500 Å from a distant source falls on a slit 0·5 mm wide. What is the distance between two dark bands on each side of central bright band of diffraction pattern observed on a screen placed 1·8 m from the slit ? *(H.S.S.C.E. 2001 ; C.B.S.E. 1990)* [**Ans.** 4·68 mm]
5. A screen is placed 2 m away from a narrow slit. Find the slit width, if the first minimum lies 5 mm on either side of the central maximum, when plane waves of 5×10^{-7} m are incident on the slit. [**Ans.** 0·2 mm]
6. A slit 4·0 cm wide is irradiated with microwaves of wavelength 2·0 cm. Find the angular spread of central maxima assuming incidence normal to the plane of the slit. *(H.S.S.C.E. 1993)* [**Ans.** 60°]
7. (*i*) Light of wavelength $5 \cdot 4 \times 10^{-5}$ cm passes through a slit 0·12 cm wide and forms a diffraction pattern on a screen 2·7 m away. What is the width of the central maxima ?

(*ii*) If the apparatus is immersed in a liquid of refractive index 1·35, what would be the width of the central fringe ? **[Ans.** (*i*) 2·43 mm ; (*ii*) 1·8 mm]

8. Determine the angular separation between central maximum and first order maximum of the diffraction pattern due to a single slit of width 0·25 mm, when light of wavelength 5890 Å is incident on it normally. (*C.B.S.E. 1993*) **[Ans.** $3{\cdot}534 \times 10^{-3}$ rad]
9. A slit of width *a* is illuminated by red light of wavelength 6200 Å. For what value of *a*, will the first minimum fall at an angle of diffraction of 30° ? **[Ans.** $1{\cdot}24 \times 10^{-6}$ m]
10. A slit of width *a* is illuminated by a light of wavelength 5500 Å. What will be the value of *a*, when (*a*) the first minimum falls at an angle of diffraction of 30°, (*b*) the first maximum falls at an angle of diffraction of 30° ? (*C.B.S.E. 1998 ; H.S.S.C.E. 1992*) **[Ans.** (*a*) $1{\cdot}1 \times 10^{-6}$ m, (*b*) $1{\cdot}65 \times 10^{-6}$ m]

Type B. On Fresnel distance

11. Calculate the distance which a beam of light of wavelength 500 nm can travel without significant broadening, if the diffracting aperture is 3 mm wide. (*C.B.S.E. 1990*) **[Ans.** 18 m]
12. Estimate the distance for which ray optics is good approximation for an aperture of 4 mm and wavelength 400 nm. (*Text Problem*) **[Ans.** 40 m]

Type C. On Resolving power

13. What is the minimum angular separation between two stars, if a telescope is used to observe them with an objective of aperture 0·2 m ? The wavelength of light used is 5900 Å. **[Ans.** $3{\cdot}6 \times 10^{-6}$ rad]
14. A telescope has an objective of diameter 0·6 m. The telescope is directed to view two distant almost point sources of light (*e.g.* two stars of a binary). The sources are roughly at the same distance of 10^4 light years along the line of sight but separated by a distance of 10^{10} m. Will the telescope resolve the two objects ? Assume that mean wavelength of light is 6000 Å. (*Text Problem*) **[Ans.** No]

MISCELLANEOUS PROBLEMS

15. (*a*) Two slits are made 1 mm apart and screen is placed 1 m away. What is the fringe separation, when blue-green light of wavelength 500 nm is used ?
(*b*) What should be the width of each slit to obtain 10 maxima of the double slit pattern, within the central maximum of the single slit pattern ? (*Text Problem*) **[Ans.** (*a*) 0·5 mm (*b*) 0·2 mm]
16. Two spectral lines of sodium D_1 and D_2 have wavelengths of approximately 5890 Å and 5896 Å. A sodium lamp sends incident plane wave on a slit of width 2×10^{-6} m. A screen is located 2 m from the slit. Find the spacing between the first maxima of two sodium lines as measured on the screen. **[Ans.** 0·9 mm]

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. Here, $a = 0{\cdot}15 \text{ cm} = 0{\cdot}15 \times 10^{-2}$ m,

$$\lambda = 5 \times 10^{-5} \text{ cm} = 5 \times 10^{-7} \text{ m}, \ D = 2{\cdot}1 \text{ m}$$

Now, $$\beta = \frac{2D\lambda}{a} = \frac{2 \times 2\cdot1 \times 5 \times 10^{-7}}{0\cdot15 \times 10^{-2}} = 1\cdot4 \times 10^{-3} \text{m}$$

$= \mathbf{1{\cdot}4 \text{ mm}}$

2. Proceed as in problem no. 1.
3. Proceed as in solved problem no. 6.01.
4. Proceed as in solved problem no. 6.01.
5. $y_1' = 5 \text{ mm} = 5 \times 10^{-3}$ m or $\dfrac{D\lambda}{a} = 5 \times 10^{-3}$ m

or $$a = \frac{D\lambda}{5 \times 10^{-3}} = \frac{2 \times 5 \times 10^{-7}}{5 \times 10^{-3}} = 2 \times 10^{-4} \text{m}$$

$= \mathbf{0{\cdot}2 \text{ mm}}$

6. Proceed as in solved problem no. 6.02.
7. (*i*) Here, $\lambda = 5{\cdot}4 \times 10^{-5} \text{ cm} = 5{\cdot}4 \times 10^{-7}$ m,

$$a = 0{\cdot}12 \text{ cm} = 0{\cdot}12 \times 10^{-2} \text{ m}, \ D = 2{\cdot}7 \text{ m}$$

Now, $$\beta_0 = \frac{2D\lambda}{a} = \frac{2 \times 2\cdot7 \times 5\cdot4 \times 10^{-7}}{0\cdot12 \times 10^{-2}}$$

$$= 2\cdot43 \times 10^{-3} \text{m} = \mathbf{2{\cdot}43 \text{ mm}}$$

(ii) When apparatus is immersed in liquid :

$$\beta_0' = \frac{2D\lambda'}{a} = \frac{2D\lambda}{a\mu} = \frac{\beta_0}{\mu} = \frac{2\cdot43}{1\cdot35} = \mathbf{1{\cdot}8 \text{ mm}}$$

8. Here, $\lambda = 5890 \text{ Å} = 5890 \times 10^{-10}$ m,

$a = 0{\cdot}25 \text{ mm} = 0{\cdot}25 \times 10^{-3}$ m

Angular separation between central and first order aximum,

$$\theta_1' = \frac{3\lambda}{2a} = \frac{3 \times 5890 \times 10^{-10}}{2 \times 0\cdot25 \times 10^{-3}} = \mathbf{3{\cdot}534 \times 10^{-3} \text{ rad}}$$

9. Proceed as in solved problem no. 6.03 (*a*).
10. Proceed as in solved problem no. 6.03.
11. $$Z_F = \frac{a^2}{\lambda} = \frac{(3 \times 10^{-3})^2}{500 \times 10^{-9}} = \mathbf{18 \text{ m}}$$
12. $$Z_F = \frac{a^2}{\lambda} = \frac{(4 \times 10^{-3})^2}{400 \times 10^{-9}} = \mathbf{40 \text{ m}}$$
13. $$d\theta = \frac{1\cdot22\lambda}{D} = \frac{1\cdot22 \times 5900 \times 10^{-10}}{0\cdot2} = \mathbf{3{\cdot}6 \times 10^{-6} \text{ rad}}$$
14. Smallest angular separation that can be resolved by the telescope,

$$d\theta = \frac{1\cdot22\lambda}{D} = \frac{1\cdot22 \times 6000 \times 10^{-10}}{0\cdot6} = 1{\cdot}22 \times 10^{-6} \text{ rad}$$

Distance of stars = 10^4 light years

$= 10^4 \times 9{\cdot}46 \times 10^{15}$ m

Angle subtended by two stars separated by a transverse distance of 10^{10} m,

$$d\theta' = \frac{10^{10}}{10^4 \times 9\cdot46 \times 10^{15}} = 1{\cdot}057 \times 10^{-10} \text{ rad}$$

Since $d\theta' << d\theta$, the two stars of the binary **cannot be resolved** by the telescope.

15. (*a*) $$\beta = \frac{D\lambda}{d} = \frac{1 \times 500 \times 10^{-9}}{1 \times 10^{-3}} = 5 \times 10^{-4} \text{m} = \mathbf{0{\cdot}5 \text{ mm}}$$

(*b*) Let *a* be width of the slit.

The width of central maximum of diffraction pattern,

$$\beta_0 = \frac{2D\lambda}{a}$$

Fringe width of interference pattern,

$$\beta = \frac{D\lambda}{d} = \frac{D\lambda}{1 \times 10^{-3}}$$

Since $\beta_0 = 10\,\beta$, we have

$$\frac{2\,D\lambda}{a} = 10 \times \frac{D\lambda}{1 \times 10^{-3}}$$

or $a = 0{\cdot}2 \times 10^{-3}\text{ m} = \mathbf{0{\cdot}2\ mm}$

16. The distance of first secondary maxima from the centre of the screen,

$$y_1{}' = \frac{3\,D\lambda}{2\,a}$$

For sodium D_1 line :

$$y_1{}' = \frac{3 \times 2 \times 5890 \times 10^{-10}}{2 \times 2 \times 10^{-6}} = 0 \cdot 8835\text{ m}$$

For sodium D_2 line :

$$y_1{}' = \frac{3 \times 2 \times 5896 \times 10^{-10}}{2 \times 2 \times 10^{-6}} = 0 \cdot 8844\text{ m}$$

Therefore, spacing between the first maxima for D_1 and D_2 lines

$$= 0{\cdot}8844 - 0{\cdot}8835 = 9{\cdot}0 \times 10^{-4}\text{ m} = \mathbf{0{\cdot}9\ mm}$$

CHAPTER
7

Polarisation of Light

7.01. TRANSVERSE NATURE OF LIGHT

In general, the waves are of two types :

1. ***Longitudinal waves.*** *The waves, in which the particles oscillate along the direction of propagation of the waves, are called longitudinal waves.*

2. ***Transverse waves.*** *The waves, in which the direction of oscillation of particles is perpendicular to the direction of propagation of the waves, are called transverse waves.*

Both types of these waves exhibit the phenomena of reflection, refraction, diffraction and interference but *polarisation* of the waves can only be exhibited by the transverse waves. This is the only phenomenon, where the two types of waves essentially differ from one another.

Key point

The phenomenon of polarisation establishes that light is transverse in nature.

To understand the polarisation of the waves, let us first consider the following mechanical experiment :

Two vertical slits S_1 and S_2 are placed parallel to each other and a string is passed through them. The end B of the string is fixed and the end A is given jerks in any direction perpendicular to its length. Then, transverse wave, whose vibrations are parallel to the length of the slit, will only pass through the slit S_1. If the slit S_2 is parallel to S_1, then amplitude of vibrations will remain unaffected [Fig. 7.01].

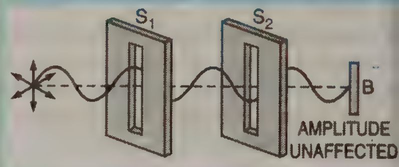

Fig. 7.01

On the other hand, when the slit S_2 is at right angle to the slit S_1, no vibrations will pass through it *i.e.* amplitude of vibrations will become zero [Fig. 7.02.].

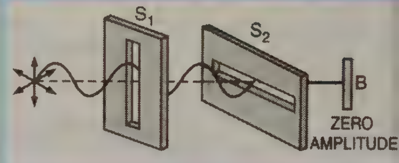

Fig. 7.02

If instead of producing transverse vibrations, we produce longitudinal vibrations in the string at the end A, the vibrations will pass through the slit S_2 irrespective of the fact that the slits S_1 and S_2 are parallel to or at right angles to each other.

From the above mechanical experiment, it follows that *if on rotating the slit S_2, the amplitude of vibration in the string decreases and becomes zero, when the two slits are at right angles, then the wave motion is transverse in nature.* On the other hand, *if the amplitude of vibration remains unaffected, the wave motion is a longitudinal one.*

A Nicol prism or tourmaline crystal cut parallel to its crystallographic axis behaves in a similar manner for light waves as the slit does in case of the wave motion produced in the string. When ordinary light is incident normally on a pair of such crystals C_1 and C_2, the intensity of emergent light is maximum, when the axis of the two crystals are parallel [Fig. 7.03.] and minimum, when the axis of the two crystals become at right angles to each other [Fig. 7.04.]. In view of the mechnical experiment discussed earlier, it follows that *light is a transverse wave motion.*

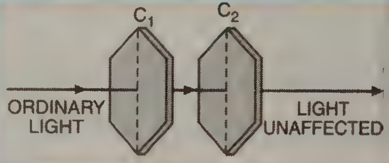

Fig. 7.03

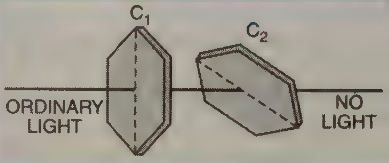

Fig. 7.04

According to Maxwell, light is electromagnetic in nature. An electromagnetic wave consists of varying electric and magnetic fields, such that the two fields are mutually perpendicular to each other and to the direction of propagation of waves. The optical phenomena *i.e.* phenomena concerning light are described by the *electric field vector* in electromagnetic waves. Therefore, transverse nature of light may be attributed to the vibrations of electric field vector in a direction perpendicular to the direction of propagation of light. In ordinary or unpolarised light, *the vibrations of electric field vector are regularly or symmetrically distributed in a plane perpendicular to the direction of the propagation of the light.*

In an ordinary ray of light, the vibrations are in all the directions but perpendicular to the direction of propagation of the light. Such a ray of light is called a ray of *ordinary* or *unpolarised light*. It is schematically represented as shown in Fig. 7.05. The arrows represent vibrations in the plane of the paper, while the dots represent vibrations in a direction perpendicular to the plane of the paper.

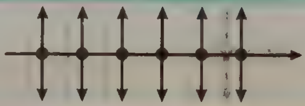

Fig. 7.05

We know that light is electromagnetic wave motion. An electromagnetic wave consists of varying electric and magnetic fields, such that the two fields are mutually perpendicular to each other and to the direction of propagation of waves. The optical phenomena are described by the *electric field vector* in electromagnetic waves. Therefore, transverse nature of light may be attributed to the vibrations of electric field vector in a direction perpendicular to the direction of propagation of light.

7.02. POLARISATION OF LIGHT

The phenomenon, due to which the vibrations of light are restricted in a particular plane, is called the polarisation of light.

When ordinary light *i.e.* unpolarised light passes through a tourmaline crystal, out of all the vibrations which are symmetrical about the direction of propagation, only those pass through it, which are parallel to its crystallographic axis AB. Therefore, on emerging through the crystal, the vibrations no longer remain symmetrical about the direction of propagation but are confined to a single plane as shown in Fig. 7.06.

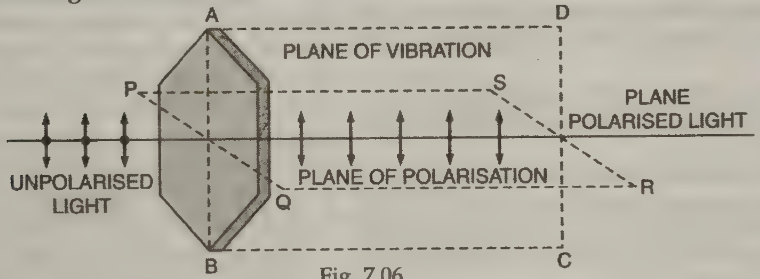

Fig. 7.06

Key point

The vibrations in plane polarised light are perpendicular to the plane of polarisation.

Plane of vibration. *The plane (ABCD), which contains the vibrations of plane polarised light, is called the plane of vibration.*

Plane of polarisation. *The plane (PQRS) perpendicular to the plane of vibrations is called the plane of polarisation.*

Plane polarished light. It *may be defined as the light, in which the vibrations of the light (vibrations of the electric vector) are restricted to a particular plane.*

According to the electromagnetic theory of light, the electric vector acts as light vector. Therefore, in a plane polarised light, the electric vector vibrates along a fixed line in a plane perpendicular to the direction of propagation.

In a plane polarised light, the vibrations are restricted to a fixed plane, so that vibrations are perpendicular to the direction of propagation of light. Fig. 7.07 (*a*) represents plane polarised light having vibrations in the plane of the paper and Fig. 7.07 (*b*) represents the plane polarised light having vibrations in a plane perpendicular to the plane of the paper.

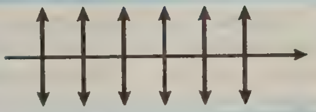

Fig. 7.07 (*a*)

Fig. 7.07 (*b*)

7.03. TO DETECT PLANE POLARISED LIGHT

The naked eye or the polariser alone cannot make distinction between the unpolarised light and the plane polarised light. Another such crystal used to analyse the nature of light is called ***analyser****.

The tourmaline crystal or Nicol prism used to produce plane polarised light is called ***polariser***. If the polariser is rotated in the path of the ordinary light, the intensity of the light transmitted from the polariser remains unchanged. It is because, in each orientation of the polariser, the plane polarised light is obtained, which has vibrations in a direction parallel to the axis of the crystal in that orientation.

If the analyser is rotated in the path of the light transmitted from the polariser, so that the axes of the polariser and the analyser are parallel to each other, then the intensity of light is found to remain unaffected (or maximum) as shown in Fig. 7.08.

Key point

A polariser alone cannot distinguish between an unpolarised and plane polarised light.

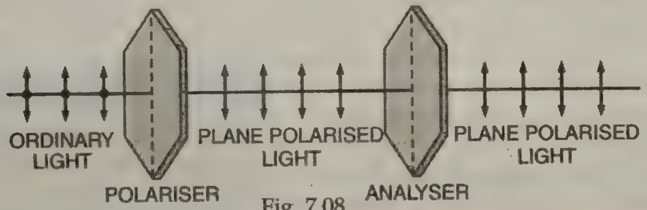

Fig. 7.08

---

*In Fig. 7.03 or 7.04, the crystal C_1 acts as a polariser and the crystal C_2 acts as an analyser.

On the other hand, the intensity of light becomes minimum, when the axis of the polariser and the analyser are perpendicular to each other [Fig. 7.09]. In the position shown in Fig. 7.09, the polariser and the analyser are said to be in *crossed positions.*

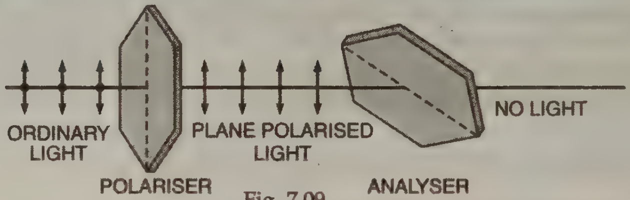

Fig. 7.09

7.04. POLARISATION BY REFLECTION

The simplest method to produce plane polarised light is by reflection.

Malus found that an ordinary beam of light on reflection from a transparent medium becomes partially polarised. The degree of polarisation increases as the angle of incidence is increased. At a particular value of angle of incidence, the reflected beam becomes completely polarised. This angle of incidence is called the ***polarising angle*** for that medium.

Therefore, *the angle of incidence, at which when ordinary light is incident on transparent refracting medium, the reflected light becomes maximum rich in plane polarised light is called polarising angle.* It is denoted by p.

The value of polarising angle varies with the wavelength of light and hence complete polarisation can be obtained only with monochronic light. In Fig. 7.10, the ordinary light is incident along AB on the surface separating air from a medium of reflective index μ. The completely plane polarised light is obtained along the path BC of reflected light, when light is incident at polarising angle p. The plane polarised light has vibrations perpendicular to the plane of paper. The light travelling along the path BD (refracted light) is unpolarised light.

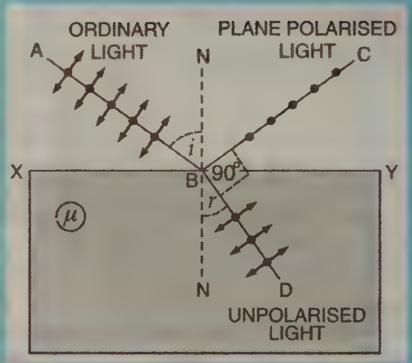

Fig. 7.10

Explanation. The vibrations perpendicular to the plane of the paper always remain parallel to the reflecting surface, whatever be the angle of incidence, and hence the condition of reflection remains the same, even if the angle of incidence is changed. The other vibrations make different angles with the reflecting surface as the angle of incidence is changed.

When light is incident at the ***polarising angle,*** the vibrations perpendicular to the plane of the paper or parallel to the reflecting surface are reflected along BC, while the other vibrations (making some angle with the reflecting surface) are transmitted and are not reflected. The reflected light is, therefore, completely *polarised in the plane of incidence.*

Key point

The light reflected from a transparent refracting medium is always plane polarised. However, the plane of vibration becomes maximum rich in such vibrations, when light is incident at polarising angle.

7.05. BREWSTER'S LAW

It states that *when light is incident at polarising angle at the interface of a refracting medium, the refractive index of the medium is equal to the tangent of the polarising angle.*

If p is polarising angle and μ, the refractive index of the refracting medium, then according to Brewster's law,

$$\mu = \tan p \qquad ...(7.01)$$

When light is incident at polarising angle, the reflected light is found to be completely plane polarised.

Refer to Fig. 7.10. When light is incident at polarising angle p on a refracting medium of refractive index μ, let r be the angle of refraction. Then, according to Snell's law,

$$\mu = \frac{\sin p}{\sin r} \qquad ...(7.02)$$

From equations (7.01) and (7.02), we have

$$\frac{\sin p}{\sin r} = \tan p$$

or $$\frac{\sin p}{\sin r} = \frac{\sin p}{\cos p}$$

or $\sin r = \cos p$ or $\sin r = \sin(90° - p)$ or $r = 90° - p$

or $r + p = 90°$

Now, angle of reflection *i.e.* $\angle$ NBC = p, the angle of incidence. Since $r + p = 90°$, it follows that $\angle$ CBD = 90° *i.e.* reflected ray BC is perpendicular to refracted ray BD.

Key point

When light is incident on a transparent refracting surface at polarising angle, the reflected and refracted rays are perpendicular to each other.

Hence, *when a ray of light is incident at polarising angle, the reflected ray is at right angle to the refracted ray.*

7.06. POLARISATION BY SCATTERING

When a beam of light passes through a medium, it gets scattered from the particles constituting the medium, provided the size of the particles is of the order of the wavelength of the light. The scattered light viewed in a direction perpendicular to the direction of the beam of light is found to be plane polarised. It gives us a method to produce plane polarised light by scattering.

Consider a beam of unpolarised light propagating along X-axis. The vibrations are confined in YZ-plane [Fig. 7.11]. After being scattered from a particle O, the light scattered along Y-axis has only those vibrations, which are perpendicular to Y-axis but parallel to Z-axis. On the other hand, the light scattered along Z-axis is found to contain only those vibrations, which are perpendicular to Z-axis and parallel to Y-axis. Thus, the scattered light, both along X-axis and Z-axis, is plane polarised light.

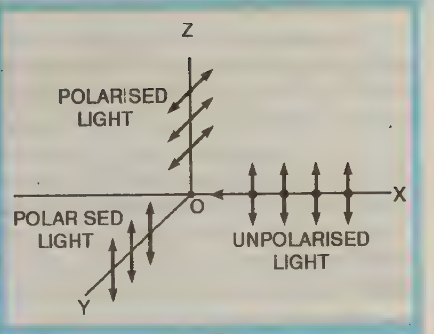

Fig. 7.11

7.07. LAW OF MALUS

It states that *when a completely plane polarised light beam is incident on an analyser, the intensity of the emergent light varies as the square of the cosine of the angle between the planes of transmission of the analyser and the polariser.*

Consider that the plane of polariser and the plane of analyser are inclined at an angle θ as shown in Fig. 7.12. Further, suppose that the plane polarised light of intensity I_0 and amplitude a is incident on the polariser. The amplitude of the incident light can be resolved into two components :

(*i*) The component $a \cos \theta$ along the plane of transmission of the analyser and

(*ii*) The component $a \sin \theta$ in a direction perpendicular to the plane of the analyser.

In case, there is no loss of light due to absorption, while traversing the analyser, then intensity of light transmitted from the analyser is given by

$$I = (a \cos \theta)^2 = a^2 \cos^2 \theta$$

But $a^2 = I_0$, the intensity of incident plane polarised light. Therefore,

$$I = I_0 \cos^2 \theta$$

or

$$I \propto \cos^2 \theta \qquad \text{...(7.03)}$$

It is called *law of Malus.*

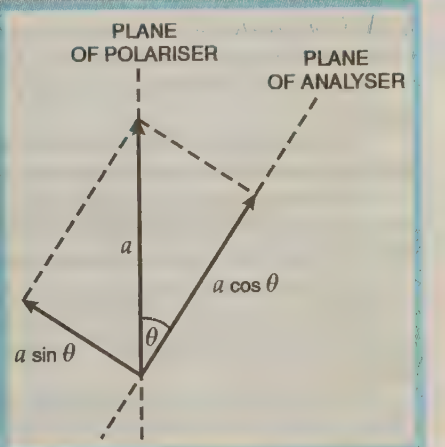

Fig. 7.12

Discussion. 1. When $\theta = 0°$ or $180°$ so that $\cos \theta = \pm 1$,

$$I = I_0$$

Therefore, *when polariser and analyser are parallel, the intensity of light transmitted from the analyser is same as that falls on it from polariser.*

2. When $\theta = 90°$ so that $\cos \theta = 0$,

$$I = 0$$

Therefore, *when the polariser and analyser are perpendicular, the intensity of light transmitted from the analyser is zero i.e. minimum.*

3. If we plot a graph between intensity of light and the angle between polariser and analyser, it will be shown in Fig. 7.13.

4. In case, the light incident on analyser is unpolarised, then

$$I = \frac{1}{2} I_0$$

It is because, in unpolarised light, the light vector vibrates randomly in a plane perpendicular to the direction of propagation and therefore to determine the intensity of transmitted light, average value of $\cos^2 \theta$ has to be substituted in equation (7.02). It can be shown that the average value of $\cos^2 \theta$ *i.e.* $\overline{\cos^2 \theta} = \frac{1}{2}$.

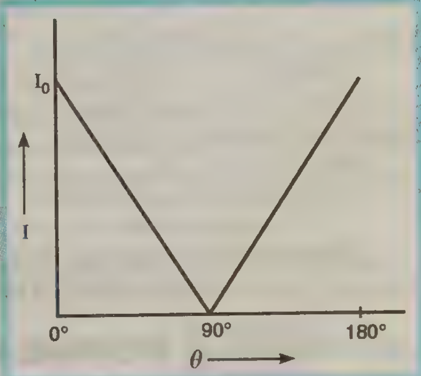

Fig. 7.13

7.08. POLAROIDS

A Nicol prism or a tourmaline crystal cannot be used to produce plane polarised beam of light of large cross-section. It is because of the reason that very large crystals of calcite and tourmaline are not available in practice.

Polaroids are thin and large sheets of crystalline polarising material (made artificially) capable of producing plane polarised beams of large cross-section.

In 1852, Herapath discovered that the synthetic small needle-shaped crystals of iodosulphate of quinine possess the property of polarising the light. These crystals were called *herapathite.* These crystals are not stable and cannot bear even a slight strain. Since such crystals cannot be used as such, a polaroid sheet is prepared from the suspension of these crystals in nitrocellulose. To impart stability, its thin sheet is mounted between the two sheets of glass or celluloid.

A polaroid sheet can also be obtained from a sheet of polyvinyl alcohol. When such a sheet is subjected to a large strain, the molecules get oriented in the direction of the applied strain. When the sheet is impregnated with iodine, the material becomes *dichroic**. The polaroid sheet so obtained is called *H-polaroid.*

If the stretched sheet of polyvinyl alcohol is heated in the presence of a dehydrating agent such as HCl, it becomes strongly dichroic as well as very stable. Such a polaroid sheet is called ***K-polaroid***.

Each polaroid sheet is enclosed between thin glass plates so as to provide mechanical support. Further, a polaroid has a characteristic plane called *transmission plane.* When unpolarised light falls on a polaroid, only the vibrations parallel to the transmission plane get transmitted [Fig. 7.14].

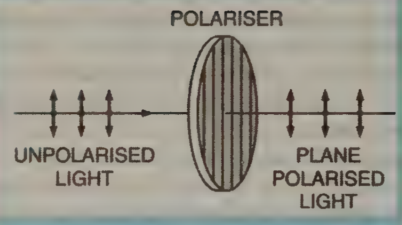

Fig. 7.14

If a polariod P_1 is placed in front of a source of light, then light coming out of it is plane polarised. When another polaroid P_2 is placed so that their transmission planes are parallel [Fig. 7.15], the plane polarised light produced by the polaroid P_1 also passes through it. However, when the polaroid P_2 is rotated through 90°, so that the transmission planes of the two polaroids become perpendicular to each other, then no light comes out [Fig. 7.16]. The two polaroids are said to be *crossed*.

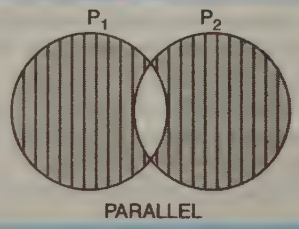

Fig. 7.15

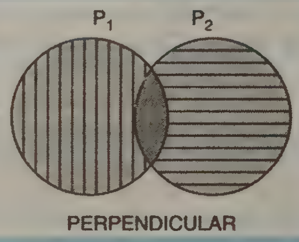

Fig. 7.16

Uses. The polaroids are widely used and a few important uses are as listed below :

1. *In sun glasses.* Polaroids are used in sun glasses. Such goggles are more efficient than those made of coloured glasses. They protect the eyes from the glare.

2. *In wind shields in automobiles.* The wind shield of an automobile is made of polaroid. Such a wind shield protects the eyes of the driver of the automobile from the dazzling light of the approaching vehicles.

For the same reasons, the covers of head lights are made of polaroids.

3. *In window panes.* The polaroids are used in window panes of a train and especially of an aeroplane. They help to control the light entering through the windows.

4. *In three dimensional motion pictures.* The pictures taken by a stereoscopic camera, when seen with the help of polaroid spectacles, create three dimensional effect.

In addition to the above uses, polaroids are used as filters in photography to produce and detect the plane polarised light in the laboratory and to study the optical properties of the metals.

SOLVED NUMERICAL PROBLEMS

TYPE A. ON BREWSTER'S LAW

Problem 7.01. A ray of light is incident on the surface of a glass plate of refractive index 1·536 at the polarising angle. Calculate the angle of refraction.

Sol. Here, $\mu = 1{\cdot}536$

If p is the polarising angle, then

$$\tan p = \mu = 1{\cdot}536 \quad \text{or} \quad p = 56°\,56'$$

If r is the angle of refraction, then

$$r = 90° - p = 90° - 56°56' = \mathbf{33°4'}$$

Problem 7.02. For a given medium, the polarising angle is 60°. What will be the critical angle for this medium ?

(H.P.S.S.C.E. 1996)

Sol. Here, $p = 60°$

Now, $\mu = \tan p = \tan 60° = \sqrt{3}$

If C is the critical angle, then $\mu = \dfrac{1}{\sin C}$

$$\text{or} \qquad \sin C = \frac{1}{\mu} = \frac{1}{\sqrt{3}} = 0{\cdot}5774 \quad \text{or} \quad \mathbf{C = 35°16'}$$

TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 7.03. Two polaroids are crossed to each other. Now, one of them is rotated through 60°. What percentage of incident unpolarised light will pass through the system ?

Sol. Let I_0 be intensity of the incident unpolarised light on the system. As the incident light is unpolarised, the intensity of light on being transmitted from the first polaroid will become

$$I = I_0\,\overline{\cos^2\theta} = \frac{I_0}{2} \qquad \left(\because \overline{\cos^2\theta} = \frac{1}{2}\right)$$

---

* A calcite crystal splits the incident ray of light into two refracted rays called *ordinary ray* and *extraordinary ray.* This phenomenon is called *double refraction.*

The tourmaline crystal is also a doubly refracting crystal with an additional property that is absorbs ordinary and extraordinary rays unequally. Such crystals are called *dichroic crystals* and this phenomenon is called *dichroism* (*selective absorption*).

If θ is the angle between the transmission planes of the wo polaroids, then intensity of light on passing through the econd polaroid is given by

$$I' = I\cos^2\theta = \frac{I_0}{2}\cos^2\theta$$

Since the two polaroids were initially crossed, the angle etween the transmission planes of the two polaroids on otating through 60° will become

$$\theta = 90° - 60° = 30°$$

$$\therefore \qquad I' = \frac{I_0}{2} \times \cos^2 30° = \frac{I_0}{2} \times \left(\frac{\sqrt{3}}{2}\right)^2 = 0{\cdot}375\, I_0$$

Hence, percentage of incident light that passes through he system,

$$\frac{I'}{I_0} \times 100 = 0{\cdot}375 \times 100 = \mathbf{37{\cdot}5\%}$$

Problem 7.04. Two polaroids are placed at 90° to each other. What happens, when (N – 1) more polaroids are inserted between them ? Their axis are equally spaced. How does the transmitted intensity behave for large N ?

Sol. When (N – 1) poleroids are inserted between two polaroids, the total number of polaroids becomes (N + 1). The axes of all the polaroids are equally spaced. If θ is angle between the axes of two conservative polaroids, then

$$\theta + \theta + \theta \text{ .... N times} = 90° \quad \text{or} \quad N\theta = \frac{\pi}{2}$$

$$\text{or} \qquad \theta = \frac{\pi}{2N}$$

According to Malus law, the intensity of light on passing through a pair of polaroid is proportional to $\cos^2\theta$. Before the light passes out of the last polaroid, this change in intensity will be repeated N times. If I_0 is intensity of the incident light and I, the intensity of light after passing through all the polaroids, then

$$I = I_0 (\cos^2\theta)^N = I_0 (\cos\theta)^{2N}$$

$$\text{or} \qquad I = I_0 \left(\cos\frac{\pi}{2N}\right)^{2N}$$

When N is very large, angle $\theta \left(= \frac{\pi}{2N}\right)$ approaches zero and hence $\cos\frac{\pi}{2N}$ approaches 1. Therefore, when N is very large, I will approach I_0.

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 7.01. Sound waves cannot be polarised. Why ?

Ans. It is because, sound waves are longitudinal in nature.

Q. 7.02. What evidence is there that sound is not electromagnetic in nature ? (C.B.S.E. 1995)

Ans. Because, sound waves can not be polarised.

Q. 7.03. Will ultrasonic waves show any polarisation ? Give reasons for your answer. (I.S.C.E. 1995)

Ans. No. It is because, ultrasonic waves are longitudinal in nature.

Q. 7.04. What information does one obtain from polarisation about the nature of light ?

Ans. Only a transverse wave motion can be polarised. Since light waves can be polarised, they must be transverse in nature.

Q. 7.05. Can electromagnetic waves be polarised ?

Ans. Yes.

Q. 7.06. Does the value of wavelength of light have any role in polarisation ?

Ans. No. The electromagnetic waves of all wavelengths can be polarised.

Q. 7.07. What is plane polarised light ? (I.S.C.E. 1997 ; C.B.S.E. 1992)

Ans. The light in which the vibrations of the light (vibrations of electric field vector) are restricted in a particular plane is called plane polarised light.

Q. 7.08. Which plane is defined as the plane of polarisation in a plane polarised electromagnetic wave ? (I.S.C.E. 1998)

Ans. The plane perpendicular to the plane of vibrations in a plane polarised light is called plane of polarisation.

Q. 7.09. Can you detect by the naked eye, whether a given light is polarised or not ?

Ans. No.

Q. 7.10. Define the polarisation angle for polarisation by reflection. (P.S.S.C.E. 2002)

Ans. *The angle of incidence, at which when ordinary light is incident on transparent refracting medium, the reflected light becomes maximum rich in plane polarised light, is called polarising angle.*

Q. 7.11. State Brewster's law.
(H.S.S.C.E. 2000, 1998 S, 1996 ; P.S.S.C.E. 1998 S ; I.S.C.E. 1996, 1995)

Ans. Refer to section 7.05.

Q. 7.12. State the law connecting the angle of polarisation with the refractive index of a medium.

Ans. Brewster's law connects the angle of polarisation and refractive index of the medium.

For statement, refer to section 7.05.

Q. 7.13. A ray of light is incident on a medium at polarising angle. What is the angle between the reflected and refracted rays ? (I.S.C.E. 1997)

Ans. 90°.

Q. 7.14. When light is polarised by reflection, what is the plane of vibration of the electric field vector in polarised light ?

Ans. The electric field vector is perpendicular to the plane of incidence.

Q. 7.15. The polarising angle of a medium is 60°. What is the refractive index of the medium ? (C.B.S.E. 2000, 1999)

Or

A ray of light strikes a glass plate at an angle of incidence 60°. If the reflected and refracted rays are perpendicular to each other, find the index of refraction of glass.

Ans. When the reflected ray and the refracted rays are perpendicular to each other, then angle of incidence is equal to polarising angle.

Therefore, $\mu = \tan p = \tan 60° = \sqrt{3}$

Q. 7.16. A ray of light falls on a transparent slab of $\mu = \sqrt{3}$. What is the value of angle of incidence, if the refracted light is completely polarised ? (*P.S.S.C.E. 1999*)

Or

What is the polarising angle of a medium of refractive index $\sqrt{3}$? (*C.B.S.E. 2000, 1999*)

Ans. Refer to VSQ 7.15.

Here, $i = p = \tan^{-1}\mu = \tan^{-1}\sqrt{3} = \mathbf{60°}$

Q. 7.17. What is a polaroid ? (*P.S.S.C.E. 2002, 2000 ; I.S.C.E. 1995*)

Ans. A polaroid is a thin and large sheet of a crystalline polarising material capable of producing plane polarised beams of light of large cross-section.

Q. 7.18. Write simple uses of polaroids. (*P.S.S.C.E. 1999 S ; H.S.S.C.E. 1997*)

Ans. Polaroids are used in sunglasses, in wind shields of automobiles, in window panes, in making three dimensional motion pictures, etc.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 7.01. Differentiate between polarised and unpolarised light. How are these represented ? (*P.S.S.C.E. 1997*)

Ans. For distinction between polarised and unpolarised light, refer to section 7.01.

For representation, refer to Fig. 7.05 (for unpolarised light) and Fig. 7.07 (*a*) or (*b*) (for plane polarised light).

Q. 7.02. Explain what is meant by : (*i*) plane polarised light, (*ii*) polarising angle. (*I.S.C.E. 1995*)

Ans. (*i*) Refer to section 7.02. (*ii*) Refer to section 7.04.

Q. 7.03. How can one distinguish between an unpolarised light beam and a linearly polarised beam using a polaroid ? (*C.B.S.E. 1996*)

Ans. When a polaroid is rotated in the path of unpolarised light, the intensity of the light transmitted from the polaroid remains undiminished. However, when the polaroid is rotated in the path of plane polarised light, its intensity will vary from maximum (when the vibrations of the plane polarised light are parallel to the axis of the polaroid) to minimum (when the direction of vibrations becomes perpendicular to the axis of the crystal).

Q. 7.04. Explain polarisation by reflection. (*Pre-degree Kerala, 1992*)

Ans. Refer to section 7.04.

Q. 7.05. Draw a sketch showing the incident, reflected and transmitted rays, when light is incident at the polarizing angle on a glass slab. (*I.S.C.E. 1994*)

Ans. Refer to Fig. 7.10.

Q. 7.06. Define (*i*) critical angle (*ii*) polarising angle. What is the relation between the two ? (*P.S.S.C.E. 1999 S, 1999, 1996 S*)

Ans. ***Critical angle (C).*** It is the angle of incidence in denser medium, at which the ray of light after undergoing refraction at the surface of separation of the two media, becomes parallel to the surface of separation.

Polarising angle (p). Refer to section 7.04.

The relation between the polarising angle and the critical angle is given by

$$\tan p = \frac{1}{\sin C}$$

Q. 7.07. The critical angle between a given transparent medium and air is denoted by C. A ray of light in air medium enters this transparent medium at an angle of incidence equal to polarising angle *p*. Deduce a relation for the angle of refraction in terms of C. (*I.S.C.E. 1998*)

Ans. According to Brewster's law, when a ray of light is incident at polarising angle,

$$\mu = \tan p \qquad \ldots(i)$$

If C is critical angle for the transparent medium and air, then

$$\mu = \frac{1}{\sin C} \qquad \ldots(ii)$$

From equations (*i*) and (*ii*), we have

$$\tan p = \frac{1}{\sin C} \qquad \ldots(iii)$$

If *r* is angle of refraction, then

$$P = 90° - r$$

or $$\tan p = \tan(90° - r) = \cot r = \frac{1}{\tan r} \qquad \ldots(iv)$$

From equations (*iii*) and (*iv*), we have

$$\tan r = \sin C \quad \text{or} \quad r = \tan^{-1}(\sin C)$$

Q. 7.08. Draw the graph showing the variation of intensity of polarised light transmitted by the analyser. (*C.B.S.E. 2001*)

Or

Sketch the graph showing the dependence of intensity of transmitted light on the angle of rotation between a polariser and an anlyser. (*C.B.S.E. 1998 S*)

Ans. For sketch of the graph, refer to Fig. 7.12.

Q. 7.09. Name one device for producing polarised light. Draw a graph showing the dependence of intensity of transmitted light on the angle between polariser and analyser. (*C.B.S.E. 1991*)

Ans. Nicol prism can be used to produce plane polarised light. For graph, refer to Fig. 7.12.

Q. 7.10. What are polaroids ? Explain their one use. (*P.S.S.C.E. 2000, 1998*)

Ans. Refer to section 7.08.

abc TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 7.01. What is the basic difference between a source of light and a source of radio waves ?

Ans. In a visible light source, the atoms act as oscillators producing oscillations independent of each other. Due to this, oscillations produced are randomly oriented (unpolarised).

In a radio wave source, the charges oscillate in a plane perpendicular to the direction of propagation of radio waves (polarised).

Q. 7.02. In light waves, the vibrations are perpendicular to the direction of propagation of light. But it is said that light requires no material medium for its pro-pagation, then what vibrates transversely in light waves ?

Ans. Light is electromagnetic in nature and it travels in the form of transverse varying electric and magnetic fields. The optical phenomena are described by the electric field vector of the electromagnetic waves. Hence, the electric field vector vibrates transversely in light waves.

Q. 7.03. Does the value of polarising angle depend upon colour (wavelength) of incident light ?

Ans. The refractive index of a material depends on the wavelengths of the light. As polarising angle depends on the refractive index, it also depends on wavelength of the light.

Q. 7.04. How do sunglasses reduce the glare of intense light ? Explain the physical principle involved.

Ans. The sunglasses are made of polaroids. When ordinary light passes through sunglasses, the ordinary light is rendered into plane polarised light. Due to this, the glare of the intense light gets reduced.

Q. 7.05. Define elliptically polarised light.

(C.B.S.E. 1992)

Ans. When two plane polarised waves are superimposed, the resultant light vector rotates in a plane perpendicular to the direction of propagation. If the resultant light vector has constant magnitude, then the tip of the light vector traces a circle and the light is said to be circularly polarised. However, if the magnitude of the resultant light vector varies periodically during its rotation, the tip of the light vector traces an ellipse and the light is said to be elliptically polarised.

Q. 7.06. What do you mean by the term crossed polaroids ?

Ans. Two polaroids are said to be crossed, when the planes of polarisation of the two polaroids are perpendicular to each other.

Q. 7.07. Two polaroids are placed at 90° to each other and the transmitted intensity is zero. What happens, when one more polaroid is placed between these two, bisecting the angle between them ?

Ans. When polaroids are placed as stated, the electric field is reduced by a factor of cos 45° and again by a factor of cos 45° by the second and third polaroids. In other words, the electric field gets reduced by a factor of $\frac{1}{\sqrt{2}} \times \frac{1}{\sqrt{2}} = \frac{1}{2}$.

Since, intensity of light waves varies as the square of the magnitude of electric field vector, the intensity of light gets reduced by a factor of $\left(\frac{1}{2}\right)^2$ *i.e.* $\frac{1}{4}$.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. What do you understand by polarisation of light ? Describe an experiment to demonstrate transverse nature of light. *(H.P.S.S.C.E. 2001)*
2. Describe an experiment to show that light waves are transverse in nature. *(H.S.S.C.E. 1999 ; C.B.S.E. 1999, 1994, 1993)*
3. A ray of light is incident at an angle of incidence p on the surface of separation between the air and a medium of refractive index μ, such that the angle between the reflected and refracted rays is 90°. Obtain the relation between p and μ. *(C.B.S.E. 1998 S)*
4. What is the phenomenon of polarisation ? Derive the relation connecting the polarising angle of a medium and its refractive index. *(C.B.S.E. 2002)*
5. What is plane polarised light ? Explain a method of producing plane polarised light. *(Karnataka,1994)*
6. Give a method for producing a beam of plane polarised light. Show how you will detect the presence of plane polarised light. Give one practical use of polarised light. *(I.S.C.E. 1996)*
7. State and prove Brewster's law of polarisation. *(H.S.S.C.E. 2002 ; P.S.S.C.E. 2001, 2000, 1999)*
8. State Brewster's law. Show that the reflected ray and the refracted ray are perpendicular to each other, when the angle of incidence is equal to polarising angle.
9. Show that when a light ray is incident at the polarising angle, the reflected ray is at right angles to the refracted ray. *(I.S.C.E. 1995 ; Karnataka, 1995, 1993)*
10. What is a plaroid ? How is plane polarised light obtained with its help ? How will you use it to distinguish between unpolarised light and plane polarised light ? *(C.B.S.E. 2001 S)*
11. What are polaroids ? Write their four uses. *(P.S.S.C.E. 2001)*

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS

FAQs FREQUENTLY ASKED NUMERICAL QUESTIONS

For Practice

Type A. On Brewster's law

1. Refractive index of water is 1·33. Calculate the angle of polarisation for light reflected from the surface of a lake. **[Ans. 53·06°]**
2. The refractive index of a medium is $\sqrt{3}$. What is the angle of refraction, if the unpolarised light is incident on it at the polarising angle of the medium ? *(C.B.S.E. 2002)* **[Ans. 30°]**

3. A ray of light is incident on the surface of glass plate of refractive index 1·5 at the polarising angle. What is the angle of refraction ? (*P.S.S.C.E. 1995*) [**Ans.** 33° 41′]
4. A ray of light strikes a glass plate at an angle of incidence 57°. If the reflected and refracted rays are perpendicular to each other, find the index of refraction of glass. [**Ans.** 1·54]

Type B. On Law of Malus

5. Two polaroids are oriented with their planes of transmission making an angle of 30° with that of preceeding sheet. What fraction of incident unpolarised light is transmitted ? [**Ans.** 37·5%]
6. An unpolarised beam of light is incident on a group of four polarising sheets, which are arranged in such a way that the characteristic direction of each polarising sheet makes an angle of 30° with that of the preceeding sheet. What fraction of light is transmitted ? $\left[\textbf{Ans. } \dfrac{27}{128}\right]$

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. $\tan p = \mu = 1{\cdot}33$ or $p = 53{\cdot}06°$
2. Proceed as in solved problem no. 7.01.
3. Proceed as in solved problem no. 7.01.
4. Since reflected and refracted rays are perpendicular,

$$p = i = 57°$$

$$\therefore \quad \mu = \tan p = \tan 57° = 1{\cdot}54$$

5. Proceed as in solved problem no. 7.03.
6. As obtained in solved problem no. 7.03, the intensity of unpolarised light transmitted through the polarising sheets arranged with their planes of transmission making an anlge of 30° is given by

$$I' = \frac{I_0}{2}\cos^2 30° = \frac{I_0}{2}\left(\frac{\sqrt{3}}{2}\right)^2 = \frac{I_0}{2}\times\frac{3}{4}$$

Therefore, intensity of transmitted light through the third polarising sheet,

$$I'' = I'\cos^2 30° = \frac{I_0}{2}\times\frac{3}{4}\times\left(\frac{\sqrt{3}}{2}\right)^2 = \frac{I_0}{2}\times\left(\frac{3}{4}\right)^2$$

Finally, intensity of light transmitted through the fourth polarising sheet,

$$I = I''\cos^2 30° = \frac{I_0}{2}\times\left(\frac{3}{4}\right)^2\times\left(\frac{\sqrt{3}}{2}\right)^2 = \frac{I_0}{2}\times\left(\frac{3}{4}\right)^3$$

$$= \frac{27\,I_0}{128}$$

$$\text{or} \quad \frac{I}{I_0} = \frac{27}{128}$$

Competitive Examination File (UnitVI)

REVISION AT A GLANCE

Chapter 1. Refraction of Light

☐ **Refraction.** *The phenomenon of change in path of light as it goes from one medium to another is called refraction.*

☐ **Laws of refraction. 1.** *The incident ray, the normal to the refracting surface of the point of incidence and the refracted ray all in the same plane.*

2. *The ratio of the sine of the angle of incidence to the sine of the angle of refraction is constant for any two given media.* It is called *ell's law.*

Mathematically : $\frac{\sin i}{\sin r} = {}^a\mu_b$

Here, ${}^a\mu_b$ is called ***relative refractive index*** of medium b (in which refracted ray travels) *w.r.t.* medium a (in which incident y travels).

☐ **Absolute refractive index.** *The absolute refractive index of a medium is defined as the ratio of the velocity of light in vacuum) to the velocity of light in the medium (v).*

Mathematically : Absolute refractive index, $\mu = \frac{c}{v}$

☐ **Lateral shift.** *The perpendicular distance between the incident and the emergent rays, when the light is incident obliquely on a rallel sided slab of a refracting material is called lateral shift.*

Mathematically : Lateral shift, $d = \frac{t}{\cos r} \sin (i - r)$

☐ **Refraction from a compound plate.** When a compound plate of two refracting slabs of materials b and c (each havin arallel refracting surfaces) is placed in a medium a, then the emergent ray is always parallel to the incident ray and th efractive indices of the three media are related to each other as below :

$${}^a\mu_b \times {}^b\mu_c = {}^a\mu_c$$

☐ **Real and apparent depth.** When an object is placed in an optically denser medium, the apparent depth of the object s always less than its real depth.

Mathematically : 1. $\frac{\text{Real depth}}{\text{Apparent depth}} = {}^a\mu_b$

2. Normal shift, $d = t\left(1 - \frac{1}{{}^a\mu_b}\right)$

☐ **Total internal reflection.** *The phenomenon of reflection of light that takes place when a ray of light travelling in a denser medium ets incident at the interface of the two media at an angle greater than the critical angle for that pair of media.*

Mathematically : ${}^a\mu_c = \frac{1}{\sin C}$

Here, ${}_a\mu^b$ is refractive index of the denser medium b *w.r.t.* the rarer medium a and C is critical angle.

☐ **Spherical refracting surface.** *The portion of a refracting medium, whose curved surface forms the part of a sphere, is called pherical refracting surface.*

When object is situated in the rarer medium, the relation between μ_1 (refractive index of rarer medium), μ_2 (refractive ndex of the spherical refracting surface) and R (radius of curvature) with the object and image distances is given by

$$-\frac{\mu_1}{u} + \frac{\mu_2}{v} = \frac{\mu_2 - \mu_1}{R}$$

When the object is situated in denser medium, the relation between μ_1, μ_2 R, u and v can be obtained by interchanging $_1$ and μ_2. In that case, the relation becomes

$$-\frac{\mu_2}{u} + \frac{\mu_1}{v} = \frac{\mu_1 - \mu_2}{R}$$

Power of spherical refracting surface : $P = \frac{\mu_2 - \mu_1}{R}$

Here, R is measured in **metre.**

☐ **Lens maker's formula.** The relation connecting the focal length of the lens with the radii of curvature of its two surfaces and the refractive index of the material of the lens is called lens maker's formula.

Mathematically : $\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$

The focal length of a convex lens is taken as positive, while that of concave lens is taken as negative.

☐ **Lens equation.** The relation between the focal length, the object and image distances is called lens equation.

Mathematically : $-\frac{1}{u}+\frac{1}{v}=\frac{1}{f}$

☐ **Linear magnification.** *The ratio of the image (formed by the lens) to the size of the object is called linear magnification produced by the lens.*

Mathematically : $m=\frac{I}{O}=\frac{v}{u}=\frac{f}{f+u}=\frac{f-v}{f}$

☐ **Power of a lens.** *It is defined as the reciprocal of the focal length of the lens in metre.*

Mathematically : 1. $P=\frac{1}{f}$

2. $P=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$

In the above two formulae ; f, R_1 and R_2 are measured in **metre.**

☐ **Two thin lenses placed in contact.** When two lenses of focal lengths f_1 and f_2 are placed in contact, the focal length of the combination is given by

$$\frac{1}{f}=\frac{1}{f_1}+\frac{1}{f_2}$$

Power of the equivalent lens : $P=P_1+P_2$

Magnification produced by equivalent lens : $m=m_1\times m_2$

☐ **Spherical aberration.** *The inability of a lens of large aperture to bring all the rays in a wide beam of light falling on it to focus a single point is called spherical aberration.*

Some Useful Facts :

1. Snell's law fails, when light is incident normally on a refracting medium.
2. Lateral shift is maximum (equal to thickness of refracting slab), when the angle of incidence is 90°.
3. The total internal reflection takes place only when the incident ray travelling in denser medium falls on the interface of the two media at an angle of incidence greater than the critical angle.
4. The power of a spherical refracting surface or a lens gives the measure of the degree to which it can converge or diverge the rays of light passing through it.
5. The focal length and power of a spherical refracting surface of a lens depend upon the refractive index of the surrounding medium also in addition to the refractive index of the material and the radii of curvature of its two surfaces.

Chapter 2. Dispersion

☐ **Refraction through a prism.** *A prism is the portion of a transparent refracting medium bounded by two plane surfaces meeting each other along a straight edge.*

A ray of light incident on one face of the prism suffers refraction successively at the two surfaces and then emerges out of it.

Mathematically : 1. $A=r_1+r_2$

2. $A+\delta=i+e$

3. When prism is placed in minimum deviation position,

$$\mu=\frac{\sin(A+\delta_m)/2}{\sin A/2}$$

4. When angle of prism is small, $\delta=A(\mu-1)$

☐ **Dispersion.** *The phenomenon of splitting up of white light into its constituent colours is called dispersion.*

Spectrum. *The band of seven colours obtained on the screen is called spectrum.*

Pure spectrum. *A spectrum, in which the constituent colours have sharp boundaries and are distinctly visible, is called the pure spectrum.*

☐ **Angular dispersion.** *The angular dispersion for any two colours is defined as the difference in deviations suffered by the two colours in passing through the prism.*

Mathematically : Angular dispersion, $\theta=\delta_v-\delta_r$

☐ **Dispersive power.** *The dispersive power of the material of a prism for any two colours may be defined as the ratio of angular dispersion for these two colours to the deviation suffered by the mean light.*

Mathematically : Dispersive power, $\omega = \dfrac{\delta_v - \delta_r}{\delta} = \dfrac{\mu_v - \mu_r}{\mu - 1}$

☐ **Dispersion without deviation.** Two prisms of suitable materials and angles of prism can be combined, so as to produce spersion without deviation.

Condition for no deviation : $\dfrac{A'}{A} = -\dfrac{\mu - 1}{\mu' - 1}$

$$\text{Net angular dispersion} = \delta\,(\omega - \omega')$$

☐ **Deviation without dispersion.** Two prisms of suitable materials and angles of prism can also be combined, so as to oduce deviation without dispersion.

Condition for no dispersion : **1.** $\dfrac{A'}{A} = -\dfrac{\mu_v - \mu_r}{\mu_v{}' - \mu_r{}'}$

2. $\dfrac{\omega}{\omega'} = -\dfrac{\delta'}{\delta}$

$$\text{Net deviation} = \delta\left(1 - \frac{\omega}{\omega'}\right)$$

☐ **Chromatic aberration.** *The inability of a lens to bring the light of different colours to focus at a single point is called chromatic erration.*

Mathematically : Chromatic aberration, $f_r - f_v = \omega \times f$

☐ **Spectrometer.** *It is an optical instrument to obtain and study the pure spectrum.*

☐ **Rayleigh's law of scattering.** *It states that the intensity of the light of wavelength λ in the scattered light varies inversely as e fourth power of its wavelength.*

☐ **Rainbow.** *The coloured arcs (or the spectrum of white light from the sun in the form of bows), seen immediately after the rain an observer with his back towards the sun, are called rainbows.*

ome Useful Facts :

1. A prism always deviates a ray of light towards its base. However, the ray of light is deviated away from the base, hen the prism is placed inside a denser medium.

2. The white light gets dispersed, while passing through a prism due to the fact that white light consists of light of different avelength.

3. When two prisms are combined to produce dispersion without deviation, the order of the colours in the spectrum ue to the combination is opposite to that due to the crown glass prism.

4. The chromatic aberration in a lens is because of the fact that it has different focal lengths for light of different colours.

5. The line emission spectrum is due to atoms, while the band emission spectrum is due to the molecules of an element.

6. The pure spectrum can be obtained by placing the prism in minimum deviation postion.

7. When light from the sun traverses the atmosphere, the scattering of the blue light is approximately sixteen times as rge as that of red light.

Chapter 3. Optical Instruments

☐ **Simple microscope.** A convex lens of small focal length is called a simple microscope or a magnifying glass.

The magnifying power of a microscope is defined as the ratio of the angle subtended by the image at the eye and the angle subtended y the object seen directly, when both lie at the least distance of distinct vision.

Mathematically : $M = \left(1 + \dfrac{D}{f}\right)$

Here, D is the least distance of distinct vision.

☐ **Compound microscope.** A compound microscope is a two lens system (object lens and eye lens of focal lengths f_o nd f_e). Its magnifying power is very large, as compared to the simple microscope.

Mathematically : $M = \dfrac{v_o}{u_o}\left(1 + \dfrac{D}{f_e}\right) = -\dfrac{L}{f_o}\left(1 + \dfrac{D}{f_e}\right)$

Here, u is distance of the object from the object lens and v ($\approx$ L, the length of the tube of microscope) is the distance at which the object lens forms the image of the object.

☐ **Astronomical telescope.** It is a two lens system and is used to observe distant heavenly objects. It is called refracting ype astronomical telescope.

☐ **Normal adjustment.** *When the final image is formed at infinity, the telescope is said to be in normal adjustment.*

Magnifying power of a telescope in normal adjustment is defined as the ratio of the angle subtended by the image at the eye as seen through the telescope to the angle subtended by the object seen directly, when both the object and the image lie at infinity.

Magnifying power in normal adjustment, $M = -\frac{f_o}{f_e}$

When the final image is formed at least distance of distinct vision,

magnifying power of the telescope, $M = -\frac{f_o}{f_e}\left(1 + \frac{f_e}{D}\right)$

☐ **Reflecting type telescope.** In a reflecting type telescope, the objective is a concave spherical mirror of large apertur in place of a convex lens.

The expression for magnifying power of a reflecting type telescope is same as that for refracting type astronomica telescope.

☐ **Prism binoculars.** It is a system of two astronomical telescopes making use of object lenses of very large focal length As such, the length of the telescopes would become very large. However, the length of the telescope tubes is cut short b making use of totally reflecting prisms.

Some Useful Facts :

1. The optical instruments are used as an aid to the human eye so as to produce higher magnification, greater resolvin power and to produce the image of close lying objects at least distance of distinct vision.
2. Eye is a natural optical instrument. It has a unique feature of automatic adjustment of its aperture and focussing.
3. The magnifying power and magnification produced by a lens are different from each other.
4. The magnifying power of a telescope is perceived as the increase in the visual angle of the image.

Chapter 4. Huygens' Principle

☐ **Wavefront.** *The locus of the points in the medium, which at any instant are vibrating in the same phase, is called wavefront Ray of light is the line drawn perpendicular to the wave front.*

☐ **Huygens' Principle. 1.** *Each point on a given (or primary) wave front acts as a source of secondary wavelets, sending ou disturbance in all directions in a similar manner as the original source of light does.*

2. *The new position of the wave front at any instant (called secondary wave front) is the envelope of the secondary wavelets at tha instant.*

It is also called ***Huygens' construction*** and it is used to find the new position of the wavefront at a later time.

Some Useful Facts :

1. The time taken for light to travel from one wave front to another is the same along any ray.
2. The contribution of a wavelet in any direction making angle θ with the normal to the wavelet is proportional t $\frac{1}{2}(1+\cos\theta)$. Since for a wavelet, which lies on the back of the secondary wavefront, θ is 180°, the contribution from such wavelet is $\frac{1}{2}(1+\cos 180°) = 0$.

Chapter 5. Interference of Light

☐ **Interference.** *The phenomenon of non-uniform distribution of energy in the medium due to superposition of two light waves called interference of light.*

☐ **Coherent sources.** *Two sources are said to be coherent, if they emit light waves of same wavelength (or frequency) and of stable phase difference.*

☐ **Young's double slit experiment.** Consider that two coherent sources are separated by a distance d so as to produc interference fringes on a screen held at a distance D from the plane of the slits. When the slits are illuminated with monochromatic light of wavelength λ, then on the two sides of the central bright fringe, alternate dark and bright fringe are formed. Let ϕ be the phase difference and x be the path difference between the two light waves reaching a point P on th screen.

1. ***Condition for maximum intensity*** **at point P :**

Phase difference, $\phi = 2n\pi$ or path difference, $x = n\lambda$, where $n = 0, 1, 2$ ....

2. ***Condition for minimum intensity*** **at point P :**

Phase difference, $\phi = (2n+1)\pi$ or path difference, $x = (2n+1)\frac{\lambda}{2}$ where $n = 0, 1, 2$ ....

3. ***Ratio of the maximum and minimum intensity :*** $\frac{I_{max}}{I_{min}} = \frac{(a_1+a_2)^2}{(a_1-a_2)^2}$

Here, a_1 and a_2 are amplitudes of the two light waves.

Also, ratio of intensity of light due to the two slits of widths w_1 and w_2 is given by

$$\frac{I_1}{I_2} = \frac{w_1}{w_2} = \frac{a_1^2}{a_2^2}$$

4. (a) *Distance of nth bright fringe from the centre of the screen :* $y_n = \frac{n D \lambda}{d}$

(b) *Angular position of the nth bright fringe :* $\theta_n = \frac{y_n}{D} = \frac{n\lambda}{d}$

5. (a) *Distance of nth dark fringe from the centre of the screen :* $y_n' = \frac{(2n+1) D\lambda}{2d}$

(b) *Angular position of the nth dark fringe :* $\theta_n' = \frac{y_n'}{D} = \frac{(2n+1)\lambda}{2d}$

6. *Fringe width :* $\beta = \frac{D\lambda}{d}$

me Useful Facts :

1. The intensity of light is directly proportional to the square of the amplitude of the wave.
2. In Young's double slit experiment, the bright and dark fringes are of equal widths.
3. The fringe width decreases, when Young's double slit experiment is immersed in a liquid.
4. The colour of thin films is due to interference between the two beams of light ; one reflected from the upper surface the film and the other emerging after reflection from the lower surface of the film.

Chapter 6. Diffraction of Light

☐ **Diffraction.** *The phenomenon of bending of light round the sharp corners and spreading into the regions of the geometrical shadow called diffraction.*

☐ **Diffraction from a slit.** A narrow slit of width a is placed at a distance D from the screen. When the slit is illuminated th a monochromatic light of wavelength λ, then alternate bright and dark bands of light are formed on both the sides of e central maximum.

1. (a) *Angular position of the nth secondary minimum :* $\theta_n = \frac{n\lambda}{a}$

(b) *Distance of the nth secondary maximum from the centre of the screen :* $y_n = \frac{n D\lambda}{a}$

2. (a) *Angular positions of the nth secondary maximum :* $\theta_n' = \frac{(2n+1)\lambda}{2a}$

(b) *Distance of the nth secondary maximum from the centre of the screen :* $y_n' = \frac{(2n+1) D\lambda}{2a}$

3. (a) *Width of a secondary maximum or minimum :* $\beta = \frac{D\lambda}{a}$

(b) *Width of the central maximum :* $\beta_0 = \frac{2D\lambda}{a}$

4. ***Half angular width of central maximum.*** The angular position of first secondary minimum is known as half angular idth of the central maximum. Thus,

$$\text{half angular width of central maximum}, \ \theta_1 = \frac{\lambda}{a}$$

5. ***Fresnel distance.*** *It is defined as the distance of the screen from the slit beyond which, the spreading of light due to diffraction ecomes quite large as compared to the size of the slit.* It is denoted by Z_F.

Mathematically : $Z_F = \frac{a^2}{\lambda}$

6. **Limit of resolution.** *The smallest separation (linear or angular) between the two point objects at which they appear just eparated, is called the limit of resolution.*

Linear limit of resolution of a microscope : $d = \frac{\lambda}{2\mu \sin\theta}$

Here, θ is semi-vertical angle of the cone formed by the object at the objective of the microscope and μ is the refractive ndex of the medium between the object and the objective.

Angular limit of resolution of a telescope : $d\theta = \frac{1 \cdot 22\,\lambda}{D}$

Here, D is diameter of the objective of the telescope.

7. **Resolving power.** *It is defined as the reciprocal of the limit of resolution.*

Resolving power of a microscope, $\frac{1}{d} = \frac{2\mu\sin\theta}{\lambda}$

Resolving power of a telescope, $\frac{1}{d\theta} = \frac{D}{1{\cdot}22\,\lambda}$

Some Useful Facts :

1. Diffraction pattern is the result of the interaction of light from the different parts of the same wavefront.
2. In diffraction pattern, the central maximum is twice as wide as any other secondary maximum.
3. All the secondary maxima are not of same intensity.

Chapter 7. Polarisation of Light

☐ **Polarisation.** *The phenomenon due to which vibrations of light are restricted in a particular plane is called polarisation.*

☐ **Plane polarised light.** *It is the light in which the vibrations of the light (vibrations of the electric vector) are restricted i particular plane.*

☐ **Plane of polarisation.** *The plane perpendicular to the plane containing the vibrations of plane polarised light is called plane polarisation.*

☐ **Brewster's law.** It states that *when light is incident at polarising angle, the reflected and refracted rays are perpendicular each other.*

Mathematically : $\mu = \tan p$

Here, p is the polarising angle for a medium of refractive index μ.

☐ **Law of Malus.** It states that *when a completely plane polarised light beam is incident on an analyser, the intensity of the emerge light varies as the square of the cosine of the angle between the planes of transmission of the analyser and the polariser.*

Mathematically : $I = I_0 \cos^2 \theta$

Here, I_0 is the intensity of incident plane polarised light and θ is the angle between the planes of transmission of analys and the polariser.

☐ **Polaroid.** *The thin and large sheets of crystalline polarising material capable of producing plane polarised beams of light of lar cross-section.*

☐ **Optical activity.** *The property of a substance of rotating the plane of vibration of the plane-polarised light, when passed throu it, is called optical activity.*

☐ **Specific rotation.** *The specific rotation of an optically active solution is numerically equal to the amount of rotation produc by the solution of length 1 m and concentration 1 kg m^{-3}.* It is denoted by S.

Mathematically : $S = \frac{\theta}{l\,c}$

Here, l, c and θ stand for length of the solution, concentration of the solution and the rotation produced in the plane polarisation of the light by the solution.

Some Useful Facts :

1. The naked eye cannot distinguish between ordinary light and the plane polarised light.
2. When a polariser is rotated in the path of ordinary light, the intensity of light remains undiminished. The intensity light transmitted from the polariser changes, in case the light falling on the polariser is plane polarised light. As such, t polariser is said to be acting as an analyser.

NUMERICAL PROBLEMS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Refraction of Light

Problem 1.01. The XY-plane is the boundary between two transparent media [Fig. 1.01]. Medium-I with $z \geq 0$ has a refractive index $\sqrt{2}$ and medium-II with $z \leq 0$ has a refractive index $\sqrt{3}$. A ray of light in medium-I given by the vector $\vec{A} = 6\sqrt{3}\,\hat{i} + 8\sqrt{3}\,\hat{j} - 10\,\hat{k}$ is incident on the plane separation. Find the unit vector in the direction of th refracted ray in medium-II. *(I.I.T. 199*

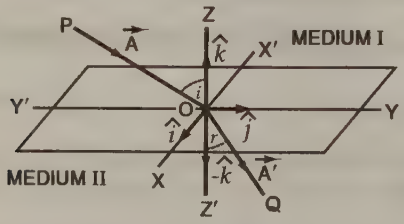

Fig. 1.01

Thought Process

1. *The angle of incidence (angle between incident r and Z-axis is given by)*

$$\cos i = \frac{\vec{A}\cdot(-\hat{k})}{|\vec{A}|}$$

Here, $\vec{A} = 6\sqrt{3}\,\hat{i} + 8\sqrt{3}\,\hat{j} - 10\,\hat{k}$

2. If r is the angle of refraction, then

$$\frac{\sin i}{\sin r}=\frac{\sqrt{3}}{\sqrt{2}}$$

3. Suppose that the refracted ray is represented by the vector

$$\vec{A}'=a\,\hat{i}+b\,\hat{j}+c\,\hat{k}$$

On refraction, the plane containing the refracted ray and the normal is the same plane, which contains the incident ray and the normal (only the inclination of the path of ray with the normal i.e. Z-axis changes). Therefore the values of a and b in vector $\vec{A}'$ must be the same as those in vector $\vec{A}$ i.e. $a=6\sqrt{3}$ and $b=8\sqrt{3}$. Hence, the vector representing the refracted ray is

$$\vec{A}'=6\sqrt{3}\,\hat{i}+8\sqrt{3}\,\hat{j}+c\,\hat{k}$$

4. The angle of refraction is given by

$$\cos r=\frac{\vec{A}'(-\hat{k})}{|\vec{A}'|}$$

Sol. The vector representing incident ray,

$$\vec{A}=6\sqrt{3}\,\hat{i}+8\sqrt{3}\,\hat{j}-10\,\hat{k}$$

$$\therefore\quad |\vec{A}|=\sqrt{(6\sqrt{3})^2+(8\sqrt{3})^2+(-10)^2}$$

$$=\sqrt{108+192+100}=20$$

Now, $$\cos i=\frac{\vec{A}.(-\hat{k})}{|\vec{A}|}$$

$$=\frac{(6\sqrt{3}\,\hat{i}+8\sqrt{3}\,\hat{j}-10\,\hat{k}).(-\hat{k})}{20}$$

$$=\frac{0+0+10}{20}=\frac{1}{2}$$

or $$i=60^\circ$$

From Snell's law, $$\frac{\sin i}{\sin r}=\frac{\sqrt{3}}{\sqrt{2}}$$

or $$\sin r=\frac{\sqrt{2}}{\sqrt{3}}\sin i=\frac{\sqrt{2}}{\sqrt{3}}\sin 60^\circ=\frac{\sqrt{2}}{\sqrt{3}}\times\frac{\sqrt{3}}{2}$$

or $$\sin r=\frac{1}{\sqrt{2}}\quad\text{or } r=45^\circ$$

Now, the vector representing the refracted ray is given by

$$\vec{A}'=6\sqrt{3}\,\hat{i}+8\sqrt{3}+c\,\hat{k}$$

and $$\cos r=\frac{\vec{A}'(-\hat{k})}{|\vec{A}'|}$$

$$\therefore\quad \cos 45^\circ=\frac{(6\sqrt{3}\,\hat{i}+8\sqrt{3}\,\hat{j}+c\,\hat{k}).(-\hat{k})}{\sqrt{(6\sqrt{3})^2+(8\sqrt{3})^2+c^2}}$$

$$=\frac{0+0-c}{\sqrt{108+192+c^2}}$$

or $$\frac{1}{\sqrt{2}}=\frac{-c}{\sqrt{300+c^2}}\quad\text{or}\quad\frac{1}{2}=\frac{c^2}{300+c^2}$$

or $$c=\sqrt{300}=\pm 10\sqrt{3}$$

Since the refracted travels downwards, we choose

$$c=-10\sqrt{3}$$

$$\therefore\quad \vec{A}'=6\sqrt{3}\,\hat{i}+8\sqrt{3}\,\hat{j}-10\sqrt{3}\,\hat{k}$$

Also, $$|\vec{A}'|=\sqrt{(6\sqrt{3})\,\hat{i}+(8\sqrt{3})\,\hat{j}\,(-10\sqrt{3})\,\hat{k}}$$

$$=\sqrt{108+142+300}=10\sqrt{6}$$

If $\hat{n}$ is unit vector along refracted ray, then

$$\hat{n}=\frac{\vec{A}'}{|\vec{A}'|}=\frac{6\sqrt{3}\,\hat{i}+8\sqrt{3}\,\hat{j}-10\sqrt{3}\,\hat{k}}{10\sqrt{6}}$$

$$=\frac{3}{5\sqrt{2}}\,\hat{i}+\frac{4}{5\sqrt{2}}\,\hat{j}-\frac{1}{\sqrt{2}}\,\hat{k}$$

Problem 1.02. An object is placed 21 cm in front of a concave mirror of radius of curvature 10 cm. A glass slab of thickness 3 cm and refractive index 1·5 is then placed close to the mirror in the space between the object and the mirror. Find the position of the final image formed. You may take the distance of the near surface of the slab from the mirror to be 1 cm. (I.I.T. 1980)

Thought Process

In the absence of the glass slab, image of the object is formed at distance u, which can be calculated by using mirror formula. When the glass slab is introduced, the reflected ray forming the image gets laterally displaced through a distance,

$$d=t\left(1-\frac{1}{\mu}\right)$$

Therefore, the distance of final image from the pole of the mirror = v + d

---

Sol. Here, $u=-\ 21$ cm ; $f=\frac{R}{2}=\frac{-10}{2}=-5$ cm ;

When the glass slab is not placed : Suppose that the image of the object AB is formed at a distance v from the pole of the mirror. Then,

$$\frac{1}{v}=\frac{1}{f}-\frac{1}{u}=\frac{1}{-5}=\frac{1}{-21}=-\frac{16}{105}$$

or $$v=\frac{-105}{16}=-6{\cdot}56\text{ cm}$$

The negative sign shows that the image formed is inverted and real. The image A′ B′ will be formed at a distance of6·56 cm from the pole of the mirror as shown in Fig. 1.02.

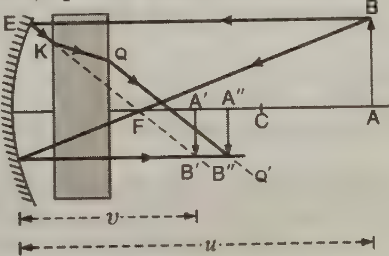

Fig. 1.02.

When the glass slab is introduced : The ray of light reflected from point E will suffer refraction at point K. It will follow the path KQ inside the glass slab and on emerging from the slab, it will travel along QQ′. Since the ray of light reflected from point E gets laterally displaced from path EKB′ to QQ′, the image will shift from A′ B′ to A′B′ *i.e.* through distance A′ A″ ≈ d given by

$$d = t\left(1 - \frac{1}{\mu}\right)$$

Here, $t = 3$ and $\mu = 1{\cdot}5$

$$\therefore \quad d = 3\left(1 - \frac{1}{1{\cdot}5}\right) = 1 \text{ cm}$$

Hence, the distance of final image from the mirror,

$$v + d = 6{\cdot}56 + 1 = \mathbf{7{\cdot}56\ cm}$$

Problem 1.03. A rectangular glass block of thickness 10 cm and refractive index 1·5 is placed over a small coin. A beaker is filled with water of refractive index 4/3 to a height of 10 cm and is placed over a small block.

(*a*) Find the apparent position of the object, when it is viewed at normal incidence.

(*b*) If the eye is slowly moved away from the normal ; at a certain position, the coin is found to disappear due to total internal reflection. At what surface does it happen and why ? (*I.I.T. 1975*)

Sol. Fig. 1.03 shows a glass slab ABCD of thickness t_1 = 10 cm placed over the coin. The beaker PQRS, filled with water to height t_2 = 10 cm, is placed over the glass slab. A ray of light OL from the coin gets refracted away from the normal LN_1 at the glass-water interface AQRD along the path LM. On reaching the water-air interface PS, it is refracted away from the normal MN_2 along MN.

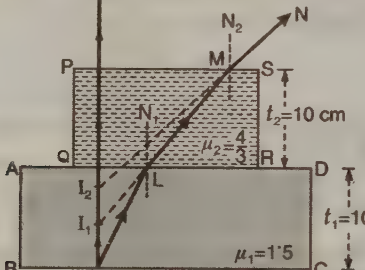

Fig. 1.03.

(*a*) The coin appears to be raised from the position O to I_1 due to normal shift produced due to refraction from glass to water ; and from position I_1 to I_2 due to normal shift produced due to refraction from water to air. If ${}^{w}\mu_g$ is refractive index of glass *w.r.t.* water, then the total normal shift in the position of the coin,

$$OI_2 = OI_1 + I_1 I_2 = t_1\left(1 - \frac{1}{{}^{w}\mu_g}\right) + t_2\left(1 - \frac{1}{\mu_2}\right)$$

$$\text{Now,} \quad {}^{w}\mu_g = \frac{\mu_2}{\mu_1} = \frac{1{\cdot}5}{4/3} = 9/8$$

$$\therefore \quad OI_2 = 10\left(1 - \frac{1}{9/8}\right) + 10\left(1 - \frac{1}{4/3}\right)$$

$$= 1{\cdot}11 + 2{\cdot}5 = 3{\cdot}11 \text{ cm}$$

Therefore, depth of the coin below the water surfac

$$= 20 - 3{\cdot}61 = \mathbf{16{\cdot}39\ cm}$$

(*b*) Of the two interfaces AQRD and PS, that interf will make the coin disappear, for which the value of criti angle is lesser. Let C_1 and C_2 be the values of the critical an for the glass-water interface and water-air interfa respectively.

$$\text{Then,} \quad \sin C_1 = \frac{1}{{}^{w}\mu_g} = \frac{1}{\mu_1/\mu_2} = \frac{\mu_2}{\mu_1} = \frac{4/3}{1{\cdot}5} = 0{\cdot}888$$

$$\text{or} \quad C_1 = 62°47'$$

$$\text{Also,} \quad \sin C_2 = \frac{1}{{}^{a}\mu_w} = \frac{1}{\mu_2} = \frac{1}{4/3} = 0{\cdot}75 \text{ or } C_2 = 48°$$

Since $C_2 < C_1$, the total internal reflection will take pl from the water-air interface first as the eye is slowly mov away. Hence, the coin disappears from the view due to to internal reflection at the water surface.

Problem 1.04. A plano-convex lens has thickness 4 c When placed on a horizontal table with the curved surfa in contact with it, the apparent depth of the bottom-m point of the lens is found to be 3 cm. If the lens is invert such that the plane face is in contact with the table, t apparent depth of the centre of plane face of the lens found to be $\frac{25}{8}$ cm. Find the focal length of the lens.

(*M.N.R. 1990 ; I.I.T. 19*

[Ans. 75 c

Hint. Proceed as in solved problem 1.44–Chapter 1.

Problem 1.05. A quarter cylinder of radius R a refractive index 1·5 is placed on a table. A point object P kept at a distance of *m* R from it. Find the value of *m* which a ray from P will emerge parallel to the table shown in Fig. 1.04. (*I.I.T. 199*

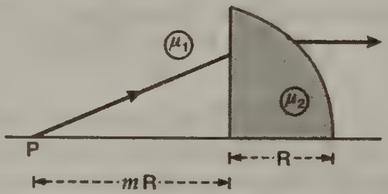

Fig. 1.04.

Sol. Due to refraction from the plane surface of t quarter cylinder, the virtual image I_1 of the object P is form as shown in Fig. 1.05.

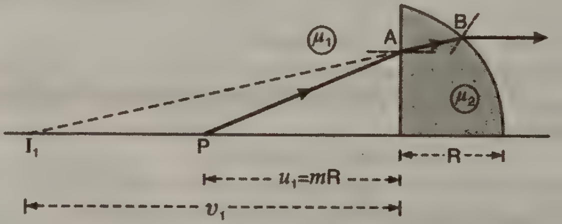

Fig. 1.05.

For the curved surface of the cylinder, I_1 acts as the re object. As the ray emerges parallel to the table, the final ima is formed at infinity.

Refraction from plane surface : Suppose that the ima I_1 is formed at a distance v_1 from the plane surface of t quarter cylinder. As the object is situated in rarer mediu we have

$$-\frac{1}{u_1}+\frac{\mu}{v_1}=\frac{\mu-1}{R_1}$$

Here, $v_1=-m\,R\,;\,R_1=\infty\,;\,\mu=1\cdot5$

$$\therefore\ -\frac{1}{-m\,R}+\frac{1\cdot5}{v_1}=\frac{1\cdot5-1}{\infty}\ \text{ or }\ \frac{1\cdot5-1}{\infty}=-\frac{1}{m\,R}$$

or $v_1=-1\cdot5\,m\,R$

Refraction from curved surface : *As the refracted ray travels in denser medium, we have*

$$-\frac{\mu}{u_2}+\frac{1}{v_2}=\frac{1-\mu}{R_2}$$

Here, $u_2=-(v_1+R)=-(1\cdot5\,m\,R+R)\,;$

$v_2=\infty,\ R_2=-R\,;\,\mu=1\cdot5$

$$\therefore\ -\frac{1\cdot5}{-(1\cdot5\,m\,R+R)}+\frac{1}{\infty}=\frac{1-1\cdot5}{-R}$$

or $$\frac{1\cdot5}{1\cdot5\,m\,R+R}=\frac{0\cdot5}{R}$$

$$1\cdot5\,m\,R+R=\frac{1\cdot5}{0\cdot5}R=3\,R\ \text{ or }\ 1\cdot5\,m\,R=2\,R$$

or $$m=\frac{2}{1\cdot5}=\frac{4}{3}$$

Problem 1.06. The distance between two point sources of light is 24 cm. Find out where would you place a converging lens of focal length 9 cm, so that the images of both sources are formed at the same point.

(Roorkee, 1988)

Sol. Fig. 1.06 shows a convex lens of focal length *f* placed between two objects I_1 and I_2 placed 24 cm apart. The lens produces a real image I_1 of the object S_1, while a virtual image I_2 of the object S_2.

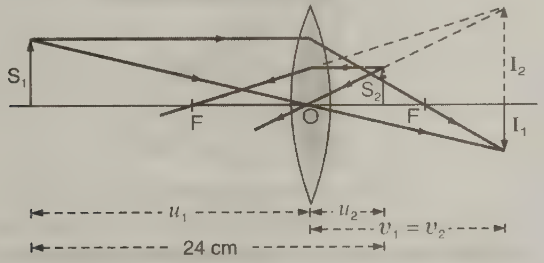

Fig. 1.06,

For source S_1 : Suppose that the object S_1 lies at a distance *x* from the lens. If u_1 and v_1 denote the distances of the object S_1 and the image I_1 from the lens, then

$$\frac{1}{f}=-\frac{1}{u_1}+\frac{1}{v_1}$$

Here, $u_1=-x$ and $f=+9$ cm

$$\therefore\ \frac{1}{v_1}=\frac{1}{f}+\frac{1}{u_1}=\frac{1}{9}+\frac{1}{-x}=\frac{1}{9}-\frac{1}{x}\qquad\text{...}(i)$$

For source S_2 : If u_2 and v_2 are distances of the object S_2 and image I_2 from the lens, then

$$\frac{1}{f}=-\frac{1}{u_2}+\frac{1}{v_2}\qquad\text{...}(ii)$$

Here, $u_2=-(24-x)$ and $f=+9$ cm

Also, as the image I_2 is formed on the same side of the lens and coincides with the image I_1,

$$v_2=-v_1\quad\text{or}\quad\frac{1}{v_2}=-\frac{1}{v_1}$$

Setting the values of u_2, *f* and $\frac{1}{v_2}$ in equation (*ii*), we have

$$\frac{1}{9}=-\frac{1}{-(24-x)}-\frac{1}{v_1}$$

or $$\frac{1}{v_1}=-\frac{1}{9}+\frac{1}{(24-x)}\qquad\text{...}(iii)$$

From equations (*i*) and (*iii*), we have

$$-\frac{1}{9}+\frac{1}{(24-x)}=\frac{1}{9}-\frac{1}{x}$$

or $$\frac{1}{(24-x)}+\frac{1}{x}=\frac{2}{9}$$

or $$x^2-24x+108=0$$

or $$x=\frac{-(-24)\pm\sqrt{(-24)^2-4\times1\times108}}{2}$$

$$=\frac{24\pm\sqrt{576-432}}{2}=\frac{24\pm12}{2}=\textbf{18 cm or 6 cm}$$

Therefore, the convex lens may be placed between the two sources, such that from one source, its distance is 18 cm and from the other source, the distance is 6 cm.

Problem 1.07. A thin biconvex lens of refractive index 3/2 is placed on a horizontal plane mirror as shown in Fig. 1.07. The space between the lens and the mirror is then filled with water of refractive index 4/3. It is found that when a point object is placed 15 cm above the lens on its principle axis, the object coincides with its own image. On repeating with another liquid, the object and the image again coincide at a distance 25 cm from the lens. Calculate the refractive index of the liquid. *(I.I.T. 2001)*

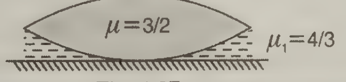

Fig. 1.07.

Thought Process

1. The radii of curvature of the two surfaces of the planoconcave lens of water (or liquid) formed between binconvex lens and plane mirror are –R and ∞, where R is radius of curvature of the surface of binconvex lens.

2. The object can coincide with its image, only if the rays of light retrace their paths i.e. they fall normally on the plane mirror. It will happen so, if the object lies at the focus of the combined lens system.

Sol. Let R be the radius of curvature of the each of the two surfaces of the biconvex lens made of material of refractive index $\mu(=3/2)$. Then, its focal length is given by

$$\frac{1}{f}=(\mu-1)\left(\frac{1}{R}-\frac{1}{-R}\right)=\left(\frac{3}{2}-1\right)\times\frac{2}{R}=\frac{1}{R}$$

When space between lens and plane mirror is filled with water :

Let f_1 be focal length of the planoconcave lens of water formed between the lens and the plane mirror. If μ_1 is refractive index of water, then

$$\frac{1}{f_1} = (\mu_1 - 1)\left(\frac{1}{-R} - \frac{1}{\infty}\right) = -\frac{(4/3 - 1)}{R} = -\frac{1}{3R}$$

If F is focal length of the combined lens system, then

$$\frac{1}{F} = \frac{1}{f} + \frac{1}{f_1} \quad \text{or} \quad \frac{1}{15} = \frac{1}{R} - \frac{1}{3R} \quad \text{or} \quad R = 10 \text{ cm}$$

When space between lens and plane mirror is filled with liquid :

Let f_2 be focal length of the plano concave lens of liquid formed between the lens and the plane mirror. If μ_2 is refractive index of the liquid, then

$$\frac{1}{f_2} = (\mu_2 - 1)\left(-\frac{1}{R} - \frac{1}{\infty}\right) = -\frac{(\mu_2 - 1)}{R}$$

If F′ is focal length of the combined lens system, then

$$\frac{1}{F'} = \frac{1}{f} + \frac{1}{f_2} \quad \text{or} \quad \frac{1}{25} = \frac{1}{R} - \frac{(\mu_2 - 1)}{R}$$

$$\text{or} \quad \frac{1}{25} = \frac{1}{10} - \frac{(\mu_2 - 1)}{10} \quad \text{or} \quad \frac{(\mu_2 - 1)}{10} = \frac{1}{10} - \frac{1}{25} = \frac{3}{50}$$

$$\text{or} \quad \mu_2 = 1 + \frac{3}{5} = 1{\cdot}6$$

Problem 1.08. A pin is placed 10 cm in front of convex lens of focal length 20 cm made of material of refractive index 1·5. The surface of the lens farther away from the pin is silvered and has a radius of curvature 22 cm. Determine the position of the final image. Is the image real or virtual ? *(I.I.T. 1978)*

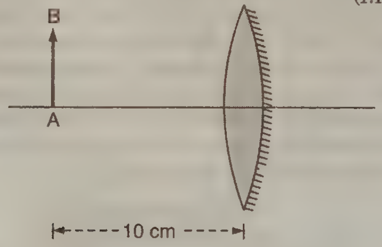

Fig. 1.08.

Thought Process

Fig. 1.08 shows a pin AB placed at a distance of 10 cm from the convex lens of focal length, f = 20 cm. The farther face of the lens of radius of curvature R_2 = 22 cm is silvered. When a ray of light from the pin falls on the silvered lens, first of all its image is formed due to refraction by the convex lens (f = 20 cm), then due to reflection by the farther silvered surface acting as a concave mirror $\left(f_m = \frac{R_2}{2}\right)$ *and finally again due to refraction (the rays reflected from the silvered surface are again refracted) by the lens (f = 20 cm).*

If F is the equivalent focal length of the system (lens, concave mirror and lens), then

$$\frac{1}{F} = \frac{1}{f} + \frac{1}{f_m} + \frac{1}{f}$$

Sol. Here, $f = 20$ cm ; $f_m = \frac{R_2}{2} = \frac{22}{2} = 11$ cm ;

$$\therefore \quad \frac{1}{F} = \frac{1}{f} + \frac{1}{f_m} + \frac{1}{f} = \frac{1}{20} + \frac{1}{11} + \frac{1}{20} = \frac{21}{10}$$

$$\text{or} \quad F = \frac{110}{21} \text{ cm}$$

As the system reflects back and converges the rays, it acts as a concave mirror of focal length $F = \frac{110}{21}$ cm.

For a concave mirror,

$$\frac{1}{u} + \frac{1}{v} = \frac{1}{F}$$

Here, $u = -10$ cm ; $F = -\frac{110}{21}$ cm ;

$$\therefore \quad \frac{1}{v} = \frac{1}{F} - \frac{1}{u} = \frac{1}{-110/21} - \frac{1}{-10}$$

$$= -\frac{21}{110} + \frac{1}{10} = \frac{-10}{110}$$

or $v = -11$ **cm**

The negative sign tells that the image will be formed on the side as the pin is. Therefore, the image formed is **real** and **inverted.**

Problem 1.09. The radius of curvature of the convex face of a plano-convex lens is 12 cm and its refractive index is 1·5.

(*a*) Find the focal length of the lens.

(*b*) The plane surface of the lens is now silvered [Fig. 1.09]. At what distance from the lens will parallel rays incident on the convex surface converge ?

(*c*) Calculate the image distance, when a point object is placed on the axis 20 cm from the lens. *(I.I.T. 1979)*

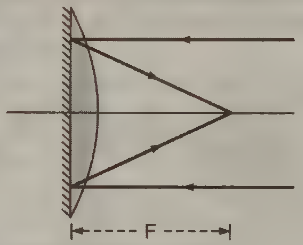

Fig. 1.09.

Sol. (*a*) Here, $R_1 = +12$ cm ; $R_2 = \infty$; $\mu = 1{\cdot}5$;

If *f* is focal length of the plano-convex lens, then

$$\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) = (1{\cdot}5 - 1)\left(\frac{1}{12} \cdot \frac{1}{+\infty}\right) = \frac{1}{24}$$

or $f = 24$ **cm**

(*b*) When the plane surface of the plano-convex is silvered, it acts as a combination* of a plano-convex lens (f = 24 cm), a plane mirror ($f_m = \infty$) and a plano-convex lens (f = 24 cm). If F is effective focal length of the system, then

$$\frac{1}{F} = \frac{1}{f} + \frac{1}{f_m} + \frac{1}{f} = \frac{1}{24} + \frac{1}{\infty} + \frac{1}{24} = \frac{1}{12}$$

or F = 12 cm

As the system reflects back and converges the rays, it acts as a concave mirror of focal length F = 12 cm.

For a concave mirror,

$$\frac{1}{u} + \frac{1}{v} = \frac{1}{F}$$

---

*For more details, refer to Thought Process of problem no. 1.08.

Here, $u = -\infty$; F = – 12 cm

$$\therefore \quad \frac{1}{v} = \frac{1}{F} - \frac{1}{u} = \frac{1}{-12} - \frac{1}{-\infty} = -\frac{1}{12}$$

or $v = -12$ cm

Hence, the parallel rays will converge at a distance of 12 m from the silvered surface.

(*c*) Here, $u = -20$ cm ; F = – 12 cm

$$\therefore \quad \frac{1}{v} = \frac{1}{F} - \frac{1}{u} = \frac{1}{-12} - \frac{1}{-20} = -\frac{1}{30}$$

or $v = -30$ cm

The negative sign shows that the image formed is real. Therefore, a real image will be formed at a distance of 30 cm rom the silvered surface.

Problem 1.10. A point object is placed at a distance of 0·3 m from a convex lens (focal length 0·2 m) cut into two halves, each of which is displaced by 0·5 mm as shown in Fig. 1.10. Find the position of the image. If more than one image is formed, find their number and the distances between them. [Ans. Two images, 1·5 mm]

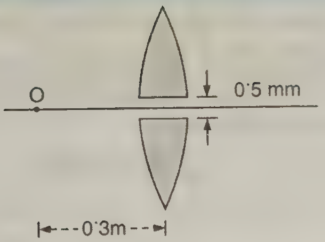

Fig.1.10.

Hint. The two halves of the lens will act as two separate lenses and hence will form two images.

To calculate distance between the two images, refer to problem 1.05-Competitive Examination File (Unit VI).

Note. For such one typical problem, refer to conceptual SAQ 5.05-Chapter 5 (Unit VI) also.

Chapter 2. Dispersion

Problem 2.01. A ray of light is incident at an angle of 60°on the first face of a prism of an angle 30°. The ray emerging out of the prism makes an angle of 30° with the incident ray [Fig. 2.01]. Show that the emergent ray is perpendicular to the face through which it emerges. Also calculate the refractive index of the material of the prism. (*Karnataka, 1993 ; I.I.T. 1978*)

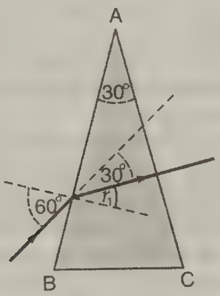

Fig. 2.01.

Sol. Here, the angle of prism, A = 30° ;

The angle of incidence at the first face, $i = 60°$;

The angle of deviation, $\delta = 30°$

If e is angle of emergence, then

$$A + \delta = i + e$$

or $e = A + \delta - i = 30° + 30° - 60° = 0°$

Therefore, as shown in the figure, the emergent ray will be perpendicular to the second face of the prism.

If r_1 is angle of refraction at the first face, then from the figure, it follows that $r_2 = 30°$.

$$\text{Now,} \quad \mu = \frac{\sin i}{\sin r_1} = \frac{\sin 60°}{\sin 30°} = \frac{\sqrt{3}/2}{1/2} = \sqrt{3} = 1{\cdot}732$$

Problem 2.02. A glass prism of angle 72° and refractive index 1·66 is immersed in water of refractive index 1·33. Find the angle of minimum deviation for a parallel beam of light passing through the prism. (*I.I.T. 1977*)

Sol. Here, A = 72° ; $^a\mu_g = 1{\cdot}66$; $^a\mu_w = 1{\cdot}33$;

$$\text{Now,} \quad {}^w\mu_g = \frac{{}^a\mu_g}{{}^a\mu_w} = \frac{1{\cdot}66}{1{\cdot}33} = 1{\cdot}248$$

If δ_m is the angle of minimum deviation, when the prism is immersed in water, then

$${}^w\mu_g = \frac{\sin (A + \delta_m)/2}{\sin A/2}$$

or $\sin (A + \delta_m)/2 = {}^w\mu_g \sin A/2 = 1{\cdot}248 \times \sin 72°/2$

$= 1{\cdot}248 \times 0{\cdot}5878 = 0{\cdot}7336$

or $(A + \delta_m)/2 = 47°11'$

or $\delta_m = 2 \times (47°11') - A = 94°22' - 72° = 22°\ 22'$

Problem 2.03. A prism of refractive index μ_1 and another prism of refractive index μ_2 are struck together without a gap as shown in Fig. 2.02. The angles of the prisms are shown. μ_1 and μ_2 depend on λ, the wavelength of light according to

$$\mu_1 = 1{\cdot}20 + \frac{10{\cdot}8 \times 10^4}{\lambda^2} \text{ and } \mu_2 = 1{\cdot}45 + \frac{10{\cdot}8 \times 10^4}{\lambda^2},$$

where λ is in nm.

(*a*) Calculate the wavelength λ_0 for which rays incident at any angle on the interface BC pass through without bending at that interface.

(*b*) For light of wavelength λ_0, find the angle of incidence *i* on the face AC, such that the deviation produced by the combination of prisms is minimum. (*I.I.T. 1998*)

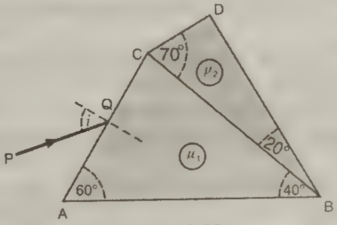

Fig. 2.02.

Thought Process

1. If rays incident at any angle on the interface BC pass through without bending at the interface for wavelength λ_0, then μ_1 and μ_2 must have the same value for that wavelength i.e.

$$1{\cdot}20 + \frac{1{\cdot}80 \times 10^4}{l_0^2} = 1{\cdot}45 + \frac{1{\cdot}80 \times 10^4}{l_0^2}$$

2. *For wavelength λ_0, $\mu_1 = \mu_2$. Therefore, the combination of the two prisms acts as a single prism, whose base angles are 60° each. Therefore, vertex angle E must also be 60°[Fig. 2.03].*

3. *In the minimum deviation position, the refracted ray QR is parallel to the base AB of the prism. Also, the angle of refaction,*

$$r = \frac{\textit{angle of prism}}{2}$$

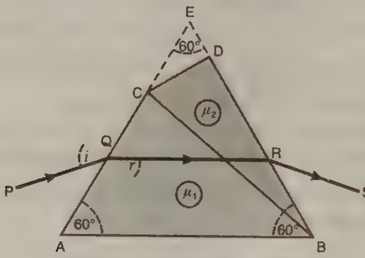

Fig. 2.03.

Sol. (*a*) If the ray incident at the interface BC passes undeviated for the wavelength λ_0, then

$$1\cdot20+\frac{10\cdot8\times10^4}{\lambda_0^2}=1\cdot45+\frac{1\cdot80\times10^4}{\lambda_0^2}$$

or $$\frac{9\cdot0\times10^4}{\lambda_0^2}=0\cdot25$$

or $$\lambda_0=\sqrt{\frac{9\cdot0\times10^4}{0\cdot25}}=6\cdot0\times10^2=\mathbf{600\ nm}$$

(*b*) Now, refractive index of the material of the prism for wavelength λ_0,

$$\mu=1\cdot20+\frac{1\cdot80\times10^4}{(600)^2}=1\cdot20+0\cdot3=1\cdot50$$

If the ray of light suffers minimum deviation, when incident at angle *i*, then angle of refraction,

$$r=\frac{60°}{2}=30°$$

From the relation : $\mu=\dfrac{\sin i}{\sin r}$, , we have

$$\sin i=\mu\sin r=1{\cdot}50\sin 30°=1{\cdot}50\times0{\cdot}5=0{\cdot}75$$

$\therefore\ \ i = \mathbf{48°\text{-}36'}$

Problem 2.04. The refractive indices of the crown glas for blue and red light are 1·51 and 1·49 respectively an those of the flint glass are 1·77 and 1·73 respectively. A isosceles prism of angle 60° is made of crown glass. A bean of white light is incident at a small angle on this prism. Th other flint glass isosceles prism is combined with the crow glass prism such that there is no deviation of the inciden light. Determine the angle of the flint glass prism. Calculat the net dispersion of the combined system. (*I.I.T. 2001*

Sol. Let A_1 and A_2 be angles of crown and flint glas prism respectively.

For crown glass prism : $\mu_b = 1{\cdot}51$; $\mu_r = 1{\cdot}49$ and $A_1 = 6$

Refractive index for mean light,

$$\mu=\frac{\mu_b+\mu_r}{2}=\frac{1\cdot51+1\cdot49}{2}=1\cdot50$$

For flint glass prism : $\mu_b' = 1{\cdot}77$; $\mu_r' = 1{\cdot}73$

Refractive index for mean light,

$$\mu'=\frac{\mu_b'+\mu_r'}{2}=\frac{1\cdot77+1\cdot73}{2}=1\cdot75$$

For no deviation,

$$A(\mu-1)+A'(\mu'-1)=0$$

or $$6°(1{\cdot}50-1)+A'(1{\cdot}75-1)=0$$

or $$A'=-\frac{6°\times0\cdot50}{0\cdot75}=\mathbf{-4°}$$

Net dispersion $= A(\mu_b-\mu_r)+A'(\mu_b'-\mu_r')$

$= 6°(1{\cdot}51-1{\cdot}49)+(-4°)(177-1{\cdot}73)$

$= \mathbf{-0{\cdot}04°}$

Chapter 3. Optical Instruments

Problem 3.01. A compound microscope is used to enlarge an object kept at a distance of 0·03 m from its objective, which consists of several convex lenses and has focal length 0·02 m. If a lens of focal length 0·1 m is removed from the objective, find out the distance by which the eye-piece of the microscope must be moved to refocus the image. (*Roorkee, 1991*)

Sol. Let F be focal length of the objective consisting of several convex lenses.

Here, F = 0·02 m ; *u* = – 0·03 m ;

If the image is formed at a distance *v* from the objective, then

$$\frac{1}{v}=\frac{1}{F}+\frac{1}{u}=\frac{1}{0\cdot02}+\frac{1}{-0\cdot03}=\frac{0\cdot03-0\cdot02}{0\cdot02\times0\cdot03}$$

or $$v=\frac{0\cdot02\times0\cdot03}{0\cdot01}=0\cdot06\ \text{m}$$

When one lens of focal length $f = 0{\cdot}1$ is removed, suppose that the new focal length of the objective becomes F′. Then,

$$\frac{1}{F}=\frac{1}{F'}+\frac{1}{f}$$

or $$\frac{1}{F'}=\frac{1}{F}-\frac{1}{f}=\frac{1}{0\cdot02}-\frac{1}{0\cdot1}=\frac{4}{0\cdot1}$$

or $$F'=\frac{0\cdot1}{4}=0\cdot025\ \text{m}$$

If the new position of the image is at a distance v' from the objective, then

$$\frac{1}{v'}=\frac{1}{F'}+\frac{1}{u}=\frac{1}{0\cdot025}+\frac{1}{-0\cdot03}=\frac{0\cdot03-0\cdot025}{0\cdot025\times0\cdot03}$$

or $$v'=\frac{0\cdot025\times0\cdot03}{0\cdot005}=0\cdot15\ \text{m}$$

Therefore, the distance through which the eye-piece of the microscope should be moved,

$$v'-v=0{\cdot}15-0{\cdot}06=\mathbf{0{\cdot}09\ m}$$

Problem 3.02. In a compound microscope, the objective and eye-piece have focal lengths of 0·95 cm and 5 cm respectively and are kept at a distance of 20 cm. The last image is formed at a distance of 25 cm from the eye-piece. Calculate the position of the object and the total magnification. (*Roorkee, 1988*)

Sol. Here, $f_o = 0{\cdot}95$ cm ; $f_e = 5$ cm ;

Distance between the objective and the eye-piece = 20 cm

Refer to Chapter 3 – Fig. 3.03 : For the eye-piece, the image A′ B′ (formed by objective) acts as the object and its age A'' B'' is formed at the least distance of distinct vision. e distance u_e of the image A' B' (objective for eye-piece) m the eye-piece is given by

$$-\frac{1}{u_e}+\frac{1}{v_e}=\frac{1}{f_e}$$

Here, $v_e = -25$ cm

$$\therefore \quad \frac{1}{u_e}=\frac{1}{v_e}-\frac{1}{f_e}=\frac{1}{-25}-\frac{1}{5}=-\frac{6}{25}$$

or $u_e = -\frac{25}{6}$ cm

The distance of the object u_o from the objective is given

$$-\frac{1}{u_o}+\frac{1}{v_o}=\frac{1}{f_o}$$

If the distance of the image A' B' from the object is v_o, en

$$v_o + |\, u_e \,| = 20$$

or $v_o = 20 - |u_e| = 20 + -\frac{25}{6} = \frac{95}{6}$ cm

$$\therefore \quad \frac{1}{u_o}=\frac{1}{v_o}-\frac{1}{f}=\frac{1}{95/6}-\frac{1}{95}-\frac{1}{0\cdot95}=-\frac{94}{95}$$

or $u_o = -\frac{95}{94}$ cm

Magnification produced by the microscope,

$$M=\frac{v_o}{u_o}\left(1+\frac{D}{f_e}\right)=\frac{95/6}{-95/94}\left(1+\frac{25}{2}\right)=-94$$

The negative sign shows that the final image formed is al and inverted.

Problem 3.03. A telescope has an objective of focal ngth 50 cm and eye-piece of focal length 5 cm. The least istance of distinct vision is 25 cm. The telescope is ocussed for distinct vision on a scale 200 cm away from the bjective. Calculate (*a*) the separation between the bjective and eye-piece (*b*) the magnification produced. *(I.I.T. 1980)*

Sol. (*a*) Here, $f_e = 5$ cm ; $f_o = 50$ cm ;
$u_o = -200$ cm ;

***Image formed by the objective*:** Refer to Chapter 3 – Fig. 3.05. If the objective forms the image A' B' at a distance v_o from the objective, then

$$\frac{1}{v_o}=\frac{1}{f_o}+\frac{1}{u_o}=\frac{1}{50}+\frac{1}{-200}=\frac{3}{200}$$

or $v_o = +\frac{200}{3}$ cm

***Image formed by the eye-piece*:** For eye-piece, the image A' B' acts as object and its virtual image A' B' is produced by the eye-piece at the least distance of distinct vision. If the image A' B' is at a distance u_e from the eye-piece, then

$$-\frac{1}{u_e}+\frac{1}{v_e}=\frac{1}{f_e}$$

Here, $v_e = -D = -25$ cm ; $f_e = 5$ cm

$$\therefore \quad \frac{1}{u_e}=\frac{1}{v_e}-\frac{1}{f_e}=\frac{1}{-25}-\frac{1}{5}=-\frac{6}{25}$$

or $u_e = -\frac{25}{6}$ cm

Therefore, separation between objective and eye-piece,

$$CC' = |v_o| + |u_e| = \frac{200}{3}+\frac{25}{6}=\frac{425}{6}=\mathbf{70{\cdot}83\ cm}$$

(*b*) Now, $m_o = \frac{v_o}{u_o} = \frac{200/3}{-200} = -\frac{1}{3}$

and $m_e = \frac{v_e}{u_e} = \frac{-25}{-25/6} = 6$

Magnification produced by the telescope,

$$m = m_o \times m_e = -\frac{1}{3} \times 6 = -2$$

The negative sign shows that final image formed is real and inverted.

Chapter 5. Interference of Light

Problem 5.01. In a two slit experiment with onochromatic light, fringes are obtained on a screen laced at some distance from the slits. If the screen is moved y 5 × 10^{-2} towards the slits, the change in fringe width is × 10^{-5}. If the distance between the slits is 10^{-3} m, calculate e wavelength of the light used. *(Roorkee, 1992)*

Thought Process

From the expression for fringe width $\left(\beta = \frac{D\lambda}{d}\right)$*, it follows that for a given slit separation (d) and the wavelength of light (λ), the fringe width (β) varies directly with the distance of screen (D) from the slits. Therefore, if D is decreased by Δ D, the fringe width will decrease by Δ β, such that*

$$\Delta\beta = \frac{\Delta D\lambda}{d}$$

Sol. Here, $d = 10^{-3}$ m; $\Delta D = 5 \times 10^{-2}$ m
$\Delta\beta = 3 \times 10–5$ m ;

Now, $\Delta\beta = \frac{\Delta D\lambda}{d}$

or $\lambda = \frac{\Delta\beta}{\Delta D} \times \frac{3\times10^{-5}}{5\times10^{-2}} \times 10^{-3} = 6 \times 10^{7}$ m

Problem 5.02. In a Young's double slit experiment, the angular width of a fringe formed on a distant screen is 0·1°. The wavelength of light used is 6000 Å. What is the spacing between the slits ? *(Roorkee, 1983)*

Hint. $\theta = \frac{\beta}{D} = \frac{D\lambda/d}{D} = \frac{\lambda}{d}$

It can be obtained that $d = 3{\cdot}44 \times 10^{-4}$ m

Problem 5.03. A beam of light consisting of two wavelengths 6500 Å and 5200 Å is used to obtain interference fringes in a Young's double slit experiment. The distance between the slits is 2 mm and distance between the plane of the slits and the screen is 120 cm.

(*a*) Find the distance of third bright fringe on the screen from the central maximum for the wavelength 6500 Å.

(*b*) What is the least distance from the central maximum, when the bright fringes due to both the wavelengths coincide ?

(I.I.T. 1985)

Sol. Here, $d = 2 \text{ mm} = 2 \times 10^{-3} \text{ m}$;
$D = 120 \text{ cm} = 1{\cdot}2 \text{ m}$;
$\lambda = 6500 \text{ Å} = 6{\cdot}5 \times 10^{-7} \text{ m}$; $\lambda' = 5200 \text{ Å} = 5{\cdot}2 \times 10^{-7} \text{ m}$

(*a*) The distance of *n*th bright fringe from the central maximum,

$$y_n = \frac{n\,D\,\lambda}{d}$$

Therefore, distance of the third bright fringe ($n = 3$) for wavelength λ ($= 6{\cdot}5 \times 10^{-7}$ m),

$$y_3 = \frac{3 \times 1{\cdot}2 \times 6{\cdot}5 \times 10^{-7}}{2 \times 10^{-3}} = 1{\cdot}17 \times 10^{-3} \text{ m} = \mathbf{1{\cdot}17 \text{ mm}}$$

(*b*) Suppose that the *n*th bright fringe due to wavelength λ coincides with the n'th bright fringe due to wavelength λ'.

Then, $\dfrac{n\,D\,\lambda}{d} = \dfrac{n'\,D\,\lambda'}{d}$

or $\quad n\lambda = n'\lambda' \quad$ ...(*i*)

Since $\quad \lambda > \lambda', n < n'$.

The two bright fringes will coincide at the least distance, if n and n' differ by 1 *i.e.* $n' = n + 1$

Therefore, equation (*i*) becomes

$$n\lambda = (n+1)\lambda'$$

or $\quad n \times 6{\cdot}5 \times 10^{-7} = (n+1) \times 5{\cdot}2 \times 10^{-7}$

or $\quad 5n = 4(n+1)$

or $\quad n = 4$

Therefore, required distance,

$$y_4 = \frac{4\,D\,\lambda}{d} = \frac{4 \times 1{\cdot}2 \times 6{\cdot}5 \times 10^{-7}}{2 \times 10^{-3}} = 1{\cdot}56 \times 10^{-3} \text{ m}$$

$= \mathbf{1{\cdot}56 \text{ mm}}$

Problem 5.04. A point source S emitting light of wavelength 600 nm is placed at a very small height *h* above a flat reflecting surface AB [Fig. 5.01]. The intensity of the reflected light is 36% of the incident intensity. Interference fringes are observed on a screen placed parallel to the reflecting surface at a very large distance D from it.

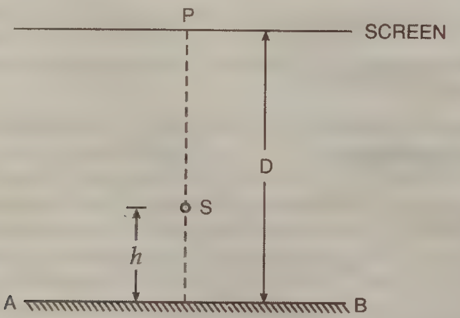

Fig.5.01

(*a*) What is the shape of the interference fringes on the screen ?

(*b*) Calculate the ratio of the minimum to the maximum intensities in the interference fringes formed near the point P.

(*c*) If the intensity at point P corresponds to a maximum, calculate the minimum distance through which the reflecting surface AB should be shifted so that the intensity at P again becomes maximum. (*I.I.T. 2002*)

Sol. (*a*) The locus of point around point P, where light reaches directly from source S or after reflection from the reflecting surface AB after covering equal path is circle. Hence, interference fringes are **circular** in shape.

(*b*) Let I_1 and I_2 be intensities of light reaching the screen directly from the source and after reflection from the reflecting surface. Then,

$$I_2 = \frac{36}{100} I_1 \quad \text{or} \quad \frac{I_2}{I_1} = 0{\cdot}36$$

$$\text{or} \quad \frac{a_2^2}{a_1^2} = 0{\cdot}36 \quad \text{or} \quad a_2 = 0{\cdot}6\,a_1$$

$$\text{Now,} \quad \frac{I_{min}}{I_{max}} = \frac{(a_1 - a_2)^2}{(a_1 + a_2)^2} = \frac{(a_1 - 0{\cdot}6\,a_1)^2}{(a_1 + 0{\cdot}6\,a_1)^2}$$

$$= \left(\frac{0{\cdot}4}{1{\cdot}6}\right)^2 = \mathbf{\frac{1}{16}}$$

(*c*) Now, the source of light lies a distance *h* above the reflecting surface. Therefore, its image will lie a distance *h* below it. Hence, path difference between the light waves reaching the screen from the source and its image will be 2 *h*. Suppose that the source of light is shifted through a distance *x* from the reflecting surface. Then, path difference between the light waves reaching the screen from the source and its image will be $2(h \pm x)$. It follows that due to shifting of the source, an extra path difference,

$$\Delta x = 2(h \pm x) - 2h = \pm 2x$$

will be produced. The intensity of light at the point P will be again maximum, if

$$2x = \lambda \quad \text{or} \quad x = \frac{\lambda}{2} = \frac{600}{2} = \mathbf{300 \text{ nm}}$$

Problem 5.05. The Young's double slit experiment is done in a medium of refractive index 4/3. A light of 600 nm wavelength is falling on the slits having 0·45 mm separation. The lower slit S_2 is covered by a thin glass sheet of thickness 10·4 μm and refractive index 1·5. The interference pattern is observed on a screen placed 1·5 m from the slits as shown in Fig. 5.02.

(*a*) Find the location of the central maximum (bright fringe with zero path difference) on the Y-axis.

(*b*) Find the light intensity of point O relative to the maximum fringe intensity. (*I.I.T. 1999*)

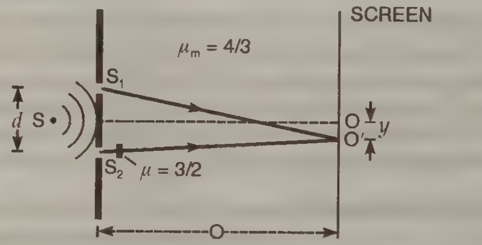

Fig.5.02

Thought Process

1. *Since light from two sources does not travel in the same optical medium, the path difference between the light from the two sources has to be calculated from the optical paths.*

2. *When both the slits are uncovered, the central maximum is formed at the centre of the screen. When the lower slit S_2 is covered with a glass plate, the path of light from lower slit S_2 upto the centre of the screen will be a little more than that from upper slit S_1. Therefore, the point O' on the screen, where*

the light from the two slits possesses zero path difference, will lie a little below the point O.

3. If ϕ is the phase difference between the light rays reaching point O from S_1 and S_2, then intensity of light at point O,

$$I = I_{max}\cos^2\frac{\phi}{2},$$

where I_{max} is intensity at point O.

Sol. (*a*) Fig. 5.02 shows the Young's double slit xperiment arrangement in a medium of refractive index μ_m. The lower slit S_2 is covered with a glass sheet of thickness t nd refractive index μ_g. The point O is centre of the screen. ince $\mu_g > \mu_m$, the length of the optical path S_1O will be less han that of S_2O. Let O′ be the point on the screen at a distance below the point O, such that the lengths of the optical paths f light from slits S_1 and S_2 to point O′ are equal.

Now, optical path of light from slit S_1 to O′

$$= \mu_m S_1O'$$

and optical path of light from slit S_2 to O′

$$= \mu_m S_2O' - \mu_m t + \mu_g t$$

For the central bright fringe to be formed at point O′, the two optical paths have to be equal *i.e.*

$$\mu_m S_1O' = \mu_m S_2O' - \mu_m t + \mu_g t$$

$$\text{or} \quad \mu_m (S_1O' - S_2O') = (\mu_g - \mu_m)\, t \qquad ...(i)$$

If d is distance between the two slits and D, the distance of the screen from the slits, then

$$S_1O' - S_2O' = \frac{y\,d}{D}$$

Therefore, equation (*i*) becomes

$$\mu_m\left(\frac{y\,d}{D}\right) = (\mu_g - \mu_m)\,t$$

Here, $\mu_m = \frac{4}{3}$; $\mu_g = 1{\cdot}5$;

$d = 0{\cdot}45$ mm $= 0{\cdot}45 \times 10^{-3}$ m ;

D = 1·5 m ; $t = 10{\cdot}4\ \mu$m $= 10{\cdot}4 \times 10^{-6}$ m

$$\therefore \quad \frac{4}{3}\left(y \times \frac{0\cdot45\times10^{-3}}{1\cdot5}\right) = \left(1\cdot5 - \frac{4}{3}\right)\times 10\cdot4\times10^{-6}$$

$$= \frac{0\cdot5\times10\cdot4\times10^{-6}\times3\times1\cdot5}{4\times3\times0\cdot45\times10^{-3}}$$

$$\text{or} \quad y = \frac{0\cdot5\times10\cdot4\times10^{-6}\times3\times1\cdot5}{4\times3\times0\cdot45\times10^{-3}}$$

$= \mathbf{4{\cdot}33 \times 10^{-3}}$ **m**

(*b*) The refractive index of glass plate *w.r.t.* medium,

$${}^m\mu_g = \frac{1\cdot5}{4/3} = \frac{9}{8}$$

Therefore, path difference between light paths S_1O and S_2O,

$$x = {}^m\mu_g\, t - t = \frac{9}{8}t - t = \frac{t}{8}$$

Phase difference between the light reaching point O from S_1 and S_2,

$$\phi = x \times \frac{2\pi}{\lambda} = \frac{t}{8} \times \frac{2\pi}{\lambda} = \frac{\pi t}{4\lambda}$$

Here, $\lambda = 600$ nm $= 600 \times 10^{-9}$ m ; $t = 10{\cdot}4 \times 10^{-6}$ m

$$\therefore \quad \phi = \frac{\pi\times10\cdot4\times10^{-6}}{4\times600\times10^{-9}} = \frac{13\,\pi}{3}$$

Therefore, intensity of light at point O,

$$I = I_{max} = \cos^2\frac{\phi}{2} = I_{max}\cos^2\frac{13\,\pi}{6} = I_{max}\cos^2\frac{\pi}{6}$$

$$= I_{max}\left(\frac{\sqrt{3}}{2}\right)^2 = \frac{3}{4}I_{max}$$

Problem 5.06. A glass plate of refractive index 1·5 coated with a thin layer of thickness t and refractive index 1·8. Light of wavelength λ travelling in air is incident normally on the layer and the two reflected rays interfere. Write the condition for their constructive interference. If λ = 648 nm, obtain the least value of t for which the rays interfere constructively. (*I.I.T. 2000*)

Sol. Here, refractive index of glass plate, $\mu = 1{\cdot}5$

and refractive index of the coating layer, $\mu' = 1{\cdot}8$

When the rays of light are reflected from the glass surface and the surface of the coating layer, the optical path difference between the two rays,

$$\Delta x = 2\,\mu'\,t,$$

where t is thickness of the coating layer.

Since $\mu' > \mu$, the rays of light suffering reflection from coating layer (optically denser medium) undergoes a phase change of π (or path difference of $\lambda/2$). On the other hand, there is no change in phase of the ray of light suffering reflection from glass plate (optically rarer medium). Therefore, net path difference in the path of two rays,

$$\Delta x' = \Delta x + \frac{\lambda}{2} = 2\,\mu'\,t + \frac{\lambda}{2}$$

For constructuve interference between the two rays of light,

$$\Delta x' = n\,\lambda \quad \text{or} \quad 2\,\mu'\,t + \frac{\lambda}{2} = n\,\lambda$$

$$\text{or} \quad \mathbf{2\,\mu'\,t} = \left(n - \frac{1}{2}\right)\lambda\text{, where } n = 1, 2, 3, ...$$

It is the condition for constructive interference between the rays of light.

The least value of the thickness of the coating layer corresponds to $n = 1$, *i.e.*

$$2\,\mu'\,t_{min} = \frac{\lambda}{2} \quad \text{or} \quad t_{min} = \frac{\lambda}{4\,\mu'}$$

Here, λ = 648 nm and $\mu' = 1{\cdot}8$

$$\therefore \quad t_{min} = \frac{648}{4\times1\cdot8} = \mathbf{90\ nm}$$

Problem 5.07. A vessel ABCD of 10 cm width has two small slits S_1 and S_2 sealed with identical glass plates of equal thickness. The distance between the slits is 0·8 mm. POQ is the line perpendicular to the plane AB and passing through O, the middle point of S_1 and S_2. A monochromatic light source is kept at S, 40 cm below P and 2 m from the vessel, to illuminate the slits as shown in Fig. 5.03. Calculate the position of the central bright fringe on the other wall CD with respect to the line OQ. Now a liquid is poured into

the vessel and filled upto OQ. The central bright fringe is found to be at Q. Calculate the refractive index of the liquid.

(I.I.T. 2001)

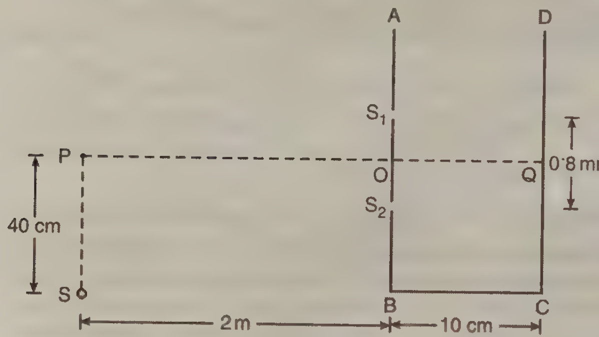

Fig. 5.03

Sol. Here, $S_1S_2 = 0{\cdot}8$ mm $= 0{\cdot}08$ cm ; PS = 40 cm,

OP = 2 m = 200 cm and OQ = 10 cm

Suppose that central maximum is formed at a point K on the wall CD, such that QK = y. The liquid waves from the source S illuminate the slits S_1 and S_2 and then reach point K as shown in Fig. 5.04.

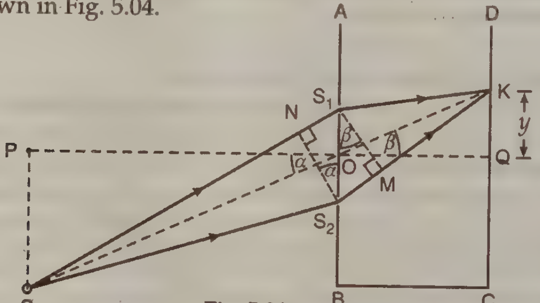

Fig. 5.04

For point K to be the position of central maximum,

$$(SS_1 + S_1K) - (SS_2 + S_2K) = 0$$

or $\quad SS_1 - SS_2 = S_2K - S_1K \qquad \text{...}(i)$

From points S_1 and S_2, drop S_1M and S_2N perpendiculars to S_2K and SS_1 respectively.

Then, $SS_1 - SS_2 \approx S_1N \quad$ and $\quad S_2K - S_1K \approx S_2M$

Therefore, equation (*i*) becomes

$$S_1N = S_2M \qquad \text{...}(ii)$$

Let $\angle POS = \alpha$. Then $\angle S_1S_2N \approx \alpha$

Hence, from right angled $\Delta\, S_1NS_2$, we have

$$S_1N = S_1S_2 \sin\alpha = 0{\cdot}08 \sin\alpha$$

Also from right angled Δ OPS, we have

$$\sin\alpha \approx \tan\alpha = \frac{PS}{OP} = \frac{40}{200} = 0{\cdot}2$$

$\therefore \quad S_1N = 0{\cdot}08 \times 0{\cdot}2 = 0{\cdot}016$ cm

Similarly, it can be obtained that

$$S_2M = S_1S_2 \sin\beta = S_1S_2 \tan\beta = 0{\cdot}8 \times \frac{QK}{OQ} = 0{\cdot}08 \times \frac{y}{10}$$

Substituting for S_1N and S_2M in equation (*ii*), we have

$$0{\cdot}016 = 0{\cdot}08 \times \frac{y}{10} \quad \text{or} \quad y = \frac{0{\cdot}016 \times 10}{0{\cdot}08} = 2 \text{ cm}$$

When liquid is poured into vessel upto OQ : On puring liquid upto OQ, the light waves from source S will reach the point Q as shown in Fig. 5.05.

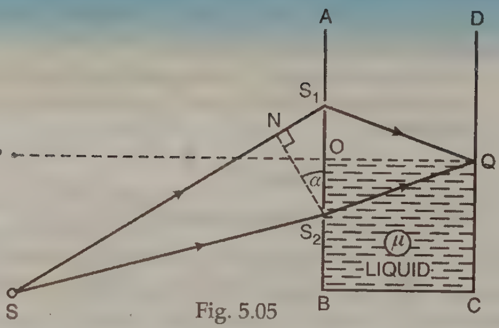

Fig. 5.05

Light waves from S_1 travel in air, while those from S_2 travel inside the liquid. Therefore, optical path difference between S_1Q and S_2Q is equal to $(\mu - 1)\, S_1Q$. Further, as $S_1S_2 << OQ$, $S_1Q \approx OQ$ and hence optical path difference between light waves reaching point Q from sources S_1 and S_2 is $(\mu - 1)$ OQ.

For point Q to be the position of central maximum,

$S_1N = (\mu - 1)$ OQ $\quad$ or $\quad 0{\cdot}016 = (\mu - 1) \times 10$

or $\quad \mu = 1{\cdot}0016$

Problem 5.08. In the Fig. 5.06, S is a monochromatic point source emitting light of wavelength $\lambda = 500$ nm. A thin lens of circular shape and focal length 0·10 m is cut into two identical halves L_1 and L_2 by a plane passing through a diameter. The two halves are placed symmetrically about the central axis SO with a gap of 0·5 mm. The distance along the axis from S to L_1 and L_2 is 0·15 m, while that from L_1 and L_2 to O is 1·30 m. The screen at O is normal to SO.

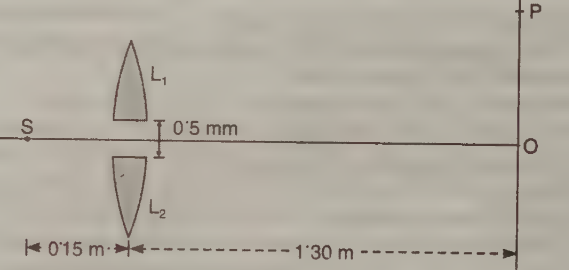

Fig. 5.06.

(*a*) If the third intensity maximum occurs at the point P on the screen, find the distance OP .

(*b*) If the gap between L_1 and L_2 is reduced from its original value of 0·5 mm, will the distance OP increase, decrease or remain the same ? *(I.I.T. 1993)*

Thought Process

The two parts L_1 and L_2 of the lens are placed to form the gap AB = 0·5 mm. As the source S lies between F and 2 F of the lens, the two parts L_1 and L_2 will form real images S_1 ans S_2 of the source S on the other side of the lens as shown in Fig. 5.07. The two images S_1 and S_2 act as two coherent sources and produce interference pattern on the screen.

Here, the distance of screen from the slits,

$$D = 1{\cdot}30\, v \quad \text{(in metre)},$$

where the distance v of the images S_1 and S_2 from the lens can be found by applying uv-relation for a lens. Further, the distance between the slits, $d = S_1 + S_2$. The value of d can be found from the similar triangles SAB and $SS_1\, S_2$.

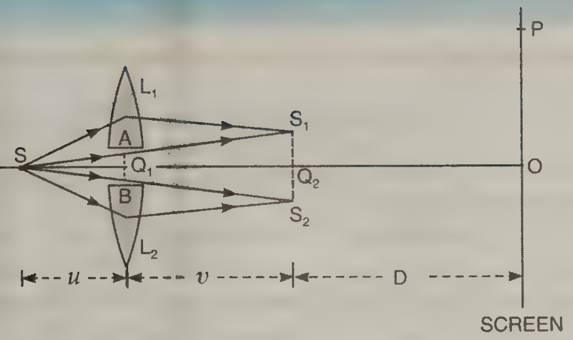

Fig. 5.07.

Sol. (*a*) Here, $u = -0{\cdot}15$ m ; $f = 0{\cdot}10$ m ;

Now, $$-\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$$

or $$\frac{1}{v} = \frac{1}{f} + \frac{1}{u} = \frac{1}{0{\cdot}01} + \frac{1}{-0{\cdot}15} = \frac{1}{0{\cdot}30}$$

or $$v = 0{\cdot}30 \text{ m}$$

$$\therefore \quad D = 1{\cdot}30 - 0{\cdot}30 = 1{\cdot}0 \text{ m}$$

Since triangles SAB and S_1 and S_2 are similar,

$$\frac{SQ_1}{SQ_2} = \frac{AB}{S_1S_2}$$

Now, $SQ_1 = u$; $SQ_2 = u + v$;

$AB = 0{\cdot}5$ mm $= 0{\cdot}5 \times 10^{-3}$ m and $S_1 S_2 = d$

$$\therefore \quad \frac{u}{u+v} = \frac{0{\cdot}5 \times 10^{-3}}{d}$$

or $$d = \frac{u+v}{u} \times 0{\cdot}5 \times 10^{-3} = \frac{0{\cdot}15 + 0{\cdot}30}{0{\cdot}15} \times 0{\cdot}5 \times 10^{-3}$$

$$= 1{\cdot}5 \times 10^{-3} \text{ m}$$

The distance of third intensity maximum is given by

$$y_3 = \frac{3 D \lambda}{d}$$

Here, $\lambda = 500$ nm $= 500 \times 10^{-9}$ m

$$\therefore \quad OP = y_3 = \frac{3 \times 1{\cdot}0 \times 500 \times 10^{-9}}{1{\cdot}5 \times 10^{-3}} = 10^{-3} \text{ m} = \mathbf{1\ mm}$$

(*b*) As the gap AB between the two parts L_1 and L_2 is decreased, the value of distance *d* will decrease. From the expression for y_3, it follows that OP will *increase*.

Chapter 6. Diffraction of Light

Problem 6.01. Angular width of central maximum in Fraunhofer diffraction pattern of a slit is measured. The is illuminated by light of wavelength 6000 Å. When the is illuminated by light of another wave-length, the gular width decreases by 30%. Calculate the wavelength this light. The same decrease in the angular width of ntral maximum is obtained, when the original apparatus mmersed in a liquid. Find refractive index of the liquid.

(*I.I.T. 1996*)

Sol. If *a* is width of the slit and λ, the wavelength of light ed, then

angular width of the central maximum,

$$2\theta_1 = \frac{2\lambda}{a} \qquad \ldots(i)$$

Suppose that when light of wavelength λ' is used, the dth of the central maximum becomes $2\theta_1'$. Then,

$$2\theta_1' = \frac{2\lambda'}{a} \qquad \ldots(ii)$$

Since the width of central maximum decreases by 30% *i.e.* becomes 70% on using light of wavelength λ' in place of λ,

$$2\theta_1' = \frac{70}{100} \times 2\theta_1 = 0{\cdot}70 \times 2\theta_1$$

or $$2\theta_1' = 0{\cdot}70\left(\frac{2\lambda}{a}\right) \qquad \ldots(iii)$$

From equations (*ii*) and (*iii*), we have

$$\frac{2\lambda'}{a} = 0{\cdot}70\left(\frac{2\lambda}{a}\right)$$

or $$\lambda' = 0{\cdot}70 \times \lambda = 0{\cdot}70 \times 6000 = \mathbf{4200\ Å}$$

The same change in angular width of the central maximum will be obtained on immersing the apparatus in a liquid, if the refractive index μ of the liquid is such that

$$\lambda' = \frac{\lambda}{\mu} \quad \text{or} \quad \mu = \frac{\lambda}{\lambda'} = \frac{6000}{4200} = \mathbf{1{\cdot}429}$$

Chapter 7. Polarisation of Light

Problem 7.01. A beam of plane polarised light falls rmally on a polariser (cross-sectional area 3 × 10^{-4} m²), ich rotates about the axis of the ray with an angular locity of 31·4 rad s^{-1}. Find the energy of light passing rough the polariser per revolution and the intensity of ergent beam, if flux of energy of the incident ray is 10^{-3}

(*Roorkee, 1994*)

Thought Process

As the polariser is continuously rotating, the angle θ between the direction of electric vector and the optical axis of the polariser also varies continuously from 0 to 2π. Therefore, in the expression for intensity of light transmitted from the polariser ($I = I_0 \cos^2\theta$), the average value of $\cos^2\theta$ has to be substituted. In other words,

$$I = I_0 \overline{\cos^2\theta}$$

Now, average value of $\cos^2\theta$ over complete cycle

i.e. $$\overline{\cos^2\theta} = \frac{1}{2}$$

Therefore, $$I = I_0 \times \frac{1}{2} = \frac{I_0}{2}$$

Sol. Here, flux of energy of the incident ray 10^{-3} W ; cross-sectional area of the polariser, A = 3 × 10^{-4} m² and angular velocity of the polariser, $\omega = 31{\cdot}4$ rad s^{-1}

Now, intensity of incident light,

$$I_0 = \frac{\text{flux of energy of the incident ray}}{\text{area of polariser}}$$

$$= \frac{10^{-3}}{3 \times 10^{-4}} \text{ W m}^{-2}$$

Therefore, intensity of emergent beam,

$$I = \frac{I_0}{2} = \frac{10^{-3}}{2 \times 3 \times 10^{-4}} = \frac{5}{3} \text{ W m}^{-2}$$

Further, energy of the light passing through the polariser per revolution, W = I × A × T,
where T is time taken by the polariser to complete one revolution.

Therefore,

$$E = I \times A \times \frac{2\pi}{\omega} = \frac{5}{3} \times 3 \times 10^{-4} \times \frac{2 \times 3 \cdot 14}{31 \cdot 4} = 10^{-4} \text{ J}$$

Problem 7.02. Unpolarised light of intensity 32 W m^{-2} passes through three polarisers, such that transmission axis of last polariser is crossed with the first. If intensity of emerging light is 3 W m^{-2}, what is the angle between the transmission axis of the first two polarisers ? At what angle will the intensity of transmitted light be maximum ?

Sol. Let θ_{12} be the angle between the transmission axes of the first two polarisers P_1 and P_2 and θ_{23}, the angle between the transmission axes of polarisers P_2 and P_3. Then,

$$\theta_{12} + \theta_{23} = 90° \qquad \text{...(}i\text{)}$$

Intensity of unpolarised light, $I_0 = 32 \text{ W m}^{-2}$

Let I_1, I_2 and I_3 be the intensities of light on passin through the first, second and third polariser respectivel Then,

$$I_1 = \frac{1}{2} I_0 = \frac{1}{2} \times 32 = 16 \text{ W m}^{-2}$$

According to Malus law, intensity of light on passin through second polariser,

$$I_2 = I_1 \cos^2 \theta_{12}$$

or $$I_2 = 16 \cos^2 \theta_{12} \qquad \text{...(}ii$$

and intensity of light on passing through third polarise

$$I_3 = I_2 \cos^2 \theta_{23} = [16 \cos^2 \theta_{12}] \cos^2 (90° - \theta_{12})$$

or $$I_3 = 16 \cos^2 \theta_{12} \sin^2 \theta_{12} = 4 \sin^2 2\,\theta_{12}$$

Since $I_3 = 3 \text{ W m}^{-2}$, we have

$$4 \sin^2 2\,\theta_{12} = 3 \quad \text{or} \quad \sin 2\,\theta_{12} = \frac{\sqrt{3}}{2}$$

or $$2\,\theta_{12} = 60° \quad \text{or} \quad \theta_{12} = 30°$$

For transmitted light (I_3) to be maximum,

$$\sin^2 2\,\theta_{12} = 1 \quad \text{or} \quad \sin 2\,\theta_{12} = 1$$

or $$2\,\theta_{12} = 90° \text{ or } \quad \theta_{12} = 45°$$

MULTIPLE CHOICE QUESTIONS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Refraction of Light

ART I. TEXT-BASED QUESTIONS

1. **Velocity of light is maximum in**
(A) diamond (B) water
(C) glass (D) vacuum *(A.F.M.C. 1996)*

2. **The refractive index of water is 1·33. What will be the speed of light in water ?**
(A) 3×10^8 m s^{-1} (B) $2{\cdot}26 \times 10^8$ m s^{-1}
(C) 4×10^8 m s^{-1} (D) $1{\cdot}33 \times 10^8$ m s^{-1}
(C.B.S.E. 1996)

3. **Light travels through a glass plate of thickness t and having a refractive index μ. If c is the velocity of light in vacuum, the time taken by the light to travel this thickness of glass is**
(A) $t \mu c$ (B) $\frac{tc}{\mu}$
(C) $\frac{t}{\mu c}$ (D) $\frac{\mu t}{c}$ *(C.B.S.E. 1996)*

4. **Time taken by the sun light to pass through a glass slab of 4 mm thickness, whose refractive index is 1·5, is**
(A) 2×10^{-1} s (B) 2×10^{8} s
(C) 2×10^{-11} s (D) 2×10^{11} s
(A.F.M.C. 1997 ; C.B.S.E. 1993)

5. **Green light of wavelength 5460 Å is incident on an air-glass interface. If the refractive index of glass is 1·5, the wavelength of light in glass would be (Given velocity of light in air, $c = 3 \times 10^8$ m s^{-1})**
(A) 3640 Å (B) 5460 Å
(C) 4861 Å (D) None of the above.
(C.B.S.E. 1993, similar Karnataka Entrance, 1991)

6. **A beam of monochromatic light is refracted from vacuum into a medium of refractive index 1·5. The wavelength of refracted light will be**
(A) same.
(B) dependent on intensity of refracted light.
(C) larger. (D) smaller. *(C.B.S.E. 1992)*

7. **A glass slab of thickness 4 cm contains the same number of waves as 5 cm of water, when both are traversed by the same monochromatic light. If the refractive index of water is 4/3, what is the refractive index of glass ?**
(A) 5/3 (B) 5/4
(C) 16/15 (D) 1·5
(Karnataka Entrance, 1990)

8. **The lateral shift produced in a parallel sided glass slab depends on**
(A) the angle of incidence.
(B) the thickness of the glass slab.
(C) the refractive index of the material of the slab.
(D) all these. *(Karnataka Entrance, 1991)*

9. **The refractive index of air *w.r.t.* glass is 2/3. The refractive index of diamond *w.r.t.* air is 12/5. Then the refractive index of glass w.r.t. diamond will be**
(A) 5/8 (B) 8/9
(C) 5/18 (D) 18/5 *(C.B.S.E. 1993)*

10. **If ${}^i\mu_j$ represents refractive index, when a light ray goes from medium i to medium j, then the product ${}^2\mu_1 \times {}^3\mu_2 \times {}^4\mu_3$ is equal to**
(A) ${}^3\mu_1$ (B) ${}^3\mu_2$
(C) ${}^4\mu_1$ (D) ${}^4\mu_2$ *(C.B.S.E. 1990)*

11. **A transparent cube contains a small air bubble. Its apparent distance is 2 cm, when seen through one face and 5 cm when seen through other face. If the refractive index of the material of the cube is 1·5, the real length of the edge of the cube must be**
(A) 7 cm (B) 7·5 cm
(C) 10·5 cm (D) 4·67 cm
(C.B.S.E. 2000 ; C.P.M.T. 1992)

12. **A ray of light from a sodium lamp undergoes total internal reflection. The critical angle will be smallest, when it travels from**
(A) water to glass. (B) glass to air.
(C) glass to water. (D) water to air.
(Karnataka Entrance, 1987, 1985)

13. **Total internal reflection takes place, when light travels from**
(A) water to glass. (B) glass to diamond.
(C) water to air (D) air to mercury.
(C.E.T. 1998)

14. **The critical angle of light passing from glass to air is minimum for**
(A) red. (B) green.
(C) yellow. (D) violet.
(Karnataka Entrance, 1993)

15. **A ray of light travelling in a transparent medium falls on a surface separating the medium from air at an angle of incidence of 45°. The ray undergoes total internal reflection. If μ is refractive index of the medium w.r.t. air, select the possible value(s) of μ from the following :**
(A) 1·3 (B) 1·4
(C) 1·5 (D) 1·6 *(I.I.T. 1998)*

16. **The sun becomes visible before the actual sunrise and remains visible even after the actual sunset. It is because of**
(A) scattering of light. (B) diffraction of light.
(C) refraction of light. (D) dispersion of light.

17. **The twinkling of stars is due to**
(A) periodic bursts of light from the star.
(B) interference between light from the sun and star.
(C) partial absorption of light in the atmosphere.
(D) refractive index fluctuation in the atmosphere.
(A.F.M.C. 1995)

18. **In optical fibres, the following principle is used :**
(A) Scattering (B) Successive reflections
(C) Refraction (D) Total internal reflection.
(Karnataka Entrance, 1994)

19. **Transmission of light in optical fibre is due to**
(A) scattering (B) diffraction
(C) polarisation
(D) multiple total internal reflection *(C.B.S.E. 2001)*

20. **Large aperture of lens results in**
(A) chromatic aberration.
(B) spherical aberration.
(C) curvature. (D) astigmatism.

21. **The spherical aberration in a lens may be minimised by designing the lens so that the deviation of rays is**
(A) minimum.
(B) minimum at first surface.
(C) minimum at second surface.
(D) equal at both surfaces.

22. **An equi-convex lens has focal length equal to the radius of curvature. Its refractive index is**

(A) 1·4 (B) 1·6
(C) 1·3 (D) 1·5 (*Karnataka, 1993 S*)

23. **What is the focal length of a double convex lens for which radius of curvature of the surfaces is 40 cm ($^a\mu_g = 1{\cdot}5$) ?**
(A) 50 cm (B) 40 cm
(C) – 30 cm (D) – 40 cm (*C.P.M.T. 1992*)

24. **A plano convex lens is made of refractive index 1·6. If the radius of curvature of the curved surface is 60 cm, then focal length of the lens is :**
(A) 50 cm (B) 100 cm
(C) 200 cm (D) 400 cm (*C.B.S.E. 1999*)

25. **If in a plano-convex lens, radius of curvature of convex surface is 10 cm and the focal length of the lens is 30 cm, the refractive index of the material of the lens will be**
(A) 1·5 (B) 1·66
(C) 1·33 (D) 3 (*M.N.R. 1988*)

26. **A thin symmetrical convex lens of refractive index 1·5 and radius of curvature 0·3 m is put in water of refractive index 4/3 . Its focal length is**
(A) 0·15 m (B) 0·30 m
(C) 0·60 m (D) 1·20 m (*Roorkee, 1992*)

27. **A concave lens of glass, refractive index 1·5, has both surfaces of the same radius of curvature R. On immersion in a medium of refractive index 1·75, it will behave as**
(A) convergent lens of focal length 3·05 R.
(B) convergent lens of focal length 3·0 R.
(C) divergent lens of focal length 3·5 R.
(D) divergent lens of focal length 3·0 R. (*I.I.T. 1999*)

28. **Focal length of a convex lens of refractive index 1·5 is 2 cm. Focal length of lens, when immersed in a liquid of refractive index of 1·25 will be**
(A) 10 cm (B) 7·5 cm
(C) 5 cm (D) 2·5 cm (*C.B.S.E. 1993*)

29. **A camera is focussed to take a close up picture of an insect at a distance of 5 cm from the camera lens. If the film is 10 cm away from the lens, what must be the focal length of the lens, expressed in cm ?**
(A) 3·3 cm (B) 10 cm
(C) 5 cm (D) 2 cm
(*Karnataka Entrance, 1992*)

30. **The graph drawn with object distance along abscissa and image distance as ordinate for a convex lens is**
(A) a straight line. (B) a circle.
(C) a parabola. (D) a rectangular hyperbola.
(*Karnataka Entrance, 1993*)

31. **Two plano-convex lenses, each having focal length of 0·4 m, are pressed against each other at their plane faces. This forms a double convex lens. At what distance from this lens must an object be placed to obtain a real, inverted image with magnification one ?**
(A) 0·8 m (B) 0·4 m
(C) 0·2 m (D) 1·6 m
(*Karnataka Entrance, 1989 ; N.C.E.R.T. 1980*)

32. **A film projector magnifies a 100 cm^2 film strip on a screen. If the linear magnification is 4, the area of the magnified film on the screen is**
(A) 1600 cm^2 (B) 400 cm^2
(C) 800 cm^2 (D) 200 cm^2
(*C.P.M.T. 1991 ; N.C.E.R.T. 1975*)

33. **The focal length of a convex lens is 30 cm and the size of image is quarter of the object. Then, the object distance is**
(A) 150 cm (B) 90 cm
(C) 60 cm (D) 30 cm (*A.F.M.C. 1995*)

34. **The distance between the object and the screen is D. A convex lens forms the image of the object on the screen in two positions separated by a distance *a*. The ratio between the size of the two images will be**
(A) D/*a* (B) D^2/*a*^{2}
(C) $\sqrt{D/a}$ (D) (D – *a*)^2/(D + *a*)^2
(*A.F.M.C. 1998*

35. **For a given distance between an object and an imag screen, magnification is 3 for a certain position of conve lens. On moving the lens through 0·2 m towards screen magnification is 1/3. Focal length of the lens is**
(A) 0·075 m (B) 0·01 m
(C) 1 m (D) 0·15 m (*Karnataka, 1995*

36. **An object is placed at a distance of *f* / 2 from a convex lens The image will be**
(A) at 3 *f* / 2, real and inverted.
(B) at 2 *f*, virtual and erect.
(C) at 2 *f*, real and inverted.
(D) at one of the foci, virtual and double its size.
(*C.P.M.T. 1989*

37. **Which of the following form(s) a virtual and erect imag for all positions of the object ?**
(A) convex lens (B) concave lens
(C) convex mirror (D) concave mirror
(*I.I.T. 1996*

38. **Two thin lenses of focal lengths f_1 and f_2 are placed in contact. The focal length of the composite lens will be**
(A) $(f_1 + f_2)/2$ (B) $(f_1 + f_2)/f_1 f_2$
(C) $\sqrt{f_1 f_2}$ (D) $f_1 f_2/(f_1 + f_2)$
(*A.I.I.M.S. 1998*

39. **Two lenses having powers + 6 D and – 4 D are placed in contact. The power of the combination is**
(A) – 2 D (B) – 4 D
(C) + 4 D (D) + 2 D (*A.F.M.C. 1989*)

40. **If a convex lens of focal length 80 cm and a concave lens of focal length 50 cm are combined together, what will be their resulting power ?**
(A) + 6·5 D (B) – 6·5 D
(C) + 7·5 D (D) – 7·5 D (*C.B.S.E. 1996*)

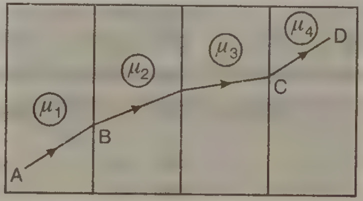
41. **Two lenses of power + 12 D and – 2 D are placed in contact. What will be the focal length of the combination ?**
(A) 10 cm (B) 12·5 cm
(C) 16·6 cm (D) 8·33 cm (*M.N.R. 1987*)

42. **A convex lens of power +6 D is placed in contact with a concave lens of power – 4 D. What will be the nature and focal length of this combination ?**
(A) concave, 25 cm (B) convex, 50 cm
(C) concave, 20 cm (D) convex, 100 cm
(*M.N.R. 1993*)

43. **A convex lens A of focal length 20 cm and a concave lens of focal length 5 cm are kept along the same axis with a distance *d* between them. If a parallel beam of light falling on A leaves B as a parallel beam, then the distance *d* (in cm) will be**
(A) 25 (B) 15
(C) 30 (D) 50
(*M.N.R. 1990 ; I.I.T. 1985*)

PART II. THOUGHT-BASED QUESTIONS

44. **A ray of light passes through four transparent media with refractive indices μ_1, μ_2, μ_3 and μ_4 as shown in figure. The**



surfaces of all media are parallel. If the emerged ray CD is parallel to the incident ray AB, we must have

(A) $\mu_1 = \mu_2$ (B) $\mu_2 = \mu_3$
(C) $\mu_3 = \mu_4$ (D) $\mu_4 = \mu_1$ (*C.B.S.E. 2001*)

45. If a glass rod is put in a beaker containing a colourless liquid, the glass rod immediately seems to disappear. It is so, because

(A) the liquid and the glass have the same colour.
(B) the glass and the liquid have the same density.
(C) the glass and the liquid have the same refractive index.
(D) the glass reflects the light transmitted by the liquid.
(*Karnataka Entrance, 1987*)

46. A plane glass slab is kept over various coloured letters. The letter which appears least raised is

(A) blue (B) violet
(C) red (D) green (*B.H.U. 1998*)

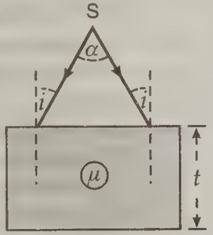
47. Air has refractive index 1·0003. The thickness of air column, which will have one more wavelength of yellow light (6000 Å) than in the same thickness of vacuum, is

(A) 2 mm (B) 2 cm
(C) 2 m (D) 2 km (*C.P.M.T. 1989*)

48. The wavelength of light diminishes μ times in a medium. A diver from inside water (μ = 1·33) looks at an object, whose natural colour is green. He sees the object as

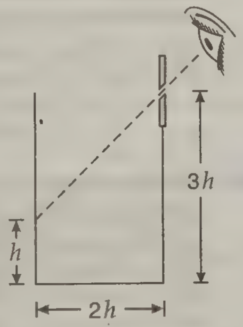
(A) green (B) blue
(C) yellow (D) red. (*C.P.M.T. 1990*)

49. A diverging beam of light from a point source S having divergence angle α, falls symmetrically on a glass slab as shown. The angles of incidence of the two extreme rays are equal. If the thickness of the glass slab is t and the refractive index μ, then the divergence angle of the emergent beam is



(A) zero
(B) α
(C) $\sin^{-1}(t/\mu)$
(D) $2\sin^{-1}(t/\mu)$ (*I.I.T. 2000*)

50. An observer can see through a pin-hole the top end of a thin rod of height h, placed as shown in the figure. The beaker height is 3 h and its radius h. When the beaker is filled with a liquid up to a height 2 h, he can see the lower end of the rod. Then, the refractive index of the liquid is



(A) 5/2
(B) $\sqrt{5/2}$
(C) $\sqrt{3/2}$
(D) 3/2 (*I.I.T. 2002*)

51. A beam of light is converging towards a point I on a screen. A parallel plate of glass (thickness in the direction of beam t, refractive index μ) is introduced in the path of the beam. The convergence point is shifted by

(A) $t\left(1-\frac{1}{\mu}\right)$ away. (B) $t\left(1+\frac{1}{\mu}\right)$ away.

(C) $t\left(1-\frac{1}{\mu}\right)$ nearer. (D) $t\left(1+\frac{1}{\mu}\right)$ nearly.

(*M.N.R. 1987*)

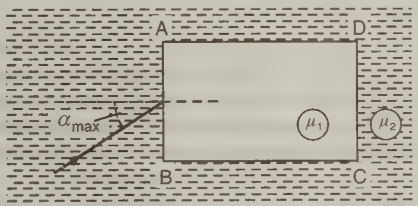
52. Light passing from air to glass is refracted, as is light passing from glass to air. However, when you look out of a window at the view outside, the light does not seem to have been distorted. This is because

(A) the angle of refraction is too small to observe.
(B) light incident upon the glass is partially reflected and this tends to mask the effect of refraction.
(C) the emergent ray is parallel to the incident ray and only lateral displacement occurs.
(D) the window pane is too thin for refraction to occur.
(*Karnataka Entrance, 1988*)

53. A person swimming at the bottom of a swimming pool looks up to the diving board. The board

(A) appears nearer. (B) appears farther.
(C) appears at the correct position.
(D) is not seen at all. (*Karnataka, 1992 S*)

54. A rectangular glass slab ABCD of refractive index μ_1 is immersed in water of refractive index μ_2 ($\mu_1 > \mu_2$). A ray of light is incident at the surface AB of the slab as shown.



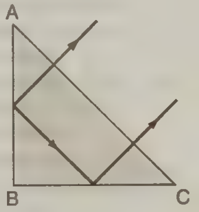
The maximum value of the angle of incidence α_{max}, such that the ray comes out only from the other surface CD is given by

(A) $\sin^{-1}\left[\frac{\mu_1}{\mu_2}\cos\left(\sin^{-1}\frac{\mu_2}{\mu_1}\right)\right]$

(B) $\sin^{-1}\left[\mu_1\cos\left(\sin^{-1}\frac{1}{\mu_2}\right)\right]$

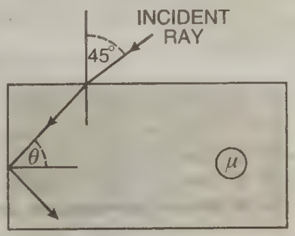
(C) $\sin^{-1}\frac{\mu_1}{\mu_2}$ (D) $\sin^{-1}\frac{\mu_2}{\mu_1}$

55. A ray of light falls on a right angled prism ABC (AB = BC) and travels as shown in the figure. The minimum refractive index of prism material should be



(A) 1·33
(B) $\sqrt{2}$
(C) 1·5
(D) 1·5 /1·33
(*Karnataka, 1992 S*)

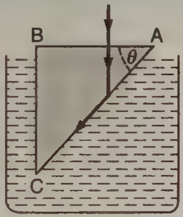
56. For the given incident ray as shown in the figure, the condition of total internal reflection of the ray will be satisfied, if the refractive index of block will be



(A) $(\sqrt{3}+1)/2$
(B) $(\sqrt{2}+1)/2$
(C) $\sqrt{3/2}$
(D) $\sqrt{7/6}$

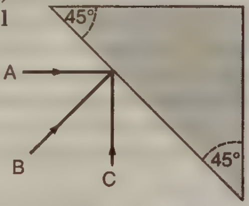
(*C.B.S.E. 2002*)

57. **A glass prism of refractive index 1·5 is immersed in water (μ = 4/3). A light beam incident normally on the face AB is totally reflected to reach the BC, if**



(A) $\sin\theta \geq 8/9$
(B) $2/3 < \sin\theta < 8/9$
(C) $\sin\theta \leq 2/3$
(D) none of the above.

58. **A, B and C in the diagram represent rays of light incident upon a face of a right-angled prism. Before emerging from the prism, which ray (or rays) will experience total internal reflection ?**



(A) A
(B) B
(C) C
(D) none of these.
(Karnataka Entrance, 1992, 1989)

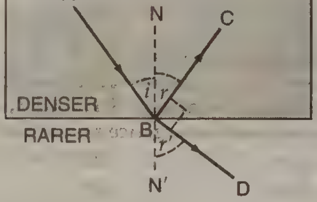
59. **A glass prism with refractive index 2 has refracting angle of 30°. One of the refracting face of the prism is polished. A beam of monochromatic light will retrace its path, if its angle of incidence over the refracting face of the prism is**
(A) 60° (B) 45°
(C) 30° (D) 0° *(B.H.U. 1999)*

60. **Refractive index of water is 5/3. A light source is placed in water at a depth of 4 m. Then what must be the maximum radius of disc placed on water surface so that the light of source can be stopped ?**
(A) 3 m (B) 4 m
(C) 5 m (D) ∞ *(C.B.S.E. 2001)*

61. **A fish looking up through the water sees the outside world contained in a circular horizon. If the refractive index of water is 4/3 and fish is 12 cm below the surface of water, then the radius of the circular horizon is**
(A) 16 cm^2 (B) 9 cm^2
(C) 12 cm^2 (D) 13·6 cm^2 *(N.C.E.R.T. 1980)*

62. **A diver in swimming pool wants to signal his distress to a person lying on the edge of the pool by flashing his water proof flash light.**
(A) He must direct the beam vertically upward.
(B) He has to direct the beam horizontally.
(C) He has to direct the beam at an angle to the vertical, which is slightly less than the critical angle of incidence for total reflection.
(D) He has to direct the beam at an angle to the vertical, which is slightly more than the critical angle of incidence for total reflection. *(N.C.E.R.T. 1972)*

63. **A ray of light from denser medium strikes a rarer medium at an angle of incidence *i*. The reflected and refracted rays make an angle 90° with each other. The angles of reflection and refraction are *r* and *r′* as shown in the figure. The critical angle is**



(A) $\sin^{-1}(\tan r)$ (B) $\sin^{-1}(\tan i)$
(C) $\sin^{-1}(\tan r')$ (D) $\tan^{-1}(\sin i)$ *(I.I.T. 198*

64. **An air bubble inside the water behaves as :**
(A) a convex lens. (B) a concave lens.
(C) a plano convex lens. (D) a concave mirror.
(A.F.M.C. 1998 ; Karnataka Entrance, 1991, 198

65. **A lens behaves as a converging lens in air and a divergi lens in water. The refractive index of the material of t lens is**
(A) equal to unity. (B) equal to 1·33.
(C) between unity and 1·33.
(D) greater than 1·33. *(C.P.M.T. 1991 ; N.C.E.R.T. 197*

66. **A hollow double concave lens is made of very th transparent material. It can be filled with air or either two liquids L_1 and L_2 having refractive indices μ_1 and respectively ($\mu_2 > \mu_1 > 1$). The lens will diverge a paral beam of light, if it is filled with**
(A) air and placed in air.
(B) air and immersed in L_1.
(C) L_1 and immersed in L_2.
(D) L_2 and immersed in L_1. *(I.I.T. 200*

67. **A double convex lens of refractive index μ_1 is immers in a liquid of refractive index μ_2. The lens will act as**
(A) diverging lens, if $\mu_1 > \mu_2$.
(B) diverging lens, if $\mu_1 < \mu_2$.
(C) converging lens, if $\mu_1 > \mu_2$.
(D) converging lens, if $\mu_1 < \mu_2$. *(I.I.T. 199*

68. **A converging lens is used to form an image on a scree When the upper half of the lens is covered by an opaq screen,**
(A) half the image will disappear.
(B) complete image will be formed.
(C) intensity of image will decrease.
(D) intensity of image will increase.
(B.H.U. 1998 ; I.I.T. 198

69. **In order to include the effect of thickness *t* of the len following four modifications are suggested in the le equation. Which one accounts for the modificati correctly in your opinion ?**

(A) $-\frac{1}{u}+\frac{1}{v}=\frac{t}{f}$ (B) $-\frac{t}{u}+\frac{1}{v}=\frac{1}{f}$

(C) $-\frac{1}{u}+\frac{t}{v}=\frac{1}{f}$ (D) $-\frac{1}{u+t}+\frac{1}{v-t}=\frac{1}{f}$

70. **A beam of light is incident on a convex lens parallel to i principal axis. As one moves away from the optical cent of the lens on its other side, the intensity of light**
(A) continously increases.
(B) continuously decreases.
(C) first increases and then decreases.
(D) first decreases and then increases.

71. **A body is located on a wall. Its image of equal size is to b obtained on a parallel wall with the help of a convex len The lens is placed at a distance *d* ahead of second wa Then the required focal length will be**
(A) only $d/4$ (B) only $d/2$
(C) more than $d/4$ but less than $d/2$
(D) loss than $d/4$ *(C.B.S.E. 200*

72. **A lens is placed between a source of light and a wall. forms images of areas A_1 and A_2 on the wall for its tw different positions. The area of the source of light is**

(A) $\sqrt{A_1 A_2}$ (B) $\frac{A_1 + A_2}{2}$

(C) $\frac{A_1 - A_2}{2}$ (D) $\frac{1}{A_1} + \frac{1}{A_2}$ *(C.B.S.E. 1995)*

3. A luminous object is placed at a distance of 30 cm from the convex lens of focal length 20 cm. On the other side of the lens, at what distance from the lens, a convex mirror of radius of curvature 10 cm be placed in order to have an upright image of the object coincident with it ?
(A) 12 cm (B) 30 cm
(C) 50 cm (D) 60 cm *(C.B.S.E. 1998)*

74. The two surfaces of a convex lens are of same radius of curvature. It is cut into two equal parts by a plane perpendicular to its principal axis. If the power of the lens was originally D, then the power of the either portion will be
(A) D/4 (B) D/2
(C) D (D) 2 D

75. The two surfaces of a convex lens are of same radius of curvature. It is cut into two equal parts by a plane containing its principal axis. If the power of the lens was originally D, then the power of the either portion will be
(A) D/4 (B) D/2
(C) D (D) 2 D

76. A spherical surface of radius of curvature R separates air (refractive index 1·0) from glass (refractive index 1·5). The centre of curvature is in the glass. A point object P placed in air is found to have a real image Q in the glass. The line PQ cuts the surface at a point O and PO = OQ. The distance PO is equal to
(A) 5 R (B) 3 R
(C) 2 R (D) 1·5 R *(I.I.T. 1998)*

77. The plane face of the plano-convex lens of focal length 20 cm is silvered as shown in the figure. What type of mirror will it behave like and what will be its focal length (f) ?

(A) $f = 20$ cm (convex)

(B) $f = 20$ cm (concave)

(C) $f = 10$ cm (convex)

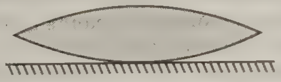
(D) $f = 10$ cm (concave)

78. A plano-convex lens is made of a material of refractive index $\mu = 1{\cdot}5$. The radius of curvature of curved surface of the lens is 20 cm. If its plane surface is silvered, the focal length of the silvered lens will be
(A) 10 cm (B) 20 cm
(C) 40 cm (D) 80 cm *(C.B.S.E. 2000)*

79. A plano convex lens acts like a concave mirror of focal length 20 cm, when its plane surface is silvered ; like a concave mirror of focal length 7 cm, when its convex surface is silvered. The refractive index of the lens material is
(A) 1·45 (B) 1·50
(C) 1·54 (D) 1·70 *(A.F.M.C. 1998)*

80. A thin lens of focal length f and its aperture has diameter d. It forms an image of intensity 3. Now the central part of aperture upto diameter $d/2$ is blocked by an opaque paper. The focal length and image intensity would change to
(A) $f/2$, I/2 (B) f, I/4
(C) $3f/4$, I/2 (D) f, 3 I/4 *(C.P.M.T. 1989)*

81. A convex lens is placed in contact with a mirror as shown in figure. If the space between them is filled with water, its power will



(A) decrease. (B) increase.
(C) remain unchanged.
(D) can increase or decrease depending on the focal length.

82. A beam of parallel rays is brought to focus by a plano-convex lens. A thin concave lens of same focal length is joined to the first lens. The effect of this is that
(A) the focal point shifts away from the lens by a small distance.
(B) the focus shifts to infinity.
(C) the focus remains undisturbed.
(D) the focus moves sidewards.

83. A real image of a distant object is formed by a plano-convex lens on its principal axis. Spherical abberation
(A) is absent.
(B) is smaller, if the curved surface of the lens faces the object.
(C) is smaller, if the plane surface of the lens faces the object.
(D) is the same, whichever side of the lens faces the object. *(I.I.T. 1998)*

84. The 'f-number' of a given camera is 8. It means that
(A) the dimater of the stop of the camera is 0·08 m.
(B) the focal length of the lens of the camera is 8·0 m.
(C) the diameter of the stop is 0·125 of the focal length of the lens.
(D) none of the above. *(Dhanbad 1994)*

Chapter 2. Dispersion

ART I. TEXT-BASED QUESTIONS

1. A glass prism placed in a homogeneous transparent medium will deviate an incident ray
(A) always towards its base.
(B) always away from its base.
(C) towards its base, only if the medium has a refractive index greater than that of glass.
(D) towards the base, only if the medium has a refractive index less than that of glass.
(Karnataka Entrance, 1988)

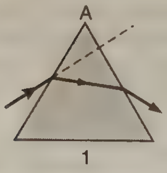
2. A ray of light passes through an equilateral prism, such that the angle of incidence is equal to the angle of emergence and the latter is equal to $\frac{3}{4}$ th the angle of prism. The angle of deviation is
(A) 45° (B) 39°
(C) 20° (D) 30° *(M.N.R. 1988)*

3. The refractive index of an equilateral prism is $\sqrt{3}$. What is the angle of minimum deviation ?
(A) 45° (B) 60°
(C) 37° (D) 30°
(C.B.S.E. 1999 ; Karnataka Entrance, 1992, 1988)

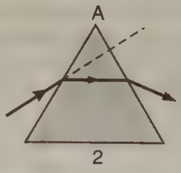
4. Angle of minimum deviation for a prism of refractive index 1·5 is equal to the angle of prism. The angle of prism is
(A) 62° (B) 41°
(C) 82° (D) 31°
(Given that cos 41° = 0·75)

5. Yellow light is refracted through a prism producing minimum deviation. If i_1 and i_2 denote the angle of incidence and emergence respectively for the prism, then
(A) $i_1 = i_2$ (B) $i_1 > i_2$
(C) $i_1 < i_2$ (D) $i_1 + i_2 = 90°$

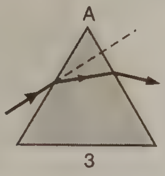
6. **The figures represent three cases of a ray passing through a prism of refractive edge A. The case corresponding to minimum deviation is**



1



2



3

(A) 1 (B) 2
(C) 3 (D) None of these.

7. **The refracting angle of a prism is A and the refractive index of the prism is cot A/2. The angle of minimum deviation is**
(A) 180° – 3A (B) 180° + 2A
(C) 90° – A (D) 180° – 2A (C.P.M.T. 1992)

8. **A prism splits a beam of white light into its seven constituent colours. This is so, because**
(A) phase of different colours is different.
(B) amplitude of different colours is different.
(C) energy of different colours is different.
(D) velocity of different colours is different.
(C.E.E.T. 1991)

9. **Refractive indices of a prism material for two wavelengths are 1·66 and 1·64. The dispersive power is**
(A) 0·02 (B) 0·012
(C) 0·01 (D) 0·03 (Karnataka, 1993 S)

10. **When a glass prism is placed inside water, its dispersive power**
(A) decreases. (B) increases.
(C) remains the same.
(D) may increase or decrease depending on the angle of prism.

11. **During dispersion of white light by prism placed in air,**
(A) only angular spread takes place.
(B) only angular deviation takes place.
(C) both angular deviation and angular spread take place.
(D) either angular spread or angular deviation for the mean colour takes place depending on the angle of the prism.
(Karnataka, 1995)

12. **A thin prism P_1 with angle 4° and made from glass of refractive index 1·54 is combined with another prism P_2 made from glass of refractive index 1·72 to produce dispersion without deviation. The angle of prism P_2 is**
(A) 5·33° (B) 4°
(C) 3° (D) 2·6° (I.I.T. 1990)

13. **The focal length of a converging lens is measured for violet, green and red colours. It is f_v, g_f and f_r respectively. We will get**
(A) $f_v = f_g$ (B) $f_g > f_r$
(C) $f_v < f_r$ (D) $f_v > f_r$ (C.B.S.E. 1997)

14. **If f_v and f_r are the focal lengths of a convex lens for violet and red light respectively and F_v and F_r are the respective focal lengths of a concave lens, then we must have**
(A) $f_v > f_r$ and $F_v < F_r$ (B) $f_v < f_r$ and $F_v < F_r$
(C) $f_v > f_r$ and $F_v > F_r$ (D) $f_v > f_r$ and $F_v > F_r$
(C.B.S.E. 1996)

15. **For achromatic combination of lenses, if we use two lenses of focal lengths f and f' and dispersive powers ω and ω' respectively, then**
(A) $\omega' = 2\omega, f' = 2f$ (B) $\omega' = 2\omega, f' = -2f$
(C) $\omega' = 2\omega, f' = f/2$ (D) $\omega' = 2\omega, f' = -f/2$
(C.P.M.T. 1982)

16. **Which of the following statement is correct ?**
(*i*) **Line spectra is characteristic of the atom.**
(*ii*) **Band spectra is characteristic of the molecule**
(A) only (*i*) is correct. (B) only (*ii*) is correct.
(C) Both (*i*) and (*ii*) are correct.
(D) Both (*i*) and (*ii*) are incorrect.

17. **Fraunhofer spectrum is a**
(A) line absorption spectrum.
(B) band absorption spectrum.
(C) line emission spectrum.
(D) band emission spectrum. (Karnataka, 19

18. **Which of the following phenomena is not explained Huygens' construction of wave-front ?**
(A) Refraction (B) Reflection
(C) Diffraction (D) Origin of spectra.
(C.B.S.E. 19

19. **The blue colour of the sky is due to the phenomenon**
(A) reflection (B) refraction
(C) scattering (D) dispersion (A.F.M.C. 19

20. **The sky appears blue, because**
(A) red light is absorbed.
(B) blue light is scattered the most.
(C) blue light is absorbed.
(D) it is its natural colour. (A.F.M.C. 19

21. **At sunrise or sunset, the sun looks more red than at m day, because**
(A) the sun is coldest at these times.
(B) of the effects of reflection and refraction.
(C) the sun is hottest at these times.
(D) of the scattering of light.
(A.F.M.C. 1995 ; C.E.E.T. 19

22. **Rainbows are formed by :**
(A) reflection and diffraction
(B) refraction and scattering
(C) dispersion and total internal reflection
(D) interference only. (C.B.S.E. 200

23. **Consider the following phenomena : Interferen dispersion, diffraction and reflection. Which phenome are involved in the formation of rainbow ?**
(A) reflection (B) diffraction
(C) interference and diffraction
(D) dispersion and reflection. (C.E.T. 199

PART II. THOUGHT-BASED QUESTIONS

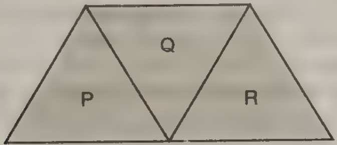
24. **If the light propagating along a straight line bends by small but fixed angle, it may be due to**
(A) reflection (B) refraction
(C) dispersion (D) diffraction

25. **Light appears to travel in straight lines, since**
(A) it is not absorbed by the atmosphere.
(B) it is reflected by the atmosphere.
(C) its wavelength is very small.
(D) its velocity is very large. (C.P.M.T. 199

26. **A ray is incident at an angle of incidence i on one surfa of a prism of small angle A and emerges normally from th opposite surface. If the refractive index of the material the prism is μ, the angle of incidence i is nealy equal to**
(A) A / μ (B) A / 2 μ
(C) μ A (D) μ A / 2 (C.B.S.E. 199

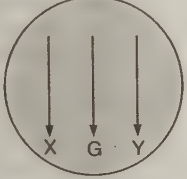
27. **A narrow beam of white light passes through a glass sla having parallel faces. Then,**
(A) the beam inside the slab remains as white light.
(B) the emergent beam is white light.
(C) the beam inside the slab undergoes dispersion.
(D) the glass slab never causes dispersion.

28. **A given ray of light suffers minimum deviation in an equilateral prisms P. Additional prisms Q and R of identical shape and of the same material as P are now added as shown in the figure. The ray will suffer**



(A) greater deviation
(B) no deviation
(C) same deviation as before
(D) total internal reflection (*I.I.T. 2001*)

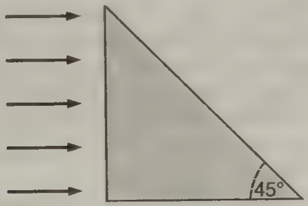
29. **The figure shows the view through the eye-piece of a prism spectrometer with its slit illuminated by the source of light emitting three wavelengths corresponding to yellow (Y), green (G) and unknown colour (X). The colour X may be**



(A) red
(B) orange
(C) pink
(D) none of the above.

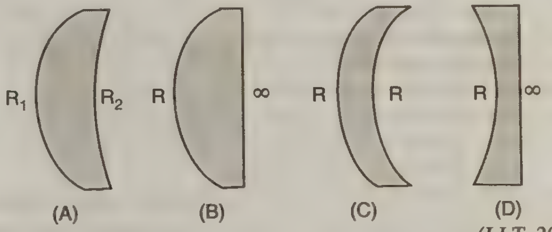
(*C.P.M.T. 1989*)

30. **A beam of light consisting of red, green and blue colours is incident on a right angled prism. The refractive index of the material of the prism for the above red, green and blue wavelengths are 1·39, 1·44 and 1·47 respectively. The prism will**



(A) separate part of the red colour from the green and blue colours.
(B) separate part of the blue colour from the red and green colours.
(C) separate all the three colours from one another.
(D) not separate even partially any colour from the other two colours. (*I.I.T. 1989*)

31. **Which one of the following spherical lenses does not exhibit dispersion ? The radii of curvature of the surfaces of the lenses are as given in the figure.**



(*I.I.T. 2002*)

32. **In case of a lens, which of the following quantities depend on the wavelengths of the incident light ?**
(A) Focal length (B) Radii of curvature
(C) Power (D) Chromatic aberration.

33. **A converging achromat is to be made by placing two lenses in contact. The proper choice is**
(A) convex lens of crown, concave lens of flint glass.
(B) convex lens of flint, concave lens of crown glass.
(C) both the lenses should be convex lenses of crown glass.
(D) both the lenses should be convex lenses of flint glass.

34. **In which one of the following regions of the electromagnetic spectrum will the vibrational motion of molecules give rise to absorption spectrum ?**
(A) ultraviolet (B) microwaves
(C) infrared (D) radiowaves.
(*S.C.R.A. 1994*)

35. **One cannot see through fog, because**
(A) fog absorbs light.
(B) the refractive index of fog is infinity.
(C) light suffers total internal reflection at the droplets in fog.
(D) light is scattered by the droplets in fog.
(*C.P.M.T. 1983*)

36. **The sky would appear red instead of blue, if**
(A) atmospheric particles scatter blue light more than red light.
(B) atmospheric particles scatter all colours equally.
(C) atmospheric particles scatter red light more than blue light.
(D) the sun was much hotter.
(*Karnataka Entrance, 1987, 1985*)

Chapter 3. Optical Instruments

PART I. TEXT-BASED QUESTIONS

1. **The focal length of the normal eye-lens is approximately**
(A) 2 cm (B) 25 cm
(C) 1 m (D) infinite

2. **A normal eye is unable to see objects closer than 25 cm (least distance of distinct vision). It is because,**
(A) the focal length of the eye-lens is 25 cm.
(B) the distance between the eye-lens and retina is 25 cm.
(C) the eye-lens cannot decrease its focal length beyond a limit.
(D) the eye-lens cannot decrease its distance from the retina beyond a limit.

3. **The final image produced by a simple microscope is**
(A) real and erect. (B) real and inverted.
(C) virtual and erect. (D) virtual and inverted
(*C.E.T. 1999*)

4. **If the least distance of distinct vision is 25 cm, then a convex lens of focal length 5 cm acts as a magnifier of magnifying power**
(A) 5 (B) less than 5
(C) 6 (D) more than 6.

5. **The focal length of the objective of a microscope is**
(A) greater than the focal length of eye-piece.
(B) less than the focal length of the eye- piece.
(C) equal to focal length of the eye-piece.
(D) arbitrary. (*M.N.R. 1994*)

6. **In a compound microscope, the intermediate image is**
(A) virtual, erect and magnified.
(B) real, erect and magnified.
(C) real, inverted and magnified.
(D) virtual, erect and reduced. (*I.I.T. 2000*)

7. **For relaxed eye, the magnifying power of a microscope is**
(A) $\frac{v_o}{u_o} \times \frac{D}{f_e}$ (B) $\frac{v_o}{u_o} \times \frac{f_e}{D}$
(C) $\frac{u_o}{v_o} \times \frac{D}{f_e}$ (D) $\frac{u_o}{v_o} \times \left(-\frac{D}{f_e}\right)$
(C.B.S.E. 1998)

8. **To increase the magnifying power of a telescope, one should increase**
(A) the focal length of the objective.
(B) the focal length of the eye-piece.
(C) aperture of the objective.
(D) aperture of the eye-piece.

9. **The convex lenses of focal lengths 0·3 m and 0·05 m are used to make a telescope. In normal adjustment, the distance between them is equal to**
(A) 0·35 m (B) 0·25 m
(C) 0·175 m (D) 0·15 m

10. **An observer looks at a tree of height 15 m with a telescope of magnifying power 10. To him, tree appears**
(A) 10 times taller. (B) 15 times taller.
(C) 10 times nearer. (D) 15 times nearer.
(N.C.E.R.T. ; C.P.M.T. 1975)

11. **An astronomical telescope of ten fold angular magnification has a length of 44 cm. The focal length of the object is**
(A) 4 cm (B) 40 cm
(C) 44 cm (D) 440 cm *(C.B.S.E. 1997)*

12. **The resolving power of a telescope depends upon**
(A) the focal length of the eye lens.
(B) the focal length of the object lens.
(C) the length of the telescope.
(D) the diameter of the object lens. *(N.C.E.R.T. 1983)*

13. **Large aperture telescopes are used for**
(A) greater resolution.
(B) greater magnification.
(C) reducing lens aberration.
(D) ease of manufacturer. *(C.P.M.T. 1989)*

14. **For observing a cricket match, binocular is preferred to terrestrial telescope for the reason that**
(A) the binocular is very easy to handle.
(B) the binocular provides three dimensional vision.
(C) the binocular produces image free of chromatic aberration.
(D) the binocular produces erect image.

15. **A reflecting telescope utilizes**
(A) a concave mirror. (B) a convex mirror.
(C) a prism. (D) a plano convex lens.
(C.E.T. 1998

PART II. THOUGHT-BASED QUESTIONS

16. **When we see an object, the image formed on the retina i**
(A) real (B) inverted
(C) virtual (D) erect.

17. **The distances of the human eye-lens from the retina is x. For a normal eye, the maximum focal length of the eye-len is**
(A) $x/2$ (B) x
(C) less than x (D) greater than x

18. **When we view objects lying at different distances from th eye, which of the following remain constant ?**
(A) The focal length of the eye-lens.
(B) The radii of curvature of the eye-lens.
(C) The object distance from the eye-lens.
(D) The image distance from the eye-lens.

19. **Myopia is due to**
(A) older age.
(B) change in focal length.
(C) shortening of eye ball.
(D) elongation of eye ball. *(A.F.M.C. 1996*

20. **When the length of a microscope tube is increased, it magnifying power**
(A) decreases. (B) increases.
(C) does not change. (D) cannot be predicted.
(M.N.R. 1986

21. **Magnifying power of a telescope is m. If the focal lengt of the eye-piece is doubled, then its magnifying power wil become**
(A) $2m$ (B) $m/2$
(C) $\sqrt{2}\,m$ (D) $3m$

22. **A fly is sitting on the objective of a telescope pointed t the moon. What effect is expected in the photograph of th moon taken through the telescope ?**
(A) The entire field of vision is blocked.
(B) There is an image of the fly on the photograph.
(C) There is no effect at all.
(D) The image of the moon is of lesser intensity.

23. **A telescope is focussed on the moon. If a tiny drop of in falls on its objective, then**
(A) moon will appear black.
(B) field of the view will be dark.
(C) there will be a dark spot in the field of view.
(D) brightness of the image will be slightly reduced.
(C.E.T. 1999

Chapter 4. Huygens' Principle

PART I. TEXT-BASED QUESTIONS

1. **Light has the following wave property :**
(A) Transverse. (B) Longitudinal.
(C) Sometimes longitudinal, sometimes transverse.
(D) Neither transverse nor longitudinal.
(Karnataka Entrance, 1994)

2. **Which of the following produces a plane wavefront ?**
(A) Point source (B) Line source
(C) Extended source (D) None of the above.

3. **As a plane wavefront propagates, its radius of curvature**
(A) decreases. (B) increases.
(C) first increases and then decreases.
(D) remains infinity.

4. **A plane wavefront is propagating in a medium. Which of the following is true ?**
(A) It propagates parallel to itself.
(B) It cannot propagate in the medium.
(C) It changes to spherical wavefront.
(D) It changes to cylindrical wavefront.

5. **Which of the following is a correct statement ? The ray o light**
(A) is always tangential to the wavefront.
(B) is always normal to the wavefront.
(C) does not exist in the Huygens' principle.
(D) may be tangential or normal to the wavefront.

6. **Which of the following does not support the wave nature of light ?**
(A) Interference (B) Diffraction
(C) Polarisation (D) Photoelectric effect.
(A.F.M.C. 1988)

7. **Huygens' wave theory of light cannot explain**
(A) diffraction. (B) interference.

(C) polarisation. (D) photoelectric effect. (A.F.M.C. 1993)

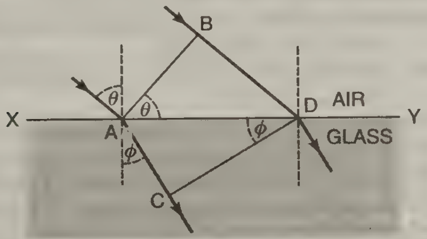
8. **Though quantum theory of light can explain a number of phenomena observed with light, it is necessary to retain the wave nature of light to explain the phenomenon of**
(A) photoelectric effect. (B) diffraction.
(C) Compton effect. (D) black body radiation.
(N.C.E.R.T. 1984)

9. **Huygens' concept of secondary waves**
(A) allows us to find the focal length of a thick lens.
(B) is a geometrical method to find a wave front.
(C) is used to determine the velocity of light.
(D) is used to explain polarisation. (A.F.M.C. 1998)

10. **Huygens' principle of secondary waves is used to**
(A) obtain the new position of wavefront geometrically.
(B) explain principle of superposition of waves.
(C) explain interference phenomenon.
(D) explain polarisation.

11. **Which one of the following phenomena is not explained by Huygens' construction of wave-front ?**
(A) Refraction (B) Reflection
(C) Diffraction (D) Origin of spectra.
(C.B.S.E. 1992)

12. **In the adjoining figure, a wavefront AB moving in air is incident on a plane glass surface XY. Its position CD, after refraction through a glass slab, is shown also along with the normals drawn at A and D. The refractive index of glass *w.r.t.* air will be equal to**



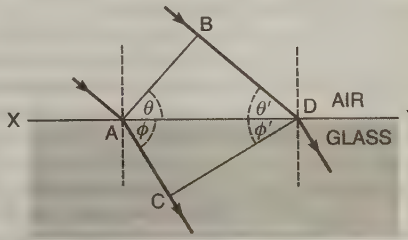
(A) $\frac{BD}{AC}$ (B) $\frac{AB}{CD}$

(C) $\frac{BD}{AD}$ (D) $\frac{AC}{AD}$ (C.P.M.T. 1986)

PART II. THOUGHT-BASED QUESTIONS

13. **Two points are situated at the same distance from a source of light but in opposite direction. The phase difference between the light waves from the two points will be**
(A) π (B) zero
(C) $\pi/2$ (D) none of the above.

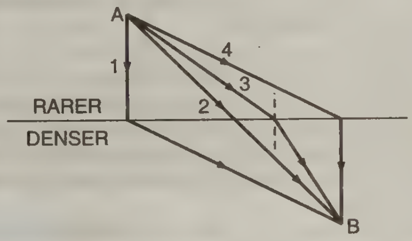
14. **In the adjoining diagram, a wave front AB moving in air is incident on a plane glass surface XY. Its position CD after refraction through a glass slab is shown along with the normals drawn at A and D. The refractive index of glass *w.r.t.* air ($^a\mu_g$) will be equal to**



(A) $\frac{\sin\theta}{\sin\theta'}$ (B) $\frac{\sin\theta}{\sin\phi'}$

(C) $\frac{\sin\phi}{\sin\theta}$ (D) $\frac{AB}{CD}$ (C.P.M.T. 1988)

15. **A ray travels the path from point A to B from a rarer to a denser medium. Of the four paths shown in the figure, which is the path for least time ?**



(A) 1 (B) 2
(C) 3 (D) 4

Chapter 5. Interference of Light

PART I. TEXT-BASED QUESTIONS

1. **One important similarity between sound and light waves is that both**
(A) can pass through even in the absence of any medium.
(B) are transverse waves.
(C) travel at the same speed in air.
(D) can show interference effects.
(*Karnataka Entrance, 1989*)

2. **Monochromatic light means**
(A) a beam of the same colour.
(B) a cluster of beam of different colours.
(C) a beam of white colour.
(D) none of these.

3. **The interference phenomenon can take place**
(A) in all waves.
(B) in transverse waves only.
(C) in longitudinal waves only.
(D) in standing waves only. (M.N.R. 1994)

4. **Two waves of the same frequency and same intensity are superimposed in the same phase. The intensity of the resultant wave at the central point will be**
(A) equal to that of the individual wave.
(B) twice that of the individual wave.
(C) three times that of the individual wave.
(D) four times that of the individual wave. (C.E.T. 1999)

5. **Two waves of the same frequency and intensity superimpose with each other in opposite phases. After the superposition, the**
(A) intensity increases by 4 times.
(B) intensity increases by 2 times.
(C) frequency increases by 4 times.
(D) none of these. (A.F.M.C. 1995)

6. **Ratio of intensities of two waves are given by 4 : 1. Then ratio of the amplitudes of the two waves is**
(A 2 : 1 (B) 1 : 2
(C) 4 : 1 (D) 1 : 4 (C.B.S.E. 1993)

7. **In Young's experiment, the ratio of maximum and minimum intensities in the fringe system is 9 : 1. The ratio of amplitudes of coherent sources is :**
(A) 9 : 1 (B) 3 : 1
(C) 2 : 1 (D) 1 : 1 (N.C.E.R.T 1990)

8. **Two waves have intensities in the ratio of 1 : 9. If these waves produce inteference, then the ratio of maximum and minimum intensities is**
(A) 3 : 1 (B) 4 : 1
(C) 9 : 1 (D) 16 : 1 *(A.F.M.C. 1998)*

9. **The intensity of light issuing out of two slits in Young's experiment is in the ratio 1 : 4. The intensity of the minimum to the maximum will be in the ratio**
(A) 1 : 2 (B) 1 : 4
(C) 1 : 9 (D) none of the above.

10. **The light waves from two coherent sources of intensity I interfere. At the minima, intensity of light is zero. The intensity of light at the maxima is**
(A) 4 I (B) I
(C) 2 I (D) I^2

11. **In Young's double slit experiment, the separation between the slits is halved and distance between the slits and screen is doubled. The fringe width is**
(A) unchanged. (B) halved.
(C) doubled. (D) quadrupled.
(I.I.T. 1981 ; similar Karnataka, 2000)

12. **How is interference pattern in double slit experiment affected, if a source of blue light is used in place of yellow light producing the same intensity ?**
(A) The fringe width will decrease.
(B) The fringe width will increase.
(C) The fringes will become brighter.
(D) The fringes will become fainter. *(C.B.S.E. 1992)*

13. **In a certain double slit experiment set up, interference fringes of width 1·0 mm each are observed with light of wavelength 5000 Å . Keeping the set up unaltered, if the source is replaced with one having a wavelength 6000 Å, the fringe width will be**
(A) 0·8 mm (B) 1·0 mm
(C) 1·2 mm (D) 1·44 mm *(C.E.T. 1998)*

14. **In a Young's experiment, two coherent sources are placed 0·90 mm apart and the fringes are observed 1 m away. If it produces the second dark fringe at a distance of 1 mm from the central fringe, the wavelength of monochromatic light used would be**
(A) 60×10^{-4} cm (B) 10×10^{-4} cm
(C) 10×10^{-5} cm (D) 6×10^{-5} cm *(C.B.S.E. 1992)*

15. **In Young's double slit experiment, we get 15 fringes per cm on the screen, while using light of wavelength 5896 Å (sodium lamp). How many fringes per cm we get with light of wavelength 7370 Å ?**
(A) 18 (B) 15
(C) 12 (D) 10 *(A.F.M.C. 1998)*

16. **For constructive interference to take place between two monochromatic light waves of wavelength λ, the path difference should be**
(A) $(2n - 1)\lambda/4$ (B) $(2n - 1)\lambda/2$
(C) $n\lambda$ (D) $(2n + 1)\lambda/2$ *(M.N.R. 1992)*

PART II. THOUGHT-BASED QUESTIONS

17. **Four light waves are expressed as**
(i) $y_1 = a_1 \sin \omega t$, (ii) $y_2 = a_2 \sin 2\omega t$,
(iii) $y_3 = a_3 \sin (\omega t + \phi)$ and
(iv) $y_4 = a_4 \sin 2(\omega t + \phi)$.
The interference is possible between
(A) (*i*) and (*ii*) (B) (*i*) and (*iii*)
(C) (*ii*) and (*iv*) (D) (*iii*) and (*iv*).

18. **In double slit experiment, the two slits are illuminated with two independent identical sources of light. What happens to the interference pattern ?**
(A) No interference pattern is produced.
(B) The intensity of bright fringes gets doubled.
(C) The intensity of bright fringes becomes four times.
(D) Two sets of interference patterns are produced.

19. **The contrast in the fringes in any interference patter depends on**
(A) fringe width. (B) wavelength.
(C) intensity ratio of the sources.
(D) distance between the slits. *(Roorkee, 1992*

20. **In double slit experiment, when one of the two slits i covered :**
(A) the bright fringes become fainter.
(B) the fringe width decreases.
(C) there is a bright slit and no interference pattern i produced.
(D) there is uniform illumination all over the screen.

21. **In a Young's double slit experiment, two slits of equa widths are arranged symmetrically w.r.t. the source. Th intensity of the central bright fringe is I. If one of the slit is closed, the intensity at the centre of the screen will be**
(A) I (B) I/4
(C) I/2 (D) 2 I *(B.H.U. 1998*

22. **Two coherent monochromatic light beams of intensitie I and 4 I are superposed. The maximum and minimun possible intensities in the resulting beams are**
(A) 5 I and I (B) 9 I and I
(C) 5 I and 3 I (D) 9 I and 3 I *(I.I.T. 1982*

23. **In the Young's double slit experiment, the interferenc pattern is found to have an intensity ratio between brigh and dark fringes as 9. This implies that**
(A) the intensities at the screen due to two slits are 5 unit and 4 units respectively.
(B) the intensities at the screen due to slits are 4 units anc 1 unit respectively.
(C) the amplitude ratio is 3.
(D) the amplitude ratio is 2. *(I.I.T. 1982*

24. **Two beams of light having intensities I and 4I interfere t produce a fringe pattern on a screen. The phase differenc between the beams is $\pi/2$ at point A and π at point B. Ther the difference between the resultant intensities at A anc B is**
(A) 2 I (B) 4 I
(C) 5 I (D) 7 I *(I.I.T. 2001*

25. **In a double slit experiment, instead of taking slits of equa widths, one slit is made twice as wide as the other. Then in the interference pattern,**
(A) the intensities of both the maxima and the minim increase.
(B) the intensities of the maxima increases and the minim has zero intensity.
(C) the intensity of the maxima decreases and that of th minima increases.
(D) the intensity of the maxima decreases and the minim has zero intensity. *(I.I.T. 2000*

26. **In a Young's double slit experiment, 12 fringes are observe to be formed in a certain segment of the screen, when ligh of wavelength 600 nm is used. If the wavelength of ligh is changed to 400 nm, number of fringes observed in th same segment of the screen is given by**
(A) 12 (B) 18
(C) 24 (D) 30 *(I.I.T. 2001*

27. **Interference was observed in interference chamber, wher air was present. Now, the chamber is evacuated and if th same light is used, a careful observer will see**
(A) no interference.
(B) interfertence with bright bands.
(C) interference with dark bands.
(D) interference, in which width of the fringe will be slightl increased. *(C.B.S.E. 1993*

28. **In Young's double slit experiment ; if a thin glass plate is placed in the path of one of the interfering beams, then**
(A) fringe width decreases.
(B) fringe width increases.
(C) fringe pattern is shifted.
(D) fringe pattern is unaffected. *(Karnataka, 1992 S)*

29. **In an ideal double-slit experiment, when a glass plate (refractive index 1·5) of thickness t is introduced in the path of one of the interfering beams (wavelength λ), the intensity at the position where the central maximum occurred pareviously remains unchanged. The minimum thickness of the glass plate is**
(A) 2λ (B) $2\lambda/3$
(C) $\lambda/3$ (D) λ. *(I.I.T. 2002)*

30. **What happens, if monochromatic light used in Young's double slit experiment is replaced by white light ?**
(A) The bright fringes become white.
(B) The central fringe is white and all other are coloured.
(C) All fringes are coloured.
(D) No fringes are observed.

31. **White light is used to obtain interference fringes in Young's double slit experiment. Then,**
(A) the central fringe will be white.
(B) the fringe next to the central fringe will be violet.
(C) the fringe next to the central fringe will be red.
(D) no dark fringe will be observed.

32. **In a Young's double slit experiment, the fringe width is found to be 0·4 mm. If the whole apparatus is immersed in water of refractive index 4/3 without disturbing the geometrical arrangement, the new fringe width will be**
(A) 0·3 mm (B) 0·4 mm
(C) 0·53 mm (D) 540 microns.
(C.B.S.E. 1991)

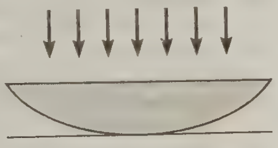
33. **In a two slit experiment with monochromatic light, fringes are obtained on a screen placed at some distance from the slits. If the screen is moved by 5×10^{-2} m towards the slits, the change in fringe width is 3×10^{-5} m. If separation between the slits is 10^{-3} m, the wave- length of light used is**
(A) 6000 Å (B) 5000 Å
(C) 3000 Å (D) 4500 Å *(Roorkee, 1992)*

34. **White light is used to illuminate the two slits in a Young's double slit experiment. The separation between the slits is d and the screen is at a distance D ($>>d$) from the slits. At a point on the screen directly in front of one of the slits, certain wavelengths are missing. Some of the missing wavelengths are**

(A) $\lambda = \dfrac{d^2}{D}$ (B) $\lambda = \dfrac{2d^2}{D}$

(C) $\lambda = \dfrac{d^2}{3D}$ (D) $\lambda = \dfrac{2d^3}{3D}$ *(I.I.T. 1984)*

35. **A thin slice is cut out of a glass cylinder along a plane parallel to its axis. The slice is placed on a flat glass plate as shown in figure. The observed interference fringes from this combination shall be**
(A) straight.
(B) circular.
(C) equally spaced.
(D) having fringe spacing, which increases as we go outwards.



(I.I.T. 1999)

36. **In a Fresnel biprism experiment, the two positions of lens give separation between the slits as 16 cm and 9 cm respectively. What is the actual distance of separation ?**
(A) 12·5 cm (B) 12 cm
(C) 13 cm (D) 14 cm
(B.H.U. 1999 ; C.B.S.E. 1998)

37. **Which of the following is conserved, when light waves interfere ?**
(A) Intensity (B) Energy
(C) Amplitude (D) Momentum.

38. **Colours appear on a thin soap film and soap bubbles due to the phenomenon of**
(A) interference. (B) scattering.
(C) diffraction. (D) dispersion.
(C.B.S.E. 1999 ; A.F.M.C. 1997, 1995 ; N.C.E.R.T. 1990)

Chapter 6 Diffraction of Light

PART I. TEXT-BASED QUESTIONS

1. **Bending of light about the corner of a sharp edged obstacle is called**
(A) deviation. (B) dispersion.
(C) polarisation. (D) diffraction. *(A.F.M.C. 1995)*

2. **While both light and sound show wave character, diffraction is much harder to observe in light. This is because :**
(A) light does not require a medium.
(B) wavelength of light is far smaller.
(C) waves of light are transverse.
(D) speed of light is far greater. *(Karnataka Entrance, 1994)*

3. **The frequency of e.m. wave which is best suited to observe a particle of radius 3×10^{-4} cm, is of the order of**
(A) 10^{15} (B) 10^{13}
(C) 10^{14} (D) 10^{12} *(C.B.S.E. 1993)*

4. **The width of diffraction fringes varies :**
(A) directly as the distance between slit and the screen.
(B) inversely as the wavelength.
(C) directly as the width of the slit.
(D) none of the above.

5. **In the diffraction pattern due to single slit of width a with incident light of wavelength λ with angle of diffraction θ, the condition for the first minimum is**
(A) $\lambda \sin\theta = a$ (B) $a \cos\theta = \lambda$
(C) $a \sin\theta = \lambda$ (D) $\lambda \cos\theta = a$
(Karnataka, 1990 S)

6. **The first diffraction minima due to a single slit diffraction is at $\theta = 30°$ for a light of wavelength 5000 Å . The width of slit is**
(A) 5×10^{-5} cm (B) 10×10^{-5} cm
(C) $2{\cdot}5 \times 10^{-5}$ cm (D) $1{\cdot}25 \times 10^{-5}$ cm
(C.P.M.T. 1985)

7. **A single slit diffraction pattern is obtained using a beam of red light. What happens, if the red light is replaced by blue light ?**
(A) There is no change in the diffraction pattern.
(B) Diffraction fringes become narrow and crowded together.
(C) Diffraction fringes become broader and farther apart.
(D) Diffraction pattern disappears.
(C.P.M.T. 1984 ; A.I.I.M.S. 1982)

8. **Two points separated by a distance of 0·1 mm can just be inspected in a microscope, when light of wavelength 6000 Å is used. If the light of wavelength 4800 Å is used, the limit of resolution will become**
(A) 0·8 mm (B) 0·12 mm
(C) 0·1 mm (D) 0·08 mm *(C.P.M.T. 1988)*

9. **The limit of resolution of a 100 cm telescope for light of wavelength $5{\cdot}5 \times 10^{-7}$ m is**
(A) 0·14″ (B) 0·3″
(C) 1′ (D) 1° *(B.H.U. 1993)*

10. **The limit of resolution of one metre radio telescope for radio waves of wavelength 10 cm is about**
(A) 7° (B) few seconds of arc.
(C) 18° (D) one minute of arc.
(Karnataka Entrance, 1992)

PART II. THOUGHT-BASED QUESTIONS

11. **Ray optics is valid, when characteristic dimensions are**
(A) much smaller than the wavelength of light.
(B) much larger than the wavelength of light.
(C) of the same order as the wavelength of light.
(D) of the order of one millimetre.
(Pre-Medical/Dentral, 1994)

12. **The interference phenomenon differs from diffraction in that unlike diffraction,**
(A) interference fringes are of varying intensity.
(B) interference cannot be observed with white light.
(C) interference minima may be perfectly dark.
(D) interference fringes are of unequal width.

13. **Yellow light is used in a single slit diffraction experiment with slit width of 0·6 mm. If yellow light is replaced by X-rays, then the observed pattern will reveal**
(A) that the central maximum is narrower.
(B) more number of fringes.
(C) less number of fringes.
(D) no diffraction pattern. *(I.I.T. 1999)*

14. **A beam of light of wavelength 600 nm from a distant source falls on a single slit 1·00 mm wide and the resulting diffraction pattern is observed on a screen 2 m away. The distance between the first dark fringes on either side of the central bright fringe is**
(A) 1·2 cm (B) 1·2 mm
(C) 2·4 cm (D) 2·4 mm *(I.I.T. 1994)*

15. **A parallel monochromatic beam of light is incident normally on a narrow slit. A diffraction pattern is formed on a screen placed perpendicular to the direction of the incident beam. At the first minimum of the diffraction pattern, the phase difference between the rays coming from the two edges of the slit is**
(A) 0 (B) $\pi/2$
(C) π (D) 2π *(I.I.T. 1998)*

16. **The amplitude modulated waves (AM) used in ratio broadcasting bend appreciably round the corners of a 1 m × 1 m wall but the frequency modulated waves (FM) bend only negligibly. If the average wavelengths of AM and FM waves are λ_1 and λ_2, then**
(A) $\lambda_1 > \lambda_2$ (B) $\lambda_1 = \lambda_2$
(C) $\lambda_1 < \lambda_2$ (D) cannot be predicted.

17. **The resolution limit of the eye is 1 minute. At a distance x km from the eye, two persons stand with a lateral separation of 3 m. For the two persons to be just resolved by the naked eye, x should be**
(A) 10 km (B) 15 km
(C) 20 km (D) 30 km *(C.P.M.T. 1990)*

18. **Diameter of human eye lens is 2 mm. What will be the minimum distance between two points to resolve them, which are situated at a distance of 50 m from eye. The wavelength of light is 5000 Å.**
(A) 2·32 m (B) 4·28 mm
(C) 1·25 cm (D) 12·48 cm *(C.B.S.E. 2002)*

19. **Scattering of light is a direct consequence of**
(A) interference. (B) dispersion.
(C) diffraction. (D) reflection.

20. **The aperture of the largest telescope in the world is of the order of 5 m. If the separation between the moon and the earth is 4×10^5 km and the wavelength of visible light is of the order of 5000 Å, then the minimum separation between objects on the surface of the moon, which can be just resolved is**
(A) 1 m approximately.
(B) 10 m approximately.
(C) 50 m approximately.
(D) 200 m approximately. *(C.P.M.T. 1989)*

Chapter 7 Polarisation of Light

PART I. TEXT-BASED QUESTIONS

1. **The phenomenon that requires transverse wave nature of light is**
(A) iffraction. (B) polarisation.
(C) interference. (D) dispersion.
(Karnataka, 1988)

2. **Light waves are transverse, because they**
(A) get reflected. (B) get refracted.
(C) get polarised. (D) do not get polarised.
(A.F.M.C. 1996)

3. **Waves that cannot be polarized are**
(A) longitudinal. (B) transverse.
(C) electromagnetic. (D) light.
(A.F.M.C. 1997 ; Karnataka Entrance, 1988, 1984)

4. **When a polaroid is rotated, the intensity of light is not found to vary. The incident light may be**
(A) completely plane polarised.
(B) partially plane polarised.
(C) unpolarised. (D) None of the above.

5. **The plane of vibration and the plane of polarisation of a beam of light**
(A) are identical to each other.
(B) are orthogonal to each other.
(C) make an angle, which depends on the colour of the light.
(D) rotate with respect of each other along the path of the beam. *(Karnataka Entrance, 1986)*

6. **Polarised light can be produced by :**
(A) dispersion. (B) scattering.
(C) interference. (D) diffraction.
(A.F.M.C. 1998)

7. **When the light is incident at the polarising angle, which of the following is completely polarised ?**
(A) Reflected light. (B) Refracted light.
(C) Both reflected and refracted light.
(D) Neither reflected nor refracted light.

8. **At the polarising angle, the angle between reflected and refracted rays is**
(A) 0° (B) 90°
(C) 180° (D) 60° *(Karnataka, 1991 S)*

9. **A ray of light is incident on the surface of a glass plate at an angle of incidence equal to Brewster's angle p. If μ is refractive index of glass *w.r.t.* air, then angle between the reflected and the refracted rays is**
(A) $90° + p$ (B) $\sin^{-1}(\mu \cos p)$
(C) 90° (D) $90° - \sin^{-1}\left(\dfrac{\sin p}{\mu}\right)$
(C.P.M.T. 1989)

10. The expression relating polarising angle and refractive index is
(A) $\mu \sin p = 1$ (B) $\mu \cot p = 1$
(C) $\mu \tan p = 1$ (D) $\mu \cos p = 1$
(Karnataka Entrance, 1989, 1984)

11. A beam of the light is partially reflected and partially refracted from a surface of refractive index $\sqrt{3}$. The angle between the reflected and refracted lights is 90°. The angle of incidence must be
(A) 50° (B) 60°
(C) 78° (D) 75°
(Karnataka Entrance, 1994)

12. Which of the following materials may be used to produce polaroids ?
(A) Tourmaline (B) Calcite
(C) Quartz
(D) Crystals of quinine iodosulphate.

13. The property of rotating the plane of polarisation is known as
(A) optical activity. (B) optical rotation.
(C) dichroism. (D) specific rotation.
(Karnataka, 1991 S)

14. The specific rotation of an optically active substance of length l cm and concentration c, with an optical rotation θ, is
(A) $\frac{l\,c}{10\,\theta}$ (B) $\frac{\theta\,l\,c}{10}$
(C) $\frac{10\,\theta}{l\,c}$ (D) $\frac{10}{\theta\,l\,c}$
Here, in the unit of specific rotation, the length of solution is expressed in decimetre (dm).
(Karnataka Entrance, 1987, 1985, 1984)

15. A decimetre length of solution with concentration 500 kg m^{-3} rotates the plane of polarization by 24°. What is the specific rotation of the solution ?
(A) 48° dm^{-1} g^{-1} cm^3 (B) 30° dm^{-1} g^{-1} cm^3
(C) 12° dm^{-1} g^{-1} cm^3 (D) 50° dm^{-1} g^{-1} cm^3
(Karnataka Entrance, 1990)

16. The specific rotation of a liquid of length 10 cm, concentration 2 g cm^{-3} is 40° dm^{-1} g^{-1} cm^3. The angle of rotation is
(A) 10° (B) 70°
(C) 80° (D) 90°
(Karnataka Entrance, 1984)

PART II. THOUGHT-BASED QUESTIONS

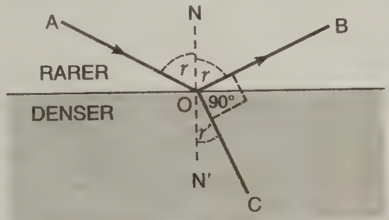
17. When a polaroid is rotated, the intensity of light varies and corresponding to a particular orientation, intensity reduces to zero. It shows that incident light is
(A) completely plane polarised.
(B) partially plane polarised.
(C) unpolarised.
(D) None of the above.

18. When a polaroid is rotated, the intensity of light varies but never reduces to zero. It shows that the incident light is
(A) completely polarised.
(B) partially plane polarised.
(C) unpolarised.
(D) None of the above.

19. Suppose p is polarising angle for a transparent medium and the speed of light in the medium is v. Then, according to Brewster's law
(A) $p = \cot^{-1} v/c$ (B) $p = \cos^{-1} v/c$
(C) $p = \sin^{-1} v/c$ (D) $p = \text{cosec}^{-1} v/c$
(Karnataka Entrance, 1987)

20. If the speed of light and the polarising angle for a given medium are c and p respectively, then from Brewster's law, we find
(A) $c = v \text{ cosec } p$ (B) $c = v \tan p$
(C) $c = v \cos p$ (D) $c = v \cot p$
(Karnataka Entrance, 1985)

21. A ray of light from a rarer medium strikes a denser medium as shown in figure. The reflected and refracted rays make an angle of 90° with each other. The angles of reflection and refraction are r and r'. The critical angle would be



(A) $\sin^{-1} (\tan r)$ (B) $\tan^{-1} (\sin r)$
(C) $\sin^{-1} (\tan r')$ (D) $\tan^{-1} (\sin r')$
(C.B.S.E. 1996)

22. In the propagation of light waves, the angle between the direction of propagation and the plane of polarisation is
(A) 0° (B) 45°
(C) 90° (D) 180° *(C.P.M.T. 1978)*

DUAL NATURE OF MATTER & RADIATION

1. **Particle Nature of Radiation**
2. **Wave Nature of Matter**

"...... the whole procedure was an act of despair because a theoretical interpretation had to be found at any price, no matter how high that might be." **– Max Planck**

CHAPTER

1

Particle Nature of Radiation

1.01. DUAL NATURE OF RADIATION

The phenomena such as interference, diffraction and polarisation were success- ly explained on the basis of wave nature of light. On the other hand, photoelectric fect, Compton effect, etc can be explained on the basis of quantum nature of diation. For instance, in photoelectric effect, when a photon of radiation strikes netal surface, it gives up all its energy to a single electron in an atom and the ctron is knocked out of the metal. It carries a part of the energy of the incident oton. In Compton effect, when an X-ray photon is incident on a free electron, the ctron recoils along a definite direction with some energy depending upon the rection along which the incident photon is scattered. From these two effects, it pears as if *a particle (photon of radiation) is colliding against another particle (electron).* ence, it became necessary to assume that in photoelectric effect and Compton fect, *radiation exhibits particle nature.*

> Quotable Quote
>
> *"If one does not feel dizzy when discussing the implications of Planck's constant h it means that one does not know what one is talking about."* – **Neils Bohr**

The various phenomena concerning radiation can be divided into three parts :

1. *The phenomena such as interference, diffraction, polarisation, etc in which teraction of radiation takes places with radiation itself.* Such phenomena can be plained on the basis of ***electromagnetic (wave) nature of radiation only.***

2. *The phenomena such as photoelectric effect, Compton effect, etc in which interaction radiation takes place with matter.* Such phenomena can be explained on the basis ***quantum (particle) nature of radiation.***

3. *The phenomena such as rectilinear propagation, reflection, refraction, etc in which e interaction of radiation takes place neither with itself, nor with matter.* Such enomena can be explained on the basis of either of the two natures of the diation.

It may be pointed out that in a particular experiment, radiation has a particular ture *i.e. either it possesses wave nature or particle nature.*

1.02. PHOTON

A photon is a packet of energy. It possesses energy given by

$$E = h\nu,$$

here h ($= 6{\cdot}62 \times 10^{-34}$ J s) is the Planck's constant and ν is the frequency of the oton. If λ is the wavelength of the photon, then

$$c = \nu\lambda$$

Here, $c = 3 \times 10^{8}$ m s^{-1} is velocity of light.

Therefore, $$E = h\nu = \frac{hc}{\lambda} \qquad \text{...(1.01)}$$

Energy of a photon is usually expressed in **electron volt (eV).**

$$\mathbf{1\ eV = 1{\cdot}6 \times 10^{-19}\ J}$$

The bigger units are keV and MeV.

$$\mathbf{1\ keV = 1{\cdot}6 \times 10^{-16}\ J \text{ and } 1\ MeV = 1{\cdot}6 \times 10^{-13}\ J}$$

> **Key point** ✓
>
> A photon is not a material particle. It is a quanta of energy.

1.03. PHOTOELECTRIC EFFECT

Hallwach discovered that an insulated zinc plate connected to a gold leaf ectroscope and charged negatively lost its charge, when a beam of ultraviolet light as directed on the plate. In order to explain this observation, Hallwach suggested at the metal surface loses negative charge due to ejection of electrons from its rface by the ultraviolet light. The effect was termed as ***photoelectric effect.***

The phenomenon of ejection of electrons from a metal surface, when light of sufficiently gh frequency falls upon it, is known as the photoelectric effect.

The electrons so emitted were called ***photoelectrons.*** J.J.Thomson showed that e photoelectrons were not different from the ordinary electrons.

> **Key point** ✓
>
> Photoelectric effect demonstrates particle nature of radiation.

1.04. EXPERIMENTAL STUDY OF PHOTOELECTRIC EFFECT

In 1900, Lenard studied the photoelectric effect experimentally. Fig. 1.01 shows the experimental arrangement used to study the photoelectric effect.

The apparatus consists of an evacuated glass tube fitted with two electrodes. The electrode E is called the *emitting electrode* and the other electrode C is called the *collecting electrode*. A varying potential difference can be applied across the two electrodes.

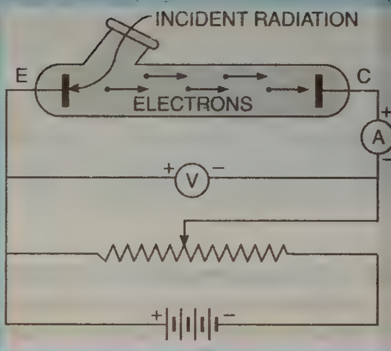

Fig. 1.01

When a suitable radiation is incident on the electrode E, electrons are ejected from it. The electrons, which have sufficient kinetic energy, reach the electrode C despite its negative polarity. The potential difference between the two electrodes acts as the retarding potential. As the collecting electrode is made more and more negative, fewer and fewer electrons will reach the cathode and the photo-electric current recorded by the ammeter will fall. In case the retarding potential equals V_0, called the ***stopping potential,*** no electron will reach the cathode and the current will become zero. In such a case, the work done by the stopping potential is equal to the maximum kinetic energy of the electrons *i.e.*

$$e\,V_0 = \frac{1}{2} m\, v_{max}^2 \qquad \text{...(1.02)}$$

As *e*, the charge on electron, is constant,

$$V_0 \propto \frac{1}{2} m\, v_{max}^2$$

Thus, the stopping potential gives the estimate of the maximum kinetic energy, with which the photoelectrons may be emitted.

Key point

The stopping potential (in volt) is numeri cally equal to the kinetic energy of photo electrons in eV.

Laws of photoelectric emission. Various experimental observations led to various conclusions, which became known as the laws of photoelectric emission, as explained below :

1. *The emission of photoelectrons takes place only when the frequency of the incident radiation is above a certain critical value, characteristic of that metal.* The critical value of frequency is known as the *threshold frequency* for the metal of the emitting electrode.

Suppose that when light of certain frequency is incident over a metal surface, the photoelectrons are emitted. To make the photoelectric current zero, a particular value of the stopping potential will be needed. If we go on reducing the frequency of incident light, the value of the stopping potential will also go on decreasing [Fig. 1.02]. At a certain value of frequency ν_0, the photoelectric current will become zero, even when no retarding potential is applied. This frequency ν_0 corresponds to the threshold frequency for the metal surface. The emission of photoelectrons does not take place till the frequency of incident light is below this value.

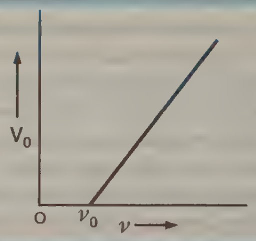

Fig. 1.02

Watch out !

If light were waves (not photons), it wil take about an year to eject a photoelectror out of the metal surface !

2. *The emission of photoelectrons starts as soon as light falls on metal surface.*

It has been found that the time lag between the incidence of photon and the emission of electron is less than 10^{-8} s.

3. *The maximum kinetic energy with which an electron is emitted from a metal surface is independent of the intensity of the light and depends only upon its frequency.*

When light of frequency ν (greater than threshold frequency ν_0) is incident, photoelectrons will be emitted. If we use incident light of different intensities (L_1, L_2), but of same frequency (ν), we shall obtain the graphs between the retarding potential and the photoelectric current as shown in Fig. 1.03. The graph shows that the value of stopping potential is the same for light of different intensities. Therefore, it follows that the maximum kinetic energy of the emitted photoelectrons is independent of the intensity of light.

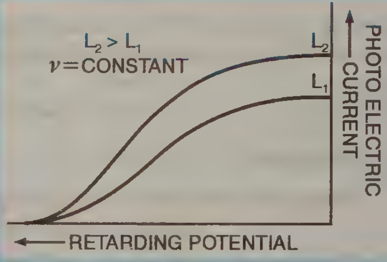

Fig. 10.3

On the other hand, if light of different frequencies (ν_1, ν_2), but of same intensity (L) is incident, we shall obtain the graphs between the retarding potential and the photoelectric current as shown in Fig. 1.04.

As the stopping potential has got different values, it follows that maximum kinetic energy with which the photoelectrons are emitted depends upon the frequency of light. Further, $V_0^{(2)} > V_0^{(1)}$ implies that if the frequency of incident light is increased, the maximum kinetic energy of the photoelectrons also increases.

4. *The number of photoelectrons emitted i.e. the photoelectric current, is independent of the frequency of the incident light and depends only upon its intensity.*

The fact that the number of photoelectrons emitted is independent of the frequency of the light can be easily followed from Fig. 1.04 and that the number of photoelectrons emitted depends upon the intensity of light is revealed by Fig. 1.03.

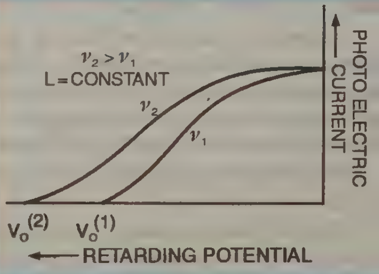

Fig. 1.04

From Fig. 1.03, it follows that as the intensity of light is increased ($L_2 > L_1$), the umber of photoelectrons emitted also increases.

1.05. EINSTEIN'S PHOTOELECTRIC EQUATION

To explain photoelectric effect, Einstein postulated that the energy carried by photon of radiation of frequency ν is $h\nu$. According to him, the emission of a hotoelectron was the result of the interaction of a single photon with an electron, which the photon is completely absorbed by the electron. We know that to remove n electron from a metal, a certain minimum amount of energy ω, called ***work unction*** of the metal, is required. Thus, when a photon of energy $h\nu$ is absorbed y an electron, an amount of energy at least equal to ω (provided $h\nu > \omega$) is used up n liberating the electron free and the difference $h\nu - \omega$ becomes available to the ectron as its maximum kinetic energy. Thus,

Watch out !

Brighter light means more photons, not more energetic photons !

$$\frac{1}{2} m v_{max}^2 = h\nu - \omega$$

or $$h\nu = \omega + \frac{1}{2} m v_{max}^2 \qquad ...(1.03)$$

Here, m is the mass of electron and v_{max} is the maximum velocity of the hotoelectrons. In fact, most of the electrons possess kinetic energy less than the aximum value as they lose a part of their kinetic energy due to collisions in scaping from the metal. Further, the work function* of the metal is a characteristic f the metal and does not depend upon the nature of the incident radiation. It is ometimes also called the ***threshold energy*** of the metal. If ν_0 is the frequency which orresponds to threshold energy of the metal, then

$$\omega = h\nu_0$$

Here, ν_0 is called the ***threshold frequency***. Putting $\omega = h\nu_0$ in equation (1.03), ve obtain

$$h\nu = h\nu_0 + \frac{1}{2} m v_{max}^2 \qquad ...(1.04)$$

The above relation is called the ***Einstein's photoelectric equation***. Since a high requency radiation consists of photons of high energy, while one of high intensity onsists of a large number of photons ; from Einstein's relation, it follows that :

1. the photoelectrons will possess positive kinetic energy and hence will be jected out of surface, only if $\nu > \nu_0$, *i.e.* if the frequency of incident radiation is greater han the threshold frequency for the metal.

2. The number of photoelectrons ejected will be large, when intense radiation s incident. This is because, an intense radiation will contain a large number of photons and photoelectric effect is a *one photon-one electron phenomenon i.e.* one photon s capable of ejecting only one electron.

3. the photoelectrons will come out of the metal surface with greater value of naximum kinetic energy $\left(\frac{1}{2} m v_{max}^2 = h\nu - h\nu_0\right)$, as the frequency of incident radiation is increased.

Key point ✓

There is no effect of frequency of incident light on the number of emitted photoelectrons.

Key point ✓

Photoelectric effect is a one photon – one electron phenomenon. One photon cannot eject more than one photoelectron.

Key point ✓

There is no effect of intensity of light on the kinetic energy of the emitted photoelectrons.

1.06. EXPERIMENTAL DETERMINATION OF PLANCK'S CONSTANT

R.A. Millikan was able to verify Einstein's photoelectric equation with the help of an experimental arrangement as shown in Fig. 1.05.

The drum D carries three cylindrical blocks. The surfaces of the blocks are coated with an alkali metal. The blocks can be cleaned with the help of knife edge K. When a beam of monochromatic light falls on the alkali metal, photoelectrons are emitted. The photoelectrons emitted reach the electrode C. The electrode C is usually kept negative *w.r.t.* the cylindrical blocks. Therefore, the photoelectrons will be repelled and only fast moving electrons will be able to reach the electrode C. The negative potential of electrode C is kept increasing, until even the fastest moving photoelectrons are repelled back. If $\frac{1}{2} m v_{max}^2$ is the kinetic energy of the fastest photoelectron and V_0 is the stopping potential, then

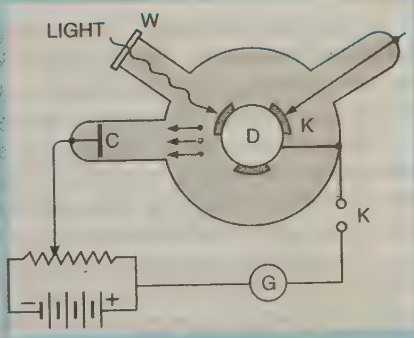

Fig. 1.05

$$\frac{1}{2} m v_{max}^2 = e\,V_0 \qquad ...(1.05)$$

Here, e is charge on an electron.

---

* Work functions of cesium, potassium, sodium, zinc and nickel are 1·8 eV, 2·3 eV, 2·5 eV, 3·4 eV and 5·9 eV respectively.

Millikan plotted a graph between the frequency (ν) of incident light and the stopping potential (V_0) over a wide range of frequencies. The graph was a straight line as shown in Fig. 1.06.

Let us consider Einstein's photoelectric equation,

$$h\nu = h\nu_0 + \frac{1}{2} m v_{max}^2$$

$$\therefore \qquad \frac{1}{2} m v_{max}^2 = h\nu - h\nu_0 \qquad \text{...(1.06)}$$

From equations (1.05) and (1.06), we obtain

$$e V_0 = h\nu - h\nu_0$$

or

$$V_0 = \frac{h\nu}{e} - \frac{h\nu_0}{e}$$

It is an equation of a straight line having slope $\frac{h}{e}$ and makes an intercept $-\frac{h\nu_0}{e}$ on the stopping potential axis.

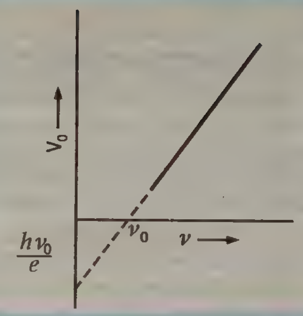

Fig. 1.06

Hence, experimental graph obtained between V_0 and ν is in agreement with Einstein's photoelectric equation.

To find the value of *h*. The slope of the graph between V_0 and ν can be measured. On multiplying with e (the electronic charge), the value of h can be obtained. It was found that

$$h = 6{\cdot}625 \times 10^{-34} \text{ J s}$$

Note. From this experimental study, one can also find the work function of the alkali metal coated on the block. By definition, when light of threshold frequency (ν_0) is incident, photoelectrons just come out but fail to reach the electrode C *i.e.* no stopping potential is required. Therefore,

when $\nu = \nu_0$, $V_0 = 0$

i.e. the intercept of the straight line graph on ν-axis gives the threshold frequency ν_0, which when multiplied with h, gives the work function of the alkali metal.

1.07. PHOTOELECTRIC CELLS

A photoelectric cell is an arrangement which converts light energy into electrical energy.

Photoelectric cells are of the following three types :

1. ***Photoemissive cells*** 2. ***Photovoltaic cells*** 3. ***Photoconductive cells.***

A photoemissive cell may be of ***vacuum type*** or ***gas filled type***. Let us discuss the working of a photoemissive cell.

Photoemissive cell. It consists of two electrodes, a cathode C and an anode A enclosed in a highly evacuated glass bulb [Fig. 1.07]. The cathode C is a semi-cylindrical plate coated with a photosensitive material, such as a layer of cesium deposited on silver oxide. The anode A is in the form of a wire, so that it does not obstruct the path of the light falling on the cathode.

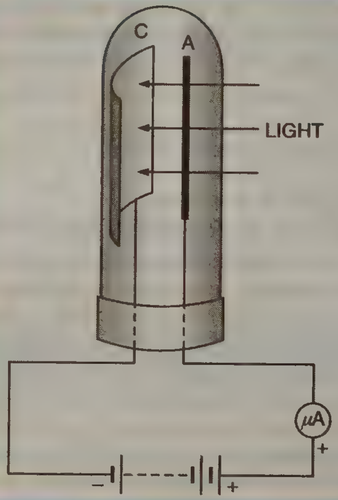

Fig. 1.07

When light of frequency above the threshold frequency for the cathode surface is incident on the cathode, photoelectrons are emitted. If a potential difference of about 10 V is applied between the anode and cathode, the photoelectrons are attracted towards the anode and the microammeter connected in the circuit will record the current.

The chief advantages of this type of photocell are that there is no time-lag between the incident light and the emission of photoelectrons and that the photoelectric current is proportional to the intensity of light. The cell is extremely acccurate in response. Hence, it is used in television and photometry.

The current may be increased by a factor of about 5 by filling the tube with an inert gas at a pressure of a few mm of mercury. When the potential difference between the electrodes exceeds the ionisation potential of the gas, the emitted photoelectrons ionise the gas atoms and now a larger current flows.

The gas filled photo cell cannot be used for registering very rapid changes of illumination, because it takes only 10^{-4} s for the ions to recombine and the current cannot follow the changes in such a short time. Hence, the current cannot maintain proportionality with the changing intensity of light. However, it is quite good for use in a film projector, as it can follow the changes in light intensity from the sound track.

1.08. APPLICATIONS OF PHOTOELECTRIC CELLS

Photoelectric cells have a variety of applications in industries and daily life. few important applications of photoelectric cells are as given below :

1. It is used for the reproduction of sound from the sound track recorded on ne edge of the cinema films.
2. It is used in a television studio to convert the light and shade of the object nto electric currents for transmission of picture.
3. It is used in a photographic camera for the automatic adjustment of aperture.
4. It is used to compare the illuminating powers of two sources of light and o measure the illumination of a surface.
5. It is used for automatic counting of the number of persons entering a hall, stadium, etc.
6. It is used for automatic switching of street lights and traffic-signals.
7. It is used for raising a fire alarm in the event of accidental fire in buildings, actories, etc.
8. It is used in burglar-alarms for houses, banks and treasuries.
9. A photo cell is also used in industries to locate flaws in metal sheets.
10. It is also used to control the temperature during a chemical reaction and hat of a furnace.
11. A photocell can be used for determining the opacity of solids and liquids.

SOLVED NUMERICAL PROBLEMS

Type A. On Energy of photon

Problem 1.01. If a light wave of wavelength 4950Å is iewed as a continuous flow of photons, what is the energy of ach photon in eV? Given, Planck's constant, $h = 6{\cdot}6\times10^{-34}$ J s, $=3\times10^{8}\,\text{m s}^{-1}$. *(I.S.C.E. 1998)*

Sol. Here, $\lambda = 4950\,\text{Å} = 4950\times10^{-10}$ m ; $h = 6{\cdot}6\times10^{-34}$ J s ; $c = 3\times10^{8}$ m s^{-1}

Energy of photon, $$E = \frac{hc}{\lambda} = \frac{6{\cdot}6\times10^{-34}\times3\times10^{8}}{4950\times10^{-10}} = 4{\cdot}0\times10^{-19}\,\text{J}$$

$$= \frac{4{\cdot}0\times10^{-19}}{1{\cdot}6\times10^{-19}} = \mathbf{2{\cdot}5\ eV}$$

Problem 1.02. Calculate the number of photons in 6·62 J of radiation energy of frequency 10^{12} Hz. Given, $h = 6{\cdot}62\times10^{-34}$ J s. *(P.S.S.C.E. 1998)*

Sol. Here, $E = 6{\cdot}62$ J ; $\nu = 10^{12}$ Hz ; $h = 6{\cdot}62\times10^{-34}$ J s

Energy of a photon, $h\nu = 6{\cdot}62\times10^{-34}\times10^{12} = 6{\cdot}62\times10^{-22}$ J

Therefore, number of photons in the given amount of radiation energy,

$$n = \frac{E}{h\nu} = \frac{6{\cdot}62}{6{\cdot}62\times10^{-22}} = 10^{22}$$

Problem 1.03. Calculate the energy of a photon, whose (*i*) frequency is 1000 kHz, (*ii*) wavelength is 5890 Å, (*iii*) wavelength is 1 Å. Also express the energy of the photon in eV in each case. Given, 1 eV = $1{\cdot}6\times10^{-19}$ J, $h = 6{\cdot}62\times10^{-34}$ J s and $c = 3\times10^{8}$ m s^{-1}.

Sol. The energy of a photon is given by

$$E = h\nu = \frac{hc}{\lambda},$$ where c is velocity of light.

Here, $h = 6{\cdot}62\times10^{-34}$ J s ; $c = 3\times10^{8}$ m s^{-1} ;
1 eV $= 1{\cdot}6\times10^{-19}$ J ;

(i) When v = 1000 kHz = 10^{6} Hz :

$$\therefore \quad E = h\nu = 6{\cdot}62\times10^{-34}\times10^{6} = \mathbf{6{\cdot}62\times10^{-28}\ J}$$

$$= \frac{6{\cdot}62\times10^{-28}}{1{\cdot}6\times10^{-19}} = \mathbf{4{\cdot}14\times10^{-9}\ eV}$$

(ii) When v = 5890 Å = 5890 × 10^{-10} m :

$$\therefore \quad E = \frac{hc}{\lambda} = \frac{6{\cdot}62\times10^{-34}\times3\times10^{8}}{5890\times10^{-10}} = \mathbf{3{\cdot}37\times10^{-19}\ J}$$

$$= \frac{3{\cdot}37\times10^{-19}}{1{\cdot}6\times10^{-19}} = \mathbf{2{\cdot}11\ eV}$$

(iii) When λ = 1 Å = 10^{-10} m :

$$\therefore \quad E = \frac{hc}{\lambda} = \frac{6{\cdot}62\times10^{-34}\times3\times10^{8}}{10^{-10}} = \mathbf{1{\cdot}99\times10^{-16}\ J}$$

$$= \frac{1{\cdot}99\times10^{-16}}{1{\cdot}6\times10^{-19}} = \mathbf{1243{\cdot}8\ eV}$$

Problem 1.04. (*a*) An X-ray tube produces a continuous spectrum of radiation with its short wavelength end at 0·66 Å. What is the maximum energy of a photon in the radiation ? *(P.S.S.C.E. 1995, 1992 ; C.B.S.E. 1990)*

(*b*) From your answer to (*a*), guess what order of accelerating voltage (for electrons) is required in such a tube.

Sol. Here, $\lambda = 0{\cdot}66\,\text{Å} = 0{\cdot}66\times10^{-10}$ m,
Now, $h = 6{\cdot}62\times10^{-34}$ J s and $c = 3\times10^{8}$ m s^{-1}

(*a*) The maximum energy of photon is given by

$$E = \frac{hc}{\lambda} = \frac{6{\cdot}62\times10^{-34}\times3\times10^{8}}{0{\cdot}66\times10^{-10}} = \mathbf{3{\cdot}01\times10^{-15}\ J}$$

$$= \frac{3{\cdot}01\times10^{-15}}{1{\cdot}6\times10^{-16}} = \mathbf{18{\cdot}81\ keV}$$

(*b*) To produce electrons of energy 18·81 keV, accelerating potential of 18·81 kV *i.e.* of the order of **20 kV** is required.

Problem 1.05. In an accelerator experiment on high energy collisions of electrons with positrons, a certain event is interpreted as annihilation of an electron-positron pair of total energy 10·2 BeV into two γ-rays of equal

energy. What is the wavelength associated with each γ-ray ? (BeV =10^9 eV). *(Text Problem)*

Sol. Here, energy of two γ-rays = 10·2 BeV

Therefore, energy of one γ-ray $= \frac{10 \cdot 2}{2} = 5 \cdot 1$ BeV

$= 5 \cdot 1 \times 10^9 \text{ eV} = 5 \cdot 1 \times 10^9 \times 1 \cdot 6 \times 10^{-19}$ J

Now, $\lambda = \frac{hc}{E} = \frac{6 \cdot 62 \times 10^{-34} \times 3 \times 10^8}{5 \cdot 1 \times 10^9 \times 1 \cdot 6 \times 10^{-19}}$

$= \mathbf{2 \cdot 434 \times 10^{-16}}$ **m**

Type B. On work function and threshold wavelength

Problem 1.06. Light of wavelength 3500 Å is incident on two metals A and B. Which metal will yield photoelectrons, if their work functions are 4·2 eV and 1·9 eV respectively ? *(C.B.S.E. 1991)*

Sol. Here, $\lambda = 3500 \text{ Å} = 3500 \times 10^{-10}$ m

The energy of incident light,

$$h\nu = \frac{hc}{\lambda} = \frac{6 \cdot 62 \times 10^{-34} \times 3 \times 10^8}{3500 \times 10^{10}} \text{ J}$$

$$= \frac{6 \cdot 62 \times 10^{-34} \times 3 \times 10^8}{3500 \times 10^{-10} \times 1 \cdot 6 \times 10^{-19}} \text{ eV}$$

$= 3 \cdot 546$ eV

The incident light will eject electrons from a metal surface, if its energy is greater than the work function of that metal. Accordingly, **metal B** will yield photoelectrons.

Problem 1.07. A metal has threshold wavelength of 6000 Å . Calculate (*i*) threshold frequency (*ii*) the work function of metal in eV. Given, *h* = 6·62 × 10^{-34} J s and *e* = 1·6 × 10^{-19} C.

Sol. Here, $\lambda_0 = 6000 \text{ Å} = 6000 \times 10^{-10}$ m ;
$h = 6 \cdot 62 \times 10^{-34}$ J s ; $e = 1 \cdot 6 \times 10^{-19}$ C

(*i*) Threshold frequency,

$$\nu_0 = \frac{c}{\lambda_0} = \frac{3 \times 10^8}{6000 \times 10^{-10}} = \mathbf{5 \times 10^{14}} \textbf{ Hz}$$

(ii) Work function, $\omega = h\nu_0 = 6 \cdot 62 \times 10^{-34} \times 5 \times 10^{14}$
$= 3 \cdot 31 \times 10^{-19}$ J

$$= \frac{3 \cdot 31 \times 10^{-19}}{1 \cdot 6 \times 10^{-19}} = \mathbf{2 \cdot 069} \textbf{ eV}$$

Type C. On Einstein's photoelectric equation

Problem 1.08. If radiation of wavelength 5000 Å is incident on a surface of work function 1·2 eV, find the value of stopping potential. *(P.S.S.C.E. 1999, 1998 S)*

Sol. Here, work function, $\omega = 1 \cdot 2 \text{ eV} = 1 \cdot 2 \times 1 \cdot 6 \times 10^{-19}$
$= 1 \cdot 92 \times 10^{-19}$ J

Wavelength of incident radiation,
$\lambda = 5000 \text{ Å} = 5000 \times 10^{-10}$ m

If photoelectrons are emitted with maximum velocity v_{max}, then

$$\frac{1}{2} m v_{max}^2 = h\nu - \omega = \frac{hc}{\lambda} - \omega$$

$$= \frac{6 \cdot 62 \times 10^{-34} \times 3 \times 10^8}{5000 \times 10^{-10}} - 1 \cdot 92 \times 10^{-19}$$

$= 3 \cdot 97 \times 10^{-19} - 1 \cdot 92 \times 10^{-19} = 2 \cdot 05 \times 10^{-19}$ J

If *e* is the charge on electron and V_0 is the stopping potential, then

$$e V_0 = \frac{1}{2} m v_{max}^2 = 2 \cdot 05 \times 10^{-19} \text{J}$$

or $V_0 = \frac{2 \cdot 05 \times 10^{-19}}{e} = \frac{2 \cdot 05 \times 10^{-19}}{1 \cdot 6 \times 10^{-19}} = \mathbf{1 \cdot 28} \textbf{ V}$

Problem 1.09. A metal has a work function of 2·0 e It is illuminated by monochromatic light of wavelengt 500 nm. Calculate : (*i*) the threshold wavelength, (*ii*) th maximum energy of photoelectrons, (*iii*) the stoppin potential. Given, Planck's constant, *h* = 6·6 × 10^{-34} J s, charg on electron, *e* = 1·6 × 10^{-19} C and 1 eV = 1·6 × 10^{-19} J. *(I.S.C.E. 199*

Sol. Here, $h = 6 \cdot 6 \times 10^{-34}$ J s ; $e = 1 \cdot 6 \times 10^{-19}$ C ;
1 eV = $1 \cdot 6 \times 10^{-19}$ J
$\omega = 2 \cdot 0 \text{ eV} = 2 \cdot 0 \times 1 \cdot 6 \times 10^{-19} = 3 \cdot 2 \times 10^{-19}$ J
$\lambda = 500 \text{ nm} = 500 \times 10^{-9}$ m ;

(*i*) If λ_0 is the threshold wavelength, then

$$\omega = \frac{hc}{\lambda_0}$$

or $\lambda_0 = \frac{hc}{\omega} = \frac{6 \cdot 6 \times 10^{-34} \times 3 \times 10^8}{3 \cdot 2 \times 10^{-19}}$

$= 618 \cdot 75 \times 10^{-9} \text{ m} = \mathbf{618 \cdot 75} \textbf{ nm}$

(*ii*) The maximum energy of photoelectrons,

$$\frac{1}{2} m v_{max}^2 = h\nu - \omega = \frac{hc}{\lambda} - \omega$$

$$= \frac{6 \cdot 6 \times 10^{-34} \times 3 \times 10^8}{500 \times 10^{-9}} - 3 \cdot 2 \times 10^{-19}$$

$= 3 \cdot 96 \times 10^{-19} - 3 \cdot 2 \times 10^{-19} = \mathbf{0 \cdot 76 \times 10^{-19}}$

(*iii*) The stopping potential is given by

$$e V_0 = \frac{1}{2} m v_{max}^2 = 0 \cdot 76 \times 10^{-19}$$

or $V_0 = \frac{0 \cdot 76 \times 10^{-19}}{e} = \frac{0 \cdot 76 \times 10^{-19}}{1 \cdot 6 \times 10^{-19}} = \mathbf{0 \cdot 475} \textbf{ V}$

Problem 1.10. Ultra-violet light of wavelength 2271 from a 100 W mercury source irradiates a photocell mad of molybdenum metal. If the stopping potential is 1·3 calculate the work function of the metal. How would th photocell respond to a high intensity (≈ 10^5 W m^{-2}) re light of wavelength 6328 Å produced by a He-Ne laser ? *(Text Problem*

Sol. Here, $V_0 = 1 \cdot 3 \text{ V} ; \lambda = 2271 \text{ Å} = 2271 \times 10^{-10}$ m

We know, $h\nu = h\nu_0 + \frac{1}{2} m v_{max}^2$

Now, $\frac{1}{2} m v_{max}^2 = e V_0 ; h\nu = \frac{hc}{\lambda}$ and $h\nu_0 = \omega$

$\therefore \quad \frac{hc}{\lambda} = \omega + e V_0$

or $\omega = \frac{hc}{\lambda} - e V_0$

Taking $h = 6 \cdot 62 \times 10^{-34}$ J s ;
$e = 1 \cdot 6 \times 10^{-19}$ C and $c = 3 \times 10^8 \text{ m s}^{-1}$, we have

$$\omega = \frac{6 \cdot 62 \times 10^{-34} \times 3 \times 10^8}{2271 \times 10^{-10}} - 1 \cdot 6 \times 10^{-19} \times 1 \cdot 3$$

$= 8 \cdot 745 \times 10^{-19} - 2 \cdot 08 \times 10^{-19} = 6 \cdot 665 \times 10^{-19}$ J

$$= \frac{6 \cdot 665 \times 10^{-19}}{1 \cdot 6 \times 10^{-19}} = \mathbf{4 \cdot 166} \textbf{ eV}$$

Threshold wavelength is given by

$$\lambda_0 = \frac{hc}{\omega} = \frac{6\cdot62\times10^{-34}\times3\times10^{8}}{6\cdot665\times10^{-19}}$$
$$= 2\cdot98\times10^{-7}\ \text{m} = 2980\ \text{Å}$$

Since wavelength 6328 Å produced by He-Ne laser and ncident on the photocell is greater than λ_0, the photocell *will not respond.*

Problem 1.11. Monochromatic radiation of wavelength 640·2 nm (1 nm = 10^{-9} m) from a lamp neon irradiates a photosensitive material made of cesium or tungsten. The stopping voltage is measured to be 0·54 V. The source is replaced by an iron source and its 427·2 nm line irradiates the same photocell. Predict the new stopping voltage. *(Text Problem)*

Sol. *For neon lamp* : $\lambda = 640\cdot2\ \text{nm} = 640\cdot2\times10^{-9}\ \text{m}$;

$$V_0 = 0\cdot54\ \text{volt}$$

Now, $$h\nu = h\nu_0 + \frac{1}{2}m v_{max}^2$$

or $$\frac{hc}{\lambda} = \omega + e V_0$$

or $$\omega = \frac{hc}{\lambda} - eV_0 = \frac{6\cdot62\times10^{-34}\times3\times10^{8}}{640\cdot2\times10^{-9}} - 1\cdot6\times10^{-19}\times0\cdot54$$
$$= 3\cdot102\times10^{-19} - 0\cdot864\times10^{-19}\ \text{m};$$
$$= 2\cdot238\times10^{-19}\ \text{J}$$

For iron source : $\lambda = 427\cdot2\ \text{nm} = 427\cdot2\times10^{-9}\ \text{m}$;

$$\omega = 2\cdot238\times10^{-19}\ \text{J}$$

Again, $\omega = \frac{hc}{\lambda} - eV_0$ or $eV_0 = \frac{hc}{\lambda} - \omega$

or $$V_0 = \frac{1}{e}\left(\frac{hc}{\lambda} - \omega\right) = \frac{1}{1\cdot6\times10^{-19}}\times\left(\frac{6\cdot62\times10^{-34}\times3\times10^{8}}{427\cdot2\times10^{-9}} - 2\cdot238\times10^{-19}\right)$$
$$= \frac{1}{1\cdot6\times10^{-19}}(4\cdot649\times10^{-19} - 2\cdot238\times10^{-19})$$
$$= \frac{2\cdot411\times10^{-19}}{1\cdot6\times10^{-19}} = \mathbf{1\cdot507\ V}$$

abc TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 1.12. If 5% of the energy supplied to an incandescent light bulb is radiated as visible light, how many visible light photons are emitted by a 100 watt bulb ? Assume the average wavelength of all visible photons to be 5600 Å . Given, $h = 6\cdot625\times10^{-34}$ J s .

Sol. Here, $\lambda = 5600\ \text{Å} = 5600\times10^{-10}\ \text{m}$;

$$h = 6\cdot625\times10^{-34}\ \text{J s};$$

$$\text{Energy of one photon} = \frac{hc}{\lambda} = \frac{6\cdot625\times10^{-34}\times3\times10^{8}}{5600\times10^{-10}}$$
$$= 3\cdot549\times10^{-19}\ \text{J}$$

A 100 watt bulb has to be supplied 100 J of energy per second.

Therefore, energy radiated as visible light by the bulb per second $= \frac{100\times5}{100} = 5$ J

Therefore, number of visible light photons emitted per second as visible light

$$= \frac{5}{3\cdot549\times10^{-19}} = \mathbf{1\cdot41\times10^{-19}}$$

Problem 1.13. Estimating the following two numbers should be interesting. The first number will tell you, why radio engineers do not need to worry much about photons. The second number tells you, why our eye can never `count photons', even in barely detectable light. Find :

(*i*) The number of photons emitted per second by a MW transmitter of 10 kW power emitting radiowaves of wavelength 500 m.

(*ii*) The number of photons entering the pupil of our eye per second corresponding to the minimum intensity of white light that we humans can perceive ($\approx 10^{-10}$ W m^{-2}). Take the area of the pupil to be about 0·4 cm^2 and the average frequency of white light to be about 6×10^{14} Hz. *(Text Problem)*

Sol. (*i*) Here, power or energy transmitted per second,

$$E = 10\ \text{kW} = 10^4\ \text{W};\ \lambda = 500\ \text{m};$$

Now, energy of one photon

$$= \frac{hc}{\lambda} = \frac{6\cdot62\times10^{-34}\times3\times10^{8}}{500}\ \text{J}$$

Therefore, number of photons emitted by the transmitter per second

$$= \frac{10^4\times500}{6\cdot62\times10^{-34}\times3\times10^{8}} = \mathbf{2\cdot518\times10^{31}}$$

(*ii*) Minimum intensity of white light = 10^{-10} W m^{-2}

Area of the pupil = 0·4 cm^2 = $0\cdot4\times10^{-4}$ m^2

Therefore, light energy falling on the pupil per second

$$= 10^{-10}\times0\cdot4\times10^{-4} = 0\cdot4\times10^{-14}\ \text{W}$$

Frequency of white light, $\nu = 6\times10^{14}$ Hz

Therefore, energy of white light photon,

$$h\nu = 6\cdot62\times10^{-34}\times6\times10^{14}\ \text{J}$$

Therefore, number of photons entering pupil of our eye per second

$$= \frac{0\cdot4\times10^{-14}}{6\cdot62\times10^{-34}\times6\times10^{14}} = \mathbf{10^4}$$

Problem 1.14. Light of intensity 10^{-5} W m^{-2} falls on a sodium photo cell of surface area 2 cm^2. Assuming that the top 5 layers of sodium absorb the incident energy, estimate the time required for photoelectric emission in the wave picture of radiation. The work function for the metal is given to be 2 eV. What is the implication of your answer ? *(Text Problem)*

Sol. Since size of the atom is about 10^{-10} m, the effective area of an atom may be considered as 10^{-20} m^2 (roughly).

Area of each layer in sodium = 2 cm^2 = 2×10^{-4} m^2

Therefore, number of atoms in 5 layers of sodium

$$= \frac{2\times10^{-4}\times5}{10^{-20}} = 10^{17}$$

If we assume that sodium has one conduction electron per atom, then

number of electrons in 5 layers of sodium = 10^{17}

Intensity of incident light = 10^{-5} W m^{-2}

Therefore, energy incident per second on the surface of the photocell $= 10^{-5} \times 2 \times 10^{-4} = 2 \times 10^{-9}$ W

Since incident energy is absorbed by 5 layers of sodium, according to wave picture of radiation, the electrons present in all the 5 layers of sodium will share the incident energy equally.

Therefore, energy received by any one electron in the 5 layers of sodium

$$= \frac{2\times10^{-9}}{10^{17}} \text{ W} = 2\times10^{-26} \text{ J s}^{-1}$$

$$= \frac{2\times10^{-26}}{1\cdot6\times10^{-19}} = 1\cdot25 \times 10^{-7} \text{ eV s}^{-1}$$

Since work function of sodium is 2 eV, an electron will be ejected as soon as it gathers energy equal to 2 eV. Therefore

time required for photoemission $= \dfrac{2}{1\cdot25\times10^{-7}}$

$= 1\cdot6 \times 10^{7}$ s $\approx$ 0·5 yea

It is contrary to the observed fact that there is no tim lag between the incidence of light and the emission of photo electrons.

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. If radiation has both particle and wave properties, how can one decide which property to use in describing physical phenomenon ?

Ans. Refer to section 1.01.

Q. 1.02. Name a phenomenon, which illustrates the particle nature of light. *(H.S.S.C.E. 2002, 1999)*

Ans. Photoelectric effect.

Q. 1.03. On which factor does the energy carried by a quantum of light depend ? *(P.S.S.C.E. 1999, 1997 S)*

Ans. Energy of a photon, $E = h\nu$

Therefore, energy of a photon depends upon its frequency.

Q. 1.04. Calculate the frequency associated with a photon of energy $3{\cdot}3 \times 10^{-20}$ J. Given $h = 6{\cdot}6 \times 10^{-34}$ J s. *(H.S.S.C.E. 2002)*

Ans. $\nu = \dfrac{E}{h} = \dfrac{3\cdot3\times10^{-20}}{6\cdot6\times10^{-34}} = \mathbf{5 \times 10^{13}}$ **Hz**

Q. 1.05. What is the energy associated in joule with a photon of wavelength 4000 Å ? *(C.B.S.E. 1994)*

Ans. $E = \dfrac{hc}{\lambda} = \dfrac{6\cdot625\times10^{-34}\times3\times10^{8}}{4000\times10^{-10}}$ J $=$ **1·656 J**

Q. 1.06. Which photon is more energetic : A red one or a violet one ? *(H.S.S.C.E. 2002, 1993 ; H.P.S.S.C.E. 1993)*

Ans. Violet photon is more energetic than red one. It is because, wavelength of violet light is less than that of red light.

Q. 1.07. Define an electron volt. *(P.S.S.C.E. 1999)*

Ans. The energy gained by an electron, when accelerated through a potential difference of 1 V, is called one electron volt (eV).

$$1\text{eV} = 1{\cdot}6 \times 10^{-19} \text{ J}$$

Q. 1.08. How many electron volts make one joule ? *(H.P.S.S.C.E. 1993)*

Ans. We know, 1 eV = $1{\cdot}6 \times 10^{-19}$ J

Therefore, $1\text{ J} = \dfrac{1}{1\cdot6\times10^{-19}} = \mathbf{6{\cdot}25 \times 10^{18}}$ **eV**

Q. 1.09. What is the frequency of a photon, whose energy is 66·3 eV ? Given, $h = 6{\cdot}673 \times 10^{-34}$ J s. *(P.S.S.C.E. 1997)*

Ans. Here, E = 66·3 eV = $66{\cdot}3 \times 1{\cdot}6 \times 10^{-19}$ J

Frequency of photon, $\nu = \dfrac{E}{h} = \dfrac{66\cdot3\times1\cdot6\times10^{-19}}{6\cdot673\times10^{-34}}$

$= \mathbf{1{\cdot}6 \times 10^{16}}$ **Hz**

Q. 1.10. Find the photon energy in eV for electromagnetic wave of wavelength (λ) 1 m. Given, $h = 6{\cdot}63 \times 10^{-34}$ J s $e = 1{\cdot}6 \times 10^{-19}$ C. *(H.S.S.C.E. 1993*

Ans. Here, $h = 6{\cdot}63 \times 10^{-34}$ J s ; $e = 1{\cdot}6 \times 10^{-19}$ C ; $\lambda = 1$ m

Energy of proton $= \dfrac{hc}{\lambda} = \dfrac{6\cdot63\times10^{-34}\times3\times10^{8}}{1}$

$= 19{\cdot}89\times10^{-26}\text{ J} = \dfrac{19\cdot89\times10^{-26}}{1\cdot6\times10^{-19}}$

$= \mathbf{1{\cdot}243 \times 10^{-6}}$ **eV**

Q. 1.11. What is photoelectric effect ? *(P.S.S.C.E. 1999 S ; C.B.S.E. 1992*

Ans. For definition, refer to section 1.03.

Q. 1.12. What are photoelectrons ?

Ans. When light of suitable wavelength falls on a metal surface, then the electrons so emitted are called photoelectrons.

Q. 1.13. Mention one physical process for the release of electrons from the surface of a metal. *(H.S.S.C.E. 2002*

Ans. By exposing the surface of metal to radiation of frequency greater than the threshold frequency for the metal

Q. 1.14. Do X-rays show the phenomenon of photoelectric effect ?

Ans. Yes, X-rays show photoelectric effect in sodium zinc, copper, etc. The energy of X-ray photon is quite large in comparison to that of visible light or ultraviolet light.

Q. 1.15. Why are alkali metals most suited for photoelectric emission ?

Ans. Alkali metals show photoelectric effect with visible light. The reason is that the work function of an alkali metal is quite low. Metals such as zinc, cadmium, etc. require much energetic radiation (such as ultraviolet light) to emit photoelectrons.

Q. 1.16. Define photoelectric work function. *(H.S.S.C.E. 1998)*

Ans. The minimum amount of energy required to eject an electron from a surface (without imparting any kinetic energy) is called work function of the surface.

Q. 1.17. What is threshold wavelength ?

Ans. *The maximum wavelength of incident light for a metal surface, above which the light cannot eject electrons, is called threshold wavelength for that metal surface.*

Q. 1.18. Two metals A and B have work functions 2 eV and 4 eV respectively. Which metal has a lower threshold wavelength for photoelectric effect ? *(C.B.S.E. 2002, 1996 ; H.S.S.C.E. 2002)*

Ans. We know, $\omega = \frac{hc}{\lambda_0}$ or $\lambda_0 \propto \frac{1}{\omega}$

It follows that for the metal B which has greater value of work function *i.e.* 4 eV, the threshold wavelength will be lower.

Q. 1.19. Define threshold frequency.

Ans. *The minimum frequency of incident light for a metal surface, below which the light cannot eject electrons, is called threshold frequency for that metal surface.*

Q. 1.20. Is photoelectric emission possible at all frequencies ? Give reasons for your answer. (*C.B.S.E. 1990*)

Ans. No, photoelectric emission is not possible at all frequencies. The incident photon of light can eject electrons, if it possesses energy greater than its work function. Since work function $\omega = h\,\nu_0$, photoelectric emission will take place, if frequency of incident light is greater than ν_0.

Q. 1.21. When radiation of frequency 10^{15} Hz is incident on a certain surface, no photoelectric emission takes place. What conculsion do you draw from this ?

Ans. It implies that frequency of 10^{15} Hz is below the threshold frequency for that metal surface.

Q. 1.22. The threshold frequency of a material is 2×10^{-14} Hz. What is its work function ? (*H.S.S.C.E. 1998 S*)

Ans. Here, $\nu_0 = 2 \times 10^{14}$ Hz

$$\therefore \quad \omega = h\,\nu_0 = 6{\cdot}62 \times 10^{-34} \times 2 \times 10^{14}$$
$$= 1{\cdot}324 \times 10^{-19}\ \text{J}$$
$$= \frac{1{\cdot}324 \times 10^{-19}}{1{\cdot}6 \times 10^{-19}} = \mathbf{0{\cdot}8275\ eV}$$

Q. 1.23. For a photosensitive surface, work function is $3{\cdot}3 \times 10^{-19}$ J. Taking Planck's constant to be $6{\cdot}6 \times 10^{-34}$ J s, find threshold frequency. (*I.S.C.E. 1997*)

Ans. Here, $\omega = 3{\cdot}3 \times 10^{-19}$ J ; $h = 6{\cdot}6 \times 10^{-34}$ J s

$$\text{Threshold frequency, } \nu_0 = \frac{\omega}{h} = \frac{3{\cdot}3 \times 10^{-19}}{6{\cdot}6 \times 10^{-34}} = \mathbf{5 \times 10^{14}\ Hz}$$

Q. 1.24. Calculate the threshold frequency of photon for photoelectric emission from a metal of work function 0·1 eV. (*C.B.S.E. 1992*)

Ans. Here, $\omega = 0{\cdot}1\ \text{eV} = 0{\cdot}1 \times 1{\cdot}6 \times 10^{-19} = 1{\cdot}6 \times 10^{-20}$ J

Therefore, threshold frequency,

$$\nu_0 = \frac{\omega}{h} = \frac{1{\cdot}6 \times 10^{-20}}{6{\cdot}62 \times 10^{-34}} = \mathbf{2{\cdot}417 \times 10^{13} Hz}$$

Q. 1.25. Calculate the work function of a metal in eV, if its threshold wavelength is 6800 Å and $h = 6{\cdot}62 \times 10^{-27}$ erg s. (*H.S.S.C.E. 1996, 1995*)

Ans. Here, $\lambda_0 = 6800$ Å $= 6{\cdot}8 \times 10^{-7}$ m,

$$\therefore \quad \omega = \frac{hc}{\lambda_0} = \frac{6{\cdot}62 \times 10^{-34} \times 3 \times 10^{8}}{6{\cdot}8 \times 10^{-7}} = 2{\cdot}92 \times 10^{-9}\ \text{J}$$
$$= \mathbf{1{\cdot}825\ eV}$$

Q. 1.26. Work function of Na is 2·3 eV. Does sodium show photoelectric emission for light of wavelength 6800 Å ? (Given, $h = 6{\cdot}63 \times 10^{-34}$ J s) (*H.S.S.C.E. 1994*)

Ans. For $\lambda = 6800$ Å $= 6{\cdot}8 \times 10^{-7}$ m,

$$\text{energy of photon} = \frac{hc}{\lambda} = \frac{6{\cdot}63 \times 10^{-34} \times 3 \times 10^{8}}{6{\cdot}8 \times 10^{-7}}$$
$$= 2{\cdot}925 \times 10^{-19}\ \text{J} = 1{\cdot}828\ \text{eV}$$

Since the energy of photon is less than the work function for Na, photoelectric emission will *not* take place.

Q. 1.27. Does the threshold frequency depend on intensity of light ? (*C.B.S.E. 1982*)

Ans. No, threshold frequency does not depend on intensity of light.

Q. 1.28. How does the maximum kinetic energy of electrons emitted vary with the work function of the metal ? (*C.B.S.E. 2001*)

Ans. The maximum kinetic energy of emitted electrons decreases, as the work function of the metal increases.

Q. 1.29. If the maximum kinetic energy of electrons emitted by a photo cell is 5 eV, what is the stopping potential ? (*H.P.S.S.C.E. 2002 ; C.B.S.E. 2001, 1996*)

Ans. The stopping potential for electrons having maximum kinetic energy of 5 eV is 5 V.

Q. 1.30. The frequency (ν) of incident radiation is greater than threshold frequency (ν_0) in a photocell. How will the stopping potential vary, if frequency (ν) is increased, keeping other factors constant ? (*C.B.S.E. 2002*)

Ans. The kinetic energy of the emitted photoelectrons will increase.

Q. 1.31. If the intensity of incident radiation in a photocell is increased, how does the stopping potential vary ? (*C.B.S.E. 2002*)

Ans. There is no effect on stopping potential.

Q. 1.32. The maximum kinetic energy of photoelectrons emitted from a surface, when photons of energy 6 eV fall on it is 4 eV. What is the stopping potential (in volt) for the fastest photoelectrons ? (*I.I.T. 1999*)

Ans. The stopping potential (in volt) for fastest photoelectrons is numerically equal to their kinetic energy (in eV). Therefore,

stopping potential for fastest photoelectrons = **4 V**

Q. 1.33. State Einstein's photoelectric equation in mathematical form. (*H.S.S.C.E. 2002*)

Ans. $h\nu = h\nu_0 + \frac{1}{2} m\, v_{max}^2$,

where the letters have their usual meanings.

Q. 1.34. Can the phenomenon of photoelectric effect be explained on the basis of wave theory ?

Ans. No, it can not be explained on wave theory.

Q. 1.35. What determines the strength of photoelectric current ?

Ans. The photoelectric current increases with the intensity of incident light.

Q. 1.36. What is the effect on the velocity of the photoelectrons, if the wavelength of the incident light is decreased ? (*C.B.S.E. 1982*)

Ans. The velocity of the photoelectrons will increase on decreasing the wavelength of the incident light.

Q. 1.37. If the intensity of incident radiation on a metal surface is doubled, what happens to the kinetic energy of the electrons emitted ? (*C.B.S.E. 1993*)

Ans. There is no effect of intensity on kinetic energy of the emitted electrons.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. Define photoelectric effect and threshold frequency. *(H.S.S.C.E. 2002 ; Pre-degree Kerala, 1992)*

Ans. Photoelectric effect. Refer to section 1.03.

Threshold frequency. Refer to VSQ 1.17.

Q. 1.02. Define work function of a metal and photoelectric effect. *(H.P.S.S.C.E. 1998)*

Ans. Work function. Refer to VSQ 1.14.

Photoelectric effect. Refer to section 1.03.

Q. 1.03. Define photoelectric work function and threshold frequency. *(H.S.S.CE. 2002)*

Ans. Photoelectric work function. Refer to VSQ 1.14.

Threshold frequency. Refer to VSQ 1.17.

Q. 1.04. Two metals X and Y when illuminated with appropriate radiations emit photoelectrons. The work function of X is higher than that of Y. Which metal will have higher value of threshold frequency and why ? *(C.B.S.E. 2001 S)*

Ans. The work function of a metal is given by

$$\omega = h\nu_0,$$

where ν_0 is threshold frequency. Since work function of metal X is higher, it will also have higher value of threshold frequency.

Q. 1.05. It is harder to remove a free electron from copper than from sodium. Which metal has greater work function ? Which has higher threshold wavelength ?

Ans. As it is harder to remove an electron from copper than sodium, work function of copper is greater.

Now, $$\omega = h\nu_0 = \frac{hc}{\lambda_0} \quad \text{or} \quad \lambda_0 \propto \frac{1}{\omega}$$

As threshold wavelength is inversely proportional to the work function, its value will be more for sodium.

Q. 1.06. Visible light cannot eject photoelectrons from copper surface, whose work function is 4·4 eV. Why ? Prove it mathematically. *(P.S.S.C.E. 2001)*

Ans. Here, $$\omega = \frac{hc}{\lambda_0} = 4{\cdot}4 \text{ eV} = 4{\cdot}4 \times 1{\cdot}6 \times 10^{-19} \text{ J}$$

Therefore, threshold wavelength for copper surface,

$$\lambda_0 = \frac{hc}{\omega} = \frac{6{\cdot}62 \times 10^{-34} \times 3 \times 10^8}{4{\cdot}4 \times 1{\cdot}6 \times 10^{-19}}$$
$$= 2{\cdot}821 \times 10^{-7} \text{ m} = 2821 \text{ Å}$$

Since wavelength of visible light (3800 Å to 7800 Å) is greater than threshold wavelength for copper surface, it cannot eject electrons from copper.

Q. 1.07. Green light ejects electrons from a certain photo-sensitive surface, yellow light does not. What will happen in case of red and violet light ? Give reasons for your answer. *(C.B.S.E. 2001 S)*

Ans. As the green light ejects electrons from the surface, wavelength of green light is less than the threshold wavelength for the surface. Further, as the yellow light cannot eject photo-electrons, the wavelength of yellow light is greater than that threshold wavelength. The wavelength of red light is greater than that of yellow light while the wavelength of violet light is less than that of green light. Hence, red light cannot cause photoelectric emission, while photoelectric emission will take place for violet light.

Q. 1.08. Two metals X and Y have work functions 2 eV and 5 eV respectively. Which metal will emit electrons, when irradiated with light of wavelength 400 nm and why ? *(C.B.S.E. 1999)*

Ans. Here, λ = 400 nm = 400×10^{-9} m

Therefore, energy of photon,

$$E = \frac{hc}{\lambda} = \frac{6{\cdot}62 \times 10^{-34} \times 3 \times 10^8}{400 \times 10^{-9}}$$
$$= 4{\cdot}965 \times 10^{-19} \text{ J}$$
$$= \frac{4{\cdot}965 \times 10^{-19}}{1{\cdot}6 \times 10^{-19}} = 3{\cdot}1 \text{ eV}$$

Since work function of metal X is less than the energy of the incident light, photoelectrons will be emitted by this metal only.

Q. 1.09. Radiation of frequency 10^{15} Hz are incident on two photosensitive surfaces P and Q. Following observations are made :

(*i*) Surface P : Photoemission occurs but the photoelectrons have zero kinetic energy.

(*ii*) Surface Q : Photoemission occurs and photoelectrons have some kinetic energy.

Which of these has a higher work function ? If the incident frequency is slightly reduced, what will happen to photoelectrons emission in the two cases ? *(C.B.S.E. 1999 S)*

Ans. From Einstein's photoelectric equation, we may write

$$\omega = h\nu - \frac{1}{2} m v_{max}^2$$

For surface P, kinetic energy of photoelectrons is zero ; while for plate Q, the photoelectrons have some kinetic energy. It follows that work function of **surface P** is greater than that of surface Q.

If the incident frequency is slightly reduced, the energy of incident photon will become less than the work function for surface P. Hence, photoelectric emission **will not take place** in case of surface P.

Q. 1.10. State the laws of photoelectric emission. *(C.B.S.E. 1998 ; H.S.S.C.E. 2001, 1995)*

Or

Write down laws of photoelectric effect. *(H.S.S.C.E. 1997 S)*

Ans. Refer to section 1.04.

Q. 1.11. Photoelectric emission is an instantaneous process. Comment.

Ans. There is no time lag between the instant the photon of light falls on the metal surface and the instant a photoelectron is emitted from the metal surface. It can not be explained by assuming wave nature of radiation. If wave nature of radiation is assumed, then it will take quite a long time (about an year) for electron to come out of the metal surface.

Q. 1.12. Every metal has a definite work function. Why do all the photoelectrons not come out with the same energy, if incident radiation is monochromatic ? Why is there an energy distribution of photoelectrons ? *(P.S.S.C.E. 1996 ; Text Question)*

Ans. Work function of a metal is the minimum energy required to knock out an electron (from the conduction band). Since electrons are present in a continuous band of levels, different electrons require different amounts of energy to get out of the atom. For this reason, the electrons knocked off by a monochromatic radiation possess different energies.

Q. 1.13. Is it essential that each incident photon should eject a photoelectron ? Explain.

Ans. The photoelectric emission takes place, when the incident photon is absorbed by the electron in the atom. The energy equal to work function of metal is used up in ejecting photoelectron and the difference appears as the kinetic energy of the electron. Since one photon can be absorbed by one electron, a photon can eject only one electron.

Q. 1.14. What is the effect of (*i*) intensity and (*ii*) frequency of incident light on photoelectric current ? Explain. (*P.S.S.C.E. 1996*)

Ans. Refer to section 1.04.

Q. 1.15. Explain the terms cut off potential (stopping potential) and threshold frequency in photoelectric effect. (*P.S.S.C.E. 1996*)

Ans. Cut of potential. *The minimum value of opposing potential difference required so as to just stop the photoelectrons emitted with maximum kinetic energy, is called stopping potential.*

Threshold frequency. Refer to VSQ 1.17.

Q. 1.16. Define the term : (*a*) work function, (*b*) threshold frequency and (*c*) stopping potential with reference to photoelectric effect. (*C.B.S.E. 2002*)

Ans. (*a*) **Work function.** Refer to VSQ 1.14.

(*b*) **Threshold frequency.** Refer to VSQ 1.17.

(*c*) **Stopping potential.** Refer to SAQ 1.14.

Q. 1.17. A source of light is placed at a distance of 50 cm from a photocell and the cut off potential is found to be V_0. If the distance between the light source and photocell is made 25 cm, what will be the new cut off potential ? Justify your answer. (*C.B.S.E. 2001 S*)

Ans. On decreasing the distance of the source of light from the photocell from 50 cm to 25 cm, the intensity of light will become four times. Since there is no effect of intensity of light on the maximum kinetic energy of emitted photoelectrons, the stopping potential will remain the same *i.e.* V_0.

Q. 1.18. For photoelectric effect in a metal, the Fig. 1.08 shows the plot of cut off voltage versus frequency of incident radiation. Calculate (*i*) the threshold frequency and (*ii*) the work function for the given metal. (*C.B.S.E. 1995*)

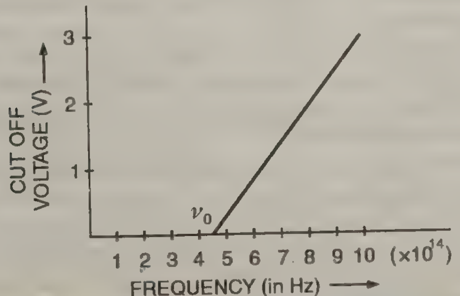

Fig. 1.08

Ans. (*i*) The threshold frequency (ν_0) is equal to the intercept made by the graph on frequency axis. Thus,

$$\nu_0 = \mathbf{4{\cdot}5 \times 10^{14}\ Hz}$$

(*ii*) Work function of the metal,

$$\omega = h\,\nu_0 = 6{\cdot}62 \times 10^{-34} \times 4{\cdot}5 \times 10^{14}$$
$$= 2{\cdot}98 \times 10^{-19}\ \text{J}$$
$$= \frac{2{\cdot}98 \times 10^{-19}}{1{\cdot}6 \times 10^{-19}} = \mathbf{1{\cdot}86\ eV}$$

Q. 1.19. Draw a graph to show the variation of stopping potential with frequency of radiations incident on a metal plate. How can the value of Planck's constant be determined from this graph ? (*C.B.S.E. 1995*)

Ans. The graph between the radiation of stopping potential (or cut off voltage) and the frequency of the incident radiation is as shown in Fig. 1.08.

***To find h₀* :** From Einstein's photoelectric equation, we have

$$h\,\nu - h\,\nu_0 = \frac{1}{2}\,m\,v_{max}^2 = e\,V_0,$$

where V_0 is the stopping potential. Therefore,

$$h = \frac{e\,V_0}{(\nu - \nu_0)}$$

From the graph, by noting ν_0 and the value of frequency ν corresponding to a certain value of stopping potential, the value of Planck's constant can be found.

Q. 1.20. Draw a graph showing the variation of stopping potential with frequency of incident radiation in relation to photoelectric effect. Deduce an expression for the slope of this graph using Einstein's photoelectric equation. (*C.B.S.E. 1997*)

Ans. For graph, refer to Fig. 1.08.

From Einstein's photoelectric equation, we have

$$h\,\nu = h\,\nu_0 + \frac{1}{2}\,m\,v_{max}^2 = h\,\nu_0 + e\,V_0,$$

or
$$V_0 = \frac{h\,\nu}{e} - \frac{h\,\nu_0}{e} \quad \text{...}(i)$$

Since ν is plotted along X-axis and V_0 along Y-axis ; comparing the equation (*i*) with the equation of a straight line*, we have

slope of V_0 versus ν graph = h/e

Q. 1.21. Define the terms 'threshold frequency' and 'stopping potential' for photo-electric effect. Show graphically how the stopping potential for a given metal varies with frequency of the incident radiations. Mark threshold frequency on this graph. (*C.B.S.E. 1998*)

Ans. Threshold frequency. Refer to VSQ 1.17.

Stopping potential. Refer to SAQ 1.14.

For answer to the remaining part of SAQ 1.21, refer to Fig. 1.08.

Q. 1.22. Define the terms 'work function' and 'threshold frequency' for photoelectric effect. Show graphically how stopping potential for a given metal varies with frequency of incident radiation. What does the slope of this graph represent ? (*C.B.S.E. 1998*)

Ans. Work function. Refer to VSQ 1.14.

Threshold frequency. Refer to VSQ 1.17.

---

* the equation of a straight line having slope *m* and making intercept *c* on *y*-axis is $y = mx + c$

For graph between stopping potential and frequency of incident radiation, refer to Fig. 1.08.

Slope of the graph $= \frac{h}{e}$

For details refer to SAQ. 1.20.

Q. 1.23. State Einstein's photoelectric equation and explain the terms involved. *(H.S.S.C.E. 2002)*

Ans. Einstein's photoelectric equation :

$$h\nu = h\nu_0 + \frac{1}{2} m v_{max}^2$$

Here, ν is frequency of incident light, ν_0 is threshold frequency and v_{max} is the maximum velocity with which photoelectrons are emitted.

Q. 1.24. An increase in frequency of incident light increases the velocity with which a photoelectron is ejected. Explain, how.

Ans. According to Einstein's photoelectric equation,

$$h\nu = h\nu_0 + \frac{1}{2} m v_{max}^2$$

or $$\frac{1}{2} m v_{max}^2 = h(\nu - \nu_0)$$

As the frequency of incident light is increased, difference $\nu - \nu_0$ and hence the value of maximum kinetic energy of the photoelectrons goes on increasing.

Q. 1.25. For a photosensitive surface, threshold wavelength is λ_0. Does photoemission occur, if the wavelength (λ) of the incident radiation is (*a*) more than λ_0, (*b*) less than λ_0? Justify your answer. *(C.B.S.E. 2001 S)*

Ans. In terms of wavelength of the incident radiation, Einstein's photoelectric equation is

$$\frac{hc}{\lambda} = \frac{hc}{\lambda_0} + \frac{1}{2} m v_{max}^2$$

(*a*) When $\lambda > \lambda_0$, $\frac{1}{2} m v_{max}^2$ is negative. Hence, photoemission will not occur, if $\lambda > \lambda_0$.

(*b*) When $\lambda < \lambda_0$, $\frac{1}{2} m v_{max}^2$ is positive. Therefore, when $\lambda < \lambda_0$, photoemission will occur.

Q. 1.26. Why does the maximum velocity of photoelectron not depend upon the intensity of radiation ? Explain.

Ans. The maximum kinetic energy of the photoelectrons is given by

$$\frac{1}{2} m v_{max}^2 = h\nu - h\nu_0$$

Thus, the maximum velocity of photoelectrons depends upon the frequency of the incident light and not on its intensity.

Q. 1.27. If the frequency of the incident radiation on the cathode of a photocell is doubled, how will the following change : (*i*) kinetic energy of the electrons, (*ii*) photoelectric current, (*iii*) stopping potential. *(C.B.S.E. 1999)*

Ans. From Einstein's photoelectric equation, we have

$$\frac{1}{2} m v_{max}^2 = h\nu - h\nu_0$$

(*i*) If the frequency of incident radiation is doubled, the difference $h\nu - h\nu_0$ and hence $\frac{1}{2} m v_{max}^2$ will increase *i.e.* kinetic energy of photoelectrons will *increase*.

(*ii*) The increase in frequency of the incident radiation has *no effect* on the photoelectric current (or the number of photoelectrons emitted).

(*iii*) If V_0 is the stopping potential, then

$$\frac{1}{2} m v_{max}^2 = e V_0$$

or $$e V_0 = h\nu - h\nu_0$$

Therefore, if the frequency of incident radiation is doubled, the stopping potential will ***increase***.

Q. 1.28. Explain the working of a photo cell. *(H.S.S.C.E. 1994)*

Ans. Refer to section 1.07.

Q. 1.29. What is a photoelectric cell ? State its two uses. *(P.S.S.C.E. 1999 S, 1999, 1992)*

Ans. Refer to sections 1.07 and 1.08.

Q. 1.30. Write four uses of photocell. *(P.S.S.C.E. 2002)*

Ans. Refer to section 1.08.

abc TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 1.01. When monochromatic radiation of wavelength 2000 Å falls upon a nickel plate, the latter acquires a positive charge. The wavelength is increased and at 3400 Å , however intense the incident radiation may be, the effect is found to cease. Explain it. *(Roorkee, 1983)*

Ans. When radiation of 2000 Å falls on nickel plate, it acquires positive charge due to emission of photoelectrons. It implies that the wavelength of the incident radiation is below the threshold wavelength of nickel.

When the incident radiation has wavelength equal to or greater than the threshold, no photoelectrons is emitted, howsoever intense the radiation may be. Since wavelength has been gradually increased to 3400 Å, when the effect is found to cease ; 3400 Å corresponds to threshold wavelength for the nickel surface.

Q. 1.02. In the photoelectric effect, there is a cut-off frequency. How does the photon picture explain this fact ? *(Roorkee, 1980)*

Or

Explain briefly, how classical theory could not explain the phenomenon of photoelectric effect.

Ans. To eject an electron from a metal surface, a minimum amount of energy, called the work function of the metal, is required. Classically, if incident radiation is a wave, its energy is shared by all the atoms in the metal surface and calculations show that it will take almost a year, when the requisite amount of energy may be accumulated by an electron. Hence, on classi-cal picture, photoelectric emission can not be instantaneous.

When the incident radiation is assumed to be consisting of photons, a photon of frequency ν_0 or more can possess the energy needed to eject an electron. If frequency of incident photon is less than ν_0, no photoelectric emission will take place. In a way, ν_0 is a cut-off frequency. As said earlier, the photo-electric emission will take place only, if the frequency of incident photon is equal to or greater than ν_0, the threshold frequency.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Describe photoelectric effect and state the laws of photoelectric emission. (*H.S.S.C.E. 2000*)
2. With reference to the photoelectric effect, define the terms 'work function' and 'threshold wavelength' for a given metal. On what factors will the following depend during photoelectric emission from a metal surface : (*i*) the magnitude of photoelectric current, and (*ii*) the velocity of ejected electrons ? (*I.S.C.E. 1998*)
3. Explain `stopping potential' and `threshold frequency' in photoelectric emission. Give an appropriate graph. (*I.S.C.E. 1996*)
4. What is photoelectric effect ? Write Einstein's photoelectric equation and use it to explain (*i*) independence of maximum energy of emitted photoelectrons from intensity of light, (*ii*) existence of a threshold frequency for emission of photo-electrons. (*C.B.S.E. 2001 S*)
5. State the dependence of work function on the kinetic energy of electrons emitted in a photo cell. If the intensity of incident light is doubled, what changes occur in the stopping potential and the photoelectric current ? (*C.B.S.E. 2000*)
6. Define threshold frequency, stopping potential and work function in photoelectric emission. Show that the existence of threshold frequency is an evidence in favour of the quantum theory. Bring out the difference in photoelectric effect produced by UV rays and that by visible light.
7. Explain Einstein's theory of photoelectric effect. (*H.S.S.C.E. 2001*)
8. What is photoelectric effect ? Derive Einstein's photoelectric equation. (*H.P.S.S.C.E. 2002*)
9. What is photoelectric effect ? Derive their laws from Einstein's photoelectric equation. (*P.S.S.C.E. 2002*)
10. Define the phenomenon of photoelectric effect. State the laws of photoelectric effect. Give Einstein's explanation of photoelectric effect. (*Karnataka, 1992 S*)
11. What is photoelectric cell ? Explain any one of the photoelectric cells. (*Karnataka, 1993 S*)
12. What is photoelectric cell ? How does it work ? Give its practical uses.

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. Discuss suitable experiments to study the laws of photoelectric emission. (*P.S.S.C.E. 2002, 2000, 1999, 1997 S*)
2. What is photoelectric effect ? Explain the effect of increase of (*i*) frequency (*ii*) intensity of the incident radiation on photoelectrons emitted by a photo-tube. (*C.B.S.E. 1994*)
3. Establish Einstein photoelectric equation. Use this equation to explain the laws of photoelectric emission. (*H.S.S.C.E. 1992 ; P.S.S.C.E. 1991*)
4. Discuss laws of photoelectric emission. How can these be explained on the basis of Einstein's photoelectric equation? (*P.S.S.C.E. 1996*)
5. What is photoelectric effect ? State its laws and derive these laws from Einstein's photoelectric equation. (*P.S.S.C.E. 2000, 1999, 1998 S*)
6. State the laws of photoelectric emission. Write Einstein's photoelectric equation. Explain in short these laws on the basis of Einstein's theory. (*P.S.S.C.E. 1995*)
7. Draw properly labelled graphs to show the following concerning photoelectric emission :
   (*a*) variation of photoelectron current with the intensity of incident radiation,
   (*b*) variation of photoelectron current with accelerating and retarding potential, and
   (*c*) variation of stopping potential with frequency of the incident radiation.
   From the graph, explain how the following can be determined :
   (*d*) Planck's constant,
   (*e*) the threshold frequency for the photosensitive material, and
   (*f*) the work function of the material. (*I.S.C.E. 1993*)
8. Write down Einstein's photoelectric equation and explain it. With the help of a neat diagram, describe briefly the construction and working of a photoemissive cell. Mention any four applications of photoelectric effect. (*Karnataka, 1994*)

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Energy of photon

1. Calculate the frequency associated with a photon of energy $3{\cdot}3 \times 10^{-20}$ J ($h = 6{\cdot}6 \times 10^{-34}$ J s). (*C.B.S.E. 1990*) **[Ans.** 5×10^{13} Hz**]**
2. Calculate the energy of a photon of green light of wavelength 5500 Å. Given, $h = 6{\cdot}62 \times 10^{-27}$ erg s. **[Ans.** 2·257 eV**]**
3. The wavelength of a spectral line is 4000 Å. Calculate its frequency and energy.
   Given, $c = 3 \times 10^8$ m s^{-1} and $h = 6{\cdot}6 \times 10^{-34}$ J s.
   (*H.S.S.C.E. 1992*) **[Ans.** $7{\cdot}5 \times 10^{14}$ Hz, 3·094 eV**]**
4. Calculate the frequency of a photon, whose energy is 7·5 eV. Given, 1 eV = $1{\cdot}6 \times 10^{-19}$ J and $h = 6{\cdot}62 \times 10^{-34}$ J s. **[Ans.** $1{\cdot}813 \times 10^{15}$ Hz**]**

Type B. On Threshold wavelength

5. Calculate the longest wavelength of the incident radiation, which will eject photoelectrons from a metal surface, whose work function is 3 eV. (*P.S.S.C.E. 2001*) **[Ans.** 4137·5 Å**]**
6. Calculate the threshold wavelength of photons, which can emit photoelectrons from cesium. Given that work function for cesium = 1·8 eV, $h = 6{\cdot}62 \times 10^{-34}$ J s. **[Ans.** 6896·8 Å**]**
7. Work function of a photosensitive metal is 1·875 eV. Calculate the wavelength of incident light, which will just cause the emission of photoelectrons. **[Ans.** 6620 Å**]**
8. The work function of sodium is 2·3 eV. Calculate the maximum wavelength in nm (nanometre) for the light that will cause photoelectrons to be emitted from sodium. (*M.N.R. 1980*) **[Ans.** 539·7 nm**]**
9. A metal has a threshold wavelength of 6000 Å. Calculate (*i*) threshold frequency (*ii*) work function of metal in eV.
   Given, $h = 6{\cdot}62 \times 10^{-34}$ J s, $e = 1{\cdot}6 \times 10^{-19}$ C.
   (*H.P.S.S.C.E. 1999 ; P.S.S.C.E. 1988*)
   [Ans. (*i*) 5×10^{14} Hz ; (*ii*) 2·07 eV**]**

10. Calculate the work function in electron volt for indium metal, given that photoelectric threshold wavelength is 6800 Å. Take $h = 6{\cdot}62 \times 10^{-27}$ erg s. **[Ans.** 1·825 eV**]**

11. A metal sheet is given a negative charge of 11·2 nC (nanocoulomb).
(*a*) How many photons of ultraviolet light is required to completely discharge the metal sheet ?
(*b*) What is the minimum amount of energy that must be absorbed by metal to effect this discharge ? Threshold frequency of metal = $4{\cdot}5 \times 10^{14}$ Hz, $h = 6{\cdot}6 \times 10^{-34}$ J s.
(*P.S.S.C.E. 1993*) **[Ans.** (*a*) 7×10^{10} ; (*b*) 1·856 eV**]**

Type C. On Einstein's photoelectric equation

12. Light of wavelength 5000 Å falls on a metal surface of work function 2·01 eV. Find the kinetic energy of photoelectrons.
(*P.S.S.C.E. 2001*) **[Ans.** 0·4725 eV**]**

13. Calculate the maximum kinetic energy of electrons emitted from a photosensitive surface of work function 3·2 eV, for the incident radiation of wavelength 300 nm.
(*C.B.S.E. 2002*) **[Ans.** 0·9375 eV**]**

14. Light of wavelength 5000 Å falls on a sensitive plate of work function 1·90 eV. Find the maximum kinetic energy of emitted photoelectrons in eV. Given, $h = 6{\cdot}62 \times 10^{-34}$ J s, $c = 3 \times 10^8$ m s^{-1}. (*H.S.S.C.E. 1993*) **[Ans.** 0·5825 eV**]**

15. Calculate the kinetic energy of a photoelectron (in eV) emitted on shining light of wavelength $6{\cdot}2 \times 10^{-6}$ m on a metal surface. The work function of the metal is 0·1 eV.
(*C.B.S.C.E. 1992*) **[Ans.** 0·1 eV**]**

16. What is the energy of emitted photoelectrons, if light of frequency 10^{16} Hz is incident on a sodium target ? Work function of sodium = 2·5 eV. (*Pre-degree Kerala, 1992*)
[Ans. 38·875 eV**]**

17. The threshold wavelength of photosensitive metal is 5000 Å. Find the kinetic energy of the photoelectrons emitted by it, when radiation of wavelength 4000 Å is incident on it. Express it in eV. Given $h = 6{\cdot}625 \times 10^{-34}$ J s, $c = 3 \times 10^8$ m s^{-1}, $e = 1{\cdot}6 \times 10^{-19}$ C. (*Karnataka, 1989 S*)
[Ans. 0·621 eV**]**

18. A sheet of silver is illuminated by monochromatic ultraviolet radiation of wavelength =1810 Å. What is the maximum energy of the emitted electron ? Threshold wavelength of silver is 2640 Å. **[Ans.** 2·156 eV**]**

19. Light of wavelength 5500 Å falls on a sensitive plate with work function 1·7 eV. Find (*a*) energy of photon, (*b*) energy of photoelectron and (*c*) stopping potential.
(*P.S.S.C.E. 2002*)
[Ans. (*a*) 2·257 eV, (*b*) 0·557 eV, (*c*) 0·557 V**]**

20. Light of wavelength 5000 Å falls on a sensitive plate with photoelectric work function equal to 1·90 eV. Find, (*i*) the energy of the photon in eV, (*ii*) the kinetic energy of the photoelectrons emitted and (*iii*) the stopping potential.
[*H.S.S.C.E. 1993*]
[Ans. (*i*) 2·483 eV ; (*ii*) 0·583 eV ; (*iii*) 0·583 V**]**

21. The photoelectric work function of a certain surface is 4 eV. What is the maximum velocity of the photoelectrons emitted by light of frequency 10^{15} Hz incident on that surface ? $h = 6{\cdot}625 \times 10^{-34}$ J s, 1 eV = $1{\cdot}602 \times 10^{-19}$ J.
(*Pre-degree Kerala, 1994*) **[Ans.** $2{\cdot}18 \times 10^5$ m s^{-1}

22. The work function of potassium is 2·3 eV. If the photoelectrons are emitted with maximum velocity of 10^4 m s^{-1} calculate the frequency of the incident radiation on the metal. Given that mass of electron, $m = 9{\cdot}1 \times 10^{-31}$ kg and and Planck's constant, $h = 6{\cdot}62 \times 10^{-34}$ J s.
[Ans. $1{\cdot}243 \times 10^{15}$ Hz**]**

23. Work function of sodium is 2·35 eV. What is the maximum wavelength of light that will cause photoelectrons to be emitted from the metal ? What will be the maximum energy of the photoelectrons, if radiation of 1000 Å falls on the metal surface ($h = 6{\cdot}625 \times 10^{-34}$ J s).
(*Karnataka, 1994 S*) **[Ans.** 5286 Å, 10·07 eV**]**

24. The energy of photoelectrons emitted from a photosensitive plate is 1·56 eV. If threshold wavelength is 2500 Å, calculate the wavelength of incident light. Given,
1 eV = $1{\cdot}6 \times 10^{-12}$ erg and $h = 6{\cdot}62 \times 10^{-27}$ erg s.
[Ans. 1902 Å**]**

25. Find the frequency of light, which ejects electrons from a metal surface fully stopped by a retarding potential of 3 V. The photoelectric effect begins in this metal at frequency of 6×10^{14} s^{-1}. Find the work function of this metal. (*H.P.S.S.C.E. 1996*)
[Ans. $13{\cdot}25 \times 10^{14}$ s^{-1}, 2·48 eV**]**

26. If photoelectrons are to be emitted from a potassium surface with a speed of 6×10^5 m s^{-1}, what frequency of radiation must be used ? Threshold frequency for potassium is $4{\cdot}22 \times 10^{14}$ Hz, $h = 6{\cdot}6 \times 10^{-34}$ J s and $m_e = 9{\cdot}1 \times 10^{-31}$ kg.
(*C.B.S.E. Sample Q. Paper*) **[Ans.** $6{\cdot}7 \times 10^{14}$ Hz**]**

MISCELLANEOUS PROBLEMS

27. Light of wavelength 2000 Å falls on an aluminium surface. In aluminium 4·2 eV are required to remove an electron. What is the kinetic energy in eV of (*a*) the fastest, (*b*) the slowest emitted photoelectrons ? What is (*c*) the stopping potential (*d*) cut off wavelength for aluminium ? Planck's constant, $h = 6{\cdot}6 \times 10^{-34}$ J s, $c = 3 \times 10^8$ m s^{-1}.
(*M.N.R. 1986*)
[Ans. (*a*) 1·9875 eV ; (*b*) 0 ; (*c*) 1·9875 V ; (*d*) 2946 Å**]**

28. When light of wavelength 250 nm is incident on the cathode of a photocell, the stopping potential recorded is 4 V. If the wavelength of the incident light is increased to 300 nm, calculate the new stopping potential.
(*C.B.S.E. 2000*) **[Ans.** 3·17 V**]**

29. When a surface is irradiated with a light of wavelength 4950 Å, a photocurrent appears which vanishes, if a retarding potential greater than 0 ·6 V is applied across the photo tube. When a different source of light is used, it is found that the critical retarding potential is changed to 1·1 V. Find the work function of the emitting surface and the wavelength of second source. If the photoelectrons (after emission from the surface) are subjected to a magnetic field of 10 T, what changes will be observed in the above two retarding potentials ? (*Roorkee, 1989*)
[Ans. 1·9 eV, 4129 Å, No change**]**

(*b*) $\frac{1}{2}m\,v_{max}^2 = \frac{hc}{\lambda} - \omega = 2\cdot257 - 1\cdot7 = \mathbf{0\cdot557\ eV}$

(*c*) V_0 = Maximum K.E. (in eV) = **0·557 V**

20. Proceed as in problem no. 19.

21. $\frac{1}{2}m\,v_{max}^2 = h\,\nu - \omega$

$= 6\cdot625\times10^{-34}\times10^{15} - 4\times1\cdot602\times10^{-19}$

$= 6\cdot625\times10^{-19} - 6\cdot408\times10^{-19} = 0\cdot217\times10^{-19}$ J

$\therefore\ v_{max} = \sqrt{\frac{2\times0\cdot217\times10^{-19}}{m}}$

$= \sqrt{\frac{2\times0\cdot217\times10^{-19}}{9\cdot1\times10^{-31}}} = \mathbf{2\cdot18\times10^{5}\ m\ s^{-1}}$

22. $h\,\nu = \omega + \frac{1}{2}m\,v_{max}^2$

$= 2\cdot3\times1\cdot6\times10^{-19} + \frac{1}{2}\times9\cdot1\times10^{-31}\times(10^4)^2$

$= 3\cdot68\times10^{-19} + 4\cdot55\times10^{-19} = 8\cdot23\times10^{-19}$ J

$\therefore\ \nu = \frac{8\cdot23\times10^{-19}}{6\cdot62\times10^{-34}} = \mathbf{1\cdot243\times10^{15}\ Hz}$

23. $\lambda_0 = \frac{h\,c}{\omega} = \frac{6\cdot625\times10^{-34}\times3\times10^{8}}{2\cdot35\times1\cdot6\times10^{-19}}$

$= 5\cdot286\times10^{-7}\ \mathrm{m} = \mathbf{5286\ Å}$

$\frac{1}{2}m\,v_{max}^2 = \frac{h\,c}{\lambda} - \omega$

$= \frac{6\cdot625\times10^{-34}\times3\times10^{8}}{1000\times10^{-10}\times1\cdot6\times10^{-19}} - 2\cdot35$

$= 12\cdot42 - 2\cdot35 = \mathbf{10\cdot07\ eV}$

24. $\frac{h\,c}{\lambda} = \frac{h\,c}{\lambda_0} + \frac{1}{2}m\,v_{max}^2$

$= \frac{6\cdot62\times10^{-27}\times3\times10^{10}}{2500\times10^{-8}} + 1\cdot56\times1\cdot6\times10^{-12}$

$= 7\cdot944\times10^{-12} + 2\cdot496\times10^{-12} = 10\cdot44\times10^{-12}$ erg

$\therefore\ \lambda = \frac{h\,c}{10\cdot44\times10^{-12}} = \frac{6\cdot62\times10^{-27}\times3\times10^{10}}{10\cdot44\times10^{-12}}$

$= 1\cdot902\times10^{-5}\ \mathrm{cm} = \mathbf{1902\ Å}$

25. $h\,\nu = h\,\nu_0 + e\,V_0$ or $\nu = \nu_0 + \frac{e\,V_0}{h}$

or $\nu = 6\times10^{-14} + \frac{1\cdot6\times10^{-19}\times3}{6\cdot62\times10^{-34}}$

$= 6\times10^{14} + 7\cdot25\times10^{14} = \mathbf{13\cdot25\times10^{14}\ s^{-1}}$

$$\omega = h\nu_0 = 6{\cdot}62 \times 10^{-34} \times 6 \times 10^{14} = 3{\cdot}97 \times 10^{-19}\ \text{J}$$

$$= \frac{3{\cdot}97\times10^{-19}}{1{\cdot}6\times10^{-19}} = \mathbf{2{\cdot}48\ eV}$$

26. $h\nu = h\nu_0 + \frac{1}{2} m v_{max}^2$

or $\nu = \nu_0 + \frac{1}{h}\left(\frac{1}{2} m v_{max}^2\right)$

$$= 4{\cdot}22\times10^{14} + \frac{1}{6{\cdot}6\times10^{-34}}\left[\frac{1}{2}\times 9{\cdot}1\times10^{-31}\times(6\times10^{5})^{2}\right]$$

$$= 4{\cdot}22 \times 10^{14} + 2{\cdot}48 \times 10^{14} = \mathbf{6{\cdot}7 \times 10^{14}\ Hz}$$

27. ***(a)*** $\frac{1}{2} m v_{max}^2 = \frac{hc}{\lambda} - \omega$

$$= \frac{6{\cdot}6\times10^{-34}\times3\times10^{8}}{2000\times10^{-10}} - 4{\cdot}2\times1{\cdot}6\times10^{-19}$$

$$= 9{\cdot}9 \times 10^{-19} - 6{\cdot}72 \times 10^{-19} = 3{\cdot}18 \times 10^{-19}\ \text{J}$$

$$= \frac{3{\cdot}18\times10^{-19}}{1{\cdot}6\times10^{-19}} = \mathbf{1{\cdot}9875\ eV}$$

(b) Slowest electrons emitted will have **zero** kinetic energy.

(c) V_0 = Maximum K.E. (in eV) = **1·9875 V**

(d) $\lambda_0 = \frac{hc}{\omega} = \frac{6{\cdot}6\times10^{-34}\times3\times10^{8}}{4{\cdot}2\times1{\cdot}6\times10^{-19}}$

$$= 2{\cdot}946 \times 10^{-7}\ \text{m} = \mathbf{2946\ Å}$$

28. $\frac{hc}{\lambda} = \omega + eV_0$ or $\omega = \frac{hc}{\lambda} - eV_0$

$$\therefore\ \omega = \frac{6{\cdot}62\times10^{-34}\times3\times10^{8}}{250\times10^{-9}} - 1{\cdot}6\times10^{-19}\times4$$

$$= 7{\cdot}944 \times 10^{-19} - 6{\cdot}4 \times 10^{-19} = 1{\cdot}544 \times 10^{-19}\ \text{J}$$

Let V_0' be stopping potential, when wavelength of inci light is increased to λ' (= 300 nm).

$$\therefore\ eV_0' = \frac{hc}{\lambda'} - \omega$$

$$= \frac{6{\cdot}62\times10^{-34}\times3\times10^{8}}{300\times10^{-9}} - 1{\cdot}544\times10^{-19}$$

$$= 6{\cdot}62 \times 10^{-19} - 1{\cdot}544 \times 10^{-19} = 5{\cdot}076 \times 10^{-19}\ \text{J}$$

or $V_0' = \frac{5{\cdot}076\times10^{-19}}{e} = \frac{5{\cdot}076\times10^{-19}}{1{\cdot}6\times10^{-19}} = \mathbf{3{\cdot}17\ V}$

29. Now, $\frac{hc}{\lambda} = \omega + eV_0$

or $\omega = \frac{hc}{\lambda} - eV_0$

$$= \frac{6{\cdot}62\times10^{-34}\times3\times10^{8}}{4950\times10^{-10}} - 1{\cdot}6\times10^{-19}\times0{\cdot}6$$

$$= 4{\cdot}01 \times 10^{-19} - 0{\cdot}96 \times 10^{-19} = 3{\cdot}05 \times 10^{-19}\ \text{J}$$

$$= \frac{3{\cdot}05\times10^{-19}}{1{\cdot}6\times10^{-19}} = \mathbf{1{\cdot}9\ eV}$$

Let λ' be wavelength of second source. Then,

$$\frac{hc}{\lambda'} = \omega + eV_0 = 3{\cdot}05\times10^{-19} + 1{\cdot}6\times10^{-19}\times1{\cdot}1$$

$$= 3{\cdot}05 \times 10^{-19} + 1{\cdot}76 \times 10^{-19} = 4{\cdot}81 \times 10^{-19}\ \text{J}$$

$$\therefore\ \lambda' = \frac{hc}{4{\cdot}81\times10^{-19}}$$

$$= \frac{6{\cdot}62\times10^{-34}\times3\times10^{8}}{4{\cdot}81\times10^{-19}} = 4{\cdot}129\times10^{-7}\ \text{m}$$

$$= \mathbf{4129\ Å}$$

There is **no effect of magnetic field** on photoelect emission.

CHAPTER
2

Wave Nature of Matter

2.01. DE-BROGLIE WAVES (Matter waves)

Radiation behaves both as wave and particle. In 1924, Loius de-Broglie put rward a bold hypothesis that matter should also possess dual nature.

Quotable Quote

"Some say that the only thing quantum theory has going for it is unquestionably correct." – **Michio Kaku**

The following observations led him to the duality hypothesis for matter :

1. *The whole energy in this universe is in the form of matter and electromagnetic diation.*

2. *The nature loves symmetry. As the radiation has got dual nature, matter should also ssess dual nature.*

Thus, according to de-Broglie, a wave is associated with every moving particle. hese waves are called ***de-Broglie waves*** or ***matter waves.***

According the quantum theory of radiation, energy of a photon is given by

$$E = h\nu \qquad \text{...(2.01)}$$

Further, the energy of a relativistic particle is given by

$$E = \sqrt{m_0^2\, c^2 + p^2\, c^2}$$

Since photon is a particle of zero rest mass, setting $m_0 = 0$ in the above equation, e have

$$E = p\,c \qquad \text{...(2.02)}$$

Key point

A photon has zero rest mass but a photon of energy E possesses a mass equal to E/c^2 and momentum equal to E/c.

From equations (2.01) and (2.02), we have

$$p\,c = h\nu$$

or

$$p = \frac{h\nu}{c} = \frac{h\nu}{\upsilon\lambda} \qquad (\because c = \upsilon\,\lambda)$$

or

$$p = \frac{h}{\lambda}$$

Therefore, the wavelength of the photon is given by

$$\lambda = \frac{h}{p} \qquad \text{...(2.03)}$$

Key point

de-Broglie waves are matter waves *i.e.* waves altogether different from electromagnetic waves.

de-Broglie asserted that the equation (2.03) is completely a general formula and pplies to photons as well as other moving particles. The momentum of a particle f mass m moving with velocity υ is $m\,\upsilon$. Hence, de-Broglie wavelength is given by

$$\lambda = \frac{h}{m\,\upsilon} \qquad \text{...(2.04)}$$

This is called ***de-Broglie relation***. It connects the ***momentum***, which is *haracteristic of the particle*, with the *wavelength*, which is *characteristic of the wave*. From his equation, the following conclusions can be drawn :

(*i*) *Lighter the particle, greater is its de-Broglie wavelength.*

(*ii*) *The faster the particle moves, the smaller is its de-Broglie wavelength.*

(*iii*) *The de-Broglie wavelength of a particle is independent of the charge or nature of the particle.*

(*iv*) *The matter waves are not electromagnetic in nature. The electromagnetic waves are produced only by charged particles.*

Key point

When a particle exhibits wave nature, it is associated with a wave packet, rather than a wave.

The calculations show that the velocity of de-Broglie waves associated with a moving particle is greater than the velocity with which the particle moves. Therefore, t was difficult to conceive as to how the de-Broglie waves are associated with a particle. If a large number of waves of frequencies differing by very small amounts are superimposed, a wave packet is formed. The velocity of the wave packet is found to be the same as that of the particle. Therefore, a plausible solution to the problem is that a moving particle is associated with a ***wave packet*** [Fig. 2.01], rather than a wave.

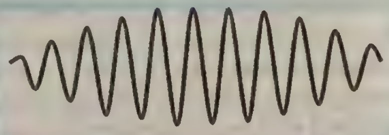

Fig. 2.01

If the velocity of the particle is comparable to the velocity of light, then mass of the particle is given by

$$m = \frac{m_0}{\sqrt{1 - v^2/c^2}}$$

Substituting for the mass m of the particle in equation (2.04), the de-Broglie wavelength of the particle, when moving with velocity comparable to velocity of light, is given by

$$\lambda = h\frac{\sqrt{1 - v^2/c^2}}{m_0\, v} \qquad ...(2.05)$$

2.02. DE-BROGLIE WAVELENGTH OF ELECTRON

Consider that an electron of mass m and charge e is accelerated through a potential difference V. If E is the energy acquired by the particle, then

$$E = e\,V$$

If v is the velocity of electron, then

$$E = \frac{1}{2} m\, v^2$$

or $$v = \sqrt{\frac{2\,E}{m}}$$

Now, de-Broglie wavelength of electron is given by

$$\lambda = \frac{h}{m\,v} = \frac{h}{m\sqrt{2\,E/m}}$$

or $$\lambda = \frac{h}{\sqrt{2\,m\,E}} \qquad ...(2.06)$$

Substituting the value of E, we get

$$\lambda = \frac{h}{\sqrt{2\,m\,e\,V}} \qquad ...(2.07)$$

Setting $m = 9{\cdot}1 \times 10^{-31}$ kg ; $e = 1{\cdot}6 \times 10^{-19}$ C and $h = 6{\cdot}62 \times 10^{-34}$ J s, we get

$$\lambda = \frac{12{\cdot}27}{\sqrt{V}} \times 10^{-10}\ \text{m}$$

or $$\lambda = \frac{12{\cdot}27}{\sqrt{V}}\ \text{Å} \qquad ...(2.08)$$

For example, the de-Broglie wavelength of electrons, when accelerated through a potential difference of 100 volt, will be

$$\lambda = \frac{12{\cdot}27}{\sqrt{100}} \approx 1{\cdot}227\ \text{Å}$$

Thus, the wavelength of de-Broglie waves associated with 100 eV electrons is of the order of the wavelength of X-rays, but the two are quite different from each other in nature.

Key point

A particle can behave both as a particl and wave but in a given situation, i behaves either as a particle or as a wave

Key point

As the accelerating voltage is increased de-Broglie wavelength of electron decreases.

Watch out !

Don't try to work out the momentum of high speed particle and hence its de-Broglie wavelength using its rest mass Mass increases significantly as the spee of the particle approaches the speed o light !

2.03. EXPERIMENTAL DEMONSTRATION OF WAVE NATURE OF ELECTRON

The wave nature of the material particles as predicted by de-Broglie was confirmed by Davisson and Germer (1927) in United States and by G.P. Thomson (1928) in Scotland. To demonstrate the wave nature of electrons, Davisson and Germer experiment is as discussed below :

Davisson and Germer experiment. Experimental arrangement used by Davisson and Germer is as shown in Fig. 2.02. Electrons from hot tungsten cathode (C) are accelerated by a potential difference V between the cathode and anode (A). A narrow hole in the anode renders the electrons into a fine beam of electrons and allows it to strike the nickel crystal. The electrons are scattered in all directions by the atoms in the crystal. The intensity of the electron beam scattered in a given direction is found by the use of a detector. By rotating the detector about an axis through the point O, the intensity of the scattered beam can be measured for different values of ϕ, the angle between incident and the scattered direction of electron beam. The graph is plotted between angle ϕ and the intensity of scattered electron beam.

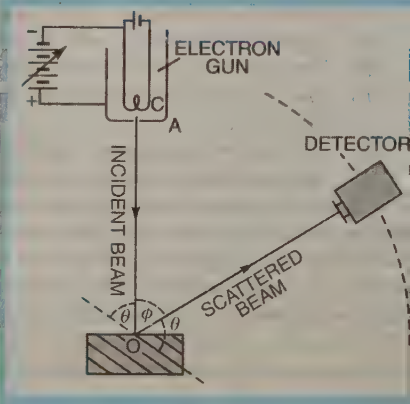

Fig. 2.02

ch graphs are plotted at different accelerating voltages. In each graph, the intensity electron beam in a given direction is proportional to the distance of the curve from e point O (the point of scattering) in that direction. The experimental curves otained by Davisson and Germer were as shown in Fig. 2.03.

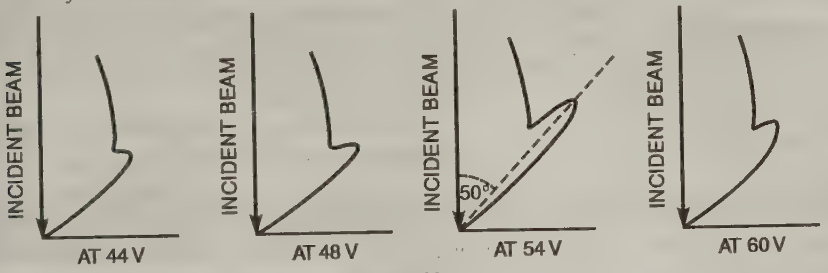

Fig. 2.03

From these experimental curves, following inferences can be drawn :

(*i*) Intensity of scattered electrons depends upon the angle of scattering ϕ.

(*ii*) Always a `bump' or a kink occurs in the curve at $\phi = 50°$, the angle which the scattered beam makes with the incident beam.

(*iii*) The size of the bump goes on increasing as the accelerating voltage is increased.

(*iv*) The size of the bump becomes maximum, when accelerating voltage is 54 volt.

(*v*) The size of the bump starts decreasing with further increase in accelerating voltage.

However, according to classical physics, there should be very little variation n the intensity of electron beam with the angle of scattering and the accelerating oltages.

Explanation. The selective reflection of the 54 volt electrons at an angle of 0°between incident and scattered beam can be termed as the diffraction of electrons rom the regularly spaced electrons of nickel crystal by virtue of their wave nature.

Key point

Since phenomenon of diffraction is exhibited by waves, electrons must be behaving as waves in Davisson and Germer experiment.

From Fig. 2.02, it follows that

$$\theta = \frac{1}{2}(180° - \phi)$$

For $\phi = 50°, \theta = \frac{1}{2}(180° - 50°) = \frac{1}{2} \times 130° = 65°$

According to Bragg's law, for first order diffraction maximum ($n = 1$), we have

$$2\,d \sin\theta = 1 \times \lambda$$

For nickel crystal, the distance between atomic planes, $d = 0{\cdot}91$ Å

Therefore, $\lambda = 2 \times 0{\cdot}91 \times \sin 65° = 1{\cdot}66$ Å

Now, wave nature of electron and hence de-Broglie hypothesis will be confirmed, if de-Broglie wavelength of electrons when accelerated through 54V comes out to be just 1·66 Å.

Putting V = 54 volt in equation (2.08), we get

$$\lambda = \frac{12{\cdot}27}{\sqrt{54}} = 1{\cdot}65 \text{ Å}$$

As the two results are in remarkable agreement, the experiment establishes the wave nature of an electron in particular and of a particle in general.

SOLVED NUMERICAL QUESTIONS

Type A. On de-Broglie wavelength of a particle

Problem 2.01. Calculate the de-Broglie wavelength for electron and proton, if their speed is 10^5 m s^{-1}. Given, mass of an electron = $9{\cdot}1 \times 10^{-31}$ kg, mass of proton = $1{\cdot}67 \times 10^{-27}$ kg and Planck's constant = $6{\cdot}62 \times 10^{-34}$ J s.

Sol. Here, $h = 6{\cdot}62 \times 10^{-34}$ J s

de-Broglie wavelength of electron :

Here, $m_e = 9{\cdot}1 \times 10^{-31}$ kg ; $v_e = 10^5$ m s^{-1}

$$\therefore \quad \lambda_e = \frac{h}{m_e\, v_e} = \frac{6{\cdot}62 \times 10^{-34}}{9{\cdot}1 \times 10^{-31} \times 10^5} = \mathbf{7{\cdot}27 \times 10^{-9}\ m}$$

de-Broglie wavelength of proton :

Here, $m_p = 1{\cdot}67 \times 10^{-27}$ kg ; $v_p = 10^5$ m s^{-1}

$$\therefore \quad \lambda_p = \frac{h}{m_p\, v_p} = \frac{6{\cdot}62 \times 10^{-34}}{1{\cdot}67 \times 10^{-27} \times 10^5} = \mathbf{3{\cdot}96 \times 10^{-12}\ m}$$

Problem 2.02. Find the de-Broglie wavelength associated with an electron moving with a velocity 0·5 *c* and rest mass = 9·1 × 10^{-31} kg.

Sol. Here, $m_0 = 9{\cdot}1 \times 10^{-31}$ kg ; $h = 6{\cdot}62 \times 10^{-34}$ J s ;

$$v = 0{\cdot}5\,c \quad \text{or} \quad v/c = 0{\cdot}5$$

Since electron is moving at a speed comparable to the velocity of light,

$$\lambda = \frac{h}{m\,v} = \frac{h\sqrt{1 - v^2/c^2}}{m_0\,v}$$

$$= \frac{6{\cdot}62 \times 10^{-34}\sqrt{1 - (0{\cdot}5)^2}}{9{\cdot}1 \times 10^{-31} \times 1{\cdot}5 \times 10^8}$$

$$= \frac{6{\cdot}62 \times 10^{-34}\sqrt{1 - 0{\cdot}25}}{9{\cdot}1 \times 10^{-31} \times 1{\cdot}5 \times 10^8}$$

$$= \mathbf{4{\cdot}2 \times 10^{-12}\ m}$$

Type B. On de-Broglie wavelength of an accelerate electron

Problem 2.03. Calculate the de-Broglie wavelengt of an electron of energy 400 eV. Given, Planck's constant = 6·6 × 10^{-34} J s, mass of electron = 9·1 × 10^{-31} kg 1 eV = 1·6 × 10^{-19} J *(H.P.S.S.C.E. 2000 ; I.S.C.E. 1993*

Sol. Here, $h = 6{\cdot}6 \times 10^{-34}$ J s ; $m = 9{\cdot}1 \times 10^{-31}$ kg ;

$$1\ \text{eV} = 1{\cdot}6 \times 10^{-19}\ \text{J}$$

$$E = 400\ \text{eV} = 400 \times 1{\cdot}6 \times 10^{-19} = 6{\cdot}4 \times 10^{-17}\ \text{J}$$

If λ is de-Broglie wavelength of electron, then

$$\lambda = \frac{h}{\sqrt{2\,m\,E}} = \frac{6{\cdot}6 \times 10^{-34}}{\sqrt{2 \times 9{\cdot}1 \times 10^{-31} \times 6{\cdot}4 \times 10^{-17}}}$$

$$= \frac{6{\cdot}6 \times 10^{-34}}{10{\cdot}8 \times 10^{-24}} = 0{\cdot}61 \times 10^{-10}\ \text{m}$$

$$= \mathbf{0{\cdot}61\ Å}$$

abc TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 2.04. Obtain the de-Broglie wavelength associated with thermal neutrons at room temperature (27°C). Hence, explain why a fast neutron beam needs to be thermalized with the environment, before it can be used for neutron diffraction experiments. *(Text Problem)*

Sol. Here, T = 27 + 273 = 300 K

Energy of neutron at temperature T, $E = \frac{3}{2}kT$

Taking $k = 1{\cdot}38 \times 10^{-23}$ J molecule^{-1} K^{-1}, we have

$$E = \frac{3}{2} \times 1{\cdot}38 \times 10^{-23} \times 300 = 6{\cdot}21 \times 10^{-21}\ \text{J}$$

Now, $\lambda = \frac{h}{\sqrt{2\,m\,E}}$

Taking mass of deutron, $m = 1{\cdot}675 \times 10^{-27}$ kg, we have

$$\lambda = \frac{6{\cdot}62 \times 10^{-34}}{\sqrt{2 \times 1{\cdot}675 \times 10^{-27} \times 6{\cdot}21 \times 10^{-21}}} = \frac{6{\cdot}62 \times 10^{-34}}{4{\cdot}56 \times 10^{-24}}$$

$$= \mathbf{1{\cdot}452 \times 10^{-10}\ m}$$

Thus, thermal neutrons have wavelength of the order of interatomic spacing(≈ 10^{-10} m)and therefore they are suitable for diffraction experiments. Fast neutrons will possess wavelength quite small as compared to interatomic spacing and are not suitable for diffraction experiments. Hence, for neutron diffraction experiments, fast neutron beam needs to be thermalized.

Problem 2.05. Crystal diffraction experiments can be performed using X-rays or electrons accelerated through appropriate voltage. Which probe has greater energy, an X-ray photon or the electron ? (For quantitative comparison, take the wavelength of the probe equal to 1 Å, which is of order of interatomic spacing in the lattice). Given, m_e = 9·11 × 10^{-31} kg. *(Text Problem)*

Sol. *For X-ray photon of wavelength of 1 Å :*

$$\lambda = 1\ Å = 10^{-10}\ \text{m}$$

$$E = \frac{hc}{\lambda} = \frac{6{\cdot}62 \times 10^{-34} \times 3 \times 10^8}{10^{-10}} = 1{\cdot}986 \times 10^{-15}\ \text{J}$$

$$= \frac{1{\cdot}986 \times 10^{-15}}{1{\cdot}6 \times 10^{-19}} = 12{\cdot}4 \times 10^3\ \text{eV} = 12{\cdot}4\ \text{keV}$$

For electron of wavelength 1 Å :

$$\lambda = 1\ Å = 10^{-10}\ \text{m}$$

Now $\lambda = \frac{h}{m\,v}$

or $m\,v = \frac{h}{\lambda} = \frac{6{\cdot}62 \times 10^{-34}}{10^{-10}} = 6{\cdot}62 \times 10^{-24}$ kg m s^{-1}

Energy of electron,

$$E = \frac{1}{2}m\,v^2 = \frac{(m\,v)^2}{2\,m}$$

$$= \frac{(6{\cdot}62 \times 10^{-24})^2}{2 \times 9{\cdot}11 \times 10^{-31}} = 2{\cdot}405 \times 10^{-17}\ \text{J}$$

$$= \frac{2{\cdot}405 \times 10^{-17}}{1{\cdot}6 \times 10^{-19}} = \mathbf{150{\cdot}5\ eV}$$

It follows that X-ray photon has greater energy.

Problem 2.06. Obtain the de-Broglie wavelength of a neutron of kinetic energy 150 eV. As said in conceptual problem 2.05, an electron beam of this energy is suitable for crystal diffraction experiments. Would a neutron beam of the same energy be equally suitable ? Explain. Given, m_n = 1·675 × 10^{-27} kg. *(Text Problem)*

Sol. Here, $m_n = 1{\cdot}675 \times 10^{-27}$ kg ;

$$E = 150\ \text{eV} = 150 \times 1{\cdot}6 \times 10^{-19}$$

$$= 2{\cdot}4 \times 10^{-17}\ \text{J}$$

Now, $\lambda = \frac{h}{m\,v} = \frac{h}{\sqrt{2\,m\,E}}$

Therefore, de-Broglie wavelength of neutron is given by

$$\lambda = \frac{6{\cdot}62 \times 10^{-34}}{\sqrt{2 \times 1{\cdot}675 \times 10^{-27} \times 2{\cdot}4 \times 10^{-17}}} = \frac{6{\cdot}62 \times 10^{-34}}{2{\cdot}835 \times 10^{-22}}$$

$$= 2{\cdot}335 \times 10^{-12}\ \text{m}$$

Since the interatomic spacing(≈ 10^{-10} m) is about 100 times greater than the de-Broglie wave length of 150 eV neutrons, they are not suitable for crystal diffraction experiments.

Problem 2.07. An electron microscope uses electrons accelerated by a voltage of 50 kV. Determine the de-Broglie wavelength associated with the electrons. If other

ctors (such as numerical aperture, etc.) are taken to be ughly the same, how does the resolving power of an ectron microscope compare with that of an optical microope which uses yellow light ? (*Text Problem*)

Sol. Here, V=50 kV

Therefore, energy of electrons

$$E = 50 \text{ keV} = 50 \times 10^3 \times 1{\cdot}6 \times 10^{-19}$$
$$= 8{\cdot}0 \times 10^{-15} \text{ J}$$

Now, $\lambda = \dfrac{h}{\sqrt{2\,m\,E}}$

Taking $m = 9{\cdot}1 \times 10^{-31}$ kg, we have

$$\lambda = \frac{6{\cdot}62 \times 10^{-34}}{\sqrt{2 \times 9{\cdot}1 \times 10^{-31} \times 8{\cdot}0 \times 10^{-15}}} = \frac{6{\cdot}62 \times 10^{-34}}{1{\cdot}207 \times 10^{-22}}$$
$$= 5{\cdot}485 \times 10^{-12} \text{ m}$$

The resolving power of a microscope is inversely proportional to the wavelength of the radiation used. Since wavelength of the yellow light is 5990Å *i.e.* $5{\cdot}99 \times 10^{-7}$ m, it follows that the electron microscope will possess resolving power 10^5 times as large as that of the optical microscope.

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 2.01. Is photon a wave or a particle ?

Ans. Photon is a particle. It possesses wave nature also.

Q. 2.02. What is the momentum of a photon of equency ν ? (*H.P.S.S.C.E. 1996*)

Ans. Momentum of photon of frequency ν, $p = \dfrac{h\nu}{c}$

Q. 2.03. Write down the relation between the energy nd the momentum of a photon. (*I.S.C.E. 1993*)

Ans. $p = \dfrac{E}{c}$, where *c* is the velocity of light.

Q. 2.04. What is the rest mass of a photon ? (*P.S.S.C.E. 1999 S ; H.P.S.S.C.E. 1993*)

Ans. Rest mass of a photon is zero.

Q. 2.05. What led to the discovery of matter waves ?

Ans. de-Broglie's concept of 'nature loves symmetry' led o the discovery of matter waves.

Q. 2.06. Is there any difference between light waves nd matter waves ?

Ans. Light waves are electromagnetic waves, whereas natter waves are not. Matter waves are associated with a noving particle.

Q. 2.07. Are matter waves electromagnetic ? Write de-Broglie wave equation. (*H.S.S.C.E. 1992*)

Ans. No, matter waves are not electromagnetic in nature.

de-Broglie relation : $\lambda = \dfrac{h}{m v}$

Q. 2.08. What information is derived from electron diffraction experiments ? (*I.S.C.E. 1997*)

Ans. A particle possesses wave nature also.

Q. 2.09. What is de-Broglie wavelength of a 3 kg object moving with a speed of 2 m s^{-1}? (*C.B.S.E. 1992*)

Ans. de-Broglie wavelength,

$$\lambda = \frac{h}{m v} = \frac{6{\cdot}62 \times 10^{-23}}{3 \times 2}$$
$$= 1{\cdot}1 \times 10^{-34} \text{ m}$$

Q. 2.10. Calculate the momentum of electrons ; if their wavelength is 2 Å. Given that Planck's constant, $h = 6{\cdot}626 \times 10^{-34}$ J s ; mass of electron, $m = 9{\cdot}1 \times 10^{-31}$ kg . (*H.P.S.S.C.E. 1998 S*)

Sol. Here, $\lambda = 2$ Å $= 2 \times 10^{-10}$ m ; $h = 6{\cdot}626 \times 10^{-34}$ J s ;
$m = 9{\cdot}1 \times 10^{-31}$ kg

Momentum of electron,

$$p = \frac{h}{\lambda} = \frac{6{\cdot}626 \times 10^{-34}}{2 \times 10^{-10}}$$
$$= 3{\cdot}313 \times 10^{-24} \text{ kg m s}^{-1}$$

Q. 2.11. A photon and an electron have the same wavelength. Which particle is moving faster ?

Ans. A photon travels with velocity of light, whereas velocity of electron is always less than that of light.

Q. 2.12. On what principle is electron microscope based ?

Ans. An electron microscope is based on the fact that the electrons can behave as waves of extremely small wavelength when accelerated through a potential difference of about 50 kV.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 2.01. What do you understand by the phrase 'dual nature of radiation' ? (*C.B.S.E. 1982, 1981*)

Ans. The phenomena such as interference, diffraction and polarisation can only be explained on the basis of wave nature of the radiation. On the other hand, the phenomena such as photoelectric effect and Compton effect can be explained by considering particle nature of radiation.

It was, therefore, concluded that the radiation has dual nature.

Q. 2.02. Derive de-Broglie's wave equation for material particles. (*H.P.S.S.C.E. 1993*)

Ans. Refer to section 2.01.

Q. 2.03. Find the momentum of an X-ray photon of wavelength λ. (*I.S.C.E. 1997*)

Ans. Refer to section 2.01.

Q. 2.04. The de-Broglie wavelength of a particle of kinetic energy K is λ. What would be the wavelength of the particle, if its kinetic energy were K /4 ? (*I.S.C.E. 1993*)

Ans. If λ is the de-Broglie wavelength of the particle of kinetic energy K, then

$$\lambda = \frac{h}{\sqrt{2\,m\,K}}$$

Suppose that the de-Broglie wavelength of the particle becomes λ', when its kinetic energy is K/4.

Then, $$\lambda' = \frac{h}{\sqrt{2\,m\,K/4}} = 2\left(\frac{h}{\sqrt{2\,m\,K}}\right) = \mathbf{2\,\lambda}$$

Q. 2.05. For a given kinetic energy, which of the following has the smallest de-Broglie wavelength : electron, proton or α-particle ? *(Text Question)*

Ans. Let m_1, m_2, m_3 be masses and v_1, v_2, v_3 be velocities for electron, proton and α-particle respectively. As the three particles are of same kinetic energy, it follows that

$$\frac{1}{2} m_1 v_1^2 = \frac{1}{2} m_2 v_2^2 = \frac{1}{2} m_3 v_3^2 = \text{E (say)}$$

$$\therefore \quad m_1 v_1 = \sqrt{2 m_1 \text{E}}, \; m_2 v_2 = \sqrt{2 m_2 \text{E}}$$

$$\text{and} \quad m_3 v_3 = \sqrt{2 m_3 \text{E}}$$

Obviously, $m_1 v_1 < m_2 v_2 < m_3 v_3$

Since de-Broglie wavelength, $\lambda = \frac{h}{m v}$, it follows that de-Broglie wave will be the smallest for α-particle.

Q. 2.06. A particle of mass M at rest decays into two particles of masses m_1 and m_2 having non zero velocities. What is the ratio of the de-Broglie wavelengths of the two particles ? *(I.I.T. 1999)*

Ans. Suppose that the particle of mass M (at rest) decays into two particles of masses m_1 and m_2, which start moving with velocities v_1 and v_2 respectively. Then, according to the principle of conservation of momentum,

$$m_1 v_1 + m_2 v_2 = \text{M} \times 0 \text{ or } m_1 v_1 = -m_2 v_2$$

$$\text{or} \quad |m_1 v_1| = |m_2 v_2|$$

Now, de-Broglie wavelength of a particle,

$$\lambda = \frac{h}{m v}$$

Since $|m_1 v_1| = |m_2 v_2|$, the two particles will have equal de-Broglie wavelengths *i.e.*

$$\frac{\lambda_1}{\lambda_2} = 1$$

Q. 2.07. A photon and electron have got the same de-Broglie wavelength. Which has greater total energy ? Explain. *(H.P.S.S.C.E. 1998)*

Or

An electron is having the de-Broglie wavelength same as the wavelength of a photon. Prove that energy of electron is greater than that of photon. *(H.P.S.S.C.E. 1995)*

Ans. Let λ be the common wavelength of electron and photon. If m and v are mass and velocity of the electron, then

$$\text{de-Broglie wavelength of electron, } \lambda = \frac{h}{m v}$$

$$\text{Energy of electron (mass } m\text{), } \text{E}_1 = m c^2$$

$$\text{Energy of the photon} \left(\text{wavelength, } \lambda = \frac{h}{m v} \right),$$

$$\text{E}_2 = \frac{h c}{\lambda} = h c \times \frac{m v}{h}$$

$$\text{or} \quad \text{E}_2 = m v c$$

$$\text{since} \quad c > v, \text{E}_1 > \text{E}_2$$

Q. 2.08. The de-Broglie wavelength of a photon is sam as the wavelength of an electron. Show that the K.E. o photon is 2 λ m c/h times the K.E. of the electron, where r is the mass of electron and c is the velocity of light.

Ans. If the photon and an electron having mass m an moving with velocity v possess the same de-brogli wavelength λ, then as obtained in SAQ 2.07,

$$\text{the energy of photon, } \frac{h c}{\lambda} = m v c$$

$$\text{and the energy of electron } = m c^2$$

The rest mass energy of photon is zero. Therefore, energ of photon refers to kinetic energy of photon. However, th energy of the electron *i.e.* $m c^2$ is the sum of its rest mass energ ($m_0 c^2$) and kinetic energy $\left(\frac{1}{2} m v^2\right)$. If E_1 and E_2 are kineti energies of photon and electron, then

$$\frac{\text{E}_1}{\text{E}_2} = \frac{m v c}{\frac{1}{2} m v^2} = \frac{2 c}{v}$$

$$\text{Now, de-Broglie wavlength, } \lambda = \frac{h}{m v}$$

$$\text{or} \quad v = \frac{h}{m \lambda}$$

Substituting for v in the above equation, we have

$$\frac{\text{E}_1}{\text{E}_2} = 2 c \Big/ \frac{h}{m \lambda} = \frac{2 \lambda m c}{h}$$

Q. 2.09. An electron and a proton have the same de Broglie wavelength. Which one of these has higher kineti energy ? *(I.S.C.E. 1994*

Or

A proton and an electron have same de-Broglie wavelength. Which of them moves fast and which possesses more kinetic energy ? Justify your answer. *(C.B.S.E. Sample Q. Paper*

Ans. Refer to SAQs 2.07 and 2.08. Photon has highe kinetic energy.

Q. 2.10. Why is the wave nature of matter not apparen in our daily observations ?

Ans. The value of de-Broglie wavelength associated wit a moving particle is given by

$$\lambda = \frac{h}{m v}$$

Consider a ball of 0·5 kg moving with a velocity o 10 m s^{-1}. It is an object from our daily observations. The de-Broglie wavelength of the ball will be

$$\lambda = \frac{6 \cdot 625 \times 10^{-34}}{0 \cdot 5 \times 10} = 1 \cdot 325 \times 10^{-34} \text{ m}$$

The value of λ is very small as compared to the size a ball of 0·5 kg would possess. Hence, wave nature of matte is not apparent in our daily observations.

abc TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 2.01. Is the de-Broglie wavelength of a photon of an electromagnetic radiation equal to the wavelength of the radiation ? *(Text Problem)*

Ans. Yes, wavelength of a photon and de-Broglie wavelength of a photon are equal.

Q. 2.02. Prove that de-Broglie hypothesis of matter waves is in agreement with Bohr's theory.

Ans. According to Bohr's theory, *angular momentum of an electron in a stationary orbit is equal to integral multiple of* $\frac{h}{2\pi}$ *i.e.*

$$m v r = n \frac{h}{2\pi} \qquad ...(i)$$

This quantisation principle applies to particle nature of the electron. If electron behaves as a wave, then stationary orbit may be interpreted as the one, whose circumference contains integral multiple of de-Broglie wavelengths of electron. Therefore, if λ is de-Broglie wavelength of electron, then

$$2\pi r = n\lambda \qquad ...(ii)$$

Dividing equation (*i*) by (*ii*), we get

$$\frac{m v r}{2\pi r} = \frac{n h}{2\pi} \cdot \frac{1}{n\lambda} \quad \text{or} \quad \lambda = \frac{h}{m v}$$

Hence, de-Broglie hypothesis is in agreement with Bohr's theory.

Q. 2.03. The extent of localisation of a particle is determined roughly by its de-Broglie wave. If an electron is localized within the nucleus (of size about 10^{-14} m) of an atom, what is its energy ? Compare this energy with the typical binding energies (of the order of a few MeV) in a nucleus and hence argue why electrons cannot reside in a nucleus. (*Text Question*)

Ans. The de-broglie wavelength of electron,

$$\lambda = \text{size of atom} = 10^{-14}\ \text{m}$$

Corresponding to this wavelength, the electron possesses energy,

$$E = \frac{h c}{\lambda} = \frac{6 \cdot 62 \times 10^{-34} \times 3 \times 10^{8}}{10^{-14}} = 1 \cdot 986 \times 10^{-11}\ \text{J}$$

$$= \frac{198 \cdot 6 \times 10^{-13}}{1 \cdot 6 \times 10^{-13}} = 124 \cdot 1\ \text{MeV}$$

If the electrons possess energy of the order of 124 MeV, they will not be able to stay inside the nucleus. It is because Coulomb's force cannot provide such a high value of binding energy to the electrons. Hence, electrons cannot reside inside the nucleus.

Q. 2.04. A fast neutron beam needs to be thermalized with the environment, before it can be used for neutron diffraction experiments. Why ? (*Text Question*)

Ans. For diffraction experiment, the de-Broglie wavelength must be of the order of interatomic spacing *i.e.* 1 Å. An electron having energy 150 eV or so possesses de-Broglie wavelength of the order of 1 Å but a neutron having the same energy possesses wavelength quite small as compared to the interatomic spacing. Hence, the neutron beam cannot be used as such for diffraction experiments.

However, a neutron at room temperature, say 27°C, possesses wavelength of the order of interatomic spacing. Therefore, in order to study diffraction experiment with a neutron beam, it should be thermalized.

FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Describe de-Broglie concept of matter waves and obtain an expression for the momentum and wavelength of the particle.
2. Derive an expression for the de-Broglie wavelength of an electron moving under a potential difference of V volt. (*H.S.S.C.E. 1999*)
3. Show that the de-Broglie wavelength λ of electrons of energy E is given by the relation :
$$\lambda = \frac{h}{\sqrt{2 m E}} \qquad \text{(C.B.S.E. 1993)}$$
4. Explain de-Broglie concept of matter waves with the help of relevant expressions. Find the wavelength of an electron moving under a potential difference of V volt.

FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. What led de-Broglie to think that matter might have wave properties ? How was his hypothesis experimentally verified ?
2. Derive de-Broglie wavelength formula. How has the same been experimentally verified ?
3. Explain dual nature of radiation and matter and describe briefly Davisson and Germer experiment for qualitative verification of matter waves.
4. Describe Davisson and Germer experiment to depict the wave nature of electron. (*H.S.S.C.E. 1999 S*)

FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On de-Broglie wavelength of a particle

1. Calculate the wavelength of matter waves associated with a particle of mass 0·5 g moving with a velocity of 400 cm s^{-1}. **[Ans.** 3·31 × 10^{-29} cm]
2. Calculate the wavelength of de-Broglie wave associated with a ball of mass 1 kg travelling with a speed of 1 m s^{-1}. **[Ans.** 6·62 × 10^{-34} m]
3. Calculate the de-Broglie wavelength of electron and proton, if their speed is 10^5 m s^{-1}. Given mass of proton = 1·67 × 10^{-27} kg ; mass of electron = 9·1 × 10^{-31} kg and h = 6·62 × 10^{-34} J s. (*H.P.S.S.C.E. 1999 S*) **[Ans.** 7·27 × 10^{-9} m ; 3·96 × 10^{-12} m]
4. Is it possible to observe de-Broglie wave associated with a material particle of 10^{-4} g moving with the velocity of light ? Planck's constant is 6·6 × 10^{-27} erg s. **[Ans.** No]
5. The de-Broglie wavelength of an electron is 2 Å. Calculate its momentum. **[Ans.** 3·31 × 10^{-24} kg m s^{-1}]
6. Find the wavelength for a beam of neutrons, whose kinetic energy is 100 eV. Given that mass of neutron = 1·676 × 10^{-24} g and h = 6·62 × 10^{-27} erg s. **[Ans.**0·0286 Å]
7. What wavelength is predicted for a beam of electrons, whose kinetic energy is 100 eV ? Given, h = 6·6 × 10^{-34} J s. (*Pre-degree Kerala, 1992*) **[Ans.** 1·223 Å]
8. Find the de-Broglie wavelength of a 2 MeV proton. Given, mass of proton is 1·67 × 10^{-27} kg. **[Ans.** 2·025 × 10^{-14} m]

Type B. On de-Broglie wavelength of an accelerated electron

9. Calculate de-Broglie wavelength of an electron beam accelerated through a potential difference of 60 V. (*C.B.S.E. 1993*) **[Ans.** 1·584 Å]

10. Calculate the wavelength of de-Broglie wave associated with a beam of electrons, which traverse a potential difference of 300 V. Assume the initial speed of electrons to be zero. **[Ans.** 0·708 Å]

11. What voltage must be applied to an electron microscope to produce electrons of wavelength 0·4 Å ? **[Ans.** 940·96 V]

MISCELLANEOUS PROBLEMS

12. Find de-Broglie wavelength of neutron at 127°C. Given, Boltzmann's constant $k = 1{\cdot}38 \times 10^{-23}$ J molecule^{-1} K^{-1}, $h = 6{\cdot}625 \times 10^{-34}$ J s, mass of neutron $= 1{\cdot}66 \times 10^{-27}$ kg. **[Ans.** 1·263 Å]

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. $\lambda = \dfrac{h}{mv} = \dfrac{6\cdot 62 \times 10^{-27}}{0\cdot 5 \times 400}$ (Take $h = 6{\cdot}62 \times 10^{-27}$ erg s)

   $= \mathbf{3{\cdot}31 \times 10^{-29}}$ **cm**

2. Proceed as in problem no. 1.

3. *For electron :*

   $$\lambda = \frac{h}{mv} = \frac{6\cdot 62 \times 10^{-34}}{9\cdot 1 \times 10^{-31} \times 10^{5}} = \mathbf{7{\cdot}27 \times 10^{-9}\ m}$$

   For proton :

   $$\lambda = \frac{h}{mv} = \frac{6\cdot 62 \times 10^{-34}}{9\cdot 1 \times 10^{-27} \times 10^{5}} = \mathbf{3{\cdot}96 \times 10^{-12}\ m}$$

4. A material particle can not move with the velocity of light. Therefore, it is **not possible** to deserve de-Broglie wavelength associated with such a particle.

5. $$p = \frac{h}{\lambda} = \frac{6\cdot 62 \times 10^{-34}}{2 \times 10^{-10}} = \mathbf{3{\cdot}31 \times 10^{-24}\ kg\ m\ s^{-1}}$$

6. $$\lambda = \frac{h}{\sqrt{2mE}}$$

   $$= \frac{6\cdot 62 \times 10^{-27}}{\sqrt{2 \times 1\cdot 676 \times 10^{-24} \times 100 \times 1\cdot 6 \times 10^{-12}}}$$

   $= 2{\cdot}86 \times 10^{-10}$ cm $= \mathbf{0{\cdot}0286}$ **Å**

7. Take mass of electron as $9{\cdot}1 \times 10^{-31}$ kg and proceed as in problem no. 6.

8. Proceed as in problem no. 6.

9. $$\lambda = \frac{h}{\sqrt{2meV}}$$

   $$= \frac{6\cdot 62 \times 10^{-34}}{\sqrt{2 \times 9\cdot 1 \times 10^{-31} \times 1\cdot 6 \times 10^{-19} \times 60}}$$

   $= 1{\cdot}584 \times 10^{-10}$ m $= \mathbf{1{\cdot}584}$ **Å**

10. Proceed as in problem no. 9.

11. Proceed as in problem no. 9.

12. Energy of neutron at 127°C *i.e.* 400 K,

    $$E = \frac{3}{2} kT = \frac{3}{2} \times 1\cdot 38 \times 10^{-23} \times 400$$

    $$= 8\cdot 28 \times 10^{-21}\ \text{J}$$

    Now, $\lambda = \dfrac{h}{\sqrt{2mE}}$

    $$= \frac{6\cdot 62 \times 10^{-34}}{\sqrt{2 \times 1\cdot 66 \times 10^{-27} \times 8\cdot 28 \times 10^{-21}}}$$

    $= 1{\cdot}263 \times 10^{-10}$ m $= \mathbf{1{\cdot}263}$ **Å**

Competitive Examination File (Unit VII)

REVISION AT A GLANCE

Chapter 1. Particle Nature of Radiation

☐ **Photon.** It is a packet of energy. A photon of frequency ν possesses energy $h\,\nu$. The rest mass of a photon is zero.

☐ **Work function of a metal.** *The minimum energy, which must be supplied to the electron so that it can just come out of a metal surface, is called the work function of the metal.* It is denoted by ω.

☐ **Photoelectric effect.** *The phenomenon of ejection of electrons from a metal surface, when light of sufficiently high frequency falls upon it, is known as photoelectric effect.*

The electrons so emitted are called ***photoelectrons.***

☐ **Threshold frequency.** *The minimum frequency (ν_0) which the incident light must possess so as to eject photoelectrons from a metal surface, is called threshold frequency of the metal.*

Mathematically : Work function, $\omega = h\,\nu_0$

☐ **Laws of photoelectric effect. 1.** Photoelectric emission takes place from a metal surface, when the frequency of incident light is above its threshold frequency.

2. The photoelectric emission starts as soon as the light is incident on the metal surface.

3. The maximum kinetic energy with which an electron is emitted from a metal surface is independent of the intensity of light and depends upon its frequency.

4. The number of photoelectrons emitted is independent of the frequency of the incident light and depends only upon its intensity.

☐ **Cut off potential.** *It is that minimum value of negative potential* (V_0) *, which should be applied to the anode in a photo cell so that the photoelectric current becomes zero.*

Mathematically :

$$e\,V_0 = \frac{1}{2} m\,v_{max}{}^2,$$

where v_{max} is the maximum velocity with which photoelectrons are emitted.

☐ **Einstein's photoelectric equation.** When light of frequency ν is incident on a metal surface, whose work function is ω (*i.e.* $h\,\nu_0$), then the maximum kinetic energy $\left(\frac{1}{2} m\,v_{max}{}^2\right)$ of the emitted photoelectrons is given by

$$h\,\nu = h\,\nu_0 = \frac{1}{2} m\,v_{max}{}^2$$

It is called Einstein's photoelectric equation. It can explain all the laws of photoelectric emission.

☐ **Photoelectric cell.** *A photo cell is an arrangement, which produces electric current, when light falls on its cathode.*

Some Useful Facts.

1. Wave nature of light cannot explain the fact that the emission of photoelectrons takes place as soon as the light is incident on the metal surface.

2. Photoelectric effect is one-one phenomenon *i.e.* one photon of light is capable of ejecting one electron only.

Chapter 2. Wave Nature of Matter

☐ **de-Broglie hypothesis.** *Both radiation and matter have dual nature.*

A particle of momentum p is associated with de-Broglie wave of wavelength

$$\lambda = \frac{h}{p} = \frac{h}{m\,v}$$

The above relation is called de-Broglie relation and the wavelength of the wave associated is called ***de-Broglie wavelength of the particle.***

☐ **de-Broglie wavelength of electron.** An electron of kinetic energy E possesses de-Broglie wavelength,

$$\lambda = \frac{h}{\sqrt{2\,m\,E}}$$

If electron is accelerated through a potential difference V, so as to acquire kinetic energy E (= e V), then

$$\lambda = \frac{h}{\sqrt{2\,m\,e\,V}} = \frac{12{\cdot}27}{\sqrt{V}}\ \text{Å}$$

Some Useful Facts

1. A moving particle is associated with a wave packet, rather than a wave.

2. In case, the particle is moving with a speed (v) comparable to the speed of light (c), then in expression

$$\lambda = \frac{h}{m\,v},$$

m refers to relativistic mass of the particle *i.e.*

$$m = \frac{m_0}{\sqrt{1 - v^2/c^2}}$$

Here, m_0 is the rest mass of the particle.

NUMERICAL PROBLEMS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Particle Nature of Radiation

Problem 1.01. Find the number of photons emitted per second by a 25 W source of monochromatic light of wavelength 6000 Å . *(Roorkee, 1983)*

Sol. Here, $\lambda = 6000$ Å $= 6 \times 10^{-7}$ m ;

power of source, P = 25 W = 25 J s^{-1} ;

Now, energy of a photon,

$$E = \frac{h\,c}{\lambda} = \frac{6 \cdot 62 \times 10^{-34} \times 3 \times 10^8}{6 \times 10^{-7}} = 3 \cdot 31 \times 10^{-19}\ \text{J}$$

Therefore, number of photons emitted per second,

$$n = \frac{P}{E} = \frac{25}{3 \cdot 31 \times 10^{-19}} = \mathbf{7{\cdot}553 \times 10^{19}}$$

Problem 1.02. Radiation of wavelength 180 nm ejects photo-electrons from a plate, when work function is 2·0 eV. If a uniform magnetic field of flux density 5·0 × 10^{-5} tesla (or weber metre^{-2} is applied parallel to the plate, what should be the radius of the path followed by electrons ejected normally from the plate with maximum energy ? *(Roorkee, 1988)*

Sol. Here,

$\omega = 2{\cdot}0$ eV $= 2{\cdot}0 \times 1{\cdot}6 \times 10^{-19} = 3{\cdot}2 \times 10^{-19}$ J ;

$\lambda = 180$ nm $= 180 \times 10^{-19}$ m

Therefore, energy of incident photon,

$$h\,v = \frac{h\,c}{\lambda} = \frac{6 \cdot 61 \times 10^{-34} \times 3 \times 10^8}{180 \times 10^{-9}} = 11{\cdot}03 \times 10^{-19}\ \text{J}$$

The maximum kinetic energy of emitted electrons,

$$\frac{1}{2} m\,v_{max}^{2} = h\,v - \omega = 11 \cdot 03 \times 10^{-19} - 3 \cdot 2 \times 10^{-9}$$

$$= 7{\cdot}83 \times 10^{-19}\ \text{J}$$

$$\therefore \quad v_{max} = \sqrt{\frac{2 \times 7{\cdot}83 \times 10^{-19}}{m}} = \sqrt{\frac{2 \times 7{\cdot}83 \times 10^{-19}}{9{\cdot}1 \times 10^{-31}}}$$

$$= 1{\cdot}31 \times 10^6\ \text{m s}^{-1}$$

If r is radius of the path followed by the electron ejected with maximum energy, then

$$B\,e\,v_{max} = \frac{m\,v_{max}^{2}}{r}$$

or $$r = \frac{m\,v_{max}}{B\,e}$$

Here, B = 5·0 × 10^{-5} T

$$r = \frac{9 \cdot 1 \times 10^{-31} \times 1 \cdot 31 \times 10^6}{5 \cdot 0 \times 10^5 \times 1 \cdot 6 \times 10^{-19}} = \mathbf{0{\cdot}149\ m}$$

Problem 1.03. A photon of wavelength 3310 Å falls a photocathode and an electron of energy 3 × 10^{-19} J ejected. If the wavelength of the incident photon is change to 5000 Å , the energy of the ejected electron is 0·972 × 10^{-19} Calculate the value of Planck's constant and threshol wavelength of the photocathode. Given, the velocity of lig = 3 × 10^8 m s^{-1}. *(I.S.T. Dhanbad, 199*

Hint. From Einstein's photoelectric equation :

$$\frac{h\,c}{\lambda_0} = \frac{h\,c}{\lambda} - \frac{1}{2} m\,v_{max}^{2}$$

For $\lambda = 3310$ Å ; $\frac{1}{2} m\,v_{max}^{2} = 3 \times 10^{-19}$ J ;

and for $\lambda = 5000$ Å, $\frac{1}{2} m\,v_{max}^{2} = 0 \cdot 972 \times 10^{-19}$ J.

Setting the above data in Einstein's photoelectr equation, we obtain two equations in h and λ_0. From the equations, the values of h and λ_0 can be obtained.

It will be found that

$$h = 6{\cdot}62 \times 10^{-34}\ \text{J s}^{-1}\ ;\ \lambda_0 = 6620\ \text{Å}.$$

Problem 1.04. A beam of light has three wavelength 4144 Å , 4972 Å and 6216 Å with a total intensity 3·6 × 10^{-3} W m^{-2} equally distributed among the thre wavelengths. The beam falls normally on an area 1·0 cm^2 of a clean metallic surface of work function 2·3 e Assume that there is no loss of light by reflection and th each energetically capable photon ejects one electro Calculate the number of photoelectrons liberated i 2 seconds. *(I.I.T. 198*

Sol. Here, work function of the metal,

$\omega = 2{\cdot}3$ e V $= 2{\cdot}3 \times 1{\cdot}6 \times 10^{-19}$ J

Now, $$\omega = \frac{h\,c}{\lambda_0}$$

$$\therefore \quad \lambda_0 = \frac{h\,c}{\omega_0} = \frac{6 \cdot 62 \times 10^{-34} \times 3 \times 10^8}{2 \cdot 3 \times 1 \cdot 6 \times 10^{-19}} = 5{\cdot}397 \times 10^{-7}$$

$$= 5397\ \text{Å}$$

The incident beam of light has wavelengths

$\lambda_1 = 4144$ Å, $\lambda_2 = 4972$ Å and $\lambda_3 = 6216$ Å

The wavelength $\lambda_3 = 6216$ Å will not cause photoelectr emission, as $\lambda_3 > \lambda_0$.

Now, total intensity of incident radiation

$= 3{\cdot}6 \times 10^{-3}$ W m^{-2}

Since total intensity is equally distributed among th three wavelengths, the intensity of each wavelength in th incident beam of light,

$$I = \frac{3\cdot6\times10^{-3}}{3} = 1\cdot2\times10^{-3}\ \text{W m}^{-2}$$

Area of surface on which the beam of light falls,

$$A = 1\cdot0\ \text{cm}^2 = 10^{-4}\ \text{m}^2$$

Therefore, energy incident for each wavelength in 2 s,

$$E = I\times A\times t = 1\cdot2\times10^{-3}\times10^{-4}\times2 = 10^{-7}\ \text{J}$$

Energy of a photon of wavelength

$$\lambda_1 = \frac{hc}{\lambda_1} = \frac{6\cdot62\times10^{-34}\times3\times10^8}{4144\times10^{-10}} = 4\cdot79\times10^{-19}\ \text{J}$$

Energy of a photon of wavelength

$$\lambda_2 = \frac{hc}{\lambda_2} = \frac{6\cdot62\times10^{-34}\times3\times10^8}{4972\times10^{-10}} = 3\cdot99\times10^{-19}\ \text{J}$$

Since each emergetically capable photon ejects one ectron, total number of photons emitted in 2 s,

$$n = \frac{E}{hc/\lambda_1} + \frac{E}{hc/\lambda_2}$$

$$= \frac{2\cdot4\times10^{-7}}{4\cdot79\times10^{-19}} + \frac{2\cdot4\times10^{-7}}{3\cdot99\times10^{-19}}$$

$$= 0\cdot5\times10^{12} + 0\cdot6\times10^{12} = \mathbf{1\cdot1\times10^{12}}$$

Problem 1.05. When a beam of 10·6 eV photons f intensity 2 W m^{-2} falls on a platinum surface of area 0^{-4} m^2 and work function 5·6 eV, 0·53% of the incident hotons eject photoelectrons. Find the number of hotoelectrons emitted per second and their minimum nd maximum energies (in eV). Take 1 eV = 1·6 × 10^{-19} J. *(I.I.T. 2000)*

Sol. Here, energy of photon,

$$E = 10\cdot6\ \text{eV} = 10\cdot6\times1\cdot6\times10^{-19}\ \text{J}$$

$$= 1\cdot696\times10^{-18}\ \text{J}$$

Energy incident per unit area per second,

$$E_{in} = 2\ \text{W m}^{-2} = 2\ \text{J s}^{-1}\ \text{m}^{-2}$$

Area of the platinum surface, $A = 10^{-4}$ m^2

Therefore, energy incident on platinum surface per econd,

$$E_{tot} = E_{in}\times A = 2\times10^{-4}\ \text{J s}^{-1}$$

Hence, number of photons incident on the whole latinum surface per second,

$$N = \frac{E_{tot}}{E} = \frac{2\times10^{-4}}{1\cdot696\times10^{-18}} = 1\cdot18\times10^{14}$$

Since 0·53% of the incident photons eject photoelectrons, umber of photoelectrons emitted from the platinum surface er second,

$$n = \frac{N\times0\cdot53}{100} = \frac{1\cdot18\times10^{14}\times0\cdot53}{100} = \mathbf{6\cdot254\times10^{11}}$$

The minimum energy of photoelectrons emitted is **zero.**

Also, the maximum energy of photoelectrons emitted,

$$E_{max} = E - \text{work function of platinum}$$

$$= 10\cdot6 - 5\cdot6 = \mathbf{5\cdot0\ eV}$$

Problem 1.06. Two metallic plates A and B, each of area 5 × 10^{-4} m^2, are placed parallel to each other at a separation of 1 cm. Plate B carries a positive charge of 33·7 × 10^{-12} C. A monochromatic beam of light, with photons of energy 5 eV each starts falling on plate A at *t* = 0 so that 10^{16} photons fall on it per square metre per second. Assume that one photoelectron is emitted for every 10^6 incident photons. Also assume that all the emitted photoelectrons are collected by plate B and the work function of plate A remains constant at the value 2 eV. Determine

(*a*) the number of photoelectrons emitted upto *t* = 10 s.

(*b*) the magnitude of the electric field between the plates A and B at *t* = 10 s and

(*c*) the kinetic energy of the most energetic photoelectrons emitted at *t* = 10 s, when it reaches plate B.

Neglect the time taken by the photoelectrons to reach plate B. Take $\varepsilon_0 = 8\cdot85\times10^{-12}$ C^2 N^{-1} m^{-2}. *(I.I.T. 2002)*

Sol. Here, Area of each of the two plates,

$$A = 5\times10^{-4}\ \text{m}^2$$

Separation between the two plates, $d = 1$ cm $= 10^{-2}$ m

(*a*) Number of photons falling on plate A per second per unit area, N = 10^{16}

Therefore, number of photons falling on plate A in 10 s,

$$N_{tot} = N\times A\times t = 10^{16}\times5\times10^{-4}\times10 = 5\times10^{13}$$

Since one photoelectron is emitted for every 10^6 incident photons, number of photoelectrons emitted in 10 s,

$$n = \frac{N_{tot}}{10^6} = \frac{5\times10^{13}}{10^6} = \mathbf{5\times10^7}$$

(*b*) Charge on plate A after 10 s (*i.e.* after the emission of 5×10^7 photoelectrons),

$$q_A = +ne = 5\times10^7\times1\cdot6\times10^{-19} = 8\times10^{-12}\ \text{C}$$

Charge on plate B after 10 s (*i.e.* after collecting 5×10^7 photoelectrons),

$$q_B = \text{initial charge} + (-ne) = 33\cdot7\times10^{-12} - 8\times10^{-12}$$

$$= 25\cdot7\times10^{-12}\ \text{C}$$

Therefore, excess charge on plate B (difference of charge on plates B and A),

$$q = q_B - q_A = 25\cdot7\times10^{-12} - 8\times10^{-12} = 17\cdot7\times10^{-12}\ \text{C}$$

Hence, electric field between the two plates,

$$E = \frac{\sigma}{2\varepsilon_0} = \frac{q/A}{2\varepsilon_0} = \frac{q}{2\varepsilon_0 A} = \frac{17\cdot7\times10^{-12}}{2\times8\cdot85\times10^{-12}\times5\times10^{-4}}$$

$$= \mathbf{2\times10^3\ N\ C^{-1}}$$

(*c*) Kinetic energy possessed by photoelectrons emitted from plate A,

$$\frac{1}{2}m{v_{max}}^2 = 5 - 2 = 3\ \text{eV}$$

Energy gained by photoelectrons inside electric field between the two plates,

$$W = Ve = (E\,d)\,e\ (\text{in joule}) = E\,d\ (\text{in eV})$$

$$= 2\times10^3\times10^{-2} = 20\ \text{eV}$$

Hence, energy of photoelectrons on reaching plate B,

$$W' = W + \frac{1}{2}m{v_{max}}^2 = 20 + 3 = \mathbf{23\ eV}$$

Problem 1.07. The peak emission from a black body at a certain temperature occurs at a wavelength of 9000 Å. On increasing its temperature, the total radiation emitted is increased 81 times. At the initial temperature, when the peak radiation from the black body is incident on a metal surface, it does not cause any photoemission from the surface. After the increase of temperature, the peak radiation from the black body caused photoemission. To bring these photoelectrons to rest, a potential equivalent to the excitation energy between *n* = 2 to *n* = 3 Bohr levels of hydrogen atom is required. Find the work function of the metal. *(Roorkee, 1993)*

Sol. Suppose that the total energy radiated per second per unit area is E and temperature of the black body is T, when the wave length of maximum emission is λ_m (= 9000 Å × 10^7 m). Then,

$$E = \sigma T^4 \qquad ...(i)$$

and $\lambda_m T = b$

or $9 \times 10^{-7} T = b \qquad ...(ii)$

Further, suppose that when the temperature of the black body is increased to T′, the total energy emitted per second per unit area becomes E′ = 81 E and the wavelength of maximum emission becomes λ_m'. Then,

$$E' = \sigma T'^4$$

or $81 E = s T'^4 \qquad ...(iii)$

and $\lambda_m' T' = b \qquad ...(iv)$

Dividing equation (*iii*) by (*i*), we have

$$\frac{81 E}{E} = \frac{\sigma T'^4}{\sigma T^4}$$

or $T' = 3 T \qquad ...(v)$

From equations (*ii*) and (*iv*), we have

$$\lambda_m' T' = 9 \times 10^{-7} T$$

or $\lambda_m' \times 3 T = 9 \times 10^{-7} T$

or $\lambda_m' = 3 \times 10^{-7}$ m

The energy of the radiation corresponding to the wavelength of maximum emission λ_m',

$$h\nu' = \frac{hc}{\lambda_m'} = \frac{6 \cdot 62 \times 10^{-34} \times 3 \times 10^8}{3 \times 10^{-7}} = 6 \cdot 62 \times 10^{-19} \text{ J}$$

$$= \frac{6 \cdot 62 \times 10^{-19}}{1 \cdot 6 \times 10^{-19}} = 4 \cdot 14 \text{ eV}$$

K.E. of photoelectrons emitted,

$\frac{1}{2} m v^2$ = excitation energy between $n = 2$ to $n = 3$ Bohr levels

$$= 13 \cdot 6 \left(\frac{1}{2^2} - \frac{1}{3^2} \right) \text{eV} = 13 \cdot 6 \times \frac{5}{36} = 1 \cdot 89 \text{ eV}$$

According to Einstein's photoelectric equation,

$$h\nu' = \omega + \frac{1}{2} m v_{max}^2$$

Therefore, work function of metal surface,

$$\omega = h\nu' - \frac{1}{2} m v_{max}^2 = 4 \cdot 14 - 1 \cdot 89 = \mathbf{2{\cdot}25\ eV}$$

Chapter 2. Wave Nature of Matter

Problem 2.01. In a photoelectric effect set up, a point source of light of power 3·2 × 10^{-3} W emits monoenergetic photons of energy 5·0 eV. The source is located at a distance of 0·8 m from the centre of a stationary metallic sphere of work function 3·0 eV and of radius 8·0 × 10^{-3}. The efficiency of photoelectron emission is one for every 10^6 incident photons. Assume that the sphere is isolated and initially neutral, and that photoelectrons are instantly swept away after emission.

(*a*) Calculate the number of photoelectrons emitted per second.

(*b*) Find the ratio of the wavelength of incident light to the de-Broglie wavelength of the fastest photoelectrons emitted. (*I.I.T. 1995*)

Sol. (*a*) Here, power of the source of light

$$= 3{\cdot}2 \times 10^{-3} \text{ W} = 3{\cdot}2 \times 10^{3} \text{ J s}^{-1}$$

The source of light emits photons of energy in all directions. The light energy falling per second on the metallic sphere of radius *r* situated at a distance R from the source of light,

$$E = \frac{\pi r^2}{4 \pi R^2} \times \text{power of the source of light}$$

Here, $r = 8{\cdot}0 \times 10^{-3}$ m and R = 0·8 m

$$\therefore \quad E = \frac{\pi \times (8 \cdot 0 \times 10^{-3})^2}{4 \pi \times (0 \cdot 8)^2} = 3{\cdot}2 \times 10^{-3} = 8 \times 10^{-8} \text{ J s}^{-1}$$

$$= \frac{8 \times 10^{-8}}{1 \cdot 6 \times 10^{-19}} = 5 \times 10^{11} \text{ eV s}^{-1}$$

Since each photon of incident light has energy 5 eV, the number of photons striking the metal sphere,

$$N = \frac{5 \times 10^{11}}{5} = 10^{11} \text{ s}^{-1}$$

Further, as the efficiency of photoelectron emission is one for every 10^6 incident photons, the number of photo-electrons emitted,

$$n = \frac{N}{10^6} = \frac{10^{11}}{10^6} = \mathbf{10^5\ s^{-1}}$$

(*b*) Now, work function of the metal sphere, ω = 3·0 eV

and energy of incident photon, $\frac{hc}{\lambda} = 5 \cdot 0$ eV

Therefore, maximum kinetic energy of the emitted photoelectrons,

$$E_{max} = \frac{1}{2} m v_{max}^2 = \frac{hc}{\lambda} - \omega = 5 \cdot 0 - 3 \cdot 0 = 2 \cdot 0 \text{ eV}$$

$$= 2{\cdot}0 \times 1{\cdot}6 \times 10^{-19} = 3{\cdot}2 \times 10^{-19} \text{ J}$$

If λ′ is de-Broglie wavelength of the fastest photoelectron, then

$$\lambda' = \frac{h}{\sqrt{2 m E_{max}}} \qquad ...(i)$$

The wavelength of incident photon of light is given by

$$\frac{hc}{\lambda} = 5 \cdot 0 \text{ eV} = 5 \cdot 0 \times 1 \cdot 6 \times 10^{-19} = 8 \cdot 10^{-19} \text{ J}$$

or $\lambda = \frac{hc}{8 \times 10^{-19}} \qquad ...(ii)$

Dividing equation (*ii*) by (*i*), we have

$$\frac{\lambda}{\lambda'} = \frac{hc}{8 \times 10^{-19}} \times \frac{\sqrt{2 m E_{max}}}{h} = \frac{c\sqrt{2 m E_{max}}}{8 \times 10^{-19}} \qquad ...(iii)$$

Now, $c = 3 \times 10^8$ m s^{-1} ; $m = 9{\cdot}1 \times 10^{-31}$ kg

and $E_{max} = 3{\cdot}2 \times 10^{-19}$ J

Setting the values of *c*, *m* and E_{max} in equation (*iii*), we have

$$\frac{\lambda}{\lambda'} = \frac{3 \times 10^8 \times \sqrt{2 \times 9 \cdot 1 \times 10^{-31} \times 3 \cdot 2 \times 10^{-19}}}{8 \times 10^{-19}}$$

$$= \frac{3 \times 10^8 \times 7 \cdot 63 \times 10^{-25}}{8 \times 10^{-19}} = \mathbf{286{\cdot}1}$$

MULTIPLE CHOICE QUESTIONS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Particle Nature of Radiation

PART I. TEXT-BASED QUESTIONS

1. **Wavelength of the radiation of frequency 100 Hz is :**
(A) 2×10^6 m (B) 3×10^6 m
(C) 4×10^6 m (D) 5×10^6 m *(C.B.S.E. 1999)*

2. **The value of Planck's constant is**
(A) $6{\cdot}63 \times 10^{-34}$ J s^{-1} (B) $6{\cdot}63 \times 10^{-34}$ kg m s^{-1}
(C) $6{\cdot}63 \times 10^{-34}$ kg m^2 (D) $6{\cdot}63 \times 10^{-34}$ J s
(C.B.S.E. 2002)

3. **The unit of Planck's constant is**
(A) N m (B) eV
(C) J s^{-1} (D) J s
(Karnataka Entrance, 1991)

4. **Planck's constant has the dimensions of**
(A) linear momentum (B) angular momentum
(C) energy (D) power *(C.B.S.E. 2001)*

5. **The energy of a photon of light is 3 eV. Then the wavelength of photon must be :**
(A) 4125 nm (B) 412·5 nm
(C) 41250 nm (D) 4 nm *(C.B.S.E. 2000)*

6. **A photon has velocity c and frequency ν. Then, which of the following represents its wavelength ?**
(A) $\dfrac{hc}{E}$ (B) $\dfrac{h\nu}{c}$
(C) $\dfrac{h\nu}{c^2}$ (D) $h\nu$ *(C.B.S.E. 1996)*

7. **The wavelength of photons is proportional to (where ν is frequency)**
(A) ν (B) $\sqrt{\nu}$
(C) $1/\sqrt{\nu}$ (D) $1/\nu$ *(C.B.S.E. 1996)*

8. **The energy of a photon of wavelength λ is**
(A) $hc\lambda$ (B) hc/λ
(C) λ/hc (D) $h\lambda/c$ *(C.B.S.E. 1992)*

9. **Electron volt is a unit of**
(A) charge (B) momentum
(C) potential difference (D) energy
(Karnataka Entrance, 1988)

10. **Which of the following phenomena exhibits particle nature of light ?**
(A) Interference (B) Diffraction
(C) Polarisation (D) Photoelectric effect
(C.B.S.E. 2001)

11. **Photoelectrons are emitted, when**
(A) a zinc plate is heated.
(B) a zinc plate is hammered.
(C) a zinc plate is irradiated with ultra-violet light.
(D) a zinc plate is subjected to very high pressure.
(Karnataka Entrance, 1993, 1991, 1988)

12. **When ultra-violet radiation is incident on a surface, no photoelectrons are emitted. If a second beam causes photoelectrons to be ejected, it may consist of**
(A) radio waves (B) infra-red rays
(C) visible light rays (D) X-rays
(C.B.S.E. 2002 ; Karnataka Entrance, 1992, 1990)

13. **The minimum energy required to remove an electron is called**
(A) work function (B) kinetic energy
(C) stopping potential (D) potential energy
(A.F.M.C. 1995)

14. **Light from a bulb falls on the wooden piece but no photoelectrons are emitted. It is because, work function of wood is**
(A) much higher than the energy of photon.
(B) less than the energy of photon.
(C) equal to energy of photon.
(D) none of these. *(A.F.M.C. 1997)*

15. **As the intensity of incident light increases :**
(A) photoelectric current increases.
(B) photoelectric current decreases.
(C) kinetic energy of emitted photo-electrons increases.
(D) kinetic energy of emitted photo-electrons decreases.
(C.B.S.E. 1999 ; C.B.S.E. 1995)

16. **Which of the following statements is correct ?**
(A) The photocurrent increases with increasing frequency.
(B) The photocurrent is proportional to the applied voltage.
(C) The photocurrent increases with intensity of light.
(D) The stopping potential increases with intensity of incident light. *(C.B.S.E. 1997)*

17. **The threshold wavelength of sodium metal is 6780 Å . The work function of metal will be**
(A) 1·83 eV (B) 2·75 eV
(C) 2·95 eV (D) 3·25 eV *(A.F.M.C. 1998)*

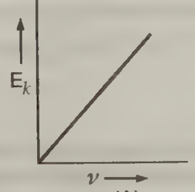
18. **The work function of a substance is 4·0 eV. The longest wavelength of light that causes photoelectron emission from this substance is approximately**
(A) 540 nm (B) 400 nm
(C) 310 nm (D) 220 nm *(I.I.T. 1998)*

19. **The photoelectric work function for a metal surface is 4·125 eV. The cut-off wavelength for this surface is :**
(A) 4125 Å (B) 2062·5 Å
(C) 3000 Å (D) 6000 Å *(C.B.S.E. 1999)*

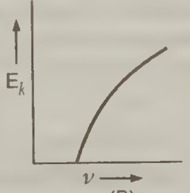
20. **The strength of photoelectric current depends upon**
(A) frequency of incident radiation.
(B) intensity of incident radiation.
(C) angle of incident radiation.
(D) distance between anode and cathode. *(M.N.R. 1981)*

21. **Consider light of given intensity and frequency falling on a substance that emits photoelectrons. The intensity is decreased to one-third its value and the frequency increased by three times. Consequently the velocity of the photoelectrons will**
(A) remain the same.
(B) increase or decrease depending on the exact values of the new intensity and frequency.
(C) decrease. (D) increase.
(Karnataka Entrance, 1987)

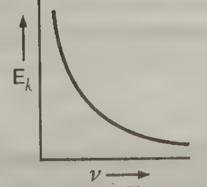
22. **The kinetic energy (E_k) of a photoelectron varies with the frequency (ν) of the incident radiation as which of the following graphs ?**



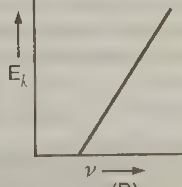
(A)



(B)



(C)



(D)

(C.B.S.E. 1996)

23. The cathode of a photoelectric cell is changed, such that the work function changes from ω_1 to ω_2 ($\omega_2 > \omega_1$). If the currents before and after change are I_1 and I_2, all other conditions unchanged, then (assuming $h\nu > \omega_2$),

(A) $I_1 = I_2$ (B) $I_1 < I_2$

(C) $I_1 > I_2$ (D) $I_1 < I_2 < 2I_1$. *(C.B.S.E. 1992)*

24. Photoelectrons are being obtained by irradiating zinc by a radiation of 3100 Å. In order to increase the kinetic energy of ejected photoelectrons,

(A) the intensity of radiation should be increased.

(B) the wavelength of radiation should be increased.

(C) the wavelength of radiation should be decreased.

(D) both wavelength and intensity of radiation should be increased. *(M.N.R. 1980)*

25. Einstein's photoelectric equation is expressed as

(A) $h\nu = \frac{1}{2}\omega_0 - m v^2$ (B) $h\nu = \omega_0 - \frac{1}{2} m v^2$

(C) $h\nu = \omega_0 + \frac{1}{2} m v^2$ (D) $h\nu = \frac{1}{2} m v^2 - \omega_0$

(C.E.T., 1998)

26. Einstein's work on photoelectric effect gives support to :

(A) $E = mc^2$ (B) $E = h\nu$

(C) $h\nu = \frac{1}{2} m v^2$ (D) $E = h/\lambda$ *(C.B.S.E. 2000)*

27. Photoelectric work function of a metal is 1 eV. Light of wavelength λ = 3000 Å falls on it. The photoelectrons come out with velocity

(A) 10 m s^{-1} (B) 10^2 m s^{-1}

(C) 10^4 m s^{-1} (D) 10^6 m s^{-1} *(C.B.S.E. 1990)*

28. Light of wavelength 5000 Å falls on a photo-sensitive plate with photoelectric work function of 1·9 eV. The kinetic energy of the photoelectrons emitted will be

(A) 0·58 eV (B) 2·48 eV

(C) 1·24 eV (D) 1·16 eV *(C.B.S.E. 1998)*

29. Light of two different frequencies, whose photons have energies 1 eV and 2·5 eV respectively successively illuminate a metal of work function 0·5 eV. The ratio of maximum speeds of the emitted electrons will be

(A) 1 : 5 (B)1 : 4

(C) 1 : 2 (D) 1 : 1 *(C.P.M.T. 1983)*

30. The maximum kinetic energy of photoelectrons emitted from a surface, when photons of energy 6 eV fall on it, is 4 eV. The stopping potential (in volt) is

(A) 2 (B) 4

(C) 6 (D) 10 *(I.I.T. 1997)*

31. The maximum velocity of an electron ejected from a photoelectric emitter, when radiation falls on the latter is found to be 2×10^6 m s^{-1}. Assuming the charge to mass ratio of electron (e/m) to be $1 \cdot 8 \times 10^{11}$ C kg^{-1}, the stopping potential is (in volt)

(A) 1·2 (B) 2·1

(C) 11·1 (D) 16·3

(Karnataka Entrance, 1987)

32. When radiation is incident on a photoelectron emitter, the stopping potential is determined to be 9 volt . Assuming the charge to mass ratio (e/m) for electron to be $1 \cdot 8 \times 10^{11}$ coulomb kg^{-1}, the maximum velocity of the ejected electron is found to be (in m s^{-1})

(A) 6×10^5 (B) 8×10^5

(C) 10×10^5 (D) $1 \cdot 8 \times 10^6$

(Karnataka Entrance, 1985)

33. A photo-sensitive material would emit electrons, if excited by photons beyond a threshold. To cross the threshold, you would increase

(A) intensity of light. (B) wavelength of light.

(C) frequency of light.

(D) the voltage applied to light source. *(M.N.R. 1983)*

34. Ultra-violet radiation of 6·2 eV falls on an aluminium surface (work function 4·2 eV). The kinetic energy (in joule) of the fastest electron emitted is approximately

(A) $3 \cdot 2 \times 10^{-21}$ (B) $3 \cdot 2 \times 10^{-19}$

(C) 4×10^{-17} (D) 3×10^{-15} *(M.N.R. 1987)*

35. When a light source is at a distance d from a photoelectric cell, the number of photoelectrons emitted from the cell is n. If the distance of light source and cell is reduced to half, then the number of photoelectrons emitted will become :

(A) $n/2$ (B) $2n$

(C) $4n$ (D) n *(C.B.S.E. 2001)*

36. A photocell is illuminated by a small bright source placed 1 m away. When the same source of light is placed 2 m away, the electrons emitted by the photo cathode ;

(A) each carry one quarter of their previous energy.

(B) each carry one quarter of their previous momenta.

(C) are half as numerous.

(D) are one quarter as numerous.

PART II. THOUGHT-BASED QUESTIONS

37. The mass of a photon at rest is

(A) zero (B) $1 \cdot 67 \times 10^{-35}$ kg

(C) 1 a.m.u. (D) 9×10^{-31} kg

(C.B.S.E. 1991 ; M.N.R. 1981)

38. Which one of the following statements about photon is incorrect ?

(A) Photon's rest mass is zero.

(B) Momentum of photon is $h\nu/c$.

(C) Photon's energy is $h\nu$.

(D) Photons exert no pressure. *(C.P.M.T. 1990)*

39. A radio transmitter operates at a frequency of 880 kHz and a power of 10 kW. The number of photons emitted per second is

(A) $1 \cdot 72 \times 10^{31}$ (B) $13 \cdot 27 \times 10^{24}$

(C) $13 \cdot 27 \times 10^{34}$ (D) $13 \cdot 27 \times 10^{44}$ *(C.B.S.E. 1996)*

40. The minimum light intensity that can be perceived by the eye is about 10^{-10} W m^{-2}. The number of photons of wavelength $5 \cdot 6 \times 10^{-7}$ m that must enter the pupil of area 10^{-4} m^2 per second for vision is approximately.

(Use $h = 6 \cdot 6 \times 10^{-34}$ J s)

(A) 3×10^2 photons (B) 3×10^3 photons

(C) 3×10^4 photons (D) 3×10^5 photons.

(N.C.E.R.T. 1982)

41. The threshold wavelength for photoelectric emission from a material is 5200 Å. Photoelectrons will be emitted, when this material is illuminated with monochromatic radiation from a

(A) 50 W infra-red lamp.

(B) 1 W infra-red lamp.

(C) 50 W ultra-violet lamp.

(D) 1 W ultra-violet lamp. *(I.I.T. 1984, 1982)*

42. Photoelectric effect supports the quantum nature of light, because

(A) there is minimum frequency of light below which no photoelectrons are emitted.

(B) the maximum kinetic energy of photoelectrons depends only on the frequency of light and not on intensity.

(C) even when a metal surface is faintly illuminated, the photoelectrons leave the surface immediately.

(D) electric charge of the electrons is quantised.

(C.E.T. 1998 ; I.I.T. 1987)

In a photoemmisive cell, with exciting wavelength λ, the fastest electron has speed of v. If the exciting wavelength is changed to $\frac{3\lambda}{4}$, the speed of the fastest emitted electron will be

(A) $v\left(\frac{3}{4}\right)^{1/2}$ (B) $v\left(\frac{4}{3}\right)^{1/2}$

(C) less than $v\left(\frac{3}{4}\right)^{1/2}$ (D) greater than $v\left(\frac{4}{3}\right)^{1/2}$

(C.B.S.E. 1998)

When a monochromatic point source of light is at a distance of 0·2 m from a photoelectric cell, the cut off voltage and saturation current are respectively 0·6 V and 18·0 mA . If the same source is placed 0·6 m away from the photocell, then

(A) the stopping potential will be 0·2 V.

(B) the stopping potential will be 0·6 V.

(C) the saturation current will be 2·0 mA.

(D) the saturation current will be 6·0 mA. *(I.I.T. 1992)*

45. If the distance of 100 W lamp is increased from a photo cell, the saturation current I in the photo cell varies with distance d as

(A) $I \propto d^2$ (B) $I \propto d$

(C) $I \propto \frac{1}{d}$ (D) $I \propto \frac{1}{d^2}$ *(N.C.E.R.T. 1990)*

46. An image of the sun is formed by a lens of focal length 50 cm on a photosensitive surface of a photoelectric cell and it produces a current I. The lens is then replaced by another lens of same diameter but of focal length 25 cm. The photoelectric current produced will be

(A) I / 2 (B) 2 I

(C) I (D) 4 I

47. When a proton is accelerated (from rest) through a potential difference of one volt, the kinetic energy gained by it is roughly equal to

(A) 1 eV (B) 1837 eV

(C) $\frac{1}{1837}$ eV (D) none of the above

Chapter 2. Wave Nature of Matter

PART I. TEXT-BASED QUESTIONS

1. If c is velocity of light, then momentum of a photon of frequency ν is

(A) $h\nu/c^2$ (B) $h\nu/c$

(C) ν/c (D) $h\nu c^2$

2. A photon behaves as if it had a mass equal to

(A) $h\nu c^2$ (B) $c^2/h\nu$

(C) $\nu c^2/h$ (D) $h\nu/c^2$

(Karnataka Entrance, 1993)

3. The momentum of a photon of wavelength 5000 Å will be

(A) $1{\cdot}3 \times 10^{-27}$ kg m s^{-1}.

(B) $1{\cdot}3 \times 10^{-28}$ kg m s^{-1}.

(C) 4×10^{-29} kg m s^{-1}.

(D) 4×10^{-18} kg m s^{-1}. *(A.F.M.C. 1998)*

4. The energy of a photon is 3×10^{-19} J. Its momentum is

(A) 3×10^{-7} kg m s^{-1} (B) 10^{-27} kg m s^{-1}

(C) 9×10^{-11} kg m s^{-1} (D) 10^{-8} kg m s^{-1}

5. The de-Broglie wave corresponding to a particle of mass m and velocity v has a wavelength associated with it

(A) $\frac{h}{mv}$ (B) hmv

(C) $\frac{mh}{v}$ (D) $\frac{m}{hv}$ *(C.B.S.E. 1992)*

6. The de-Broglie wavelength of an electron moving with a speed of $6{\cdot}6 \times 10^5$ m s^{-1} is nearly equal to

(A) 10^{-11} m (B) 10^{-9} m

(C) 10^{-7} m (D) 10^{-5} m *(C.P.M.T. 1993)*

7. The wavelength of an electron moving with a velocity of 500 km s^{-1} is (take $m_e = 9 \times 10^{-31}$kg and $h = 6{\cdot}6 \times 10^{-34}$ J s)

(A) 2·9 mm (B) 3·0 mm

(C) 0·5 nm (D) 1·47 nm *(N.C.E.R.T. 1984)*

8. The following particles are moving with the same velocity. Then maximum de-Broglie wavelength will be for

(A) proton (B) α-particle

(C) neutron (D) β-particle *(C.B.S.E. 2002)*

9. The de-Broglie wavelength λ of a particle is related to its kinetic energy E as ;

(A) $\lambda \propto E$ (B) $\lambda \propto \frac{1}{E}$

(C) $\lambda \propto \sqrt{E}$ (D) $\lambda \propto \frac{1}{\sqrt{E}}$

10. An electron accelerated through a potential difference of V volt has a wavelength λ associated with it. Mass of proton is nearly 2000 times that of an electron. In order to have the same λ for proton, it must be accelerated through a potential difference (in volt) of

(A) V (B) 2000 V

(C) $\frac{V}{2000}$ (D) $\sqrt{2000}$ V

(N.C.E.R.T. 1975)

11. An electron of mass m and charge e is accelerated from rest through a potential difference V in vacuum. Its final velocity will be

(A) $\frac{eV}{2m}$ (B) $\frac{eV}{m}$

(C) $\sqrt{\frac{2eV}{m}}$ (D) $\sqrt{\frac{eV}{m}}$ *(C.B.S.E. 1996)*

12. An electron of mass m, when accelerated through a potential difference V, has de-Broglie wavelength λ. The de-Broglie wavelength associated with a proton of mass M and accelerated through the same potential difference will be

(A) $\lambda\sqrt{\frac{M}{m}}$ (B) $\lambda\sqrt{\frac{m}{M}}$

(C) $\lambda\frac{M}{m}$ (D) $\lambda\frac{m}{M}$ *(C.B.S.E. 1995)*

13. An electron is accelerated through a potential difference of 150 V. The wavelength associated with it is :

(A) 100 Å (B) 1 Å

(C) 4·2 Å (D) 10 Å

14. An electron is accelerated through a potential difference of 100,000 V. The energy acquired by the electron is

(A) $0{\cdot}53 \times 10^{-17}$ J (B) $1{\cdot}6 \times 10^{-14}$ J

(C) $1{\cdot}6 \times 10^{-10}$ J (D) $1{\cdot}6 \times 10^{-34}$ J

15. An electron beam has a kinetic energy equal to 100 eV. Find the wavelength associated with the beam, if mass of

electron = $9{\cdot}1 \times 10^{-31}$ kg 1 eV = $1{\cdot}6 \times 10^{-19}$ J and Planck's constant = $6{\cdot}6 \times 10^{-34}$ J s.
(A) 1·22 Å (B) 6·3 Å
(C) 24·6 Å (D) 0·12 Å *(C.B.S.E. 1996)*

16. **A photon and an electron have the same wavelength. Then, the velocity of photon is**
(A) less than that of the electron.
(B) greater than that of the electron.
(C) equal to that of the electron.
(D) none of the above.

17. **If we consider electrons and photons of the same wavelength, then they will have the same**
(A) energy (B) velocity
(C) momentum (D) angular momentum.
(A.F.M.C. 1997)

18. **In X-ray diffraction experiment, distance between atomic lattice planes of diffraction grating is $2{\cdot}8 \times 10^{-10}$ m. Then the maximum wavelength of X-rays (in metre) is**
(A) 2·5 (B) $5{\cdot}6 \times 10^{-10}$
(C) 4×10^{-10} (D) $4{\cdot}6 \times 10^{-10}$ *(C.B.S.E. 2001)*

19. **One can study crystal structure by electron diffraction as well as by neutron diffraction. In order to have the same wavelength λ for the electron (mass m_e) and neutron (mass m_n), their velocities should be in the ratio (electron velocity/neutron velocity)**
(A) 1 (B) m_e / m_n
(C) $m_e\, m_n$ (D) m_n / m_e

20. **The magnification produced in an electron microscope is of the order of**
(A) 10 (B) 10^3
(C) 10^5 (D) 10^7

HT-BASED QUESTIONS

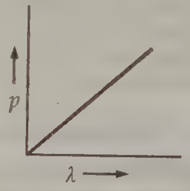
21. **The energy E and momentum p of a photon is given by $E = h\nu$ and $p = h/\lambda$. The velocity of photon will be**
(A) E/p (B) $E\,p$
(C) $(E/p)^2$ (D) $(E/p)^{1/2}$
(C.P.M.T., 1991 ; N.C.E.R.T. 1980)

22. **Neglecting variation of mass with velocity, the wavelength associated with an electron having the kinetic energy E is proportional to**
(A) $E^{1/2}$ (B) $E^{-1/2}$
(C) E (D) E^{-2} *(N.C.E.R.T. 1980)*

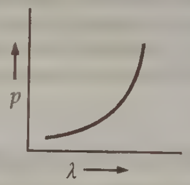
23. Consider a proton moving with kinetic energy E. de-Broglie wavelength is given by (c = speed of ligh
h = Planck's constant ; M = mass of proton ; q = charge
proton)
(A) $hc/\sqrt{2ME}$ (B) $h/q\sqrt{ME}$
(C) $h/\sqrt{2ME}$ (D) $\sqrt{2MEq}/hc$
(Karnataka Entrance, 19

24. **A particle of mass M at rest decays into two particles masses m_1 and m_2 having non-zero velocities. The ratio the de-Broglie wavelengths of the particles (λ_1/λ_2) is**
(A) m_1/m_2 (B) m_2/m_1
(C) 1 (D) $\sqrt{m_2}/\sqrt{m_1}$ *(I.I.T. 199*

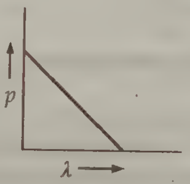
25. **Which of the following figures represent the variation particle momentum and the associated de-Brogl wavelength ?**



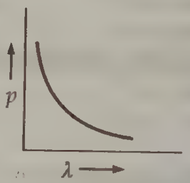
(A)



(B)



(C)



(D)

(A.I.I.M.S. 1982

26. **An electron microscope gives higher magnification than a optical microscope, because**
(A) the electrons have lesser wavelength as compared t light waves.
(B) the velocity of electrons is smoother than that of light
(C) the electrons have more energy than the light particles
(D) more powerful lenses are used in the electron microscope. *(C.E.T. 1998*

CHAPTER

1

Structure of Nucleus

1.01. RUTHERFORD'S ALPHA SCATTERING EXPERIMENT

Quotable Quote

"We have no right to assume that any physical laws exist, or if they have existed upto now, that they will continue to exist in a similar manner in the future."

– **Max Planck**

Rutherford and his two associates, Geiger and Marsden, studied the scattering of the α-particles from a thin gold foil in order to investigate the structure of the atom. An α-particle is a positively charged particle having a mass equal to that of helium atom and positive charge in magnitude equal to twice the charge on an electron. They are found to be emitted by many radioactive elements. The α-particle scattering experiment provided very useful information about the structure of the atom.

Experimental arrangement. The α-particles from $_{83}Bi^{214}$ (a radioactive source) contained in a lead cavity are collimated into a narrow beam with the help of a lead plate having a narrow slit as shown in Fig. 1.01. The narrow beam of α-particles then falls on a thin gold foil (about $2{\cdot}1 \times 10^{-7}$m thick). The α-particles scattered in different directions were detected with the help of an α-particle detector. The whole apparatus was arranged inside a vacuum chamber to prevent the scattering of α-particles from air molecules.

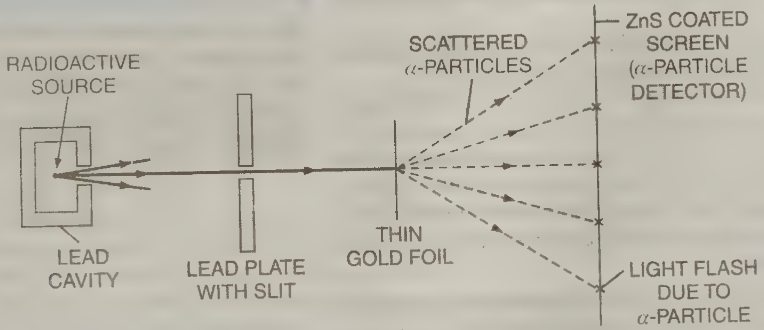

Fig. 1.01

Observations. 1. *Most of the α-particles were found to pass through the gold foil without any appreciable deflection.*

2. *The different α-particles, in passing through the gold foil, underwent different amounts of deflections. A large number of α-particles suffered fairly large deflections.*

3. *A very small number of α-particles (about 1 in 8000) practically retraced their paths or suffered deflection of nearly 180°.*

4. *The graph between the total number of α-particles $N(\theta)$ scattered through angle α and the scattering angle θ was found to be as shown in Fig. 1.01.*

The α-particles scattered from the gold foils are very heavy particles (about 7000 times heavier than electrons) and possess high initial speeds. Thomson's atom model cannot explain the scattering of α-particles through large angles and particularly through 180°. It is because, the light particles like electrons cannot deflect the massive α-particles through 180°.

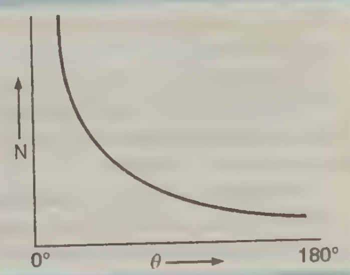

Fig. 1.02

Explanation. To explain the above experimental observations, Rutherford assumed that the scattering of α-particles from the gold atoms was due to Coulomb's interaction between the positive charge of the α-particle and the positive charge in the gold atom. On this basis, he theoretically calculated the number of α-particles that would be deflected through angle θ. The theoretical graph between N (θ) and θ was found to be in full agreement with the graph shown in Fig. 1.02 obtained experimentally. The experimental observations led Rutherford to the following conclusions :

1. Since most of the α-particles passed undeviated, *the atom has a lot of empty space in it.*

2. Since the fast and the heavy α-particles could be deflected even through 180°, *the whole of the positive charge and practically the entire mass of the atom is confined to an extremely small central core.* It was called ***nucleus.***

Since 1 in about 8000 α-particles is deflected through 180°, the size of the nucleus is about $\frac{1}{10,000}$th of the size of the atom.

3. The scattering of different α-particles through different angles was explained on the ***nuclear model of the atom*** as given below :

The α-particles such as a and a', which pass through the atom at a large distance from the nucleus, experience a small electrostatic force of repulsion due to the nucleus and hence undergo a very small deflection. The α-particles b and b', which pass through the atom at a close distance from the nucleus suffer a large deflection. The α-particles such as c, which travel towards the nucleus directly, slow down as they move and ultimately come to rest and then after being deflected through 180°, retrace their path [Fig. 1.03].

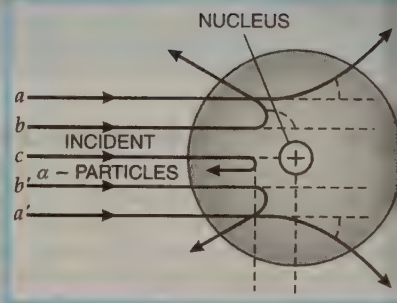

Fig. 1.03

1.02. CONCLUSIONS FROM RUTHERFORD'S EXPERIMENT

The following conclusions can be drawn from Rutherford's α-scattering experiment :

1. An atom may be regarded as a sphere of diameter 10^{-10}m but whole of the positive charge and almost the entire mass of the atom is concentrated in a small central core called nucleus, having a diameter of about 10^{-14} m.
2. The nucleus is surrounded by electrons. In other words, the electrons are spread over the remaining part of the atom, leaving plenty of empty space in the atom.
3. As the atom is electrically neutral, the total positive charge on the nucleus is equal to the total negative charge of the electrons in the atom.
4. Rutherford pointed out that the electrons inside the atom are not stationary for if they were at rest, they would be pulled into the positive nucleus due to the strong electrostatic force of attraction between the nucleus and the electrons. He assumed that the electrons are revolving around the nucleus in circular orbits, the necessary centripetal force being provided to them by the electrostatic force of attraction between the electrons and the nucleus.

Key point

An atom has a nearly continuous mas distribution in Thomson's atom model But according to Rutherford's aton model, the distribution of mass in the aton is highly non-uniform.

1.03. COMPOSITION OF NUCLEUS

The nucleus was first discovered in 1911 by Lord Rutherford and his associates by experiments on scattering of alpha particles by atoms. He found that the scattering results could be explained, if atoms consist of a *small, central, massive* and *positive core* surrounded by orbiting electrons. The experimental results indicated that the size of the nucleus is of the order of 10^{-14} metre and is thus 10,000 times smaller than the size of atom. The study of radioactivity revealed that nucleus is not a composite body but is made of ***nucleons.*** Further, it is practically responsible for the whole of the mass of the atom.

The Jargon

Protons and neutrons inside the nucleu are called nucleons.

In periodic table, elements are arranged according to their atomic numbers. The Zth element in the periodic table has Z protons in its nucleus and this number Z is known as ***atomic number.*** If there are N neutrons in the nucleus, then the number of protons and neutrons is given by

$$A = Z + N,$$

where A is known as ***mass number.*** It may be made clear that the nuclear mass is different from the mass number. Actually, mass number is the integer closest to the nuclear mass.

In nuclear physics, it is very convenient to represent nucleus of an element as ${}_ZX^A$, where Z and A are respectively the atomic number and mass number of an element, whose chemical symbol is X. For example, nucleus of sodium having 11 protons and 12 neutrons ($Z = 11$, $A = 23$) is represented as ${}_{11}Na^{23}$.

Magnetic moment of nucleus. In order to explain hyperfine structure of the spectral lines, in 1924, Pauli suggested angular momentum for the nucleus. The protons and neutrons were also considered as particles having orbital and spin motion.

When a charged particle like proton moves in a closed path, it possesses angular momentum and at the same time it produces magnetic field. The magnetic field at ge distances may be described as due to a magnetic dipole located at the centre the current loop (closed path of proton). Thus, the orbital and spin motion of otons produce extranuclear magnetic field, which can be assumed as due to gnetic dipoles located at the centre of the nucleus. Since a magnetic dipole ssesses magnetic moment, the nucleus also possesses magnetic moment.

Proton. Proton is a positively charged particle. The magnitude of charge on proton is 1·6 × 10^{-19} coulomb. The rest mass of proton is 1·6725× 10^{-27} kg. rther, the rest mass of proton (m_p) is 1836·1 times the rest mass of electron (m_e). has got intrinsic angular momentum (spin) equal to $\frac{1}{2}$. It also possesses a very all magnetic moment as compared to that of electron.

Neutron. Neutron possesses no charge and its rest mass (m_n) is 1836·6 times rest mass of electron. Neutron has got intrinsic angular momentum equal to that proton. Since magnetic moment of a particle is the effect of the rotating electric arge, the uncharged neutron might be expected to have no magnetic moment at . In fact, it also possesses a small magnetic moment.

Thus, we find that neutrons and protons have identical properties except that oton is a positively charged particle and neutron without any charge. As said rlier, protons and neutrons are collectively called nucleons.

Watch out !

The main drawback with neutrons is that : they have no charge. There is no way to artificially accelerate them !

The following gives a detailed account of the properties of neutron :

1. Neutron is constituent of nucleus and is an elementary particle having mass ual to 1·6748× 10^{-27} kg.
2. It is an uncharged particle and hence the electric and magnetic fields have effect on it.
3. Being neutral, it possesses very high penetrating power.
4. Also due to its neutral nature, it possesses very low ionising power.
5. Neutron is a stable particle within the nucleus. However, outside the ucleus, the neutron is an unstable particle. Its half life period is about 12 minutes. decays according to the following scheme :

$$_0n^1 \longrightarrow {}_1H^1 + {}_{-1}e^0 + \bar{\nu},$$

here $\bar{\nu}$ is called ***antineutrino***.

6. The neutrons can be slowed down by passing them through heavy water, araffin wax, graphite, etc. This happens due to the elastic scattering of the neutrons. e scatterers are commonly known as ***moderators***.
7. The slow neutrons, also known as ***thermal neutrons***, are found to be more ficient in causing nuclear reactions.

1.04. ISOTOPES, ISOTONES AND ISOBARS

Isotopes. *The atoms of an element, which have the same atomic number but different ass numbers, are called isotopes*. In other words, the number of protons inside the ucleus or the number of electrons outside the nucleus of such atoms is the same ut the number of neutrons inside the nucleus is different. Thus, isotopes differ only s regards the number of neutrons inside their nuclei. As their atomic number is ame, they occupy the same position in the periodic table and hence they possess lentical chemical properties. Such elements cannot be separated by chemical means nd different techniques have been developed for their separation and to study their elative abundance. Some examples of isotopes are :

(*i*) ${}_8O^{16}$, ${}_8O^{17}$, ${}_8O^{18}$, (*ii*) ${}_{17}Cl^{35}$, ${}_{17}Cl^{37}$, (*iii*) ${}_{82}Pb^{206}$, ${}_{82}Pb^{207}$, ${}_{82}Pb^{208}$

Self-test Question

Values of atomic mass for most elements are close to whole number multiples of the mass of one hydrogen atom, but some are not (e.g. chlorine has an atomic mass of 35·5). Why ?

It may be pointed out that though the isotopes have identical chemical roperties, the nuclear properties are highly dissimilar. For example, out of three sotopes of sodium, ${}_{11}Na^{24}$ is found to decay by positron-emission, ${}_{11}Na^{23}$ is stable nd ${}_{11}Na^{22}$ is found to decay by beta-emission.

Self-test Question

Chlorine's proton number is 17. How many neutrons are there in each of its isotopes : Cl^{35} and Cl^{37} ? Which of the two isotopes is most abundant and by how much ?

Isotones. *The atoms whose nuclei have same number of neutrons are called isotones*. ecause of symmetry of nuclear forces in protons and neutrons, isotones and sotopes play very similar roles in nuclear forces.

Isobars. *The atoms, which have same mass number but different atomic numbers, are alled isobars*. Since isobars have same mass number, they have same number of ucleons (neutrons and protons) in their nuclei. The number of protons in their nuclei nd hence the number of electrons revolving around their nuclei are different in such toms. Therefore, the chemical properties of isobars are different. Some examples f isobars are :

(*i*) ${}_1H^3$ and ${}_2He^3$ (*ii*) ${}_3Li^7$ and ${}_4Be^7$ (*iii*) ${}_{18}Ar^{40}$ and ${}_{20}Ca^{40}$ (*iv*) ${}_{32}Ge^{76}$ and ${}_{34}Se^{76}$
No stable isobars are found among the higher elements.

1.05. SIZE OF NUCLEUS

The fact that nucleus has a finite size became evident from the Rutherford's alpha particle scattering experiments. The results of α-scattering experiment can be easily explained on the basis of the Coulomb's interaction between the α-particle and the nucleus of the gold atom. Further, the measurement of the distance of closest approach of the α-particle helped in estimating the size of the nucleus. The radius of gold nucleus was estimated to be about $4{\cdot}1\times 10^{-14}$m.

The size of the nucleus has been measured with the help of a variety of experiments involving the scattering of particles such as neutrons, protons, electrons, etc. In every case, it is found that *the volume of the nucleus is directly proportional to the number of nucleons (mass number) constituting the nucleus.* If R is the radius of the nucleus having mass number A, then

$$\frac{4}{3}\pi R^3 \propto A$$

or $$R \propto A^{1/3}$$

or $$R = R_0 A^{1/3}, \qquad \text{...(1.01)}$$

where $R_0 = 1{\cdot}1\times 10^{-15}$ is the range of nuclear force. It is also known as ***nuclear unit radius***. It is believed to be the average nucleon size. The value of R_0 is not definite. Electron scattering experiments predict slightly smaller value of R_0 than that predicted by neutron scattering experiment. It is because, in neutron scattering experiment, the charge on nucleus does not play any role as it does in electron scattering experiments. The different values of nuclear radius from these experiments indicate that the matter and charge are not distributed in a similar fashion inside the nucleus.

Self-test Question

High energy X-rays may have wa lengths as short as 10^{-11} m. What are implications for probing size of nucleus using such X-rays ?

Owing to the small size of the nucleus, fermi (F) is found to be a convenient unit of length in nuclear physics. It is defined as

$$\mathbf{1\ fermi\ (F) = 10^{-15}\ m}$$

1.06. NUCLEAR DENSITY

The expression for radius of nucleus can be used to compute the density of the nucleus. Let us find the density of the nucleus of an atom, whose mass number is A. If we neglect the mass of the orbital electrons, then

mass of the nucleus of the atom of mass number A

$$= A \text{ a.m.u.} = A \times 1{\cdot}660565 \times 10^{-27} \text{ kg}$$

If R is the radius of the nucleus, then

$$\text{volume of nucleus} = \frac{4}{3}\pi R^2 = \frac{4}{3}\pi (R_0 A^{1/3})^3 = \frac{4}{3}\pi R_0^{\,3} A$$

Taking $R_0 = 1{\cdot}1 \times 10^{-15}$ m, we have

$$\text{volume of the nucleus} = \frac{4}{3}\pi (1{\cdot}1\times 10^{-15})^3 \times A \text{ m}^3$$

$$\text{Density of the nucleus, } \rho = \frac{\text{mass of nucleus}}{\text{volume of nucleus}} = \frac{A\times 1{\cdot}660565\times 10^{-27}}{\frac{4}{3}\pi(1{\cdot}1\times 10^{-15})^3\times A}$$

$$= 2{\cdot}97 \times 10^{17} \text{ kg m}^{-3} \qquad \text{(independent of A)}$$

Watch out !

A test tube full of bare nuclei will we heavier than the earth !

Discussion. 1. The density of the nuclei of all the atoms is same as it is independent of mass number.

2. The high density of the nucleus ($\approx 10^{17}$ kg m^{-3}) suggests the compactness of the nucleus. Such examples of high densities are met in the form of neutron stars.

3. The experiments reveal that the density of nucleus is maximum at the centre and falls to zero as we move radially outwards. In other words, the nucleus does not have sharp boundary. The effective value of radius of the nucleus is taken as the distance from its centre, where the density is half its value at the centre.

4. Recent high energy electron scattering experiments have proved that matter is not uniformly distributed inside the nucleus.

Key point

The density of nuclear matter is same all the nuclei (independent of Z).

Key point

The density of nuclear matter is extreme large as compared to the average dens of matter distributed in the atom.

1.07. FORCE BETWEEN NUCLEONS

The nucleus of an atom is a small sphere of diameter of about 10^{-14} metre and a number of protons and neutrons are packed inside it. Due to electrostatic interaction between protons (positively charged), the strong Coulomb's repulsive force will try to blow them apart, whereas the weak gravitational force between the cleons due to their rest masses will try to hold them together. In order to see, what ll actually happen, let us make an estimate of the magnitudes of Coulomb's and avitational forces between two protons inside a nucleus.

Magnitude of gravitational force. The gravitational force between two protons ch of mass m_p and separated by a distance r is given by

$$F_{grav} = G\frac{m_p\, m_p}{r^2}$$

Now, $m_p = 1{\cdot}67 \times 10^{-27}$ kg and $G = 6{\cdot}66 \times 10^{-11}\ \text{N m}^2\,\text{kg}^{-2}$

$$\therefore \quad F_{grav} = \frac{6{\cdot}66\times10^{-11}\times(1{\cdot}67\times10^{-27})^2}{r^2} = \frac{1{\cdot}86\times10^{-64}}{r^2}\ \text{N}$$

Magnitude of Coulomb's force. The Coulomb's or electrostatic force between vo protons each having charge q and located at the same distance r is given by

$$F_{elec} = \frac{1}{4\pi\varepsilon_0}\cdot\frac{q\cdot q}{r^2}$$

Now $\quad \dfrac{1}{4\pi\varepsilon_0} = 9\times10^9\ \text{N m}^2\,\text{C}^{-2}\ ;\ q = 1{\cdot}6\times10^{-19}\ \text{C}$

$$\therefore \quad F_{elec} = \frac{9\times10^9\times(1{\cdot}6\times10^{-19})^2}{r^2} = \frac{2{\cdot}304\times10^{-28}}{r^2}\ \text{N}$$

Hence, $\quad \dfrac{F_{elec}}{F_{grav}} = \dfrac{2{\cdot}304\times10^{-28}}{r^2}\times\dfrac{r^2}{1{\cdot}86\times10^{-64}} \approx 10^{36}$

Therefore, inside the nucleus, Coulomb's electrostatic repulsion between two rotons is about 10^{36} times the gravitational attraction between them.

Key point

Inside the nucleus, electrostatic force of repulsion between two protons is about 10^{36} times the gravitational force of attraction between them.

On the other hand, electrostatic force of attraction between a proton and an electron kept a certain distance apart is about 10^{42} times the gravitational force of attraction between them at the same distance.

1.08. NUCLEAR INSTABILITY

It follows that Coulomb's electrostatic repulsion between two protons is extremely large as compared to the gravitational force of attraction between them. Therefore, if Coulomb's repulsive and gravitational attractive forces are the only forces operating inside the nucleus, it cannot be stable. The stability of nuclus has been explained on the basis of the existence of a third type of force inside the nuclues, called ***nuclear force.*** It is such a strong attractive force that Coulomb's repulsive force between protons is unable to tear off the nucleus.

Key point

The extremely large magnitude of electrostatic force of repulsion between protons is the basic cause of nuclear instability.

The stability of a nucleus is determined by many factors. A brief account of a few such factors is as given below :

1. The stability of a nucleus is determined by the value of its binding energy per nucleon*. In general, higher the value of the binding energy per nucleon, more is the nucleus stable.

2. The stability of a nucleus is also determined by its neutron to proton ratio. In general, for stable nuclei, neutron proton ratio should be greater than 1.

Only the lightest nuclei tend to have equal number of protons and neutrons. As Z increases, the disruptive forces due to Coulomb's repulsion between the protons would tend to tear off the neucleus, unless some extra attractive forces were not brought into the nuclear structure. These extra attractive forces are provided by neutrons, whose number exceeds the number of protons by a larger and larger amount as Z increases.

Key point

Electrostatic repulsion would tear the nucleus apart. There has to be a force to bind all nucleons. Neutrons are not repelled electrostatically, but they would tend to drift about anywhere if not held tightly in the nucleus by a strong attractive force.

3. Apart from the high values of binding energy per nucleon and a proper neutron-proton ratio, the stability of a nuclon is determined by the consideration, whether it is an ***even-even nucleus*** (even Z and even A) or an ***even-odd nucleus*** (even Z and odd A) or ***odd-even nucleus*** (odd Z and even A) or an ***odd-odd nucleus*** (odd Z and odd A). It is found that an even-even nucleus is more stable, even if it has comparatively low value of binding energy per nucleon. An even-odd or an odd-even nucleus is found to be lesser stable, while the odd-odd nucleus is found to be least stable.

1.09. NUCLEAR FORCE

Inside the nucleus, Coulomb's repulsive force between two protons is about 10^{36} times as large as the gravitational force between them. In the presence of such a tremendous repulsive force between two protons, the small attractive gravitational force can do little in preventing them from getting away from each other. But we know that even a heavy nucleus containing a large number of protons is stable. It is, therefore, evident that a third type of force does exist between the nucleons and it is known as *nuclear force*. This force should be basically a very strong attractive force, so that even the large electrostatic force of repulsion between the protons may not be able to blow apart the protons.

---

*Refer to section 1.12.

Key point

Nuclear forces give rise to a negative p ential energy (binding energy), which observed as a loss in mass (mass defec

The exact force law obeyed by the nuclear force is not known but at a distance of about 10^{-14} m, nuclear force is estimated to be about 100 times as strong as the Coulomb's force between the two protons. Therefore, the relative strengths of the gravitational, Coulomb's and nuclear force are

$$F_g : F_e : F_n :: 1 : 10^{36} : 10^{38}$$

Properties. The nuclear forces are found to possess following properties :

1. ***Nuclear forces are strongest forces in nature.*** Nuclear forces are about 10^{38} times as strong as gravitational forces.

2. ***Nuclear forces are short range forces.*** The nuclear force between two nucleons becomes negligible, when the distance between them is greater than 4·2 fermi or $4{\cdot}2 \times 10^{-15}$ m. However, the range of nuclear force is taken as 1·5 fermi, where the magnitude of the nuclear force becomes about one-third of its maximum value. Thus, unlike gravitational and electromagnetic forces (which extend up to infinity), nuclear force is a short range force.

Key point

Nuclear forces are strongest attracti forces, which hold nucleons togeth inside the nucleus. They are short rang charge independent and non-centr forces.

3. ***Nuclear forces are basically strong attractive forces, but contain a small component of repulsive forces.*** The nuclear force comes into action as an attractive force, when two nucleons are at a distance of about 10^{-14} m (size of nucleus). As the distance is decreased, the attractive force increases rapidly and becomes maximum at a distance of about $1{\cdot}5 \times 10^{-15}$. If distance is decreased further, at a distance of $0{\cdot}5 \times 10^{-15}$ m, it changes suddenly into a repulsive force. Thus, over a large part of nucleous, the nuclear force is strong attractive and is strong repulsive only over a small part of the nucleus. This repulsive part saves the nucleus from collapsing.

4. ***Nuclear forces are saturated forces.*** A nucleon inside the nucleus does not experience nuclear force due to all other nucleons. It experiences force only due to its nearest neighbouring nucleons. A direct consequence of this property is that mean binding energy per nucleon for most of the nuclei has a constant value of 8 MeV per nucleon.

5. ***Nuclear forces are charge independent.*** Inside the nucleus, the attractive forces between two nucleons are of three types *i.e.* force between a neutron and a proton (*n-p*), between two neutrons (*n-n*) and between two protons (*p-p*).

Experiments indicate that the three types of forces *i.e.* *n-p*, *n-n* and *p-p* have the same magnitude *i.e.*

$$n\text{-}p \approx n\text{-}n \approx p\text{-}p$$

Thus, inside the nucleus, the force between nucleons is not affected by the charge of the proton and this property is known as *charge independence of nuclear forces.*

6. ***Nuclear forces are spin-dependent.*** The force between two nucleons having parallel spins is greater than the force between the two nucleons having anti-parallel spins and hence nuclear forces are spin dependent.

7. ***Nuclear forces are exchange forces.*** The nuclear force between the two nucleons is the result of the exchange of π mesons (π^0, π^+ and π^-) between them.

8. ***Nuclear forces are non-central forces.*** The force between two nucleons does not act along the line joining their centres and for this reason, it is called a *non-central force.*

1.10. MASS-ENERGY EQUIVALENCE

Einstein's mass-energy equivalence is a consequence of variation of mass with velocity. From the special theory of relativity, it follows that the kinetic energy of a moving particle is equal to c^2 times the increase in mass due to its motion. If m_0 is rest mass of the particle and m, the mass in motion, then kinetic energy of the particle,

$$T = (m - m_0)\, c^2$$

According to Einstein, the rest mass of the particle is due to an internal store of energy $m_0 c^2$, called the ***rest mass energy*** of the particle. Therefore, the total energy of a moving particle is given by

$$E = T + m_0 c^2 = (m - m_0)\, c^2 + m_0 c^2$$

or

$$E = m c^2 \qquad \text{...(1.02)}$$

Thus, a mass m is equivalent to an energy $m\,c^2$. This is the famous ***Einstein's -energy relationship*** showing the equivalence of mass and energy.

Discussion. The mass-energy equivalence relation leads to the following rtant conclusions :

1. The equation (1.02) may be written as

$$\Delta E = \Delta m\,c^2,$$

e Δm is the increase in mass corresponding to the increase in energy ΔE. It forms asis of nuclear fission and fusion relations. A mass Δm is equivalent to energy ^{2} and an energy ΔE is equivalent to a mass $\Delta E/c^2$. Thus, *special theory of relativity ves energies to all masses and mases to all energies.*

2. In classical mechanics, the laws of conservation of mass and energy are two rate principles independent of each other. The relation $E = m\,c^2$, leads to the cation of the two laws into one law *i.e.* ***law of conservation of relativistic energy.***

3. In classical mechanics, mass is considered something fundamental to er, while energy is a property of the matter acquired by virtue of its position figuration) or motion. The relation $E = m\,c^2$ puts an end to such a distinction veen mass and energy.

Self-test Question

How long could you run a 1000 MW power station on 1 kg of matter (assuming all of it is converted into useful energy ?

1.11. ATOMIC MASS UNIT

The atomic mass unit* (a.m.u.) is a very small unit of mass and it is found to ery convenient in nuclear physics.

Atomic mass unit is defined as $\frac{1}{12}$ *th of the mass of one* ${}_6C^{12}$ *atom.*

According to Avogadro's hypothesis, number of atoms in 12 g of ${}_6C^{12}$ is equal vogadro number. *i.e.* $6{\cdot}023 \times 10^{23}$.

Therefore, the mass of one carbon atom (${}_6C^{12}$) is $\dfrac{12}{6{\cdot}023 \times 10^{23}}$ *i.e.* $1{\cdot}992678 \times$ ^{26} kg.

Therefore, $\quad 1 \text{ a.m.u.} = \dfrac{1}{12} \times 1{\cdot}992678 \times 10^{-26}$ kg

or $\quad$ **1 a.m.u. = $1{\cdot}660565 \times 10^{-27}$ kg**

The mass of a hydrogen atom comes out to be 1·00794a.m.u. The masses of ny atoms are found to be close to integral multiple† of the mass of an hydrogen m. However, the atomic mass of the chlorine atom is 35·47 a.m.u. and is not egral multiple of the atomic mass of hydrogen. The measurement of atomic sses with the help of mass-spectrometer revealed that many elements possess topes. The chlorine is composed of two isotopes having atomic masses 34·98 ı.u. and 36·98 a.m.u. Their relative abundance is 75·4% and 24·6% respectively. e atomic mass of chlorine is taken weighted average of the masses of its two topes. Thus,

$$\text{atomic mass of chlorine atom} = \frac{75{\cdot}4 \times 34{\cdot}98 + 24{\cdot}6 \times 36{\cdot}98}{100} = 35{\cdot}47 \text{ a.m.u.}$$

On the atomic scale, mass of a proton is taken as

$$m_p = 1{\cdot}007275 \text{ a.m.u.} = 1{\cdot}007275 \times 1{\cdot}660565 \times 10^{-27} = 1{\cdot}67265 \times 10^{-27} \text{ kg}$$

d mass of a neutron is taken as

$$m_n = 1{\cdot}008665 \text{ a.m.u.} = 1{\cdot}008665 \times 1{\cdot}660565 \times 10^{-27} = 1{\cdot}67495 \times 10^{-27} \text{ kg}$$

Energy equivalent of a.m.u.

According to Einstein's mass-energy equivalence relation, the energy uivalent of mass m is given by

$$E = m\,c^2,$$

here c is speed of light.

Suppose that $\quad m = 1 \text{ a.m.u.} = 1{\cdot}660565 \times 10^{-27}$ kg

Since $\quad c = 2{\cdot}998 \times 10^8 \text{ m s}^{-1}$, the energy equivalent of 1 a.m.u. is given by

$$1 \text{ a.m.u.} = (1{\cdot}660565 \times 10^{-27} \text{ kg}) \times (2{\cdot}998 \times 10^8 \text{ m s}^{-1})^2 = 1{\cdot}4925 \times 10^{-10} \text{ J}$$

Since $\quad 1 \text{ MeV} = 1{\cdot}602 \times 10^{-13}$ J, we have

---

*Atomic mass unit is also denoted as u.

†Before 1960, atomic mass unit was defined as $\frac{1}{16}$ th of mass of an ${}_8O^{16}$ atom. On this basis, the atomic masses of many elements iffer considerably from the integral multiples of the mass of hydrogen atom.

$$1\ \text{a.m.u.} = \frac{1{\cdot}4925\times10^{-10}}{1{\cdot}602\times10^{-13}}$$

or $$\mathbf{1\ a.m.u. = 931{\cdot}5\ MeV}$$

Note. It can be calculated that the energy equivalents of the mass of an electron, proton and neutron are respectively

$$m_e = 0{\cdot}511\ \text{MeV},\ m_p = 938{\cdot}279\ \text{MeV and } m_n = 939{\cdot}573\ \text{MeV}$$

1.12. MASS DEFECT AND BINDING ENERGY

In general, the nucleus of an atom is stable. The protons and neutrons are held inside the nucleus by the strong attractive forces, called nuclear forces. Since the free protons would exert a very strong force of repulsion on each other, it is worthwhile to investigate as to how a nucleus is formed from free protons and neutrons.

Mass defect. It is found that the mass of a stable nucleus is always less than the total mass of the constituent nucleons. In other words, if a certain number of neutrons and protons are brought together to form a nucleus, the mass of the nucleons forming the nucleus decreases or *defects.*

The difference between the sum of the masses of the nucleons constituting a nucleus and the rest mass of the nucleus is known as mass defect. It is denoted by Δm.

Let us calculate the mass defect in case of the nucleus of an atom ${}_ZX^A$. The nucleus of the atom contains Z protons and (A–Z) neutrons. Therefore,

mass of the constituting nucleons $= Z\,m_p + (A - Z)\,m_n$

If $m_N({}_ZX^A)$ is mass of the necleus of the atom ${}_ZX^A$, then the mass defect is given by

$$\Delta m = [Z\,m_p + (A - Z)\,m_n] - m_N({}_ZX^A) \qquad ...(1.03)$$

The mass defect can also be expressed in another form as explained below :

Adding and subtracting the mass of Z electrons *i.e.* $Z\,m_e$ on the R.H.S. of equation (1.03), we have

$$\Delta m = [Z\,m_p + (A - Z)\,m_n + Z\,m_e] - m_N({}_ZX^A) - Z\,m_e$$
$$= [Z\,(m_p + m_e) + (A - Z)\,m_n] - [m_N({}_ZX^A) + Z\,m_e]$$

Now, $m_p + m_e = m({}_1H^1)$, mass of hydrogen atom and

$m_N({}_ZX^A) + Z\,m_e = m({}_ZX^A)$, mass of the atom ${}_ZX^A$

Therefore, $$\Delta m = [Z\,m({}_1H^1) + (A - Z)\,m_n] - m({}_ZX^A) \qquad ...(1.04)$$

Binding energy. When a nucleus is formed from the free nucleons, the decrease in mass of the nucleons is released as equivalent energy (in accordance with Einstein's mass-energy relation). The energy equivalent to mass defect is used in *binding* the nucleons and is called ***binding energy*** of the nucleus. In order to break the nucleus or to completely separate the nucleons from each other, an equal amount of work has to be done.

Thus, *the binding energy of a nucleus may be defined as the energy equivalent to the mass defect of the nucleus.* It may be measured as the work required to be done to separate the nucleons an infinite distance apart, so that they no longer interact with each other.

If Δm is mass defect of a nucleus, then according to Einstein's mass-energy relation,

binding energy of the nucleus $= \Delta m\, c^2$ (in joule)

Here, mass defect Δm has to be measured in kilogram. In case, mass defect is measured in a.m.u., then

binding energy of the nucleus $= \Delta m \times 931{\cdot}5$ (in MeV)

The binding energy of a nucleus may also be expressed in terms of masses of protons, neutrons and the nucleus as explained below :

From equation (1.03), we have

$$\text{binding energy} = [\{Z\,m_p + (A - Z)\,m_n\} - m_N({}_ZX^A)] \times 931{\cdot}5 \qquad ...(1.05)$$

Here, $m_N({}_ZX^A)$ is mass of the nucleus of the atom ${}_ZX^A$.

Also, using equation (1.04), we have

$$\text{binding energy} = [\{Z\,m({}_1H^1) + (A - Z)\,m_n\} - m({}_ZX^A)] \times 931{\cdot}5 \qquad ...(1.06)$$

Here, $m({}_1H^1)$ and $m({}_ZX^A)$ represent mass of hydrogen atom (${}_1H^1$) and the atom ${}_ZX^A$.

Key point

Nuelceons are bound together by the strong nuclear force. The binding energy of the nucleus may be termed as the work done against this binding force to pull the nucleons apart.

Watch out !

Mass defect and hence binding energy of hydrogen nucleus is zero. It is because, there is only one nucleon. Therefore, strong nuclear force is not involved and so no work need to be done to overcome it !

Watch out !

Binding energy is sometimes considered a negative quantity, since it is an energy deficit !

Binding energy per nucleon. *The binding energy per nucleon is the average energy ired to extract one nucleon from the nucleus.* It is obtained by dividing the binding gy of the nucleus by the number of nucleons it contains.

$$\text{Thus, binding energy per nucleon} = \frac{\text{binding energy}}{A} \qquad ...(1.07)$$

It may be pointed out that the binding energy per nucleon of a nucleus is more ortant than the total binding energy of the nucleus. The higher value of the ding energy per nucleon indicates comparatively greater stability of the nucleus.

Packing fraction. *The packing fraction of a nucleus is defined as the mass defect per eon of the nucleus.*

$$\text{Thus,} \qquad \text{packing fraction} = \frac{\text{mass defect}}{A} \qquad ...(1.08)$$

The packing fraction of a nucleus is closely related to its binding energy per leon.

1.13. BINDING ENERGY CURVE (Nuclear Stability)

Knowing the mass of the nucleus or the mass of the atom, the binding energy l binding energy per nucleon of a nucleus can be easily determined. The values hese two quantities for a few nuclei are given in the following table :

Nuclei	Binding energy	Binding energy per nucleon
$_1H^2$	2·22 MeV	1·11 MeV
$_2H^4$	28·32 MeV	7·08 MeV
$_3Li^7$	37·66 MeV	5·38 MeV
$_{17}Cl^{35}$	287·84 MeV	8·22 MeV
$_{26}Fe^{56}$	492·26 MeV	8·79 MeV
$_{83}Bi^{209}$	1640·26 MeV	7·85 MeV
$_{92}U^{235}$	1786·0 MeV	7·6 MeV

It follows that binding energy of $_3Li^7$ is greater than that of $_2He^4$, but the value its binding energy per nucleon is lesser. However, $_2He^4$ is found to be more stable an $_3Li^7$. Therefore, it may be concluded that the stability of a nucleus (in addition a few other factors*) depends upon binding energy per nucleon rather than the cal binding energy of the nucleus. Hence, the knowledge of binding energy per cleon of a nucleus is more important than its binding energy.

Fig. 1.04 shows the graph between binding energy per nucleon and mass mber of different nuclei. From the binding energy curve, the following inferences n be drawn :

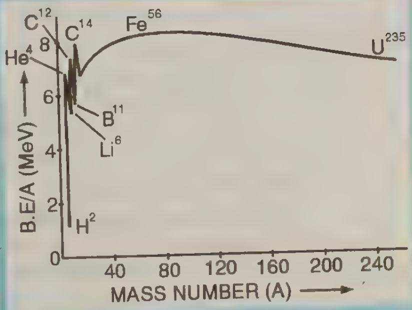

Fig. 1.04

1. The binding energy per nucleon for light nuclei, such as $_1H^2$, is very small.

2. The binding energy per nucleon increases rapidly for nuclei upto mass mber 20 and the curve possesses peaks corresponding to nuclei $_2He^4$, $_6C^{12}$ and O^{16}. The peaks indicate that these nuclei are more stable than those in their eighbourhood. It confirms the reason for extraordinary stability of α-particle.

3. After mass number 20, binding energy per nucleon increases gradually and r mass number between 40 and 120, the curve becomes more or less flat. The verage value of binding energy per nucleon in this region is about 8·5 MeV. For A 56 ($_{26}Fe^{56}$), the binding energy per nucleon is maximum and it is equal to 8·8 MeV.

4. After mass number 120, binding energy per nucleon starts decreasing and rops to 7·6 MeV for uranium. This low value of binding energy per nucleon in case f heavy nuclei is unable to have control over the Coulomb's repulsion between the rge number of protons. Such nuclei are unstable and are found to disintegrate by mitting α-particles. An α-particle is a nucleus of helium (2 protons and 2 neutrons). he emission of α-particle not only decreases Coulomb's repulsive force inside the ucleus but also increases the value of B.E./A of the nucleus due to its extraordinary table structure (α-particle has large binding energy). It is called ***α-decay***.

Sometimes, the heavy nuclei increase the value of their B.E./A by emitting an lectron. It is called ***β-decay***. Inside the nucleus, an electron does not exist. It is created t the time of β-decay due to conversion of a neutron into proton. The β-decay leads o increase in Coulomb's repulsive force, but it increases B.E./A and also improves he ***neutron-proton ratio***†.

---

*Refer to section 1.08.

†As discussed in section 1.08, it is a factor, which determines the stability of a nucleus.

All such nuclei, which undergo α and β-decay are called *radioactive nuclei.*

5. The binding energy per nucleon has a low value for both very light and very heavy nuclei. In order to attain higher value of binding energy per nucleon, the lighter nuclei may unite together to form a heavier nucleus (process of ***nuclear fusion***) or a heavier nucleus may split into lighter nuclei (process of ***nuclear fission***). In both the nuclear processes, the resulting nucleus acquires greater value of binding energy per nucleon along with the liberation of energy.

Watch out !

Once you reach iron in nuclear reaction it's all over. No more energy availabl Iron is ***cold and deed*** in terms of availabl nuclear energy !

SOLVED NUMERICAL PROBLEMS

Type A. On size of nucleus

Problem 1.01. Obtain approximately the ratio of the nuclear radii of the gold isotope $_{79}Au^{197}$ and the silver isotope $_{47}Ag^{107}$. *(Text Problem)*

Sol. We know that $R \propto A^{1/3}$

Therefore, $$\frac{R_1}{R_2} = \left(\frac{A_1}{A_2}\right)^{1/3}$$

Here, $A_1 = 197;\ A_2 = 107$

$$\therefore \quad \frac{R_1}{R_2} = \left(\frac{197}{107}\right)^{1/3} = \mathbf{1\cdot226}$$

Type B. On Nuclear density

Problem 1.02. Assuming that protons and neutrons have equal masses, calculate how many times nuclear matter is denser than water. Given that nuclear radius is given by $R = 1\cdot2 \times 10^{-15}\ A^{1/3}$ metre and mass of a nucleon $= 1\cdot67 \times 10^{-27}$ kg.

Sol. Here, $R = 1\cdot2 \times 10^{-15}\ A^{1/3}$ m ;

mass of one necleon $= 1\cdot67 \times 10^{-27}$ kg ;

Let us calculate the density of the nucleus of mass number A.

Then, mass of the nucleus $= 1\cdot67 \times 10^{-27} \times A$ kg

Volume of the nucleus, V

$$= \frac{4}{3}\pi R^3 = \frac{4}{3}\pi\,(1\cdot2\times10^{-15}\ A^{1/3})^3\ \text{m}^3$$

Density of the nucleus,

$$\rho_{nuc} = \frac{1\cdot67\times10^{-27}\times A}{\frac{4}{3}\pi\,(1\cdot2\times10^{-15}\ A^{1/3})^3}$$

$$= 2\cdot307\times10^{17}\ \text{kg m}^{-3}$$

Now, density of water, $\rho_{wat} = 10^3$ kg m^{-3}

$$\frac{\rho_{nuc}}{\rho_{wat}} = \frac{2\cdot307\times10^{17}}{10^3} = \mathbf{2\cdot307 \times 10^{14}}$$

Type C. On Mass defect and Binding energy

Problem 1.03. Find out the binding energy per nucleon of an α-particle in MeV. It is given that the masses of α-particle, proton and neutron are respectively 4·00150 a.m.u., 1·00728 a.m.u. and 1·00867 a.m.u. *(I.S.C.E. 1998)*

Sol. An α-particle *i.e.* nuclues of helium, consists of two protons and two neutrons.

Here, $m_{He} = 4\cdot00150$ a.m.u. ; $m_p = 1\cdot00728$ a.m.u. ;
$m_n = 1\cdot00867$ a.m.u.

Therefore, mass of protons and neutrons constituting an α-particle,

$$2\,m_p + 2\,m_n = 2\times1\cdot00728 + 2\times1\cdot00867 = 4\cdot0319 \text{ a.m.u}$$

Mass defect, $\Delta m = (2\,m_p + 2\,m_n) - m_{He}$

$$= 4\cdot0319 - 4\cdot00150 = 0\cdot0304 \text{ a.m.u.}$$

Now, 1 a.m.u. = 931·5 MeV

Therefore, binding energy of α-particle

$$= \Delta m \times 931\cdot5 = 0\cdot0304 \times 931\cdot5 = \mathbf{28\cdot32\ Me}$$

Problem 1.04. The mass of deutron ($_1H^2$)nucleus 2·013553 a.m.u. If the masses of proton and neutron a 1·007275 a.m.u. and 1·008665 a.m.u. respectively, calcula the mass defect, the packing fraction, binding energy an binding energy per nucleon.

Sol. Here, $m_p = 1\cdot007275$ a.m.u. ; $m_n = 1\cdot008665$ a.m.u

and mass of $_1H^2$ nucleus, $m_N\,(_1H^2) = 2\cdot013553$ a.m.u

The deutron nucleus contains one proton and on neutron. Therefore,

mass of nucleons constituting deutron,

$$m_p + m_n = 1\cdot007275 + 1\cdot008665 = 2\cdot015940 \text{ a.m.u.}$$

Therefore, mass defect, $\Delta m = (m_p + m_n) - m_N(_1H^2)$

$$= 2\cdot015940 - 2\cdot013553 = \mathbf{0\cdot002387\ a.m.u.}$$

Packing fraction, $$\frac{\Delta m}{A} = \frac{0\cdot002387}{2} = \mathbf{0\cdot0011935\ a.m.u.}$$

Now, binding energy of deutron

$$= \Delta m \times 931\cdot5 = 0\cdot002387 \times 931\cdot5$$
$$= \mathbf{2\cdot22\ MeV}$$

Therefore, binding energy per nucleon of deutron

$$= 2\cdot22/2 = \mathbf{1\cdot11\ MeV}$$

Problem 1.05. Obtain the binding energy of the nucle $_{26}Fe^{56}$ and $_{83}Bi^{209}$ in units of MeV from the following data mass of hydrogen atom = 1·007825 a.m.u., mass of neutror = 1·008665 a.m.u.; mass of $_{26}Fe^{56}$ atom = 55·934939 a.m.u and mass of $_{83}Bi^{209}$ atom = 208·980388 a.m.u.

(C.B.SE. 1993, Pre-degree Kerala, 1991)

Also calculate binding energy per nucleon in the two cases. *(Text Problem)*

Sol. Here, mass of hydrogen atom,

$m(_1H^1) = 1\cdot007825$ a.m.u. $m_n = 1\cdot008665$ a.m.u

If $m(_ZX^A)$ represents the mass of the atom $_ZX^A$, then binding energy of the nucleus of the atom $_ZX^A$ is given by

$$\text{B.E.} = (_ZX^A)$$
$$= [\{Z\,m(_1H^1) + (A - Z)\,m_n\} - m(_ZX^A)] \times 931\cdot5$$

(*i*) Here, $m(_{26}Fe^{56}) = 55\cdot934939$ a.m.u. ;

$$Z = 26 \text{ and } A - Z = 56 - 26 = 30$$

$\therefore$ B.E. ($_{26}Fe^{56}$)

$= [\{26 \times 1\cdot007825 + 30 \times 1\cdot008665\} - 55\cdot934939] \times 931\cdot5$

$= [\{26\cdot20345 + 30\cdot25995\} - 55\cdot934939] \times 931\cdot5$

$= \mathbf{492\cdot26\ MeV}$

B.E. per nucleon of $_{26}Fe^{56} = 492\cdot26/56 = \mathbf{8\cdot79\ MeV}$

(*ii*) Here, $m(_{83}Bi^{209}) = 208\cdot980388$ a.m.u. ;

$$Z = 83 \text{ and } A - Z = 209 - 83 = 126$$

Therefore, B.E. ($_{83}Bi^{209}$)

$= [\{83 \times 1\cdot007825 + 126 \times 1\cdot008665\} - 208\cdot980388] \times 931\cdot5$

$= [\{83\cdot64975 + 127\cdot09179\} - 208\cdot980388] \times 931\cdot5$

$= \mathbf{1640\cdot26\ MeV}$

B.E. per nucleon of $^{83}Bi^{209} = 1640\cdot26/209 = \mathbf{7\cdot848\ MeV}$

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. How many electrons, protons and neutrons re there in a nucleus of atomic number 11 and mass umber 24 ? (*I.I.T. 1982*)

Ans. Number of electrons or protons, Z = **11**
and number of neutrons, A – Z = 24 – 11 = **13**

Q. 1.02. What are the number of protons and the umber of netrons in a nucleus of ${}_{92}U^{238}$? (*I.S.C.E. 1993*)

Ans. Here, number of protons, Z = **12**
number of neutrons, A – Z = 238 – 92 = **146**

Q. 1.03. How many electrons, protons and neutrons are here in 16 g of ${}_8O^{16}$?

Ans. Number of atoms in 16 g of ${}_8O^{16}$ is equal to vogadro number, N = $6{\cdot}02 \times 10^{23}$. Therefore,
number of electrons or protons in 16 g of ${}_8O^{16}$,

$$N \times Z = 6{\cdot}02 \times 10^{23} \times 8 = \mathbf{4{\cdot}816 \times 10^{24}}$$

and number of neutrons in 16 g of ${}_8O^{16}$,

$$N \times (A - Z) = 6{\cdot}02 \times 10^{23} \times (16 - 8) = \mathbf{4{\cdot}816 \times 10^{24}}$$

Q. 1.04. Is a free neutron stable particle ?

Ans. A free neutron is not a stable particle.

Q. 1.05. Give an equation representing the decay of a free neutron. (*H.S.S.C.E. 1998*)

Ans. Equation representing decay of a free neutron.

$${}_0n^1 \longrightarrow {}_1H^1 + {}_{-1}e^0 + \bar{\nu}$$

Q. 1.06. What is meant by the term 'isotope' ? (*I.S.C.E. 1998*)

Ans. The atoms of an element, which have the same atomic number but different mass numbers, are called isotopes.

Q. 1.07. What are isotones ? (*P.S.S.C.E. 2002, 1999*)

Ans. The atoms, whose nuclei have same number of neutrons, are called isotones.

Q. 1.08. How is radius of nucleus related to mass number ?

Ans. The relation between radius and mass number is :

$$R = R_0 A^{1/3}$$

Q. 1.09. What will be the ratio of the radii of two nuclei of mass numbers A_1 and A_2? (*C.B.SE. 2000, 1995*)

Ans. Let R_1 and R_2 be radii of the nuclei of mass numbers A_1 and A_2 respectively. Then, from the relation $R = R_0 A^{1/3}$, it follows that

$$\frac{R_1}{R_2} = \frac{R_0 A_1^{1/3}}{R_0 A_2^{1/3}} = \left(\frac{A_1}{A_2}\right)^{1/3}$$

Q. 1.10. What is the order of the magnitude of the density of nucleus ?

Ans. Nuclear density ≈ 10^{17} kg m^{-3}

Q. 1.11. What is the ratio of the nuclear densities of two nuclei having mass numbers in the ratio 1 : 4 ? (*C.B.SE.1998 S*)

Ans. Nuclear density is independent of the mass number of a nucleus. Since the two nuclei having mass numbers in the ratio 1 : 4 have same nuclear density, ratio of their nuclear densities is 1.

Q. 1.12. What holds nucleons together in a nucleus ? (*H.S.S.C.E. 2001*)

Ans. Inside the neclueons, the electrostatic force of repulsion between the protons is extremely large. They are held inside the nucleus due to nuclear force between them, which is basically a strong attractive force.

Q. 1.13. State Einstein's mass-energy relation. (*I.S.C.E. 1997*)

Ans. In a process, when a mass *m* is completely converted into energy, the energy obtained is given by

$$E = m c^2$$

Q. 1.14. Define atomic mass unit. (*H.S.S.C.E. 1997 S*)

Or

What is atomic mass unit ? (*I.S.C.E. 1995*)

Ans. 1 a.m.u. = $\frac{1}{12}$th of the mass of one ${}_6C^{12}$ atom

Q. 1.15. Express one atomic mass unit (1 a.m.u.) in kilogram. (*H.S.S.C.E. 1994*)

Ans. 1 a.m.u = **$1{\cdot}66 \times 10^{-27}$ kg**

Q. 1.16. How many joule are there in one MeV ? (*H.P.S.S.C.E. 1997*)

Ans. 1 MeV = 10^6 eV = $10^6 \times 1{\cdot}6 \times 10^{-19}$ = **$1{\cdot}6 \times 10^{-13}$ J**

Q. 1.17. Define mass defect. (*H.S.S.C.E. 2001*)

Ans. *The difference between the sum of the masses of the neucleons constituting a nucleus and the rest mass of the nucleus is known as mass defect.*

Q. 1.18. What do you mean by mass defect of a nucleus ? (*H.S.S.C.E. 1993*)

Ans. Refer to section 1.12.

Q. 1.19. Define binding energy of a nucleus. (*H.S.S.C.E. 2002 ; H.P.S.S.C.E. 2001*)

Ans. *The binding energy of a nucleus is equal to the amount of work done to separate the nucleons an infinite distance apart from each other, so that they no longer interact with each other.*

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. Draw a labelled schematic arrangement showing Rutherford's alpha particle scattering experiment. (*I.S.C.E. 1997*)

Ans. Refer to Fig. 1.01.

Q. 1.02. What conclusions are drawn from Rutherford scattering experiments ? (*I.S.C.E. 1995*)

Ans. Refer to section 1.02.

Q. 1.03. Nuclear atom model is required to explain the results of Rutherford experiment. Why ?

Ans. In Rutherford experiment, a few α-particles are scattered through large angles. Therefore, massive and positive part of atom should be concentrated in a small portion of the atom. This small positive part having almost the entire mass of the atom was called nucleus and therefore the main feature of any atom model should be the presence of the central part called nucleus.

Q. 1.04. Explain, how Rutherford's experiment on scattering of α-particles led to the estimation of the size of the nucleus. (*C.B.S.E. 1993*)

Ans. As most of the α-particles passed straight through gold foil and a very few were scattered back, it indicated that the central part of the atom must be positive and it should be a very small part of the atom. As only 1 in about 8000 α-particles retraced its path, the size of nucleus was estimated to be about $\frac{1}{10,000}$ th of the size of an atom.

Q. 1.05. The three stable isotopes of neon : Ne^{20}, Ne^{21} and Ne^{22} have respectively abundances of 90·51%, 0·27% and 9·22%. The atomic masses of the three isotopes are 19·99 a.m.u., 20·99 a.m.u. and 21·99 a.m.u. respectively. Obtain the average atomic mass of neon. *(Text Question)*

Sol. The average atomic mass of neon,

$$A = \frac{90 \cdot 51 \times 19 \cdot 99 + 0 \cdot 27 \times 20 \cdot 99 + 9 \cdot 22 \times 21 \cdot 99}{100}$$

$= 20 \cdot 177$ a.m.u.

Q. 1.06. Prove that nuclear density is same for all nuclei. *(P.S.S.C.E. 1999 S, 1992)*

Or

Show that the density of nuclear matter is constant. *(P.S.S.C.E. 1992)*

Ans. Refer to section 1.06.

Q. 1.07. Why is the density of nucleus more than that of the atom ?

Ans. The size of nucleus is of the order of 10^{-14} m and it is made of protons and neutrons only.

On the other hand, size of atom is of the order of 10^{-10} m. Whereas, the size of atom increases by a very large factor (10^4 times as large as the nucleus), its mass increases only by a small amount (additional mass is the mass of orbital electrons only). For this reason, the density of nucleus is very large as compared to that of the atom.

Q. 1.08. You are given two nuclides $_3X^7$ and $_3Y^4$.

(*i*) Are they the isotopes of the same element ? Why ?

(*ii*) Which one of the two is likely to be more stable ? Give reasons. *(C.B.S.E. 2000, 1995)*

Ans. **(*i*)** Yes, $_3X^7$ and $_3Y^4$ are isotopes of the same elements. It is because, an element is characterised by its atomic number. Since, both X and Y have atomic number 3, they represents the same element *i.e.* Li.

(*ii*) $_3X^7$ (or $_3Li^7$)is more stable than $_3Y^4$ (or $_3Li^4$)(. It is because, the greater number of neutrons in $_3Li^7$ results in greater attractive force between the nucleons so as to win over the Coulomb's repulsive force between the protons.

Q. 1.09. What are nuclear forces ?

Ans. Refer to section 1.09.

Q. 1.10. Give two important characteristics of nuclear forces. *(P.S.S.C.E. 2002, 1999 S, 1999 ; C.B.S.E. 1992)*

Ans. Refer to section 1.09.

Q. 1.11. What do you mean by the charge independent nature of nuclear forces ?

Ans. Refer to section 1.09.

Q. 1.12. Express 16 mg mass into equivalent energy in electron volt. *(P.S.S.C.E. 2000 ; H.S.S.C.E. 1992)*

Ans. Here $m = 16 \text{ mg} = 16 \times 10^{-3} \text{ g} = 16 \times 10^{-6} \text{ kg}$

$\therefore \quad E = m c^2 = 16 \times 10^{-6} \times (3 \times 10^8)^2 = 1 \cdot 44 \times 10^{12}$ J

$$= \frac{1 \cdot 44 \times 10^{12}}{1 \cdot 6 \times 10^{-19}} = 9 \times 10^{-30} \text{ eV}$$

Q. 1.13. Convert one a.m.u. in MeV. *(P.S.S.C.E. 1998 S)*

Or

Calculate the energy equivalent to one atomic mass unit (1 a.m.u.) in MeV. *(H.S.S.C.E. 1995)*

Ans. Refer to section 1.11.

Q. 1.14. What is mass defect ? What light does it thro on the binding energy of a nucleus ? *(I.S.C.E. 199*

Ans. Mass defect. For definition, refer to VSQ 1.17.

The binding energy of a nucleus is measured as th energy equivalent to the mass defect.

Q. 1.15. Why nuclei invariably have mass less tha the sum of the masses of the individual nucleons i them ?

Ans. To make a nucleus, protons and neutrons have t come together in a very small space of the order of 10^{-14} m The energy required to do so is provided by the nucleons a the expense of their masses. Due to this, the mass of th nucleus formed is always less than the sum of the masses o the consituent nucleons.

Q. 1.16. Draw a curve to show the variation of bindin energy per nucleon with mass number. Show the positio of H^2 and U^{238} on this curve. *(I.S.C.E. 1995*

Ans. Refer to Fig. 1.04.

Q. 1.17. Draw the graph showing variation of bindin energy per nucleon with mass number. Write two mai inferences drawn from the graph. *(C.B.S.E. 2002, 1994 ; H.S.S.C.E. 2002*

Ans. For graph between B.E/A and A, refer to Fig. 1,04

The following inferences can be drawn from thi graph :

1. The peaks corresponding to $_2He^4$, $_6C^{12}$ and $_8O^{16}$ indicate that these nuclei are more stable than those in thei neighbourhood.

2. B.E./A has a low value for both light nuclei (A < 20) and for very heavy nuclei (A > 210). The light nuclei tend t unite (process of fusion) and heavy nuclei tend to split (process of fission) in order to attain greater value of B.E./A and hence greater stability.

Q. 1.18. For greater stability, a nucleus should have greater value of binding energy per nucleon. Why ?

Ans. The B.E. of $_3Li^7$ is greater than that of $_2He^4$ but the value of its B.E./A is lesser. Since $_2He^4$ is found to be more stable than $_3Li^7$, it follows that the stability of a nucleus depends upon the higher value of its B.E./A rather than the higher value of its total B.E.

Q. 1.19. How will you correlate B.E. with the stability of a nucleus ? *(P.S.S.C.E. 1995)*

Ans. Refer to SAQ 1.18.

Q. 1.20. Draw a graph showing the variation of binding energy per nucleus with mass number of different nuclei. Mark the regions, where nuclei are (*i*) prone to fusion (*ii*) prone to fission and (*iii*) most stable. *(C.B.S.E. 1996)*

Ans. For graph between B.E./A and A, refer to Fig. 1.04.

(*i*) In the region A < 20, the B.E./A of the nuclei is quite low except for the nuclei $_2He^4$, $_6C^{12}$ and $_8O^{16}$. In an attempt to have greater value of B.E./A, the nuclei in the region A < 20 unite to form a heavier nucleus and therefore, the nuclei in this region are prone to nuclear fusion.

(*ii*) In the region A > 210, the B.E./A of the nuclei is again quite low. The nuclei in this region have a tendency to split so as to improve the value of their B.E./A. Hence, in region A > 210, the nuclei are prone to nuclear fission.

(*iii*) In the region 40 < A < 120, the nuclei are most stable. It is indicated by the flat shape of the graph. The value of B.E./A in this region is maximum *i.e.* about 8·8 MeV per nucleon.

Q. 1.21. Draw a diagram to show the variation of binding energy per necleon with mass number for different uclei. State with reason why light nuclei usually undergo uclear fusion. (*C.B.S.E. 2001*)

Ans. For binding energy per nucleon versus mass umber diagram, refer to Fig. 1.04.

For cause of light nuclei to undergo fusion, refer to SAQ .20. (*i*).

Q. 1.22. Draw a diagram to show the variation of binding energy per nucleon with mass number for different nuclei. State why heavy nuclei undergo fission. (*C.B.S.E. 2001*)

Ans. For binding energy per nucleon versus mass number diagram, refer to Fig. 1.04.

For cause of heavy nuclei to undergo fission, refer to SAQ 1.20. (*ii*).

abc TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 1.01. Is the probability of backward scattering (*i.e.* scattering of α-particles at angles greater than 90°) predicted by Thomson's model much less, about the same or much greater than that predicted by Rutherford's model ? (*Text Question*)

Ans. Thomson's model predicts the backward scattering of α-particles much less than that predicted by Rutherford's model. The reason is that in Thomson's model, positive charge is uniformly distributed over whole of the nucleus instead of being concentrated in a small part.

Q. 1.02. The isotope $_8O^{16}$ has 8 protons, 8 neutrons and 8 electrons, while $_4Be^8$ has 4 protons, 4 neutrons and 4 electrons. Yet the ratio of their atomic masses is not exactly 2. Why ? (*Text Question*)

Ans. It is because of the fact that the mass of a nucleus is slightly less than the mass of the constituent nucleons. This decrease in mass is called mass defect. Since, the mass defect in case of $_8O^{16}$ is not exactly twice the mass defect in case of $_4Be^8$, the ratio of the atomic masses is not exactly 2.

Q. 1.03. The atomic mass of an element is the weighted average of the atomic masses of different isotopes of that element. This explains, why atomic masses of many elements show large departures from integer values. However, even if we consider masses of individual isotopes, they are not strictly integer multiples of the mass of a hydrogen atom. How do you account for this fact ? (*Text Question*)

Ans. It is because of following reasons :

1. The mass of a proton is not the same as that of a neutron.
2. The atomic mass also includes mass of electrons and an atom of mass number A has Z electrons (and not A electrons).
3. The mass of nucleus is slightly less than the mass of the constituent nucleons.

Q. 1.04. In heavy nuclei, number of neutrons is more than number of protons. Why ?

Ans. In heavy nuclei, the number of protons is very large. Due to this, the electrostatic force, which is a long range force, also becomes very large. To contain the nucleons inside the nucleus, the only attractive force is the nuclear force. But it is a short range force and can act only between neighbouring nucleons. A nucleus will be stable, if the number of neutrons is more than the number of protons so as to provide sufficient attractive force.

Q. 1.05. Binding energy per nucleon versus mass number curve for nuclei is shown in Fig. 1.05. W, X, Y, Z are four nuclei indicated on the curve. The following processes can possibly take place :

(*a*) Y → 2 Z (*b*) W → X + Z (*c*) W → 2 Y (*d*) X → Y + Z

Which of the above four processes, leads to the release of energy ? (*I.I.T. 1999*)

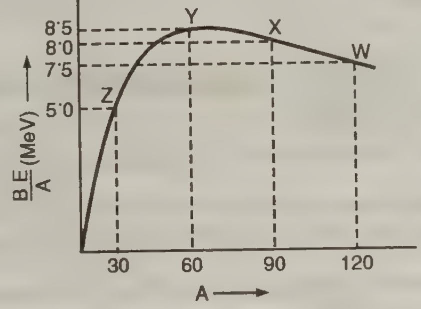

Fig. 1.05

Ans.(*a*) *For process* Y → 2 Z :

Binding energy before decay = 60 × 8·5 = 510 MeV

Binding energy after decay = 2 × (30 × 5·0) = 300 MeV

(*b*) ***For process* W → X + Z :**

Binding energy before decay = 120 × 7·5 = 900 MeV

Binding energy after decay = 90 × 80 + 30 × 5·0 = 870 MeV

(*c*) ***For process* W →2 Y :**

Binding energy before decay = 120 × 7·5 = 900 MeV

Binding energy after decay = 2 × (60 × 8·5) = 1020 MeV

(*d*) ***For process* X → Y + Z :**

Binding energy before decay = 90 × 8·0 = 720 MeV

Binding energy after decay = 60 × 8·5 + 30 × 5·0 = 660 MeV

Only the process (*c*) is accompanied with the increase in the binding energy. The larger the binding energy of the product nuclei formed, the larger would be the energy released. Hence, the process W → 2 Y leads to the release of the energy.

Q. 1.06. M_1 and M_2represent the masses of $_{10}Ne^{20}$ nucleus and $_{20}Ca^{40}$nucleus respectively. State, whether $M_1 = 2\ M_1$ or $M_2 > 2\ M_1$ or $M_2 < 2\ M_1$? (*P.S.S.C.E. 2001 ; I.I.T. 1998*)

Ans. Let m_p be the mass of a proton and m_n, the mass of a neutron. Since some energy is required to bind a nucleus, the mass of a nucleus is always less than the mass of constituent nucleons. Therefore,

$$M_1 < 10\ (m_p + m_n) \text{ and } M_2 < 20\ (m_p + m_n)$$

Since the binding energy per nucleon of $_{20}Ca^{40}$ is more than that of $_{10}Ne^{20}$, the difference $\dfrac{M_2 - 20\ (m_p - m_n)}{40}$ will be more than that of $\dfrac{M_1 - 10\ (m_p + m_n)}{20}$

i.e. $M_2 - 20\,(m_p + m_n) > \frac{40}{20}\,[M_1 - 10\,(m_p + n_n)]$ or $M_2 > 2\,M_1$

FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Size of nucleus

1. Calculate the radius of oxygen nucleus. Given that $R_0 = 1{\cdot}1 \times 10^{-15}$ m. **[Ans.** $2{\cdot}77 \times 10^{-15}$ m]
2. The radius of oxygen nucleus ($_8O^{16}$) is $2{\cdot}8 \times 10^{-15}$ m. Calculate the radius of the lead nucleus ($_{82}Pb^{205}$). **[Ans.** $6{\cdot}55 \times 10^{-15}$ m]

Type B. On Nuclear density

3. Compare the radii of two nuclei with mass numbers 1 and 27 respectively. Also compare their nuclear densities. *(P.S.S.C.E. 2001)* $\left[\textbf{Ans.}\ \frac{1}{3}, 1\right]$
4. Calculate the density of hydrogen nucleus in SI units. Given, $R_0 = 1{\cdot}1 \times 10^{-15}$ m and 1 a.m.u. = $1{\cdot}66 \times 10^{-27}$ kg. **[Ans.** $9{\cdot}354 \times 10^{17}$ kg m^{-3}]

Type C. On Mass defect and Binding energy

5. The mass of $_3Li^7$ nucleus is 0·042 a.m.u. less than the sum of masses of its nucleons. Find the binding energy per nucleon. **[Ans.** 5·586 MeV]
6. Calculate the binding energy an alpha-particle. Given : mass of proton = 1·0073 a.m.u., mass of neutron = 1·0087 a.m.u., mass of α-particle = 4·0015 a.m.u. *(I.S.C.E. 1994)* **[Ans.** 28·4 MeV]
7. Calculate the binding energy pernucleon of $_{17}Cl^{35}$ nucleus. Given that mass of $_{17}Cl^{35}$ nucleus = 34·98000 a.m.u., mass of proton = 1·007825 a.m.u., mass of neutron = 1·008665 a.m.u. and 1 a.m.u. = 931 MeV. *(C.B.S.E. 2002)* **[Ans.** 8·2 MeV]
8. Calculate the binding energy per nucleon of $_{20}Ca^{40}$ nucleus. Given mass of $_{20}Ca^{40}$ nucleus = 39·962589 a.m.u., mass of proton = 1·007825 a.m.u., mass of neutron = 1·008665 a.m.u. and 1 a.m.u. = 931 MeV. *(C.B.S.E. 2002)* **[Ans.** 8·55 MeV]
9. Calculate binding energy per nucleon of $_{26}F^{56}$. Given : $m_N(_{26}F^{56})$ = 55·934939 a.m.u. ; m(neutron) = 1·008665 a.m.u. ; m(proton) = 1·007825 a.m.u. *(C.B.S.E. 2002, 1995)* **[Ans.** 8·79 MeV]
10. Calculate the binding energy per nucleon of $_{83}Bi^{209}$. Given, $m_N(_{83}Bi^{209})$ = 208·980388 a.m.u. ; m(neutron) = 1·008665 a.m.u. and m(proton) = 1·007825 a.m.u. *(C.B.S.E. 1995)* **[Ans.** 7·844 MeV]
11. Calculate the (*i*) mass defect, (*ii*) binding energy and (*iii*) the binding energy per nucleon for a $_6C^{12}$ nucleus. Nuclear mass of $_6C^{12}$ = 12· 000000 a.m.u., mass of hydrogen nucleus = 1·007825 a.m.u. and mass of neutron = 1·008665 a.m.u.
[Ans. (*i*) 0· 09894 a.m.u. ; (*ii*) 92·1 MeV ; (*iii*) 7·675 MeV]
12. Calculate the binding energy of $_2He^4$, $_{17}Cl^{35}$ and $_{26}Fe^{56}$, if the masses of their respective nuclei are 4·002603 a.m.u. ; 34·9800 a.m.u. and 55·934939 a.m.u. respectively. Also, calculate binding energy per nucleon in each case. *(Text Problem)* **[Ans.** 7·07 MeV, 8·22 MeV ; 8·79 MeV]
13. The masses of $_{26}Fe^{56}$ and $_{83}Bi^{209}$ nuclei are 55·934939 and 208·980388 u respectively. Mass of a proton = 1·007825 u and mass of a neutron = 1·008665 u. Calculate the binding energies of these nuclei and show which nucleus is more stable. *(H.P.S.S.C.E. 1996)* **[Ans.** 492·0 MeV, 1639·38 MeV ; $_{26}Fe^{56}$ is more stable]

MISCELLANEOUS PROBLEMS

14. What energyis needed to split an alpha particle to pieces ? Given mass of α-particle is 4·0039 a.m.u., mass of proton = 1·007825 a.m.u., mass of neutron = 1·008665 a.m.u. and 1 a.m.u. = 931 MeV. *(C.B.S.E. 1990)* **[Ans.** 27·07 MeV]
15. The neutron separation energy is defined to be the energy required to remove a neutron from a nucleus. Obtain the

neutron separation energies of the nuclei $_{20}\text{Ca}^{41}$ and $_{13}\text{Al}^{27}$ from the following data :
m_n = 1·008665 a.m.u. ; $m(_{20}\text{Ca}^{40})$ = 39·962591 a.m.u. ; $m(_{20}\text{Ca}^{41})$ = 40·962278 a.m.u. ; $m(_{13}\text{Al}^{26})$ = 25·986895 a.m.u. and $m(_{13}\text{Al}^{27})$ = 26·981541 a.m.u. *(Text Problem)*

[Ans. 836 MeV , 13·06 MeV]

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. $R = R_0 A^{1/3} = 1\cdot1 \times 10^{-15} \times (16)^{1/3} = 1\cdot1 \times 10^{-15} \times 2\cdot52$
$= \mathbf{2\cdot77 \times 10^{-15}\ m}$

2. *For oxygen :*
$R = R_0 A^{1/3}$
or $R_0 = \dfrac{R}{A^{1/3}} = \dfrac{2\cdot8\times10^{-15}}{(16)^{1/3}} = \dfrac{2\cdot8\times10^{-15}}{2\cdot52}$
$= 1\cdot11\times10^{-15}\text{m}$
For lead :
$R = R_0 A^{1/3} = 1\cdot11 \times 10^{-15} \times (205)^{1/3}$
$= 1\cdot11 \times 10^{-15} \times 5\cdot90 = \mathbf{6\cdot55 \times 10^{-15}\ m}$

3. $\dfrac{R_1}{R_2} = \left(\dfrac{A_1}{A_2}\right)^{1/3} = \left(\dfrac{1}{27}\right)^{1/3} = \mathbf{\dfrac{1}{3}}$
Nuclear density is independent of mass number and is same for all nuclei. Therefore,
$\dfrac{\rho_1}{\rho_2} = \mathbf{1}$

4. $\rho = \dfrac{A\,(\text{in kg})}{4/3\times\pi R^3} = \dfrac{A\,(\text{in kg})}{4/3\times\pi R_0^3\,A}$
$= \dfrac{A\times1\cdot66\times10^{-27}}{4/3\times\pi\times(1\cdot1\times10^{-15})^3\times A}$
$= \mathbf{9\cdot354 \times 10^{17}\ kg\ m^{-3}}$

5. $\dfrac{\text{B.E.}}{A} = \dfrac{\Delta m\times931}{A} = \dfrac{0\cdot042\times931}{7} = \mathbf{5\cdot586\ MeV}$

6. $\text{B.E.} = \left[(2\,m_n + 2\,m_p) - m(_2\text{He}^4)\right]\times931$
$= [2 \times 1\cdot0087 + 2 \times 1\cdot0073 - 4\cdot0015] \times 931$
$= \mathbf{28\cdot4\ MeV}$

7. Proceeding as in problem no. 6, it can be obtained that
B.E. = 286·89 MeV
$\therefore\ \dfrac{\text{B.E.}}{A} = \dfrac{286\cdot89}{35} = \mathbf{8\cdot2\ MeV}$

8. Proceed as in problem no. 7.

9. Proceed as in problem no. 7.

10. Proceed as in problem no. 7.

11. $\Delta m = (6\,m_n + 6\,m_p) - m(_6\text{C}^{12})$
$= (6 \times 1\cdot008665 + 6 \times 1\cdot007825) - 12\cdot000000$
$= \mathbf{0\cdot09894\ a.m.u.}$
$\text{B.E.} = \Delta m \times 931 = 0\cdot09894 \times 931 = \mathbf{92\cdot1\ MeV}$
$\therefore\ \dfrac{\text{B.E.}}{A} = \dfrac{92\cdot1}{12} = \mathbf{7\cdot675\ MeV}$

12. Take m_n = 1·008665 a.m.u., m_p = 1·007825 a.m.u. and proceed as in problem no. 7.

13. By proceeding as in problem no. 7, find B.E. of $_{26}\text{Fe}^{56}$ and $_{83}\text{Bi}^{209}$ and then their $\dfrac{\text{B.E.}}{A}$. As $\dfrac{\text{B.E.}}{A}$ of $_{26}\text{Fe}^{56}$ is greater than that of $_{83}\text{Bi}^{209}$, $_{26}\text{Fe}^{56}$ is more stable.

14. Energy needed to split an α-particle is equal to its B.E.

15. ***For $_{20}$Ca^{41} nucleus :***
Neutron separation energy
$= \left[\{m(_{20}\text{Ca}^{40}) + m_n\} - m(_{20}\text{Ca}^{41})\right]\times931$
$= \left[(39\cdot962591 + 1\cdot008665) - 40\cdot962278\right]\times931$
$= \mathbf{8\cdot36\ MeV}$
Similarly, find neutron separation energy of $_{13}\text{Al}^{27}$ nucleus.

CHAPTER
2

Radioactivity

2.01. NATURAL RADIOACTIVITY

Natural radioactivity was discovered by Henri Becquerel in 1896. He found that a photographic plate gets blackened, when placed near double sulphates of potassium and uranium. Further observations in this respect led Becquerel to the conclusion that uranium emitted special kind of rays and such rays were called *Becquerel rays*. Pierre and Marrie Curie found that the radiation from pitchblende was four times stronger than uranium. This led to an intensive search for the source of stronger radiation. Finally, in 1898 they succeeded in discovering two new substances which they named polonium ($_{84}Po^{210}$) and radium ($_{88}Ra^{226}$).

The spontaneous transformation of an element into another with the emission of some particle (or particles) or electromagnetic radiation is called ***natural radioactivity***.

The substances capable of emitting radiations are called ***radioactive substances***. As a rule, radioactivity is displayed by the heavy nuclei occurring at the end of the periodic table beyond lead.

2.02. NUCLEAR RADIATION

Two years after the discovery of radioactivity in 1828, Earnest Rutherford engaged himself in measuring the intensity of the radiation emitted by a radioactive substance. The experimental arrangement made was as follows :

A radioactive substance was placed at a fixed distance from the detector. Foils of increasing thickness were placed between the radioactive substance and the detector, starting with very thin foils of paper and then aluminium foils. A graph between thickness of the foil and the intensity of radiation was plotted. The graph obtained was as shown in Fig. 2.01. The resulting curve shows three distinct portions :

(*i*) The portion AB of the curve represents the quick absorption of one component of the radiation which is less penetrating. This component was called *α-rays*.

(*ii*) After a particular thickness of foil, the α-rays get absorbed and along BC, the curve does not fall off with distance quickly. It, therefore, represents the absorption of a penetrating component of the radiation, which was called ***β- rays***.

(*iii*) A similar change takes place along CD showing the absorption of the third component of the radiation. Since the fall of curve with distance is very slow in this part of the graph, it corresponds to a highly penetrating component of the radiation. This component was given the name *γ-rays*.

In 1899, Rutherford analysed the radiation emitted by radioactive substances by studying the action of electric and magnetic fields on them. A small quantity of a radioactive substance is placed in a deep cavity made in a thick block of lead. The radiation striking the walls of the cavity are absorbed, while the remaining portion of the radiation is rendered into a narrow and a parallel beam. The lead cavity containing the radioactive substance is placed in an evacuated enclosure. A strong electric field is applied to the radiation beam by placing two charged parallel plates on either side of the beam [Fig. 2.02]. It is found that a part of the beam bends towards the negative plate through a small amount, thereby showing that they consist of heavy positively charged particles, called α-particles. Another part of the beam bends towards positive plate through a large amount and hence must be consisting of *light* and *negatively charged* particles, called *β-particles*. However, the remaining part of the beam goes straight without being affected by the electric field. They were given the name *gamma-rays* (γ-rays) and were found to be electromagnetic in nature.

Quotable Quote

"Whatever nature has in store for mankind, unpleasant as it may be, men must accept, for ignorance is never better than knowledge." – **Enrico Fermi**

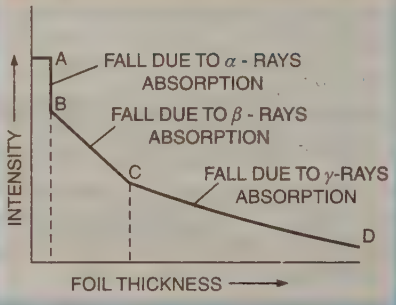

Fig. 2.01

Watch out !

The word *ray* can be used to describe radiated particles as particles as well as photons of electromagnetic radiation !

Key point ✓

Geiger counters are best for detecting α and β-rays. They are less efficient for detecting γ-rays due to the high penetrating and low ionizing powers of γ-rays.

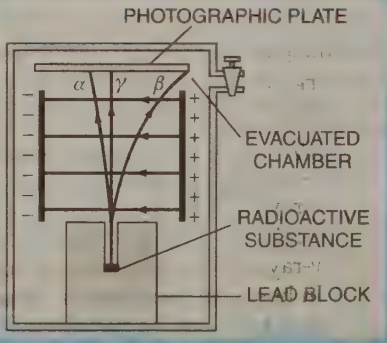

Fig. 2.02

The nature of the three types of radiation emitted by a radioactive substance can also be determined by applying magnetic field perpendicular to their path. Fig. 2.03 shows the deflection in the path of the radiation, when a strong magnetic field is applied perpendicular to the plane of the paper and in the inward direction. The application of the Fleming's left hand rule tells that the component which is deflected towards left consists of positively charged particles while the one deflected towards the right consists of negatively charged particles, recognised as α-rays and β-rays respectively. The third component *i.e.* γ-rays, however, remains undeflected showing that they do not have any charge.

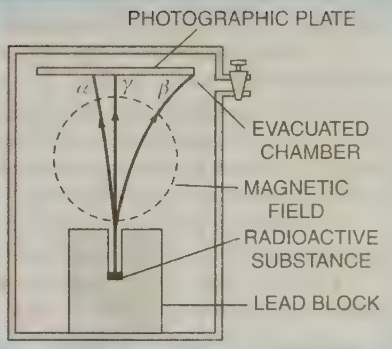

Fig. 2.03

Properties of α-rays. 1. α-particles have been identified as helium nuclei (atoms of helium that have lost two orbital electrons). Thus α-particles carry double the positive charge of proton and are four times as heavy.

2. The velocity of α-particles ranges from $1{\cdot}4 \times 10^7$ m s^{-1} to $2{\cdot}05 \times 10^7$ m s^{-1} depending upon the radioactive substance emitting them. In other words, energy of α-particles emitted from radioactive substance varies from 4·19 to 6·78 MeV.

3. Although α-particles possess large amount of energy, they are the least penetrating of the three types of rays. This is because they are massive particles and hence are easily stopped by an aluminium sheet only 0·02 mm thick or even by an ordinary sheet of paper.

Key point

α-particles are helium nuclei.

4. They have unusually great ionising power. Each α-particle produces thousands of ions before being absorbed.

5. At normal pressure in air, the range of α-particles varies from 3 to 8 cm depending on the initial kinetic energy of the particles.

6. α-particles produce fluroscence in substances like zinc sulphide and barium platinocyanide.

7. α-particles are deflected by electric and magnetic fields.

8. α-particles affect a photographic plate.

9. α-particles, while passing through metal foils, get scattered.

10. They can produce artificial radioactivity in certain elements and can produce nuclear reactions.

Properties of β-rays. 1. β-particles have been found to be streams of electrons.

2. The velocity of β-particles ranges from 33% to 99·8% of the velocity of light. These are the swiftest material particles known in physics. Although the velocities of these particles are enormous, their average energy is only 2 to 3 MeV, because of their extremely small mass.

Key point ✓

Electrons of nuclear origin are called β-particles.

3. β-particles can easily pass through a few millimetre thick aluminium sheets.

4. They can produce ionization in gases, but their ionizing power is quite small as compared to that of α-particles.

5. The range of β-particles in air is several metres.

Self-test Question ?

Explain why β-particles have a higher charge to mass ratio than α-particles.

6. They can also produce fluorescence in materials like zinc sulphide and barium platinocyanide.

7. β-particles are deflected by electric and magnetic fields.

8. They can affect a photographic plate.

9. They can produce artificial radioactivity.

Properties of γ-rays. 1. γ-rays are electromagnetic waves and have velocity equal to that of light.

2. γ-rays are highly penetrating. They can penetrate through several centimetres thick iron and lead blocks.

Key point ✓

γ-rays are high energy photons of electromagnetic waves having extremely small wavelengths.

3. They have got small ionising power.

4. They can produce fluorescence in a substance like willemite.

5. They can affect a photographic plate.

6. γ-rays are not deflected by electric and magnetic fields.

7. γ-rays knock out electrons from the surface on which they fall.

8. γ-rays produce heating effect in the surface exposed to them.

9. γ-rays can produce nuclear reactions.

10. In hospitals, hard γ-rays are used in radio-therapy.

2.03. LAWS OF RADIOACTIVE DECAY

Rutherford and Soddy studied the phenomenon of radioactivity in details and formulated the following laws, known as the laws of radioactive decay :

1. *Radioactivity is a spontaneous phenomenon and one cannot predict, when a particular atom* in a given radioactive sample will undergo disintegration.*

2. *When a radioactive atom disintegrates, either an α-particle (nucleus of helium) or a β-particle (electron) is emitted.*

The new atom so formed (called daughter atom) may emit a γ-ray photon, in case the nucleus is left in excited state on emitting the α or β-particle. Further, both α and β-particles are never emitted simultaneously. It may also be pointed out that a radioactive atom can never emit more than one α-particle or β-particle at a time.

Watch out !

All radioactive nculei have the same chance or probability of disintegration. However, a radioactive nucleus may undergo disintegration next moment, while some other may have to wait for billions of years to decay !

3. *The emission of an α-particle by a radioactive atom results in a daughter atom, whose atomic number is 2 units less and mass number is 4 units less than that of the parent atom.*

Due to α-decay, the transformation of the radioactive parent atom (${}_{Z}X^{A}$) into the daughter atom (${}_{Z-2}Y^{A-4}$) may be represented as below :

$$ {}_{Z}X^{A} \xrightarrow{\alpha-\text{decay}} {}_{Z-2}Y^{A-4} $$

4. *The emission of a β-particle by a radioactive atom results in a daughter atom, whose atomic number is 1 unit more but mass number is same as that of the parent atom.*

Due to β-decay, the transformation of the parent atom (${}_{Z}X^{A}$) into the daughter atom (${}_{Z+1}Y^{A}$) may be represented as below :

$$ {}_{Z}X^{A} \xrightarrow{\beta-\text{decay}} {}_{Z+1}Y^{A} $$

5. *The number of atoms disintegrating per second of a radioactive sample at any time is directly proportional to the number of atoms present at that time.* The rate of disintegration of the sample cannot be altered by changing the external factors, such as pressure, temperature, etc. It is known as ***radioactive decay law***.

Consider that a radioactive sample contains N_0 atoms initially ($t = 0$). As the time elapses, the atoms of the sample decrease due to disintegration. Suppose that after time t, the number of the atoms reduce to N and after time $t + dt$, the number of atoms further decrease to $N - dN$. Obviously, in the time interval between t and $t + dt$ *i.e.* equal to dt, the number of atoms decrease by $N - (N - dN)$ *i.e.* dN.

Therefore, rate of disintegration of atoms at time $t^{\dagger} = \dfrac{dN}{dt}$

According to radioactive decay law, the rate of disintegration at any time t is directly proportional to the number of atoms present at time t *i.e.*

$$ \frac{dN}{dt} \propto N $$

or $$ \frac{dN}{dt} = -\lambda N, \qquad \text{...(2.01)} $$

where the constant of proportionality λ is called ***decay constant*** of the radioactive sample. It is also known as ***disintegration constant*** or ***transformation constant***. Its value depends upon the nature of the radioactive sample. Further, the negative sign indicates that the number of the atoms of the sample decreases with the passage of time.

From equation (2.01), we have

$$ \frac{dN}{N} = -\lambda\, dt $$

Integrating, we have

$$ \int \frac{dN}{N} = -\lambda \int dt $$

or $$ \log_e N = -\lambda t + k, \qquad \text{...(2.02)} $$

where k is constant of integration and it can be evaluated from the following boundary condition :

When $t = 0, N = N_0$

On setting $t = 0$ and $N = N_0$, the equation (2.02) becomes

$$ \log_e N_0 = -\lambda \times 0 + k $$

or $$ k = \log_e N_0 $$

Substituting for k in equation (2.02), we get

$$ \log_e N = -\lambda t + \log_e N_0 $$

---

* It is better to say that the nucleus of an atom undergoes disintegration.

[†] In fact, it is the rate of disintegration of the atoms in the time interval between t and $t + dt$.

or $$\log_e \frac{N}{N_0} = -\lambda t \quad \text{or} \quad \frac{N}{N_0} = e^{-\lambda t}$$

or $$N = N_0 e^{-\lambda t} \qquad ...(2.03)$$

The equation (2.03) gives the number of atoms left after time t.

It follows that the number of atoms of a radioactive sample decreases xponentially with the passage of time. If we plot a graph between N (the number f atoms left behind at time t) and the time t, the graph will be as shown in Fig. 2.04. ollowing inferences can be drawn from the graph :

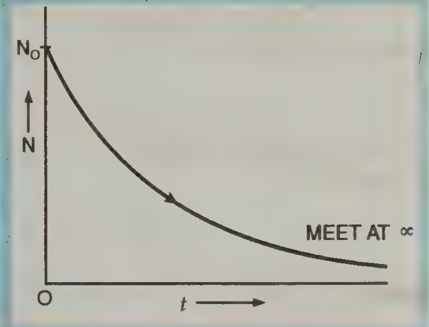

Fig. 2.04

1. Since the decay of radioactive sample obeys exponential law, the number f atoms decreases rapidly in beginning and the rate of decay becomes slower and lower, as the number of atoms decrease with passage of time.

2. The graph meets the time axis at infinity. Therefore, all the radioactive amples (irrespective of their nature) will always take infinite time to disintegrate ompletely. In this respect, all the radioactive samples seem to be identical. However, t is not true. Some radioactive substances are found to be more active than the thers.

3. The slope of the graph *i.e.* rate of disintegration of a radioactive sample is etermined by the value of its decay constant. A radioactive sample having the larger alue of decay constant λ will decay rapidly and in that case the graph between N nd t falls off rapidly with time.

2.04. RADIOACTIVE DECAY CONSTANT

The decay constant of a radioactive sample is a characteristic of the radioactive ubstance. The radioactive substances having large value of the decay constant, ecay rapidly in comparison to those having a small value of decay constant.

According to radioactive decay law,

$$\frac{dN}{dt} = -\lambda N \quad \text{or} \quad \lambda = \frac{-dN/dt}{N}$$

Hence, *radioactive decay constant of a substance (radioactive) may be defined as the atio of its instantaneous rate of disintegration to the number of atoms present at that time.*

Again, $$N = N_0 e^{-\lambda t}$$

If $$t = \frac{1}{\lambda},$$

then $$N = N_0 e^{-\lambda \frac{1}{\lambda}} = \frac{1}{e} N_0 = \frac{N_0}{2 \cdot 718} = 0 \cdot 368\, N_0$$

Hence, *radioactive decay constant of a substance may also be defined as the reciprocal f the time, after which the number of atoms of a radioactive substance decreases to 0·368 or 36·8%) of their number present initially.*

2.05. HALF-LIFE

The half-life of a radioactive substance is defined as the time during which the nuclei f half of the atoms of the radioactive substance will disintegrate. It is denoted by T.

Consider that a radioactive sample contains N_0 atoms at time $t = 0$. Then, the umber of atoms left behind after time t is given by

$$N = N_0 e^{-\lambda t} \qquad ...(2.04)$$

From the definition of half-life, it follows that

when $t = T$ (half-life of the sample), $N = \frac{N_0}{2}$

Setting the above condition in equation (2.04), we have

$$\frac{N_0}{2} = N_0\, e^{-\lambda T}$$

or $$e^{-\lambda T} = \frac{1}{2} \quad \text{or} \quad e^{\lambda T} = 2$$

or $$\lambda T = \log_e 2 = 2{\cdot}303 \log_{10} 2 = 2{\cdot}303 \times 0{\cdot}3010 = 0{\cdot}693$$

or $$T = \frac{0 \cdot 693}{\lambda} \qquad ...(2.05)$$

Thus, half-life of a radioactive substance is inversely proportional to its decay onstant and is a characteristic property of its nucleus. It cannot be altered by any nown method.

Key point

The half-life of a radioactive substance cannot be altered by any known method.

Self-test Question

The half-life of Rn^{220} is 55·5 s. Use equation (2.05) to show that the decay constant for radon is 0·0125 s^{-1}.

Note. There is another useful relation to express the fraction of atoms of a adioactive sample left behind after time t in terms of its half-life :

We know that after time T (half life), the number of atoms of the sample reduce to $\frac{N_0}{2}$ *i.e.* $\frac{N}{N_0}$ becomes equal to $\frac{1}{2}$. After another time equal to T, the value of $\frac{N}{N_0}$ will become $\frac{1}{2} \times \frac{1}{2}$ *i.e.* $\left(\frac{1}{2}\right)^2$. Therefore, it follows that after a time equal to n half lives of the sample,

$$\frac{N}{N_0} = \left(\frac{1}{2}\right)^n$$

In general, after a time t $(= n\,T)$, the fraction of the radioactive atoms left behind is given by

$$\frac{N}{N_0} = \left(\frac{1}{2}\right)^n = \left(\frac{1}{2}\right)^{t/T} \qquad ...(2.06)$$

2.06. MEAN-LIFE OR AVERAGE-LIFE

The average-life of a radioactive substance is defined as the average time for which the nuclei of the atoms of the radioactive substance exist. It is denoted by T_a.

Obviously, the average-life of a radioactive sample may be calculated by finding the total life of all the atoms of the substance in a sample and then dividing it by the total number of atoms present in that sample.

Consider that initially $(t = 0)$, the number of atoms present in a sample of radioactive substance is N_0. Suppose that at time t, the number of atoms reduces to N and at time $t + dt$, the number of atoms becomes $N - dN$. Obviously, each of the dN atoms disintegration during the time interval between t and $t + dt$ has lived for a time t.

Therefore, the total life of dN atoms $= t\,dN$

and the total life of all the N_0 atoms $= \int_0^{N_0} t\,dN$

Hence, the average-life of the radioactive sample*, $T_a = \dfrac{\int_0^{N_0} t\,dN}{N_0} = \dfrac{N_0/\lambda}{N_0}$

or

$$T_a = \frac{1}{\lambda} \qquad ...(2.07)$$

Thus, the average-life of a radioactive substance is equal to the reciprocal of its decay constant. From the equations (2.05) and (2.07), we have

$$T = 0{\cdot}693\ T_a \qquad ...(2.08)$$

i.e. half-life of a radioactive substance is equal to 0·693 times its average-life.

2.07. ACTIVITY OF RADIOACTIVE SUBSTANCE

The activity of a radioactive substance may be defined as the rate at which the nuclei of its atoms in the sample disintegrate.

If a radioactive sample contains N atoms at any time t, then its activity at time t is defined as

$$R = -\frac{dN}{dt} \qquad ...(2.09)$$

The negative sign shows that with the passage of time, the activity of the radioactive substance decreases.

Key point

The activity of a radioactive substanc decreases as the number of undecaye nuclei decrease with time.

Since according to the radioactive decay law,

$$\frac{dN}{dt} = -\lambda N,$$

the equation (2.09) may be expressed as

$$R = \lambda N \qquad ...(2.10)$$

Since $N = N_0 e^{-\lambda t}$, we have

$$R = \lambda N_0 e^{-\lambda t}$$

or

$$R = R_0 e^{-\lambda t} \qquad ...(2.11)$$

---

* It can be proved that $\int_0^{N_0} t\,dN = \frac{N_0}{\lambda}$

Here, $\lambda N_0 = R_0$ is activity of the radioactive sample at time $t = 0$.

The equation (2.09) tells that the activity of a radioactive sample may be xpressed as *disintegrations per second*. The practical unit of activity of a radioactive ample is **curie (ci).**

The activity of a radioactive sample is called one curie, if it undergoes $3{\cdot}7 \times 10^{10}$ isintegrations per second. Thus,

$$\textbf{1 curie (ci)} = 3{\cdot}7 \times 10^{10} \text{ disintegrations s}^{-1}$$

Key point ✓

In terms of activity, the equation (2.06) can be expressed as

$$\frac{R}{R_0} = \left(\frac{1}{2}\right)^n = \left(\frac{1}{2}\right)^{t/T}$$

The **millicurie (mci)**, one thousandth of a curie and **microcurie (μci)**, equal to ne millionth of a curie are smaller units of radioactivity. Thus,

$$\textbf{1 millicurie (mci)} = 3{\cdot}7 \times 10^{7} \text{ disintegrations s}^{-1}$$

$$\textbf{1 microcurie } (\mu\textbf{ci}) = 3{\cdot}7 \times 10^{4} \text{ disintegrations s}^{-1}$$

There is also another unit of radioactivity, called **rutherford (rd).**

The activity of a radioactive sample is called one rutherford, if it undergoes 10^6 isintegrations per second. Thus,

$$\textbf{1 rutherford (rd)} = 10^{6} \text{ disintegrations s}^{-1}$$

The smaller units in this case are **millirutherford (mrd)** and **microrutherford urd).** Thus,

$$\textbf{1 millirutherford (mrd)} = 10^{3} \text{ disintegrations s}^{-1}$$

$$\textbf{1 microrutherford } (\mu\textbf{rd}) = 1 \text{ disintegration s}^{-1}$$

It follows that

$$\textbf{1 curie (ci)} = 3{\cdot}7 \times 10^{4} \text{ rutherford}$$

Self-test Question ?

Show that

1 curie = $3{\cdot}7 \times 10^4$ rutherford

2.08. ALPHA DECAY

Nuclei that contain more than about 210 nucleons are so large that the short ange nuclear force holding them together becomes insufficient to counterbalance he long range electrostatic repulsive force between the protons. Such nuclei may chieve greater stability by emitting alpha particles. An α-particle has high value of binding energy ($\approx$ 28 MeV). Therefore, on emission of α-particle, the binding nergy per nucleon increases and the residual nucleus tends towards greater stability.

In general, the α-decay can be represented as below :

$${}_ZX^A \longrightarrow {}_{Z-2}Y^{A-4} + {}_2He^4 + E_\alpha, \qquad \text{..(2.12)}$$

where E is the energy released in the process of α-decay.

Key point ✓

On the emission of an α-particle, binding energy per nucleon of the residual nucleus increases. It is because, though an α-particle consists small number of nucleons *i.e.* 4, its binding eneergy is quie large. Hence, by α-decay, a radioactive nucleus tends to become more stable.

If m_X, m_Y and m_{He} represent the masses of parent nucleus X, daughter nucleus Y and the α-particle respectively, then the energy released is given by

$$E = (m_X - m_Y - m_{He})\, c^2 \qquad \text{...(2.13)}$$

The energy carried by the α-particle in the process of α-decay can be calculated by applying principles of conservation of energy and momentum. Then, by taking he masses of parent nucleus X, daughter nucleus Y and the α-particle as A, A – 4 and 4 a.m.u. respectively, it can be proved that the kinetic energy of the α-particle s given by

$$E_\alpha = \frac{A-4}{A} E \qquad \text{...(2.14)}$$

In the decay of ${}_{86}Rn^{222}$, it is found that Q = 5·587 MeV

Therefore, kinetic energy of the α-particle,

$$E_\alpha = \frac{222-4}{222} \times 5{\cdot}587 = 5{\cdot}486 \text{ MeV}$$

Key point ✓

The energy of α-particles emitted by a radioactive substabce (α-emitter) has a unique value.

The value of kinetic energy of the α-particle is really found to be of the order of 4-9 MeV for various α-emitters. But the calculations tell that the nucleus of the α-emitter behaves as a potential barrier, which can be surmounted by an α-particle having energy of the order of 25 MeV. Classically, it is impossible to explain as to how an α-particle having insufficient energy will come out of the nucleus.

In 1928, Gamow, Congdon and Gurney explained the emission of α-particles in terms of the penetration of the nuclear potential barrier on the basis of quantum theory as explained below :

An α-particle does not exist in the nucleus as such. But just at the time of emission, two protons and two neutrons combine to form an α-particle. The α-particle is constantly in motion inside the nucleus with a speed* of about 10^7 m s^{-1}. Since size of the nucleus is about 10^{-14} m, the α-particle takes about 10^{-21} s to move across

Key point ✓

The nucleus of an α-emitter poses as a potential barrier of height several times the kinetic energy of an α-particle. On classical picture, an α-particle cannot come out of the nucleus. However, α-decay does occur through the process of tunneling of the nucleus, which is based on quantum mechanical considerations.

---

* Corresponding to the kinetic energy of α-particles in the decay of Rn^{222} *i.e.* 5·486 MeV, it can be shown that the speed of the α-particles is about $1{\cdot}62 \times 10^7$ m s^{-1}.

the nucleus. In other words, α-particle presents itself again and again before the potential barrier about 10^{21} times in a second. Quantum mechanically, even with insufficient kinetic energy, the α-particle has a very small but definite probability p of its crossing the potential barrier. But since the frequency of attempts ν (= 10^{21} s^{-1}) is very large, the probability of its escaping the potential barrier,

$$P = p \times \nu$$

becomes considerable and it penetrates the potential barrier. It is called ***tunneling of the nucleus.***

This is how the quantum theory explains the emission of α-particle from the nucleus, which otherwise has got insufficient energy to surmount the much higher nuclear potential barrier.

Watch out !

Classical physics is the old stuff. It believes in determinism : perfect laws of nature from which everything could ultimately be predicted. Quantum physics accepts uncertainity.

2.09. BETA DECAY

A nucleus is usually unstable due to its low value of binding energy per nucleon. Another reason of the unstability of the nucleus is either a higher or a lower neutron to proton ratio than that for the stable nuclei.

The β-decay occurs in case of nuclei, which possess a higher value of neutron to proton ratio than that for the stable nuclei. The β-particle is an electron of nuclear origin. Since an electron does not exist inside the nucleus, it is assumed to be formed by the conversion of a neutron into a proton and electron. Since neutron number decreases by one and the proton number increases by one, β-decay helps to decrease the neutron to proton ratio. In the beginning, the creation of electron inside the nucleus was supposed to be according to the following equation :

$$_0n^1 \longrightarrow {}_1H^1 + {}_{-1}e^0 \qquad ...(2.15)$$

Key point

The radioactive nuclei, which have neutron to proton ratio greater than that for stable nuclei undergo β-decay. By β-decay, such nuclei tend to decrease their neutron to proton ratio.

Therefore, the β-decay may be taking place according to the equation

$$_ZX^A \longrightarrow {}_{Z+1}Y^A + {}_{-1}e^0 + E_\beta, \qquad ...(2.16)$$

where E_β is the energy with which β-particle is emitted. The calculations show that β-decay is energetically possible (E_β =+ve), only if mass of the parent atom (whose nucleus is $_ZX^A$) is greater than the mass of the daughter atom (whose nucleus is $_{Z+1}Y^A$). For example, $_{83}Bi^{210}$ decays to $_{84}Po^{210}$ by emitting β-particle of energy 1·17 MeV *i.e.*

$$_{83}Bi^{210} \longrightarrow {}_{84}Po^{210} + {}_{-1}e^0 + 1{\cdot}17 \text{ MeV}$$

From the above equation, it follows that in the β-decay of $_{83}Bi^{210}$, the energy of the electrons should always be equal to 1·17 MeV. This is because according to the above decay scheme, electron is the only particle, which leaves the nucleus and it should carry whole of the energy. However, the energy of electrons in β-decay of $_{83}Bi^{210}$ is found to vary continuously between zero to maximum value 1·17 MeV, called *end point energy* as shown in Fig. 2.05.

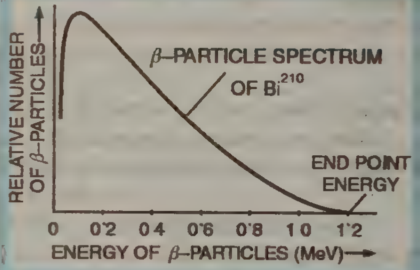

Fig. 2.05

Further, if electron is created inside the nucleus in accordance with the equation (2.15), then spin conservation principle is also violated as it is known that each of the three particles, *i.e.* neutron, proton and electron, possesses spin equal to $\frac{1}{2}$. Thus, if β-decay takes place according to the equation (2.16), then

(*i*) experimentally observed continuous energy spectrum of β-decay cannot be explained.

(*ii*) spin conservation principle will be violated.

Key point

The particle neutrino was postulated in order to explain the continuous energy spectrum of β-decay and to keep the spin conservation principle in tact.

These problems were overcome by Pauli in 1930. According to him, when a neutron disintegrates into a proton and electron, an uncharged particle of zero rest mass (practically) and spin $\frac{1}{2}$, called ***antineutrino*** ($\bar{\nu}$)) is also produced. The decay of neutron takes place as given below :

$$_0n^1 \longrightarrow {}_1H^1 + {}_{-1}e^0 + \bar{\nu} \qquad ...(2.17)$$

The existence of neutrino was experimentally observed in 1956 by Reines and Cohean.

Also, the transformation describing the β-decay will be as below :

$$_ZX^A \longrightarrow {}_{Z+1}Y^A + {}_{-1}e^0 + \bar{\nu} + E_\beta \qquad ...(2.18)$$

Thus, in β-decay, electron and antineutrino come out of the nucleus and share the end point energy of β-emission in all proportions with each other, so that when antineutrino does not get any energy, all the energy is carried by the electron and in case antineutrino grabs whole of the energy, then electron is left without any

Key point

The energy of β-particles emitted by a radioactive substance (β-emitter) can have any value between zero and end-point energy.

energy. Further, the decay scheme suggested by equation (2.17), keeps the spin conservation principle intact.

2.10. GAMMA DECAY

We know that in an atom electrons revolve in different shells around the nucleus associated with definite amount of energy. These are called ***atomic energy levels*** and transitions between these energy levels account for the emission of visible and X-ray spectra. It has been investigated that similar energy states called ***nuclear energy levels*** exist inside the atomic nuclei. The transitions between two nuclear energy levels also result in the emission of energy. The frequency of the energy emitted in nuclear transitions falls in γ-ray region.

Key point

X-rays are high-energy photons, like γ-rays. The only difference between the two is the way in which they are produced. X-rays are emitted by the excited atoms, whereas γ-rays are emitted by the excited nuclei.

During radioactive decay, the emission of α or β-particles usually leaves the residual nucleus in an excited state, which is found to go to some other excited state or ground state by the emission of γ-rays, whose energy is equal to the difference of energy between the two nuclear energy levels. For example, it is found that in the decay of ${}_{27}\mathrm{Co}^{60}$, the emission of β-particle is immediately followed by emission of γ-ray photons of energy 1·17 MeV and 1· 33 MeV [Fig. 2·06]. The usual β-decay of ${}_{27}\mathrm{Co}^{60}$ into ${}_{28}\mathrm{Ni}^{60}$ may be written as

$${}_{27}\mathrm{Co}^{66} \longrightarrow {}_{28}\mathrm{Ni}^{60*} + {}_{-1}e^{0}$$

The asterisk mark (*) on the symbol for nickel indicates that it is left in an excited state having energy greater than that of the ground state. The excited nucleus of nickel comes to ground state by first emitting γ-ray of energy 1·17 MeV and then of energy 1·33 MeV. Thus, transition from excited state to ground state may be represented by

$${}_{28}\mathrm{Ni}^{60*} \longrightarrow {}_{28}\mathrm{Ni}^{60} + \mathrm{E}_{\gamma}$$

By studying the energies of the γ-rays emitted, the energy levels of a nucleus can be obtained.

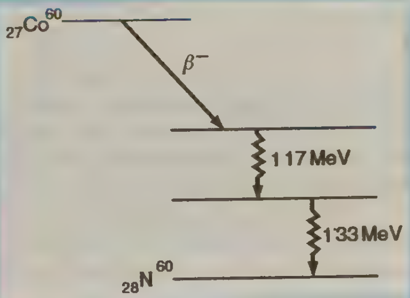

Fig. 2.06

Key point

The energy of γ-rays emitted by a radioactive substance can have unique and discrete values.

2.11. ARTIFICIAL RADIOACTIVITY

Apart from naturally occurring radioactive substance, the radioactivity can also be induced by artificial means through nuclear transmission. The phenomenon of artificial radioactivity was discovered by Joliot and Curie, when they bombarded aluminium with α-particles obtained from polonium. They found that even when the source of α-radiations was removed, the aluminium piece continued giving off some type of radiation. Further investigations revealed that the radiation consisted of positrons. Also, it was found that the rate of emission of the radiation was found to decrease exponentially as is the case with natural radioactivity. Hence the phenomenon was termed as artificial radioactivity. The nuclear transformation in the above described case proceeds as follows :

$${}_{2}\mathrm{He}^{4} + {}_{13}\mathrm{Al}^{27} \longrightarrow {}_{15}\mathrm{P}^{30} + {}_{0}n^{1}$$

The isotope ${}_{15}\mathrm{P}^{30}$ is unstable and radioactive. It decays as follows :

$${}_{15}\mathrm{P}^{30} \longrightarrow {}_{14}\mathrm{Si}^{30} + {}_{1}e^{0} + \gamma$$

The half-life period of radioactive phosphorus is found to be 2·2 minutes. Soon, other scientists started investigations and found that not only the α-particles but other projectiles like proton, deutrons and even neutrons can induce artificial radioactivity.

2.12. RADIO ISOTOPES

The isotopes of an element, capable of emitting radiation just as radioactive elements do, are called radioisotopes.

Usually, the radioisotopes are artificially produced. For example, ${}_{6}\mathrm{C}^{11}$ and ${}_{6}\mathrm{C}^{13}$ are radioisotopes of ${}_{6}\mathrm{C}^{12}$; and ${}_{11}\mathrm{Na}^{22}$ and ${}_{11}\mathrm{Na}^{24}$ are radioisotopes of ${}_{11}\mathrm{Na}^{23}$. The chemical properties of the radioisotopes of an element are same and they differ only in their atomic weights. A few common radioisotopes are *Iodine-131, Phosphorus-33, Carbon-14, Cobalt-60, Sulphur-35 and Sodium-24*. The half lives of radioisotopes are usually small. A large number of radioisotopes are produced by $(n - \gamma)$ reaction. Such reactions are achieved by bombarding stable nuclides with slow neutrons. Following are a few examples :

$${}_{53}\mathrm{I}^{127} + {}_{0}n^{1} \longrightarrow {}_{53}\mathrm{I}^{128*} + \gamma$$

Here, ${}_{53}\mathrm{I}^{128*}$ is radioisotope of iodine.

$${}_{27}\mathrm{Co}^{59} + {}_{0}n^{1} \longrightarrow {}_{27}\mathrm{Co}^{60*} + \gamma$$

$${}_{15}\mathrm{P}^{31} + {}_{0}n^{1} \longrightarrow {}_{15}\mathrm{P}^{32*} + \gamma$$

Radioisotope of carbon *i.e.* $_6C^{14*}$ is continuously produced in the atmosphere due to neutrons in cosmic rays bombarding nitrogen nuclei :

$$_7N^{14} + {_0n^1} \longrightarrow {_6C^{14*}} + {_1H^1}$$

There are many other nuclear reactions which lead to the production of radioisotopes.

Radioisotopes have proved to be of great use in a number of fields and are produced on a large scale these days. Before studying the other uses of radioisotopes, it is necessary to understand their use as *tracers*.

Tracer. The use of radioisotopes as tracers has provided solution to many problems, particularly those connected with the life processes :

During the intake of different elements and compounds, the biological organisms absorb them differently. Further, the exact distribution of the elements and their function in the various parts of the organisms cannot be known clearly. In tracer technique, a radioisotope is made to enter the organism along with the elements and compounds, whose absorption, functioning and distribution to other parts of the organism is to be studied. The radioisotope acts as a *tag* or a *label* for the element or compound under study. By detecting the radiation emitted by the radioactive isotope from the different parts of the body, the details regarding the absorption and function of the compounds by the organism are found out.

Uses of radioisotopes. The radioisotopes have been used successfully for research in fields of biology, physiology, chemistry, physics, agriculture and other sciences in addition to industry. Following are a few broad uses of radioisotopes in different fields :

1. ***In medical science.*** The radioisotopes have been used to study the deficiency of red blood cells in human body (by using *Iron-59*), pumping action of heart (by using *Sodium-24* and *Iodine-131*), functioning of organs like kidney, liver under normal and diseased conditions (by using *Iodine-131*). Radioisotopes have been used to detect brain tumours and relieve the patient from severe heart pain. Further, *Cobalt-60* and *Gold-198* are used for the treatment of the cancer, *Phosphorus-32* for skin diseases and *Iodine-131* for the treatment of thyroid gland.

2. ***In agriculture.*** The radioisotopes are used to study the function of fertilisers for different plants. They have also been used for developing new species of a plant by causing genetic mutations.

3. ***In industry.*** The radioisotopes are used to study wear and tear of piston rings and of gears in engines and then in the study of suitable lubricant for their prevention. They have been used to study the underlying earth layers during oil-exploration operations. They are also used to detect flaws in metal structure and for different treatments of alloys such as quenching, annealing and case hardening. They are used for uniform mixing of lubricants and greases.

4. ***In nuclear research.*** Radioisotopes have been used in the study of nuclear disintegration of elements.

5. ***In food preservation.*** By exposing the vegetables and other food-stuffs to radiations from radioisotopes, their *shelf-life* can be increased.

6. ***In radioactive dating.*** *Carbon-14* has been used for dating the culture history or for estimating the age* of some geological formation.

2.13. RADIOACTIVE DATING

An interesting practical application of radioactivity has been developed in recent years in the shape of estimating the age of earth, old rocks, deep sea sediments and other geological formations. This method was first developed by Rutherford and Jolly in 1913.

Uranium-lead dating is used to know the age of earth, while carbon dating is used to estimate the time that has elapsed after the death of a once living organism. The real secret of dating the age of earth or some geological formation lies in the fact that radioactive isotopes have got very long half lives as compared to that of their decay products, till stable element is formed.

Self-test Question ?

All uranium on earth is older than the earth itself. U^{238} has a half-life of around 4·5 billion years ; U^{235} has a much shorter half-life of $7{\cdot}1 \times 10^8$ years. Is it any surprise that U^{238} is the more abundant series ?

Radioactive carbon dating. Carbon-14 has been used for dating the cultural history or for estimating the age of some geological formation.

The isotope of carbon $_6C^{14}$ has got a half life of 5568 years and is produced in the atmosphere by bombardment of $_7N^{14}$ nuclei by neutrons in cosmic rays. Living plants and animals absorb carbon in themselves from the carbon dioxide they take from atmosphere. Thus, radioactive isotope ${}_6C^{14}$ is found in living plants and animals in the same proportion as it is found in the atmosphere. But when an organism dies, the intake of ${}_6C^{14}$ stops and the ${}_6C^{14}$ already depcsited decays, with a half life of 5568 years.

---

* For details, refer to section 2·13-Radioactive dating.

Suppose that the number of ${}_6C^{14}$ atoms in an organism was N_0, when it met its death at time $t = 0$. Today *i.e.* after a time t after its death, the remains of that once living organism are found to contain the atoms of ${}_6C^{14}$ and ${}_6C^{12}$ equal to say N_{14} and N_{12} respectively. Obviously, the present number of ${}_6C^{12}$ atoms together with the number of ${}_6C^{14}$ atoms must be equal to N_0, the number ${}_6C^{14}$ atoms present at $t = 0$ *i.e.*

$$N_0 = N_{12} + N_{14} \qquad ...(2.19)$$

According to radioactive decay law, we have

$$N_{14} = N_0 e^{-\lambda t}, \qquad ...(2.20)$$

where λ is decay constant of ${}_6C^{14}$ nuclei. From equations (2.19) and (2.20), we have

$$N_{14} = (N_{12} + N_{14})\, e^{-\lambda t}$$

or
$$e^{\lambda t} = \frac{N_{12}}{N_{14}} + 1 \quad \text{or} \quad t = \frac{1}{\lambda}\log_e\left(\frac{N_{12}}{N_{14}} + 1\right)$$

or
$$t = \frac{2\cdot 303}{\lambda}\log_{10}\left(\frac{N_{12}}{N_{14}} + 1\right)$$

Now, value of decay Constant ${}_6C^{14}$,

$$\lambda = \frac{0\cdot 993}{5568} = 1\cdot 245 \times 10^{-4}\ \text{year}^{-1}$$

and by measuring the ratio of ${}_6C^{14}$ and ${}_6C^{12}$ in the remains of the once living organisms, one can calculate how long ago it died. The ratio carbon technique has been of great value in the research and dating of archeological specimens.

Now, value of decay constant for ${}_6C^{14}$,

$$\lambda = \frac{0\cdot 693}{5568} = 1\cdot 245 \times 10^{-4}\ \text{year}^{-1}$$

and by measuring the ratio of ${}_6C^{14}$ and ${}_6C^{12}$ in the remains of the once living organism, one can calculate how long ago it died. The radio carbon technique has been of great value in the research and dating of archeological specimens.

Self-test Question

Carbon-14 dating is only accurate for organic objects between 200 and 10,000 years old. Why ?

SOLVED NUMERICAL PROBLEMS

Type A. On Radioactive decay law and Half life

Problem 2.01. After a certain lapse of time, the fraction of radioactive polonium undecayed is found to be 12·5 % of the initial quantity. What is the duration of this time lapse, if the half life of polonium is 138 days ?

(C.B.S.E. Sample Q. Paper)

Sol. Here, half life, T = 138 days

Therefore,
$$\lambda = \frac{0\cdot 693}{T} = \frac{0\cdot 693}{138} = 5\cdot 022 \times 10^{-3}\ \text{day}^{-1}$$

Also
$$\frac{N}{N_0} = 12\cdot 5\% = \frac{12\cdot 5}{100} = 0\cdot 125$$

Let t be the required time. Then,

$$\frac{N}{N_0} = e^{-\lambda t}$$

or
$$0\cdot 125 = e^{-5\cdot 022 \times 10^{-3} t}$$

or
$$e^{5\cdot 022 \times 10^{-3} t} = \frac{1}{0\cdot 125} = 8$$

or
$$5\cdot 022 \times 10^{-3}\, t = \log_e 8 = 2\cdot 303 \times 0\cdot 9031 = 2\cdot 08$$

or
$$t = \frac{2\cdot 08}{5\cdot 022 \times 10^{-3}} = \mathbf{414\cdot 18\ days}$$

Problem 2.02. The half-life of U^{238} against alpha decay is $1\cdot 42 \times 10^{17}$ s. How many disintegrations per second occur in 1 g of U^{238} ? Given, Avogadro number = $6\cdot 02 \times 10^{23}$ mol^{-1}.

(I.S.C.E. 1993)

Sol. Here, $T = 1\cdot 42 \times 10^{-17}$ s ;

Avogadro number = $6\cdot 02 \times 10^{23}$ mol^{-1}

Number of U^{238} atoms in 1 g,

$$N = \frac{6\cdot 02 \times 10^{23}}{238} = 2\cdot 53 \times 10^{21}$$

Now,
$$T = \frac{0\cdot 693}{\lambda}$$

or
$$\lambda = \frac{0\cdot 693}{T} = \frac{0\cdot 693}{1\cdot 42 \times 10^{17}} = 4\cdot 88 \times 10^{-18}\,\text{s}^{-1}$$

Now,
$$\frac{dN}{dt} = \lambda N = 4\cdot 88 \times 10^{-18} \times 2\cdot 53 \times 10^{21}$$
$$= \mathbf{1\cdot 235 \times 10^{4}\ s^{-1}}$$

Type B. On Activity of a Radioactive Substance

Problem 2.03. In an experiment, the activity of 1·2 milligram (mg) of radioactive potassium chloride (chloride of isotope K-40) was found to be 170 s^{-1}. Taking molar mass of K-40Cl to be 0·075 kg mole^{-1}, find the number of K-40 atoms in the sample and hence find the half-life of K-40. Given, Avogadro number = $6\cdot 0 \times 10^{23}$ mole^{-1}.

(I.S.C.E. 1997)

Sol. Here, molar mass of K-40Cl, M = 0·075 kg mole^{-1}

mass of K-40Cl , $m = 1\cdot 2$ mg $= 1\cdot 2 \times 10^{-6}$ kg

Since 1 mole of a substance contains molecules equal to Avogadro number (= $6\cdot 0 \times 10^{23}$),

the number of atoms in the K-40Cl sample,

$$N = \frac{6\cdot 0 \times 10^{23}}{0\cdot 075} \times 1\cdot 2 \times 10^{-6} = \mathbf{9\cdot 6 \times 10^{18}}$$

Also, activity of the given sample, $\frac{dN}{dt} = 170\ s^{-1}$

If λ is disintegration constant, then

$$\frac{dN}{dt} = \lambda\ N \quad \text{or} \quad 170 = \lambda \times 9{\cdot}6 \times 10^{18}$$

$$\text{or} \qquad \lambda = \frac{170}{9{\cdot}6 \times 10^{18}} = 1{\cdot}77 \times 10^{-17}\,s^{-1}$$

Therefore, half life of the sample,

$$T = \frac{0{\cdot}693}{\lambda} = \frac{0{\cdot}693}{1{\cdot}77 \times 10^{-17}} = 3{\cdot}915 \times 10^{16}\,s$$

$$= \mathbf{1{\cdot}241 \times 10^{9}\,years}$$

Problem 2.04. Biologically useful technetium nuclei (with atomic weight 99) have a half life of 6 hours. A solution containing 10^{-12} gram of this is injected into the bladder of a patient. Find its activity at the beginning and after one hour. *(Text Problem)*

Sol. Here, half life, T = 6 h

$$\text{Therefore,} \qquad \lambda = \frac{0{\cdot}693}{T} = \frac{0{\cdot}693}{6}\ h^{-1} = 0{\cdot}1155\ h^{-1}$$

Now, number of technetium atoms in 10^{-12} g in the beginning,

$$N_0 = \frac{\text{Avogadro number}}{\text{atomic weight}} \times 10^{-12}$$

$$= \frac{6{\cdot}025 \times 10^{23} \times 10^{-12}}{99} = 6{\cdot}086 \times 10^{9}$$

Activity of technetium nuclei in the beginning ($t = 0$),

$$R_0 = \lambda\ N_0 = 0{\cdot}1155 \times 6{\cdot}086 \times 10^{-9}$$

$$= \mathbf{7{\cdot}03 \times 10^{8}\ h^{-1}}$$

Now, the number of atoms left after time t,

$$N = N_0\, e^{-\lambda t}$$

Here, $t = 1$ h

$$\therefore \qquad N = 6{\cdot}086 \times 10^{9}\, e^{-0{\cdot}1155 \times 1}$$

$$= 6{\cdot}086 \times 10^{9} \times 0{\cdot}891 = 5{\cdot}423 \times 10^{9}$$

Therefore, activity of technetium after 1 hour,

$$R = \lambda\ N = 0{\cdot}1155 \times 5{\cdot}423 \times 10^{9}$$

$$= \mathbf{6{\cdot}264 \times 10^{8}\ h^{-1}}$$

Problem 2.05. Calculate the half life period of a radio-active substance, if its activity drops to $\frac{1}{16}$ th of its initial value in 30 years. *(C.B.S.E. 1998)*

Sol. Let R_0 and R be the values of initial (t = 0) and present (t = 30 years) activities of the radio-active sample.

$$\text{Here,} \qquad R = \frac{1}{16}\, R_0\,;\ t = 30 \text{ years}$$

$$\text{Now,} \qquad R = R_0\, e^{-\lambda t}$$

$$\therefore \qquad \frac{1}{16} R_0 = R_0\, e^{-\lambda \times 30} \quad \text{or} \quad e^{30\lambda} = 16$$

$$\text{or} \qquad \lambda = \frac{\log_e 16}{30} = \frac{2{\cdot}3026 \log 16}{30}$$

$$= \frac{2{\cdot}3026 \times 1{\cdot}2041}{30} = 0{\cdot}0924\ \text{year}^{-1}$$

If T is half life period, then

$$T = \frac{0{\cdot}693}{\lambda} = \frac{0{\cdot}693}{0{\cdot}0924} = 7{\cdot}5 \text{ years}$$

Type C. On α, β and γ-decays

Problem 2.06. The nucleus of $_{92}U^{238}$ is unstable against α-decay with a half life of about $4{\cdot}5 \times 10^{9}$ years. Write down the equation of the decay and estimate the kinetic energy of the α-particle from the following data : mass of $_{92}U^{238}$ atom = 238·05081 a.m.u. ; mass of $_2He^4$ atom = 4·00260 a.m.u. ; mass of $_{90}Th^{234}$ atom = 234·04363 a.m.u. *(Text Problem)*

Sol. The α-decay of $_{92}U^{238}$ may be represented as

$$_{92}U^{238} \longrightarrow {}_{90}Th^{234} + {}_2He^4 + E_\alpha,$$

where E_α is the kinetic energy of the emittted α-particle.

If $m_N(_{92}U^{238})$, $m_N(_{90}Th^{234})$ and $m_N(_2He^4)$ are masses of $_{92}U^{238}$, $_{90}Th^{234}$ and $_2He^4$ nuclei respectively, then

$$E_\alpha = [m_N(_{92}U^{238}) - m_N(_{90}Th^{234}) - m_N(_2He^4)] \times 931{\cdot}5 \text{ MeV} \qquad ...(i)$$

If $m(_{92}U^{238})$, $m(_{90}Th^{234})$ and $m(_2He^4)$ represent masses of $_{92}U^{238}$, $_{90}Th^{234}$ and $_2He^4$ atoms, then equation (*i*) may be expressed as

$$E_\alpha = [\{m(_{92}U^{238}) - 92\, m_e\} - \{m(_{90}Th^{234}) - 90\, m_e\} - \{\, m(_2He^4) - 2\, m_e\}] \times 931{\cdot}5$$

$$= [m(_{92}U^{238}) - m(_{90}Th^{234}) - m(_2He^4)] \times 931{\cdot}5$$

$$= [238{\cdot}05081 - 234{\cdot}04363 - 4{\cdot}00260] \times 931{\cdot}5$$

$$= 0{\cdot}00458 \times 931{\cdot}5 = \mathbf{4{\cdot}27\ MeV}$$

This energy is shared by $_{90}Th^{234}$ and α-particle. Since α-particle is quite lighter, most of the energy released is carried by the α-particle.

Problem 2.07. The nucleus Ne^{23} decays by β-emission. Write down the β-decay equation and determine the maximum kinetic energy of the electron emitted from the following data : mass of $_{10}Ne^{23}$ atom = 22·994466 a.m.u. ; mass of $_{11}Na^{23}$ atom = 22·989770 a.m.u. *(Text Problem)*

Sol. The β-decay of Ne^{23} may be represented as

$$_{10}Ne^{23} \longrightarrow {}_{11}Na^{23} + {}_{-1}e^0 + \overline{\nu} + E_\beta,$$

where E_β is the maximum kinetic energy of the emitted β-particle.

Suppose the $m_N(_{10}Ne^{23})$ and $m_N(_{11}Na^{23})$ represent the masses of $_{10}Ne^{23}$ and $_{11}Na^{23}$ nuclei respectively. Then ignoring the mass of $\overline{\nu}$, we have

$$E_\beta = [m_N(_{10}Ne^{23}) - m_N(_{11}Na^{23}) - m_e] \times 931{\cdot}5 \text{ MeV} \qquad ...(i)$$

If $m(_{10}Ne^{23})$ and $m(_{11}Na^{23})$ represent the masses of $_{10}Ne^{23}$ and $_{11}Na^{23}$ atoms respectively, then equation (*i*) may be expressed as

$$E_\beta = [\{m(_{10}Ne^{23}) - 10\, m_e\} - \{m(_{11}Na^{23}) - 11\, m_e\} - m_e] \times 931{\cdot}5$$

$$= [m(_{10}Ne^{23}) - m(_{11}Na^{23})] \times 931{\cdot}5$$

$$= [22{\cdot}994466 - 22{\cdot}989770] \times 931{\cdot}5 = \mathbf{4{\cdot}374\ MeV}$$

The energy released is shared by $_{11}Na^{23}$ nucleus and the electron and neutrino pair released. As electron-neutrino pair is much lighter than the $_{11}Na^{23}$ nucleus, practically whole of the energy released is carried by electron-neutrino pair. When neutrino gets zero energy, the electron will carry the maximum energy. Therefore, maximum kinetic energy of electron emitted is 4·374 MeV.

Problem 2.08. Obtain the maximum kinetic energy of β-particles and the radiation frequencies corresponding to γ-decays in the decay scheme shown in Fig. 2.08 given below. You are given that

mass of Au^{198} atom = 197·968233 a.m.u.,
mass of Hg^{198} atom = 197·966760 a.m.u. *(Text Problem)*

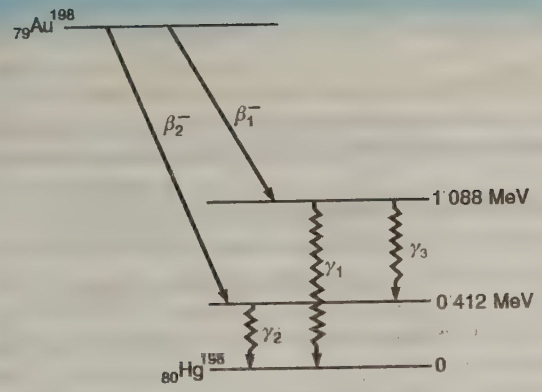

Fig. 2.08

Sol. Here, $E_1 = 0$;

$E_2 = 0{\cdot}412$ MeV $= 0{\cdot}412 \times 1{\cdot}6 \times 10^{-13}$ J ;

$E_3 = 1{\cdot}088$ MeV $= 1{\cdot}088 \times 1{\cdot}6 \times 10^{-13}$ J

If ν_1, ν_2 and ν_3 are frequencies of the γ-ray photons γ_1, γ_2 and γ_3 respectively, then

$$\nu_1 = \frac{E_3 - E_1}{h} = \frac{1{\cdot}088 \times 1{\cdot}6 \times 10^{-13} - 0}{6{\cdot}62 \times 10^{-34}}$$

$$= \mathbf{2{\cdot}63 \times 10^{20}\ s^{-1}}$$

$$\nu_2 = \frac{E_2 - E_1}{h} = \frac{0{\cdot}412 \times 1{\cdot}6 \times 10^{-13} - 0}{6{\cdot}62 \times 10^{-34}}$$

$$= \mathbf{9{\cdot}96 \times 10^{19}\ s^{-1}}$$

and $\nu_3 = \dfrac{E_3 - E_2}{h}$

$$= \frac{1{\cdot}088 \times 1{\cdot}6 \times 10^{-13} - 0{\cdot}412 \times 1{\cdot}6 \times 10^{-13}}{6{\cdot}62 \times 10^{-34}}$$

$$= \mathbf{1{\cdot}63 \times 10^{20}\ s^{-1}}$$

The emission of β_1^- decay may be represented as :

$$_{79}Au^{198} \longrightarrow {}_{80}Hg^{198} + {}_{-1}e^0 + E(\beta_1^-) + E(\gamma_1),$$

where $E(\gamma_1) = E_3 - E_1 = 1{\cdot}088 - 0 = 1{\cdot}088$ MeV

If $m_N({}_{79}Au^{198})$ and $m_N({}_{80}Hg^{198})$ represent masses of $_{79}Au^{198}$ and $_{80}Hg^{198}$ nuclei respectively, then

$$E(\beta_1^-) = [m_N({}_{79}Au^{198}) - m_N({}_{80}Hg^{198}) - m_e] \times 931{\cdot}5 - E(\gamma_1), \quad ...(i)$$

If $m({}_{79}Au^{198})$ and $m({}_{80}Hg^{198})$ represent masses of $_{79}Au^{198}$ and $_{80}Hg^{198}$ atoms respectively, then equation (*i*) may be expressed as

$$E(\beta_1^-) = [\{m({}_{79}Au^{198}) - 79\, m_e\} - \{m({}_{80}Hg^{198}) - 80\, m_e\} - m_e] \times 931{\cdot}5 - 1{\cdot}088$$

$$= [m({}_{79}Au^{198}) - m({}_{80}Hg^{198})] \times 931{\cdot}5 - 1{\cdot}088$$

$$= (197{\cdot}968233 - 197{\cdot}966760) \times 931{\cdot}5 - 1{\cdot}088$$

$$= 1{\cdot}372 - 1{\cdot}088 = \mathbf{0{\cdot}284\ MeV}$$

The emission of β_2^- decay may be represented as :

$$_{79}Au^{198} \longrightarrow {}_{80}Hg^{198} + {}_{-1}e^0 + E(\beta_2^-) + E(\gamma_2)$$

As in cse of β_1^- decay, it can be found that

$$E(\beta_2^-) = [m({}_{79}Au^{198}) - m({}_{80}Hg^{198})] \times 931{\cdot}5 - E(\gamma_2)$$

$$= 1{\cdot}372 - 0{\cdot}412 = \mathbf{0{\cdot}960\ MeV}$$

abc TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 2.09. The normal activity of living carbon-containing matter is found to be about 15 decays per minute for every gram of carbon. This activity arises from the small proportion of radioactive C^{14} present with the ordinary carbon isotope C^{12}. When the organism is dead, its interaction with the atmosphere (which maintains the above equilibrium activity) ceases and its activity begins to drop. From the known half life (= 5730 years) of C^{14} and the measured activity, the age of the specimen can be approximately estimated. This is the principle of C^{14} dating used in archaeology.*

Suppose a specimen from Mohenjodaro gives an activity of 9 decays per minute per gram of carbon. Estimate the approximate age of the Indus valley civilization.

(*Text Problem*)

Sol. Suppose that the number of C^{14} atoms per gram were N_0 at $t = 0$ (initially), when its activity was 15 decays per minute per gram. Today, *i.e.* after time t (age of the once living organism), the number of C^{14} atom per gram left is N and it shows an activity of 9 decays per minute per gram. Now, activity of a radioactive substance is given by

$$R = R_0\, e^{-\lambda t}$$

Here, $R_0 = 15$ decays min^{-1} ; $R = 9$ decays min^{-1}

$$\therefore \quad 9 = 15\, e^{-\lambda t}$$

$$\text{or} \quad e^{\lambda t} = \frac{15}{9} = 1{\cdot}6667$$

$$\text{or} \quad \lambda t = \log_e 1{\cdot}6667 = 2{\cdot}303 \log_{10} 1{\cdot}6667$$

$$= 2{\cdot}303 \times 0{\cdot}2219 = 0{\cdot}5110$$

$$\text{or} \quad t = \frac{0{\cdot}5110}{\lambda}$$

Now, decay constant, $\lambda = \dfrac{0{\cdot}693}{T} = \dfrac{0{\cdot}693}{5730}$ year^{-1}

$$\therefore \quad t = \frac{0{\cdot}5110 \times 5730}{0{\cdot}693} = \mathbf{4225{\cdot}15\ years}$$

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 2.01. What do you mean by radioactive substance ?

Ans. A radioactive substance is one, whose atoms have unstable nuclei. The nuclei of radioactive substances emit α, β and γ-rays.

Q. 2.02. Name two radioactive elements, which are not found in observable quantities in nature. Why is it so ?

(*C.B.S.E. 1996 S*)

---

* The example is artificial, meant only to give you practice with the principle of the C^{14} dating method.

Ans. Plutonium and tritium are two radioactive elements, which are not found in observable quantities in nature. It is because of their very small values of half lives.

Q. 2.03. Among alpha, beta and gamma radiations, which are the ones affected by a magnetic field ? *(I.S.C.E. 1996)*

Ans. Alpha and beta radiations are affected by the magnetic field.

Q. 2.04. Which has greater ionising power : alpha particle or beta particle ? *(C.B.S.E. 1996)*

Ans. Alpha particle.

Q. 2.05. Why do alpha particles have a high ionising power ? *(C.B.S.E. 1998 S)*

Ans. Being massive and of large nuclear cross-section, α-particle possesses high ionising power.

Q. 2.06. "All radioactive substances seem to be identical." Comment.

Ans. A radioactive sample requires infinite time to disintegrate completely and in this sense, all the radioactive substances are identical.

Q. 2.07. Define radioactive decay constant. *(P.S.S.C.E. 1999 S)*

Ans. The decay constant of a radioactive substance is defined as the reciprocal of that time in which the number of atoms of the substance become $\frac{1}{e}$th of the atoms present initially.

Q. 2.08. Explain, why it is not possible to define the total life of a radioactive substance.

Ans. The radioactivity is a spontaneous phenomenon and obeys the law of chance only. Therefore, as the nucleus of an atom can have any value of total life (between zero to infinity), it is not possible to define the total life of a radioactive substance.

Q. 2.09. Define half life of a radioactive material.
(H.P.S.S.C.E. 2001 ; P.S.S.C.E. 1999 ; H.S.S.C.E. 1998 S ; C.B.S.E. 2002, 1992, 1991)

Ans. Refer to section 2.17.

Q. 210. The half life of ${}_6C^{14}$ is 5700 years. What does it mean ?

Ans. The nuclei of one half of the ${}_6C^{14}$ atoms will undergo disintegration in 5700 years

Q. 2.11. Give the relation between 'half life' and disintegration constant of a radioactive material. *(I.S.C.E. 1998)*

Ans. Relation between half life and decay constant :

$$T = \frac{0{\cdot}693}{\lambda}$$

Q. 2.12. Plutonium decays with a half life of 24,000 years. If plutonium is stored for 72,000 years, what fraction of it remains ? *(C.B.S.E. 1994)*

Ans. Here, T = 24,000 years ; t = 72,000 years

$$\text{Now,} \quad \frac{N}{N_0} = \left(\frac{1}{2}\right)^{t/T} = \left(\frac{1}{2}\right)^{\frac{72000}{24000}} = \left(\frac{1}{2}\right)^3 = \frac{1}{8}$$

Q. 2.13. A radioisotope of silver has half-life of 20 minutes. What fraction of the original mass would remain after one hour ? *(I.S.C.E. 1993)*

Ans. Here, T = 20 min ; t = 1 hour = 60 min

$$\text{Now,} \quad \frac{N}{N_0} = \left(\frac{1}{2}\right)^{t/T} = \left(\frac{1}{2}\right)^{\frac{60}{20}} = \left(\frac{1}{2}\right)^3 = \frac{1}{8}$$

Q. 2.14. A certain radioactive substance has a half-life period of 30 days. What is the disintegration constant ? *(H.P.S.S.C.E. 1997)*

Ans. Here, T = 30 days

Now, disintegration constant,

$$\lambda = \frac{0{\cdot}693}{T} = \frac{0{\cdot}693}{30} = \mathbf{0{\cdot}0231\ day^{-1}}$$

Q. 2.15. Define average life of a radioactive substance. *(P.S.S.C.E. 1999 S)*

Ans. Refer to section 2.18.

Q. 2.16. Write down expression relating half life of a radioactive element to its average life.

Ans. Half life = 0·693 × average life

Q. 2.17. What is meant by the activity of a radioactive material ? *(I.S.C.E. 1997)*

Ans. *The activity of a radioactive substance is defined as the rate at which the nuclei of its atoms in the sample disintegrate.* Thus,

$$\text{activity of a substance, } R = -\frac{dN}{dt}$$

Q. 2.18. Does the activity of a radioactive element depend on external physical conditions ?

Ans. No.

Q. 2.19. Write down the value of one millicurie in terms of rutherford.

Ans. 1 millicurie = $3{\cdot}7 \times 10^7$ disintegrations s^{-1} and 1 rutherford = 10^6 disintegrations s^{-1}

∴ 1 millicurie = 37 rutherford

Q. 2.20. A radioactive substance having N nuclei has activity A. Write down an expression for its half-life in terms of A and N. *(I.S.C.E. 1997)*

Ans. Half life, $T = \frac{0{\cdot}693}{\lambda}$

But $\quad R = N\lambda \quad$ or $\quad \lambda = \frac{R}{N}$

∴ $\quad T = 0{\cdot}693 \times \frac{N}{R}$

Q. 2.21. Write a general equation that represents beta emission. *(P.S.S.C.E. 1998)*

Ans. General equation for β-decay :

$${}_ZX^A \longrightarrow {}_{Z+1}Y^A + {}_{-1}e^0 + \bar{\nu} + E_\beta$$

Q. 2.22. What is the difference between an electron and a β-particle ? *(P.S.S.C.E. 1999 S)*

Ans. An electron and a β-particle are essentially the same. The electron of nuclear origin is called a β-particle.

Q. 2.23. Why is the energy variation of the electrons emitted during a beta decay continuous ? *(C.B.S.E. 1998 S)*

Or

Why is the energy distribution of beta rays continuous ? *(C.B.S.E. 1993)*

Ans. β-decay is the result of conversion of a neutron into a proton, electron and an antineutrino $(\bar{\nu})$. Since the energy available in β-decay is shared by the electron and the antineutrino in all possible proportions as they come out of nucleus ; the β-ray spectrum is continuous in nature.

Q. 2.24. Why do all electrons emitted during beta decay ot have the same energy ? (C.B.S.E. 1996)

Ans. Refer to VSQ 2.24.

Q. 2.25. Why does a nucleus emit a γ-ray photon ?

Ans. During α or β-decay, the residual nucleus is somemes left in the excited state. When the nucleus de-excites, it emits energy. The energy emitted is found to be in γ-ray region.

Q. 2.26. What is a radioisotope ?

Ans. The isotope of an element capable of emitting radiations like a radioactive substance is called a radioisotope. Usually, radioisotopes are artificially produced.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 2.01. State the difference between X-rays and γ-rays..

Ans. Both X-rays and γ-rays are electromagnetic waves. Iowever, they differ in the following aspects :

1. The wavelength of γ-rays is very small as compared o that of X-rays.
2. The penetrating power of γ-rays is very high as ompared to that of X-rays.
3. The origin of X-rays is due to atomic de-excitation, vhle the origin of γ-rays is due to nuclear de-excitation.

Q. 2.02. State laws of radioactivity.
(H.S.S.C.E. 1996 ; Pre-degree Kerala, 1994)

Ans. Refer to section 2.03.

Q. 2.03. What are the characteristics of radioactivity ?

Ans. Following are a few characteristics of radioactivity.

1. It is a spontaneous phenomenon.
2. It obeys exponential decay laws.
3. The rate of radioactive disintegration of a substance annot be altered by changing the external factors, such as ressure, temperature, etc.

Q. 2.04. Natural radioactive nuclei are nuclei of high nass number. Why ?

Ans. The B.E./A of the nuclei of high mass number is mall as compared to that of the stable nuclei. Also, neutron o proton ratio of the nuclei of high mass number is different rom that for stable nuclei. Such nuclei undergo radioactive ecay so as to attain greater value of B.E./A and also to cquire the proper neutron to proton ratio.

Q. 2.05. Why heavy stable nuclei must contain more neutrons than protons ?

Ans. The heavy nuclei tend to become unstable due to large number of protons inside it. For heavy nuclei to be stable, the electrostatic repulsive force between protons must be dominated by attractive nuclear force resulting from neutron-neutron, neutron-proton and proton-proton interactions. So that it can happen, number of neutrons must be greater than number of protons.

Q. 2.06. Define the term `decay constant' for a radioactive substance. Deduce the relation between decay constant and half life period. (C.B.S.E. 1993)

Ans. Decay constant. Refer to section 2.04.

Relation between T and λ. Refer to section 2.05.

Q. 2.07. All the radioactive series terminate at lead as their final product. Explain, why.

Ans. It is found that the half lives of the intermediate radioactive elements formed in any of the three radioactive series (*uranium series, actinium series* and *thorium series*) are very small as compared to the element at the head of the series. For this reason, all the radioactive series ultimately end into lead, the stable element.

Q. 2.08. Two radioactive nuclei X and Y initially contain an equal number of atoms. Their half life is 1 hour and 2 hours respectively. Calculate the ratio of their rates of disintegration after two hours. (C.B.S.E. 2002)

Ans. Here, half life of sample X, $T_1 = 1$ h

and half life of sample Y, $T_2 = 2$ h

Let N be the number of atoms of each of the two samples initially. Thus number of atoms of sampel X after 2 h, $N_1 = \frac{N}{4}$

and number of atoms of sample Y after 2h, $N_2 = \frac{N_2}{2}$

Let R_1 and R_2 be their rates of disintegration after 2 h. If λ_1 and λ_2 are their respective decay constant, then

$$\frac{R_1}{R_2} = \frac{\lambda_1 N_1}{\lambda_2 N_2} = \frac{T_2 N_1}{T_1 N_2} \qquad \left(\because T = \frac{0\cdot693}{\lambda}\right)$$

$$= \frac{2 \times N/4}{1 \times N/2} = 1$$

Q. 2.09. The half life period of a radioactive substance is 30 days. What is the time taken for $\frac{3}{4}$th of its original mass to disintegrate ? (C.B.S.E. 1994)

Ans. Here, T = 30 days ; $\frac{N_0 - N}{N_0} = \frac{3}{4}$ or $\frac{N}{N_0} = \frac{1}{4}$

If *t* is the required time, then

$$\frac{N}{N_0} = \left(\frac{1}{2}\right)^{t/T} \quad \text{or} \quad \left(\frac{1}{2}\right)^{t/30} = \frac{1}{4} \quad \text{or} \quad \left(\frac{1}{2}\right)^{t/30} = \left(\frac{1}{2}\right)^2$$

$$\therefore \quad \frac{t}{30} = \frac{1}{2} \quad \text{or} \quad t = 60 \text{ days}$$

Q. 2.10. A radioactive substance decays to $\frac{1}{32}$th its initial activity in 25 days. Calculate its half life. (C.B.S.E. 1992)

Ans. If T is the half life of the radioactive substance, then

$$\frac{R}{R_0} = \left(\frac{1}{2}\right)^{t/T}$$

Here, $\frac{R}{R_0} = \frac{1}{32}$; $t = 25$ days

$$\therefore \quad \frac{1}{32} = \left(\frac{1}{2}\right)^{25/T} \quad \text{or} \quad \left(\frac{1}{2}\right)^{25/T} = \left(\frac{1}{2}\right)^5$$

$$\text{or} \quad \frac{25}{T} = 5 \quad \text{or} \quad T = 25/5 = 5 \text{ days}$$

Q. 2.11. What fraction of tritium will remain undecayed after 25 years ? Given, half life is 12·5 years. (H.P.S.S.C.E. 1993)

Ans. Now, $\frac{N}{N_0} = \left(\frac{1}{2}\right)^{t/T}$, where T is half life and $\frac{N}{N_0}$ is fraction of atoms left after time *t*.

Here, T = 12·5 years ; t = 25 years

$$\therefore \quad \frac{N}{N_0} = \left(\frac{1}{2}\right)^{\frac{25}{12\cdot5}} = \left(\frac{1}{2}\right)^2 = \frac{1}{4}$$

Q. 2.12. Define `disintegration constant' and `mean life' of a radioactive substance. Give the unit for each. *(C.B.S.E. 1997)*

Ans. Disintegration constant. For definition, refer to section 2.04.

Its unit is reciprocal of time *i.e.* s^{-1} or $year^{-1}$.

Mean life. For definition, refer to section 2.06. Its unit is that of time *i.e.* s or year.

Q. 2.13. Distinguish between half and average life of a radioactive substance. *(P.S.S.C.E. 1998)*

Ans. Refer to sections 2.05 and 2.06.

Q. 2.14. The half life period of radioactive element A is the same as the mean life time of another radioactive element B. Initially both of them have same number of atoms. The radioactive element B decays faster than A. Explain, why. *(P.S.S.C.E. 2001)*

Ans. Let λ_1 and λ_2 be decay constants of element A and B respectively.

$$\text{Then,} \quad \frac{0\cdot693}{\lambda_1} = \frac{1}{\lambda_2} \quad \text{or} \quad \frac{\lambda_1}{\lambda_2} = 0\cdot693$$

Let N be the number of atoms of each of the two samples initially. If R_1 and R_2 are their rates of disintegration, then

$$\frac{R_1}{R_2} = \frac{\lambda_1 N}{\lambda_2 N} = \frac{\lambda_1}{\lambda_2} = 0\cdot693$$

Hence, R_2 is greater than R_1.

Q. 2.15. Define two units of radioactivity. How are they related ? *(P.S.S.C.E. 1993)*

Ans. In radioactivity, curie and rutherford are two units used to measure activity of a radioactive substance. For definitions, refer to section 2.07.

The two units are related to each other as below :

$$1 \text{ curie } = 3{\cdot}7 \times 10^4 \text{ rutherford}$$

Q. 2.16. In a radioactive decay, the nucleus emits an α-particle followed by two β-particles. Show that the final nucleus is an isotope of the original one.

Ans. Let the original nucleus and final nucleus be represented as ${}_{Z_1}X^{A_1}$ and ${}_{Z_2}Y^{A_2}$ respectively. Then the given radioactive decay process may be represented as

$${}_{Z_1}X^{A_1} \longrightarrow {}_{Z_2}Y^{A_2} + {}_2He^4 + 2\,{}_{-1}e^0$$

Obviously, $Z_2 = Z_1 - (2 - 2) = Z_1$

Hence, the final nucleus is an isotope of the original nucleus.

Q. 2.17. A radioactive nucleus undergoes a series of decays according to the sequence

$$A \xrightarrow{\beta} A_1 \xrightarrow{\alpha} A_2 \xrightarrow{\alpha} A_3$$

If the mass number and atomic number of A_3 are 172 and 69 respectively, what is the mass number and atomic number of A ? *(C.B.S.E. 1994)*

Ans. Since the nucleus A_3 is ${}_{69}A_3{}^{172}$ and β-particle is an electron (${}_{-1}e^0$) and α-particle is ${}_2He^4$ (nucleus of helium), the given decay series may be represented as

$${}_{72}A^{180} \xrightarrow{\beta} {}_{73}A_1{}^{180} \xrightarrow{\alpha} {}_{71}A_2{}^{176} \xrightarrow{\alpha} {}_{69}A_3{}^{172}$$

i.e. the mass number and atomic number of radioactive nucleus A are 180 and 72 respectively.

Q. 2.18. A radioactive isotope D decays according to the sequence

$$D \xrightarrow{{}_0n^1} D_1 \xrightarrow{\alpha} D_2$$

If the mass number and atomic number of D_2 are 176 and 71 respectively, find the mass number and atomic number of D. Amongst D, D_1 and D_2, do we have any isobars or isotopes ? *(C.B.S.E. 1998)*

Ans. α-particle is nucleus of helium (${}_2He^4$).

Therefore, the above mentioned radioactive decays will proceed as below :

$${}_{73}D^{181} \xrightarrow{{}_0n^1} {}_{73}D_1{}^{180} \xrightarrow{{}_2He^4} {}_{71}D_2{}^{176}$$

Therefore, mass number and atomic number of D are 181 and 73 respectively.

Since atomic number of D_1 and D are same, D and D_1 are isotopes.

Q. 2.19. A radioactive nucleus A decays as follows :

$$A \xrightarrow{{}_1e^0} A_1 \xrightarrow{\alpha} A_2$$

If the mass number and atomic number of A_2 are 176 and 71 respectively, what are the mass numbers and atomic numbers of A_1 and A ? Which of these three elements are isobars ? *(C.B.S.E. 1999)*

Ans. Proceed as in SAQ 2.32.

Mass number of A_1 = 180, mass number of A = 180

Atomic number of A_1 = 73, atomic number of A = 74

The elements A_1 and A are isobars.

Q. 2.20. The sequence of stepwise decays of radioactive nucleus is

$$D \xrightarrow{\alpha} D_1 \xrightarrow{\beta} D_2 \xrightarrow{\alpha} D_3 \xrightarrow{\alpha} D_4$$

If the nucleon number and atomic number for D_2 are respectively 176 and 71, what are the corresponding values for D and D_4 nuclei. Justify your answers. *(C.B.S.E. 1998)*

Ans. An α-particle is the nucleus of helium (${}_2He^4$) and a β-particle is an electron (${}_{-1}e^0$). Therefore, the above mentioned radioactive decays will proceed as below :

$${}_{72}D^{180} \xrightarrow{{}_2He^4} {}_{70}D_1{}^{176} \xrightarrow{{}_{-1}e^0} {}_{71}D_2{}^{172} \xrightarrow{{}_2He^4}$$
$${}_{69}D_3{}^{172} \xrightarrow{{}_2He^4} {}_{67}D_4{}^{168}$$

The nucleon number and atomic number corresponding to D are 180 and 72 ; while those corresponding to D_4 are 168 and 67.

Q. 2.21. The isotope uranium ${}_{92}U^{238}$ decays successively to form ${}_{90}Th^{234}$, ${}_{91}Pa^{234}$, ${}_{92}U^{234}$, ${}_{90}Th^{230}$ and ${}_{88}Ra^{226}$. What are the radiations emitted in these five steps ? *(C.B.S.E. 1981)*

Ans. In the first step (${}_{92}U^{238}$ to ${}_{90}Th^{234}$) : When ${}_{92}U^{238}$ decys to ${}_{90}Th^{234}$, mass number decreases by 4 and atomic number decreases by 2. Therefore, α-particle (${}_2He^4$) is emitted. The decay takes place as below :

$${}_{92}U^{238} \longrightarrow {}_{90}Th^{234} + {}_2He^4$$

In the second step (${}_{90}Th^{234}$ to ${}_{91}Pa^{234}$) : When ${}_{90}Th^{234}$ decays to ${}_{91}Pa^{234}$, mass number remains unchanged and the atomic number increases by 1. Therefore, β-particle (${}_{-1}e^0$) is emitted. The decay takes place as below :

$${}_{90}Th^{234} \longrightarrow {}_{91}Pa^{234} + {}_{-1}e^0$$

In the third step ($_{91}Pa^{234}$ to $_{92}U^{234}$) : Here also, the mass mber remains same and the atomic number increases by Therefore, in the third step, the β-decay takes place as resented below :

$$_{91}Pa^{234} \longrightarrow {}_{92}U^{234} + {}_{-1}e^0$$

In fourth step ($_{92}U^{234}$ to $_{90}Th^{230}$) and fifth step ($_{90}Th^{230}$ $_{8}Ra^{226}$) : In each of these two steps, α-decays takes place.

Q. 2.22. Does the ratio of neutrons to protons in a cleus increase, decrease or remain the same after the ission of an α-particle ? (H.P.S.S.C.E. 1994)

Ans. The number of neutrons (N = A – Z) in a nucleus either equal to or greater than the number of protons (Z). e emission of an α-particle involves the emission of two otons and two neutrons. It can be easily seen that $\frac{N-2}{Z-2}$ ll always be greater than $\frac{N}{Z}$ *i.e.* the ratio of neutrons to otons in a nucleus always increases after the emission of α-rticle.

Q. 2.23. A nucleus contains no electrons, but can eject em. Why ?

Ans. The emission of electron from a radioactive nucleus is termed as β-decay. At the time of β-decay, a neutron converts into a proton according to the following scheme :

$$_0n^1 \longrightarrow {}_1H^1 + {}_{-1}e^0 + \bar{\nu}$$

In this manner, the nucleus emits electron (along with the antineutrons), although it does not contain it.

Q. 2.24. Explain, with an example, whether the neutron-proton ratio increases or decreases during beta decay. (C.B.S.E. 1998 S)

Ans. When β-decay takes place, a neutron inside the nucleus converts into proton. Therefore, on beta decay, whereas the number of neutrons decreases by one, the number of protons increases by one. Obviously, the neutron-proton ratio decreases on β-decay.

Consider the β-decay of Bi^{210} :

$$_{83}Bi^{210} \longrightarrow {}_{84}Po^{210} + {}_{-1}e^0$$

Before β-decay : $\frac{A-Z}{Z} = \frac{210-83}{83} = \frac{127}{83}$

After β-decay : $\frac{A-Z}{Z} = \frac{210-84}{84} = \frac{126}{84}$

TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 2.01. Why all the three types of rays *i.e.* α, β and γ, come out from a radioactive sample though a single dioactive sample obeys a particular decay mode ?

Ans. The decay of a radioactive element is not a single age process. The daughter element formed further decays to some other element and so on, till stable lead is formed. the complete decay scheme (from parent element to the able lead), a few radioactive elements undergo α-decay, hile others β-decay. The γ-ray is emitted in cases, when the ucleus after an α or a β-decay is left in the excited state.

Q. 2.02. The half-life period of a radioactive element X is same as the mean-life time of another radioactive ement Y. Initially both of them have the same number of oms. Which of the radioactive element decays faster than e other ? (I.I.T. 1999)

Ans. Let λ and λ′ be decay constants of radioactive ements X and Y respectively. If T is half-life period of X and $_a'$, the mean life time of element Y, then

$$T = \frac{0\cdot693}{\lambda} \quad \text{and} \quad T_a' = \frac{1}{\lambda'}$$

Since $T = T_a'$, we have

$$\frac{0\cdot693}{\lambda} = \frac{1}{\lambda'} \quad \text{or} \quad \lambda = 0\cdot693\,\lambda' \quad \text{or} \quad \lambda' > \lambda$$

The decay rate of a radioactive sample is given by

$$\frac{dN}{dt} = -\lambda N$$

As both the elements have the same number of atoms nitially,

$$\frac{dN}{dt} \propto \lambda$$

Since decay constant of element Y is greater than that of , the element Y decays faster than X.

Q. 2.03. At a given instant, there are 25% undecayed radioactive nuclei in a sample. After 10 s, the number of undecayed nuclei reduces to 12·5%. Calculate (*a*) mean life of the nuclei and (*b*) the time in which the number of undecayed nuclei will further reduce to 6·25% of the reduced number. (I.I.T. 1996)

Ans. (*a*) Since the number of undecayed nuclei is reduced from 25% to 12·5% (*i.e.* to one half) in 10 s, the half life of the radioactive sample,

$$T = 10\text{ s}$$

Now, $T = \frac{0\cdot693}{\lambda}$ or $\lambda = \frac{0\cdot693}{T}$

Therefore, mean life, $T_a = \frac{1}{\lambda} = \frac{T}{0\cdot693} = \frac{10}{0\cdot693} = 14\cdot43$ s

(*b*) Suppose that the number of undecayed nuclei are N_0 and they will reduce to 6·25% of this number (say N) in time *t*. Then,

$$\frac{N}{N_0} = \left(\frac{1}{2}\right)^{t/T}$$

Here, $N = \frac{6\cdot25}{100} N_0 = \frac{N_0}{16}$

$$\therefore \quad \frac{N_0/16}{N_0} = \left(\frac{1}{2}\right)^n \quad \text{or} \quad \left(\frac{1}{2}\right)^{t/T} = \frac{1}{16} = \left(\frac{1}{2}\right)^4$$

or $\frac{t}{T} = 4$ or $t = 4\,T = 4 \times 10 = 40$ s

Q. 2.04. The α-particle faces a coulomb barrier. A neutron being uncharged faces no such barrier. Why does the nucleus $_{92}U^{238}$ not decay spontaneously by emitting a neutron ? Given, $m_N(_{92}U^{237}) = 237\cdot04874$ a.m.u., $m_n = 1\cdot00867$ a.m.u. and $m_N(_{92}U^{238}) = 238\cdot05081$ a.m.u.

Ans. The possible decay would be

$$_{92}U^{238} \longrightarrow {}_{92}U^{237} + {}_0n^1$$

Since $m_N(_{92}U^{238})$ *i.e.* 238·05081 a.m.u. is less than the mass of the products *i.e.* $m_N(_{92}U^{237}) + m_n$ *i.e.* 237·04874 + 1·00867 *i.e.* 238·05741 a.m.u., the decay is not energetically allowed.

Q. 2.05. If the α-decay of U^{238} is energetically allowed (*i.e.* the decay products have a total mass

less than the mass of U^{238}), what prevents U^{238} from decaying all at once ? *(Text Question)*

Ans. The α-decay is caused by the quantum mechanical tunnelling of the nucleus by the α-particles. The rate of tunnelling is determined by the height of the nuclear potential barrier, its width, etc.

Q. 2.06. Why are α-particles emitted rather than say protons or $_2He^3$ nuclei ?

Ans. It is because of the high value of binding energy of the α-particle. Therefore, on emission of α-particle, the binding energy per nucleon of the residual nucleus increas appreciably. On the other hand, the emission of a proton $_2He^3$ nuclei may not be energetically possible.

Q. 2.07. Why electron capture is common in case heavy nuclei ?

Ans. A heavy nucleus has large positive charg Moreover, the radius of K-shell in heavy nuclei is muc smaller than that in case of a light nucleus. Due to both thes factors, the K- shell electron experiences a large force attraction due to positive nucleus and is captured by it.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. What is radioactivity ? Give the properties of different types of rays emitted by radioactive substances.
2. Write down the laws of radioactive decay and deduce expression for the decay law. *(H.P.S.S.C.E. 1997)*
3. What is readioactivity ? State the laws of radioactive disintegration. Show that radioactive decay is expontential in nature. *(P.S.S.C.E. 1999, 1998 S)*
4. State the radioactive decay law. Show by derivation that the number of unchanged nuclei left (*i.e.* the number of parent nuclei) decreases exponentially with time. *(I.S.C.E. 1993)*
5. State the law of radioactive decay. Deduce the relation $N = N_0 e^{-\lambda t}$, where symbols have their usual meanings. Sketch a graph to illustrate radioactive decay. *(H.P.S.S.C.E. 2000, 1999 S ; C.B.S.E. 1999 S)*
6. $_{92}U^{238}$ decays successively to form $_{90}Th^{234}$, $_{91}Pa^{234}$, $_{82}U^{234}$, $_{90}Th^{230}$, $_{88}Ra^{236}$ and $_{86}Rn^{222}$. What are the radioactive radiations emitted in each decay process ? *(C.B.S.E. 1996 S)*
7. Define decay constant of a radioactive sample. Which of the following radiations, α-rays, β-rays, γ-rays. (*i*) are similar to X-rays ? (*ii*) are easily absorbed by matter ? (*iii*) travel with greatest speed ? (*iv*) are similar in nature to cathode rays ? *(C.B.S.E. 2001)*
8. State the law of radioactive decay. Define half life period and obtain an expression for it. *(H.S.S.C.E. 2002)*
9. Define the term decay constant and half life of a radioactive sample. Derive the relation connecting the two. *(C.B.S.E. 2001, P.S.S.C.E. 2001)*
10. Write down the laws of radioactivity and define half li period and find out an expression for it. *(H.S.S.C.E. 1997*
11. Derive the radioactive decay law. Define half-life (T) of radioactive substance and show that
$$T = \frac{0 \cdot 693}{\lambda},$$
where λ is the decay constant. *(I.S.C.E. 199*
12. Define the term `half-life $T_{1/2}$ of a radioactive substanc and establish its relation with decay constant (λ). *(H.S.S.C.E. 2002 ; C.B.S.E. 1999 S ; I.S.C.E. 199*
13. Define half-life time and average life time of a radioactiv element. Derive expression for half life time. *(P.S.S.C.E. 199*
14. What is α-decay ? Explain in brief.
15. Explain β-decay. *(H.S.S.C.E. 200*
16. Why do we say that β-rays emitted from a radioactiv substance have a continuous energy spectrum ? How d this fact lead to the discovery of neutrino ?
17. Explain the phenomenon of γ-decay.
18. What is alpha decay, beta decay and gamma decay ? *(H.P.S.S.C.E. 199*
19. Define half life of a radioactive substance. Derive a expression for it. *(H.S.S.C.E. 2002, 1995, 1994 ; H.P.S.S.C.E. 1995, 199*
20. Explain radio-carbon dating. *(I.S.C.E. 199*

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Radioactive decay law and Half life

1. How many disintegrations per second will occur in one gram of $_{92}U^{238}$, if its half life against alpha decay is $1{\cdot}42 \times 10^{17}$ s ? *(C.B.S.E. 2001)* **[Ans.** $1{\cdot}235 \times 10^4\ s^{-1}$]
2. The half life of $_{92}U^{238}$ against α-decay is $4{\cdot}5 \times 10^9$ years. How many disintegrations per second occur in 1 g $_{92}U^{238}$? **[Ans.** $1{\cdot}235 \times 10^4$ s
3. The atomic weight of radium is 226. It is observed tha $3{\cdot}67 \times 10^{10}$ α-particles are emitted per second from or gram of radium. Calculate in years the half life period radium. **[Ans.** 1548·7 years

4. Find the half life of U^{238}, if one gram of it emits $1{\cdot}24\times10^4$ α- particles per second. Given that Avogadro number $= 6{\cdot}025 \times 10^{23}$. **[Ans.** $4{\cdot}484 \times 10^9$ **years]**

5. 4 g of radioactive material of half life 10 years is kept in a store for 15 years. How much material is disintegrated ? **[Ans.** 2·5856 g**]**

6. One gram of radium is reduced by 2 milligram in 5 years by α-decay. Calculate the half period of radium. (*P.S.S.C.E. 1993*) **[Ans.** 1730·3 years**]**

7. The half-life of a radioactive substance is 1672 years. If the initial mass of the substance is 1 g, after how many years will only 1 mg of it to be left behind ? (*P.S.S.C.E. 1999 S*) **[Ans. 16669·5 years]**

8. The half life of radium is 1590 years. In how many years will one gram of the pure element lose 1 centigram ? **[Ans. 23·06 years]**

9. A nucleus of UX_1 has a half life of 24·1 days. How long a sample UX_1 will take to change 90% of it to UX_2 ? **[Ans. 79·97 days]**

ype B. On Activity of a radioactive substance

10. The half-life time of a radioactive substance is 100 years. Calculate in how many years the activity will decay to 1/10th of its initial value. (*P.S.S.C.E. 2000, 1999*) **[Ans. 332·3 years]**

11. The half-life of a radioactive substance is 5×10^3 years. In how many years, its activity will decay to 0·2 times of its initial value ? Given $\log_{10} 5 = 0{\cdot}6990$. (*P.S.S.C.E. 2000*) **[Ans.** $1{\cdot}16 \times 10^4$ **years]**

12. One gram of $_{88}Ra^{226}$ has activity of one curie. Find its half life period. Given that a kilo mole of $_{88}Ra^{226}$ contains $6{\cdot}025 \times 10^{26}$ atoms. **[Ans. 1583·2 years]**

13. Determine the amount of $_{84}Po^{210}$ necessary to provide a source of α-particles of 5 mci strength. The half-life of polonium is 138 days. **[Ans.** $1{\cdot}11 \times 10^{-6}$ **g]**

MISCELLANEOUS PROBLEMS

14. The count rate from a radioactive sample falls from $4{\cdot}0 \times 10^6\ s^{-1}$ to $1{\cdot}0 \times 10^6\ s^{-1}$ in 20 hours. What will be the count rate 100 hours after the beginning. **[Ans.** $3{\cdot}91 \times 10^3\ s^{-1}$**]**

15. A radioactive sample can decay by two different processes. The half-life for the first process is T_1 and that for the second process is T_2. Show that the effective half-life T of the nucleus is given by

$$\frac{1}{T} = \frac{1}{T_1} + \frac{1}{T_2}$$

17. A point source of γ-radiation has a half-life of 30 minutes. The initial count rate recorded by Geiger counter placed 2 m from the source is $360\ s^{-1}$. The distance between the counter and the source is altered. After 1·5 hours, the count rate recorded is $5\ s^{-1}$. What is the new distance between the counter and the source ? **[Ans. 6 m]**

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. Same as solved problem no. 2.02.

2. $$\lambda = \frac{0{\cdot}693}{4{\cdot}5\times10^9}\ \text{year}^{-1}$$
$$= \frac{0{\cdot}693}{4{\cdot}5\times10^9\times365\times24\times60\times60}\ s^{-1}$$

Number of atoms in 1g of U^{238}, $N = \dfrac{6{\cdot}02\times10^{23}}{238}$

Using the relation : $\dfrac{dN}{dt} = \lambda N$,

it can be obtained that

$$\frac{dN}{dt} = \mathbf{1{\cdot}235 \times 10^4\ s^{-1}}$$

3. Number of atoms in 1 g of Ra^{236}, $N = \dfrac{6{\cdot}02\times10^{23}}{226}$

$$\frac{dN}{dt} = 3{\cdot}67\times10^{10}\ s^{-1}$$

Using the relation : $\dfrac{dN}{dt} = \lambda N$,

it can be found that

$$\lambda = 1{\cdot}378 \times 10^{-11}\ s^{-1}$$

$$\therefore\ T = \frac{0{\cdot}693}{\lambda} = \frac{0{\cdot}693}{1{\cdot}378\times10^{-11}}\ s$$
$$= \frac{0{\cdot}693}{1{\cdot}378\times10^{-11}\times60\times60\times24\times365}$$
$$= \mathbf{1548{\cdot}7\ years}$$

4. Number of U^{238} atoms in 1 g,

$$N = \frac{6{\cdot}025\times10^{23}}{238} = 2{\cdot}53\times10^{21}$$

Now, $\dfrac{dN}{dt} = \lambda N$ or $1{\cdot}24 \times 10^4 = \lambda \times 2{\cdot}53 \times 10^{21}$

or $$\lambda = \frac{1{\cdot}24\times10^4}{2{\cdot}53\times10^{21}} = 4{\cdot}9\times10^{-18}\ s^{-1}$$

$$\therefore\ T = \frac{0{\cdot}693}{\lambda} = \frac{0{\cdot}693}{4{\cdot}9\times10^{-18}} = 1{\cdot}414\times10^{17}\ s$$
$$= \mathbf{4{\cdot}484 \times 10^9\ years}$$

5. $$\lambda = \frac{0{\cdot}693}{T} = \frac{0{\cdot}693}{10} = 0{\cdot}0693\ \text{year}^{-1}$$

Now, $m = m_0 e^{-\lambda t} = 4e^{-0{\cdot}0693\times15}$
$= 4 \times 0{\cdot}3536 = 1{\cdot}4144$ g

Therefore, material disintegrated
$= 4 - 1{\cdot}4144 = \mathbf{2{\cdot}5856\ g}$

6. $m_0 = 1$ g, $m_0 - m = 2$ mg $= 0{\cdot}002$ g
$\therefore m = m_0 - 0{\cdot}002 = 1 - 0{\cdot}002 = 0{\cdot}998$ g

Now, $m = m_0 e^{-\lambda t}$ or $e^{\lambda t} = \dfrac{m_0}{m}$

or $$\lambda t = \log_e \frac{m_0}{m}$$

or $$\lambda = \frac{2{\cdot}303}{t}\log_{10}\frac{m_0}{m} = \frac{2{\cdot}303}{5}\log_{10}\frac{1}{0{\cdot}998}$$
$$= \frac{2{\cdot}303}{5}\log_{10}1{\cdot}002 = \frac{2{\cdot}303}{5}\times0{\cdot}0009$$
$$= 4{\cdot}005\times10^{-4}\ \text{year}^{-1}$$

$$\therefore\ T = \frac{0{\cdot}693}{\lambda} = \frac{0{\cdot}693}{4{\cdot}005\times10^{-4}} = \mathbf{1730{\cdot}3\ years}$$

7. $m_0 = 1$ g ; $m = 1$ mg $= 10^{-3}$ g ;

$$\lambda = \frac{0{\cdot}693}{1672} = 4{\cdot}1447\times10^{-4}\ \text{year}^{-1}$$

As obtained in problem no. 6,

$$t=\frac{2\cdot303}{\lambda}\log_{10}\frac{m_0}{m}=\frac{2\cdot303}{4\cdot1447\times10^{-4}}\log_{10}\frac{1}{10^{-3}}$$

$$=\frac{2\cdot303\times3}{4\cdot1447\times10^{-4}}=\mathbf{16669{\cdot}5\ years}$$

8. $\lambda=\frac{0\cdot693}{1590}=4\cdot3585\times10^{-4}\ \text{year}^{-1};$

$$m_0=1\,g\,;m_0-m=0\cdot01\ g$$

$$\therefore\ m=m_0-0{\cdot}01=1-0{\cdot}01=0{\cdot}99\ g$$

Using the relation : $t=\frac{2\cdot303}{\lambda}\log_{10}\frac{m_0}{m}$,

it can be obtained that

$$t=\mathbf{23{\cdot}06\ years}$$

9. $\lambda=\frac{0\cdot693}{24\cdot1}=0\cdot0288\ \text{day}^{-1}$

Let t be the time in which 90% of the sample of UX_1 changes to UX_2.

Therefore, sample of UX_1 left behind after time t = 10%

or $\frac{m}{m_0}=10\%=0\cdot1$ or $\frac{m_0}{m}=10$

Using the relation : $t=\frac{2\cdot303}{\lambda}\log_{10}\frac{m_0}{m}$,

it can be obtained that

$$t=\mathbf{79{\cdot}97\ days}$$

10. $R=\frac{10}{100}\times R_0=0\cdot1\,R_0,$

$$\lambda=\frac{0\cdot693}{100}=6\cdot93\times10^{-3}\ \text{year}^{-1}$$

Now, $R=R_0\,e^{-\lambda t}$ or $\lambda t=\log_e\frac{R_0}{R}$

or $t=\frac{2\cdot303}{\lambda}\log_{10}\frac{R_0}{R}$

$$=\frac{2\cdot303}{6\cdot93\times10^{-3}}\log_{10}\frac{R_0}{0\cdot1\,R_0}=\frac{2\cdot303\times1}{6\cdot93\times10^{-3}}$$

or $t=\mathbf{332{\cdot}3\ years}$

11. Proceed as in problem no. 10.

12. $R=\frac{dN}{dt}=1\,\text{curie}=3\cdot7\times10^{10}\ s^{-1}$

Number of atoms in 1 g of Ra^{226}, $N=\frac{6\cdot025\times10^{26}}{1000\times226}$

Using the relation : $\frac{dN}{dt}=\lambda N$,

it can be obtained that

$$\lambda=1{\cdot}388\times10^{-11}\ s^{-1}$$

$$\therefore\quad T=\frac{0\cdot693}{\lambda}=\frac{0\cdot693}{1\cdot388\times10^{-11}}\ s$$

$$=\frac{0\cdot693}{1\cdot388\times10^{-11}\times60\times60\times24\times365}$$

$$=\mathbf{1583{\cdot}2\ years}$$

13. $R=\frac{dN}{dt}=5\,\text{mci}=5\times3\cdot7\times10^{7}\ s^{-1},$

$$\lambda=\frac{0\cdot693}{T}=\frac{0\cdot693}{138}\ \text{day}^{-1}=\frac{0\cdot693}{138\times24\times60\times60}$$

$$=5\cdot812\times10^{-8}\ s^{-1}$$

Using the relation : $\frac{dN}{dt}=\lambda N$,

it can be obtained that

$$N=3{\cdot}183\times10^{15}$$

Therefore, mass of Po^{210},

$$m=\frac{210\times N}{\text{Avogadro number}}=\frac{210\times3\cdot183\times10^{15}}{6\cdot02\times10^{23}}$$

$$=\mathbf{1{\cdot}11\times10^{-6}\ g}$$

14. $R_0=4{\cdot}0\times10^6\ s^{-1}$; $R=1{\cdot}0\times10^6\ s^{-1}$ and $t=20$ hours

Now, $\frac{R}{R_0}=\left(\frac{1}{2}\right)^{t/T}$ or $\frac{1\cdot0\times10^6}{4\cdot0\times10^6}=\left(\frac{1}{2}\right)^{20/T}$

or $\left(\frac{1}{2}\right)^2=\left(\frac{1}{2}\right)^{20/T}$ or $\frac{20}{T}=2$

or $\therefore$ T = 10 hours

Let R′ be count rate, 100 hours after beginning. Then,

$$\frac{R'}{R_0}=\left(\frac{1}{2}\right)^{t/T}\quad\text{or}\quad R'=R_0\left(\frac{1}{2}\right)^{t/T}$$

or $R'=4\cdot0\times10^6\times\left(\frac{1}{2}\right)^{100/10}=4\cdot0\times10^6\times\left(\frac{1}{2}\right)^{10}$

$$=\frac{4\cdot0\times10^6}{1024}=\mathbf{3{\cdot}91\times10^3\ s^{-1}}$$

15. Let N be the total number of atoms of the radioacti

sample present initially. If $\frac{dN_1}{dt}$ and $\frac{dN_2}{dt}$ are decay rat

by the first and second process, then

$$\frac{dN_1}{dt}=\lambda_1 N\quad\text{and}\quad\frac{dN_2}{dt}=\lambda_2 N$$

Here, λ_1 and λ_2 are decay constants for the first and seco

process respectively.

Therefore, decay rate of sample by both the processes,

$$\frac{dN_1}{dt}+\frac{dN_2}{dt}=\lambda_1 N+\lambda_2 N$$

or $\frac{dN_1}{dt}+\frac{dN_2}{dt}=(\lambda_1+\lambda_2)N$ ...

If λ is effective decay constant for the radioactive samp

then

$$\frac{dN_1}{dt}+\frac{dN_2}{dt}=\lambda N$$ ...(

From equations (*i*) and (*ii*), we have

$$\lambda N=(\lambda_1+\lambda_2)N\quad\text{or}\quad\lambda=\lambda_1+\lambda_2$$

or $\frac{\lambda}{0\cdot693}=\frac{\lambda_1}{0\cdot693}+\frac{\lambda_2}{0\cdot693}$ ...(i

Now, $\frac{0\cdot693}{\lambda_1}=T_1,\ \frac{0\cdot693}{\lambda_2}=T_2$

and $\frac{0\cdot693}{\lambda_1}=T$, effective half-life of the sample.

Therefore, equation (*iii*) becomes

$$\frac{1}{T}=\frac{1}{T_1}+\frac{1}{T_2}$$

16. Number of atoms in 1 mg of Th^{232},

$$N=\frac{6\cdot02\times10^{23}}{232}\times10^{-3}=2\cdot595\times10^{18}$$

α-particles are emitted by the thorium source in all th directions *i.e.* in a solid angle of 4 π steradian. Therefor

$$\frac{dN}{dt}=22\times4\pi\ \ \alpha\text{-particles minute}^{-1}$$

Using the relation : $\frac{dN}{dt}=\lambda N$, it can be obtained that

$$T_a = \frac{1}{\lambda} = 9\cdot3865\times10^{15}\ \text{minutes}$$

$$= \frac{9\cdot3865\times10^{15}}{60\times24\times365} = \mathbf{1\cdot786\times10^{10}\ years}$$

17. Initial count rate, $R_0 = 360\ s^{-1}$,
$T = 30$ minutes $= 0\cdot5$ hour
Initial distance between source and counter, $r = 2$ m
Suppose that distance between the source and counter is altered to r' so that after time t (= 1·5 hour) the count rate becomes, $R' = 5\ s^{-1}$
The change in count rate is both due to radioactive disintegration and due to change in intensity of γ-radiation at the counter due to change of its distance from the source.

Suppose that count rate changes from R_0 to R due to radioactive disintegration only. Then,

$$\frac{R}{R_0} = \left(\frac{1}{2}\right)^{t/T} \quad \text{or} \quad \frac{R}{360} = \left(\frac{1}{2}\right)^{1\cdot5/0\cdot5} \quad \text{or} \quad \frac{R}{360} = \left(\frac{1}{2}\right)^{3}$$

$$\text{or} \quad R = \frac{360}{8} = 45\ s^{-1}$$

The change in count rate from R to R′ is due to change in intensity of γ-radiation at the counter. Since intensity of γ-radiation varies inversely as the square of distance,

$$\frac{R}{R'} = \left(\frac{r'}{r}\right)^2 \quad \text{or} \quad r' = r\times\left(\frac{R}{R'}\right)^{1/2}$$

$$\text{or} \qquad r' = 2\times\left(\frac{45}{5}\right)^{1/2} = 2\times3 = \mathbf{6\ m}$$

CHAPTER

3

Nuclear Reactions

3.01. NUCLEAR REACTIONS

The heavy nuclei such as $_{92}U^{238}$ undergo disintegration, by their own, resulting into the formation of the nuclei of new elements. Such nuclear disintegrations are called **natural nuclear transmutations.**

Quotable Quote

"I do no know with what weapons Worl War 3 will be fought, but World War will be fought with sticks and stones."

– Albert Einstei

The natural nuclear transmutations led Rutherford to think that it might be possible to disintegrate atomic nuclei by artificial means. In 1919, he was able to bring about the first artificial transmutation by bombarding nitrogen nuclei with α-particles which produced an isotope of oxygen and proton. The reaction taking place may be represented by the equation :

$$_7N^{14} + {_2He^4} \longrightarrow {_8O^{17}} + {_1H^1}$$

Such nuclear transmutation carried out by artificial means is called a nuclear reaction.

We know that in a chemical reaction, the rearrangement of atoms takes place. Similarly, in a nuclear reaction, the rearrangement of nucleons takes place, when the bombarding particle strikes the target nucleus.

After the successful attempt made by Rutherford, many other such nuclear reactions were carried out. The bombarding particles called *projectiles*, generally used were α-particle ($_2He^4$), proton ($_1H^1$), deutron ($_1H^2$), neutron ($_0n^1$) and gamma-ray photon (γ). This led to the formation of more than 500 artificial radioactive isotopes. The nuclear reaction

$$_7N^{14} + {_2He^4} \longrightarrow {_8O^{17}} + {_1H^1}$$

is referred as (α, p) *reaction.* A few important nuclear reactions are given below :

1. α-particle as projectile :

(i) (α-p) reactions

$$_{12}Mg^{24} + {_2He^4} \longrightarrow {_{13}Al^{27}} + {_1H^1}$$
$$_{13}Al^{27} + {_2He^4} \longrightarrow {_{14}Si^{30}} + {_1H^1}$$

(ii) (α-n) reactions

$$_3Li^7 + {_2He^4} \longrightarrow {_5B^{10}} + {_0n^1}$$
$$_{11}Na^{23} + {_2He^4} \longrightarrow {_{13}Al^{26}} + {_0n^1}$$

2. Proton as projectile :

(i) (p-α) reactions

$$_5B^{11} + {_1H^1} \longrightarrow {_4Be^8} + {_2He^4}$$
$$_{13}Al^{27} + {_1H^1} \longrightarrow {_{12}Mg^{24}} + {_2He^4}$$

(ii) (p-n) reactions

$$_3Li^7 + {_1H^1} \longrightarrow {_4Be^7} + {_0n^1}$$
$$_8O^{18} + {_1H^1} \longrightarrow {_9F^{18}} + {_0n^1}$$

(iii) (p-d) reactions

$$_3Li^7 + {_1H^1} \longrightarrow {_3Li^6} + {_1H^2}$$
$$_4Be^9 + {_1H^1} \longrightarrow {_4Be^8} + {_1H^2}$$

(iv) (p-γ) reactions

$$_6C^{12} + {_1H^1} \longrightarrow {_7N^{13}} + \gamma$$
$$_{13}Al^{27} + {_1H^1} \longrightarrow {_{14}Si^{28}} + \gamma$$

3. Neutron as projectile :

(i) (n-α) reactions

$$_7N^{14} + {_0n^1} \longrightarrow {_5B^{11}} + {_2He^4}$$
$$_{11}Na^{23} + {_0n^1} \longrightarrow {_9F^{20}} + {_2He^4}$$

(ii) (n-p) reactions

$$_7N^{14} + {_0n^1} \longrightarrow {_6C^{14}} + {_1H^1}$$
$$_{30}Zn^{64} + {_0n^1} \longrightarrow {_{29}Cu^{64}} + {_1H^1}$$

(iii) (n-γ) reactions

$${}_{1}H^{1} + {}_{0}n^{1} \longrightarrow {}_{1}H^{2} + \gamma$$
$${}_{29}Cu^{65} + {}_{0}n^{1} \longrightarrow {}_{29}Cu^{66} + \gamma$$

4. Deutron as projectile :

(i) (d-α) reactions

$${}_{8}O^{16} + {}_{1}H^{2} \longrightarrow {}_{7}N^{14} + {}_{2}He^{4}$$
$${}_{20}Ca^{40} + {}_{1}H^{2} \longrightarrow {}_{19}K^{38} + {}_{2}He^{4}$$

(ii) (d-p) reactions

$${}_{3}Li^{7} + {}_{1}H^{2} \longrightarrow {}_{3}Li^{8} + {}_{1}H^{1}$$
$${}_{11}Na^{23} + {}_{1}H^{2} \longrightarrow {}_{11}Li^{24} + {}_{1}H^{1}$$

(iii) (d-n) reactions

$${}_{1}H^{2} + {}_{1}H^{2} \longrightarrow {}_{2}He^{3} + {}_{0}n^{1}$$
$${}_{1}H^{2} + {}_{1}H^{3} \longrightarrow {}_{2}He^{4} + {}_{0}n^{1}$$

5. γ-ray photon as projectile. A nuclear reaction in which γ-ray or photon is ne projectile is called *photo-nuclear reaction* or *photo disintegration.*

$${}_{1}H^{2} + \gamma \longrightarrow {}_{1}H^{1} + {}_{0}n^{1}$$
$${}_{4}Be^{9} + \gamma \longrightarrow {}_{3}Li^{8} + {}_{1}H^{1}$$

3.02. SYMBOLIC REPRESENTATION OF NUCLEAR REACTION

In general, a nuclear reaction may be represented by the equation :

$${}_{Z_1}X^{A_1} + {}_{Z_2}P^{A_2} \longrightarrow {}_{Z_3}Y^{A_3} + {}_{Z_4}O^{A_4} + Q,$$

vhere X, P, Y and O represent the *target nucleus, bombarding, particle, residual nucleus* nd *outgoing* particle (or group of particles) respectively and Q represents the energy equired to carry out the nuclear reaction or the energy liberated in the reaction.

Further, all the nuclear reactions obey the following conservation laws :

1. ***Law of conservation of nucleon number.*** According to this law,

$$A_1 + A_2 = A_3 + A_4$$

2. ***Law of conservation of charge number.*** According to this law,

$$Z_1 + Z_2 = Z_3 + Z_4$$

3. ***Law of conservation of mass and energy.*** According to this law, the energy equired to carry out the nuclear reaction or the energy liberated is equal to the nergy equivalent of the masses of the nuclei on the two sides of the above equation.

4. ***Law of conservation of momentum.*** The linear momenta of residual nucleus nd outgoing particle is always equal to the linear momenta of target nucleus and ombarding particle.

3.03. COMPOUND NUCLEUS

From the discussion made in last sections, it appears as if a nuclear reaction is *one stage process i.e.* bombarding particle strikes the target nucleus resulting into he formation of a new nucleus and a new particle. According to Bohr, many nuclear eactions proceed in two stages.

In the *first stage,* the bombarding particle strikes the target nucleus to form a ew nucleus called ***compound nucleus.*** The atomic and the mass numbers of the ompound nucleus are respectively the sum of the atomic and mass numbers of the arget nucleus and bombarding particle. A compound nucleus may be formed in a ifferent way but from the compound nucleus one cannot know the manner in which t was formed.

In the *second stage,* the compound nucleus decays into a new nucleus by emitting a particle or a group of particles. This is because the compound nucleus is unstable.

Therefore, a nuclear reaction may be represented as

$$X + P \longrightarrow [C] \longrightarrow Y + O$$

Here, [C] represents the compound nucleus. Further compound nucleus may decay by a number of different modes. That the formation of compound nucleus is a reality, is hinted by the fact that it has a life time of the order of 10^{-16} s. It is very large as compared to the time 10^{-21} s, which a bombarding particle (on an average) requires to cross through the nucleus.

3.04. Q-VALUE OF A NUCLEAR REACTION

In a nuclear reaction, sum of the masses of the target nucleus (X) and the bombarding particle (P) may be greater or less than the sum of the masses of the product nucleus (Y) and the outgoing particle (O). To account for the law of conservation of mass-energy*, the nuclear reaction is represented as :

$$X + P \longrightarrow Y + O + Q,$$

where Q is called ***Q-value of the nuclear reaction.***

If the mass of the product nucleus and outgoing particle is less than the mass of the target nucleus and bombarding particle, then Q-value of nuclear reaction will be positive. Such nuclear reaction is called ***exoergic reaction.***

On the other hand, *if the mass of the product nucleus and outgoing particle is greater than the mass of the target nucleus and bombarding particle, the Q-value of nuclear reaction will be negative.* Such nuclear reaction is called ***endoergic reaction.***

The liberation or absorption of energy in the nuclear reaction takes place in accordance with Einstein's mass-energy equivalence formula.

Key point

The changes in nuclei during nuclear reactions alter the potential energies of the nuclei and particle involved so that reactions are a source of nuclear energy.

3.05. NUCLEAR FISSION

The process of splitting of a heavy nucleus into two nuclei of nearly comparable masses with liberation of energy is called nuclear fission.

Fission was first observed, when Fermi and his coworkers were trying to produce *transuranic element* by bombarding $_{92}U^{235}$ with slow neutrons. As a result, compound nucleus $_{92}U^{236}$ was formed. It disintegrated into the two nuclei $_{56}Ba^{141}$ and $_{36}Kr^{92}$ with the release of three neutrons and a lot of thermal energy. The fission reaction of $_{92}U^{235}$ may be represented as given below :

$$_{92}U^{235} + {}_0n^1 \longrightarrow [_{92}U^{235}] \longrightarrow {}_{56}Ba^{141} + {}_{36}Kr^{92} + 3\,{}_0n^1 + Q$$

The energy (Q) released was estimated to be 200 MeV per fission (or about 0·9 MeV per nucleon) and is equivalent to the difference in masses of the nuclei before and after the fission. Each of the three neutrons carries an energy of about 2 MeV. As such, these fast neutrons will escape and cannot cause the fission of other U^{235} nuclei. In order to utilise them to cause fission of three other U^{235} nuclei and so on, they have to be slowed down.

Key point

Fission is breaking of a heavy nucleus into two nuclei of comparable sizes.

Theory. Neil Bohr and J.A. Wheeler explained the nuclear fission on the basis of ***liquid drop model*** of the nucleus. The $_{92}U^{235}$ nucleus behaves like a liquid drop and owing to surface tension is perfectly spherical in shape. When the neutron strikes the nucleus, some energy called the excitation energy is imparted to the nucleus. The phenomenon of surface tension tries to keep the nucleus spherical in shape, whereas the excitation energy tries to deform it. Due to the struggle between the surface tension and the excitation energy, the oscillations are set up inside the compound nucleus [Fig. 3.01]. As a result of this, the nucleus continuously gets deformed from spherical shape to ellipsoidal and then to the shape of a dumb-bell, till the Coulomb's repulsive force between protons succeeds in tearing the two bells apart in a manner that the products are again spherical in shape. This is illustrated in Fig. 3.01.

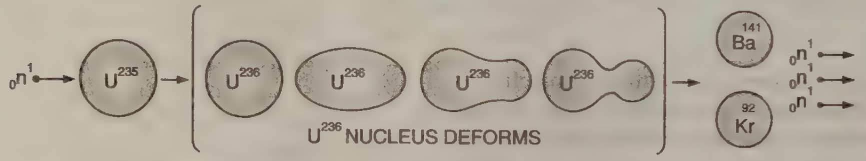

Fig. 3.01

The jargon

The liquid drop model of the nucleus : like a drop of water – a nucleus has a limited size ; a nucleus cannot be compressed ; a nucleus can split into smaller parts.

Further, it has been found that the fission is most favourable energetically, when the two fragments are of unequal sizes. Fig. 3.02 shows the distribution of the mass numbers of the fragments from the fission of $_{92}U^{235}$ by slow moving neutrons. The curve is symmetrical about $A = \frac{235}{2}$ but strong peaks occur in the vicinity of A = 92 and another around A=141. It indicates that when the fission of U^{235} takes place, its splitting into the nuclei Ba^{141} and Kr^{92} is most favourable.

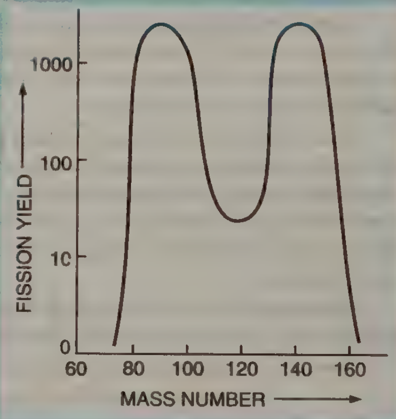

Fig. 3.02

3.06. NUCLEAR CHAIN REACTION

When U^{235} nucleus is bombarded with a thermal neutron, it splits into Ba^{141} and Kr^{92} along with the liberation of three neutrons and an energy of 200 MeV per fission reaction. The fission reaction may be represented as

---

*In nuclear reaction, bombarding particle strikes the target nucleus with some energy. Further, product nucleus and outgoing particle may also appear with some energy. In the present discussion, the mass will include the rest mass and the mass equivalent to energy possessed by the nucleus or the particle.

$$_{92}U^{235} + {_0n^1} \longrightarrow {_{56}Ba^{141}} + {_{36}Kr^{92}} + 3\,{_0n^1} + Q$$

The above fission reaction has two important characteristics :

(i) The energy liberated per fission reaction is very large.

(ii) In each fission reaction, three more neutrons are produced. The three eutrons may, then, cause the fission of three other U^{235} nuclei producing 9 neutrons nd so on. Due to the multiplication of neutrons in this manner, the whole of the J^{235} block may undergo fission in a very short time. Such a fission reaction is called ***ncontrolled chain reaction.*** It is called so because of the reason that once the fission eaction gets initiated, then it proceeds at such a fast pace that it cannot be shut-ff. An atom bomb is an example of an uncontrolled fission reaction.

Controlled chain reaction. To achieve a controlled chain reaction, arrange-nent is made for the partial absorption of neutrons available from each U^{235} ission. Fig. 3.03 shows the controlled chain reaction in which one neutron is bsorbed out of the three neutrons from one U^{235} fission. The neutrons are bsorbed by using cadmium rods, which act as ***control rods.*** The system in which he nuclear chain reaction may proceed in a controlled manner is called ***nuclear eactor.***

Watch out !

One should clearly understand the distinction between *absorbing neutrons* and *absorbing their energy.* The moderator should absorb only the energy ; the control rod must do away with the neutrons themselves !

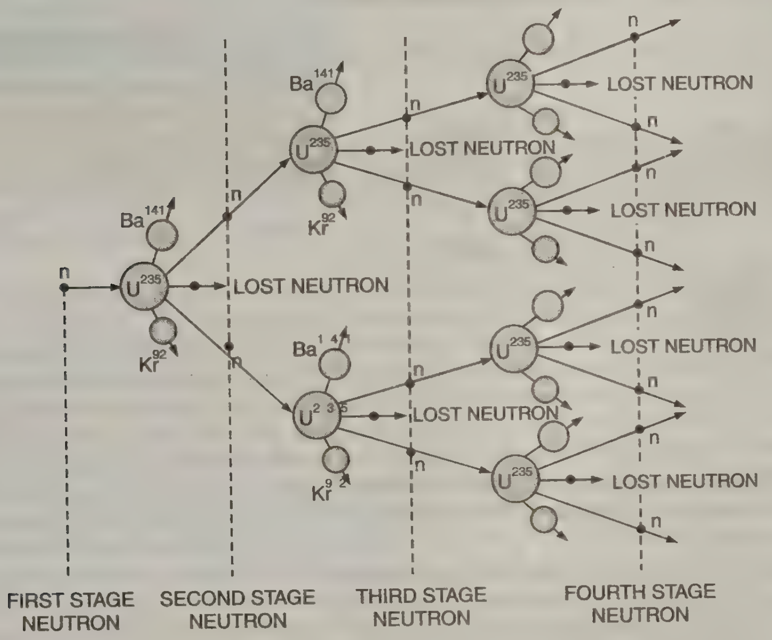

Fig. 3.03

A fission chain reaction may die out because of the following reasons :

1. The energy of the thermal neutrons required for the fission of U^{235} nuclei is of the order of 0·025 eV. However, the neutrons produced in the fission of U^{235} possess quite large energy as compared to the energy of thermal neutrons. As such, the neutrons escape the U^{235} block without causing the fission of U^{235} nuclei and due to this, the fission reaction may come to a stop.

So that the fission reaction does not stop, the neutrons produced in fission of U^{235} nuclei are slowed down by using graphite rods or heavy water. Such substances are rich in hydrogen nuclei. When fast moving neutrons collide against them, neutrons almost come to rest. Such substances used for slowing down the neutrons are called ***moderator.***

2. The neutrons produced in the U^{235} block leak from the block, if the size of the block is smaller than the ***critical size.***

The U^{235} block is said to be of critical size, if the number of neutrons lost per second is just equal to the number of neutrons produced per second in the block.

The mass of the U^{235} block of critical size is called ***critical mass.*** Some neutrons are also lost due to their absorption by the impurities present in the U^{235} block.

So that the fission reaction proceeds smoothly, the number of neutrons produced per second should be greater than the number of neutrons lost per second from the block. It is achieved by having U^{235} block of size bigger than the critical size. The loss of neutrons from the U^{235} block is also minimised by providing a layer of non-fissionable material over the U^{235} block. In fact, whether a chain reaction will remain steady or accelerate or retard is determined by a factor, called ***neutron reproduction factor (k).***

Neutron reproduction factor is defined as the ratio of the rate of production of neutrons to the rate of loss of neutrons. Thus,

$$k = \frac{\text{rate of production of neutrons}}{\text{rate of loss of neutrons}} \qquad ...(3.01)$$

A fission reaction will be steady, in case $k = 1$. In case $k > 1$, the fission reaction will accelerate and it will retard, in case $k < 1$.

3.07. NUCLEAR REACTOR

A nuclear reactor is a device in which nuclear fission can be carried out through a sustained and a controlled chain reaction. It is also called an atomic pile. By making use of uranium as fuel, the products such as neutrons (useful for causing fission of uranium), radioisotopes and heat energy (to run turbines) are produced.

Construction. A nuclear reactor consists of thick blocks of carbon surrounded by thick absorbing walls of concrete as shown in Fig. 3.04. The other parts of the nuclear reactor are as explained below :

Watch out !

99·3% of uranium is the isotope U^{238} ; only 0·7% of mixed uranium is of the isotope U^{235} which provides the power in a normal fission reactor !

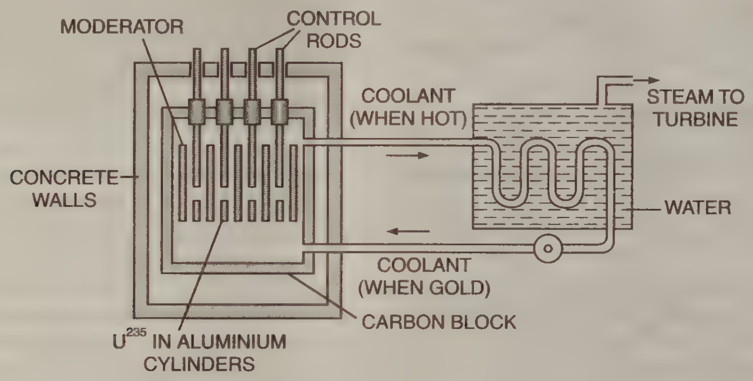

Fig. 3.04

1. ***Nuclear fuel.*** The fissionable material used in the reactor is called nuclear fuel. It generally consists of ${}_{92}U^{235}$ sealed in aluminium cylinders. These cylinders are inserted in the holes drilled in the carbon blocks.

2. ***Moderator.*** The material used to slow down the fast moving neutrons produced as a result of nuclear fission is called moderator. The neutrons released in the fission of uranium possess energy of the order of 2 MeV. Moderator reduces their energy to 0·0235 eV, which corresponds to the thermal motion of the neutron. For this reason, the neutrons slowed down to the energy of 0·0235 eV are called ***thermal neutrons.*** In a nuclear reactor, the moderator is either graphite (carbon) or water or heavy water (deuterium oxide).

The Apsra reactor at Bhabha Atomic Research Centre, Trombay uses water as moderator. It was commissioned in the year 1956. It is a swimming pool type nuclear reactor. It has rendered a great service in the field of genetic studies in agricultural crops. The nuclear reactors at Tarapur, Kalpakkam, Kota and Narora are used for power production and in these reactors, heavy water is used as moderator.

3. ***Control rods.*** The materials that can absorb the neutrons are used to control the nuclear chain reaction. Cadmium* or boron rods are used for this purpose. They can be moved in or out of the holes drilled in the carbon blocks. When the control rods are completely pushed into the carbon blocks, they absorb the neutrons to such an extent that the chain reaction comes to a halt. As the rods are slowly withdrawn, the chain reaction proceeds and more we withdraw the rods, stronger is the intensity of the chain reaction.

4. ***Coolant.*** The material used to absorb the heat generated as a consequence of chain reaction is called coolant. The coolant releases the heat energy to the water and the water is thus converted into super heated steam, which is used to run the turbines. These turbines in turn are used to operate the machines, say electric

---

*Cadmium has high cross-section for neutron absorption.

generator. Liquid sodium may also be used as coolant. Sometimes heavy water is used as coolant.

5. ***Protective shield.*** To prevent the spreading of the radioactive effect to the space around the nuclear reactor, it is enclosed in thick concrete walls called protective shield. The protective shield may be 10 m thick.

Working. A single slow neutron causes the fission of ${}_{92}U^{235}$ nucleus, with the release of 200 MeV energy and three fast neutrons. The cadmium rods partially absorb the neutrons and the moderator slows down the remaining neutrons. The slow neutrons carry out the fission of other ${}_{92}U^{235}$ nuclei and so on. In order to step up the reaction, the cadmium rods are slowly withdrawn, while to step down the reaction, the cadmium rods are slowly introduced. In addition to control rods, the reactors are provided with safety rods. For the fair functioning of a nuclear reactor, its k-factor is kept close to unity by moving the cadmium rods in or out.

The k-factor is defined as *the ratio of the number of fissions produced by a given generation of neutrons to the number of fissions of the preceeding generation of neutrons.* It is also called ***reproduction factor.***

Key point

Fission powers nuclear power stations.

Uses. 1. Nuclear reactors are used in electric power generation.

2. They are used to produce radioactive isotopes for their use in medical science, agriculture and industry.

3. They are also used to produce neutron beams of very high intensity for their use in nuclear research.

3.08. NUCLEAR FUSION

When two or more than two light nuclei fuse together to form heavy nucleus with the liberation of energy, the process is called nuclear fusion. For example, two deutrons can fuse together to form a helium nucleus releasing 24 MeV of energy. The fusion reaction may be expressed as below :

$$ {}_1H^2 + {}_1H^2 \longrightarrow {}_2He^4 + 24 \text{ MeV} $$

Key point

Fusion is sticking together of two light nuclei.

The above nuclear fusion reaction is energetically possible, only if the mass of the ${}_2He^4$ nucleus is less than the sum of the masses of the two deutron nuclei. The difference in the initial mass and the final mass of the product nuclei is liberated as the energy of fusion reaction. It may be pointed out that the fusion of two light nuclei takes place in an attempt to achieve greater stability. It is because, the high value of the binding energy per nucleon is one of the factors responsible for the greater stability of a nucleus. It follows from the binding energy curve that in the low mass number region, the binding energy per nucleon increases with the mass number. When two lighter nuclei fuse together to form a heavier nucleus, the net mass defect and hence the binding energy of the nucleus so formed will be more.

To carry out the fusion of two nuclei, they must be brought so much close to each other that they overcome the electrostatic repulsion and come within the attractive range of the nuclear forces. This is possible only, when they approach each other with kinetic energy of the order of 0·1 MeV or more. This is best obtained by raising the temperature of the two nuclei to about 10^7 K. At this temperature, the thermal motion of the atoms is with kinetic energy of the order of 0·1 MeV. For this reason, nuclear fusion reaction is also termed as ***thermonuclear reaction***.

Temperature of the order of 10^7 K is very difficult to obtain. However, this can be triggered by atomic explosion involving fission. Once the fusion begins, the energy liberated can maintain the minimum required temperature and the fusion continues. The thermonuclear fusion is thought to be the source of energy in the sun and the stars.

We have already seen that the fission of one ${}_{92}U^{235}$ nucleus releases 200 MeV of energy. Thus, the energy liberated in the above mentioned fusion reaction is smaller (24 MeV) than that released in case of U^{235} fission reaction. However, if we work out the energy released for same mass in the two cases, we find that the energy released in the fusion reaction is about seven times as large as in fission reaction.

3.09. STELLAR ENERGY (ENERGY GENERATION IN THE SUN AND STARS)

The sun radiates energy at a tremendous rate of 4×10^{16} J s^{-1}. The stars are also radiating a huge amount of energy. Further, they have been radiating energy for several billions of years. It has been estimated that the chemical processes like burning or nuclear fission cannot account for such a large burst of radiation for several billions of years. Whereas no known chemical process can be source of such

Key point

Fusion powers the sun and the stars.

a large amount of energy, possibility of fission as the cause of this energy is ruled out on the basis of the fact that sun does not have the required abundance of heavy nuclei of fissionable matter. On the other hand, about 90% of the mass of the sun consists of hydrogen and helium.

Thus, we conclude that thermonuclear reactions are the main source of energy in the sun as well as in the stars. Two types of cyclic processes are proposed to be occurring in the sun and the stars as explained below :

1. Carbon nitrogen cycle. The process was proposed by Bethe in 1938. A proton reacts with carbon-12 producing nitrogen-13 and releasing energy. The nitrogen-13 is unstable and emits a positron producing carbon-13, which further reacts with a proton, producing nitrogen-14 and releasing energy. The nitrogen-14 further reacts with a proton producing oxygen-15 and energy. The oxygen-15 is unstable, which emits a positron and some energy converting itself into nitrogen-15. The nitrogen-15 again reacts with a proton producing carbon-12 and helium. Here, carbon acts as a nuclear catalytic agent. The process can be symbolically represented as follows :

$$\begin{array}{rcl}
{}_1H^1 + {}_6C^{12} & \longrightarrow & {}_7N^{13} + Q_1 \\
{}_7N^{13} & \longrightarrow & {}_6C^{13} + {}_1e^0 \\
{}_1H^1 + {}_6C^{13} & \longrightarrow & {}_7N^{13} + Q_2 \\
{}_1H^1 + {}_7N^{14} & \longrightarrow & {}_8O^{15} + Q_3 \\
{}_8O^{15} & \longrightarrow & {}_7N^{15} + {}_1e^0 + Q_4 \\
{}_1H^1 + {}_7N^{15} & \longrightarrow & {}_6C^{12} + {}_2He^4
\end{array}$$

All the above nuclear reactions, when summed up, give the following net nuclear reaction :

$$4\,{}_1H^1 \longrightarrow {}_2He^4 + 2\,{}_1e^0 + Q$$

i.e. four protons combine together to yield helium and two positrons along with the release of 24·7 MeV of energy (Q). The carbon atom with which the reaction commenced, is returned at the end of the complete cycle. In other words, it acts merely as a catalytic agent.

2. Proton-proton cycle. Another nuclear fusion cyclic process, which can account for the release of same amount of energy is as below :

$$\begin{array}{rcl}
{}_1H^1 + {}_1H^1 & \longrightarrow & {}_1H^2 + {}_1e^0 + Q_1 \\
{}_1H^1 + {}_1H^2 & \longrightarrow & {}_2He^3 + Q_2 \\
{}_1H^1 + {}_2He^3 & \longrightarrow & {}_2He^4 + {}_1e^0 + Q_3,
\end{array}$$

These nuclear reactions can be summed up as

$$4\,{}_1H^1 \longrightarrow {}_2He^4 + 2\,{}_1e^0 + Q$$

The net reaction and the release of energy Q = 24·7 MeV are same in two cases. It is found that the carbon-nitrogen cycle occurs at rather late stage in the life of a star. The proton-proton cycle takes place at comparatively low temperatures and the carbon-nitrogen cycle takes place at predominantly high temperatures. However, in the interior of our sun, the temperature is of the order of 2×10^6 K, at which both of the above mentioned processes are equally probable. Stars having temperature more than that of the sun obtain their energy from carbon-nitrogen cycle and those at lower temperature from proton-proton cycle.

3.10. RADIATION HAZARDS

Radioactive elements and radioisotopes are continuously emitting radiations in the form of α, β and γ–rays. The exposure of skin to X-rays causes severe burns. But a person exposed to radiations like α, β and γ–rays may get damaged to an extent which may ultimately lead to his death and yet he may not be aware of the damage. Madame Curie and Enrico Fermi lost their lives, because of the damage caused by these radiations.

When the radiation such as β-ray enters a living system, the cells and tissues get damaged due to interaction with radiation. The damaged cells and tissues hamper the normal functioning of the living system leading ultimately to the death of the organism. The experiments conducted on persons (already suffering from radiation hazards) reveal that the following types of damages can be caused by the radiations.

1. The exposure to radiation induces deleterious genetic effects.
2. The strong α-ray exposure can cause lung cancer.
3. The exposure to fast and slow neutrons can cause blindness.

4. The exposure to neutrons, protons and α-particles can cause damage to red blood cells.
5. The exposure to α-particles can cause disastrous effects.
6. The strong exposures to protons and neutrons can cause serious damage to productive organs.

Safety measures from radiation hazards. Following precautions are observed y the workers engaged in this field :

1. The radioisotopes are transferred in thick walled lead containers and are kept in rooms with thick walls of lead.
2. The radioisotopes are handled with the help of remote control devices.
3. The workers are asked to wear lead aprons.
4. The radioactive contamination of the work area is avoided at all costs.

3.11. NUCLEAR HOLOCAUST

The energy released on the fission of one U^{235} nucleus is about 200 MeV or $200 \times 1{\cdot}6 \times 10^{-13}$ J. Therefore, energy released, when say 50 kg of U^{235} undergoes ission will be

$$Q = 200 \times 1{\cdot}6 \times 10^{-13} \text{ number of } U^{235} \text{ nuclei in 50 kg}$$

$$= 200 \times 1{\cdot}6 \times 10^{-13} \times \frac{50 \times 6{\cdot}025 \times 10^{26}}{235} \approx 4 \times 10^{15} \text{ J}$$

The same amount of energy can be made available from 20,000 tons of TNT. This simple comparison reveals that nuclear fission is a great source of energy and if 50 kg of U235 in made to undergo fission, it will result in a super explosion. In fact, in 1945, USA dropped an atom bomb (fission bomb) on Hiroshima, (Japan) which produced an explosion equivalent to 20,000 tons of TNT. The radioactive fallout immediately engulfed 10 km² of the city and more than 67% of the structure of the city was destroyed and about 1,35,000 people were either killed or injured.

The fusion bombs are still more devastating. A super explosion of 10^7 tons of TNT was first tested in 1954 by causing the fusion of deuterium and tritium (isotopes of hydrogen).

It is estimated that superpowers have so much of nuclear weapons in their store, which are sufficient to destroy several times the every type of life on the earth. Such a nuclear holocaust will not only destroy the existing life, but the radioactive fallout on this account will render the earth unfit for life for all times.

SOLVED NUMERICAL PROBLEMS

Type A. On Nuclear Reactions

Problem 3.01. Complete the following nuclear reactions :

(*i*) $_{13}Al^{27} + {}_0n^1 \longrightarrow ? + {}_2He^4$

(*ii*) $_{15}P^{31} + \gamma \longrightarrow ? + {}_0n^1$

(*iii*) $_9F^{19} + {}_1H^1 \longrightarrow {}_8O^{16} + ?$

Sol. (*i*) $_{13}Al^{27} + {}_0n^1 \longrightarrow ? + {}_2He^4$

Let the residual nucleus be $_ZY^A$.

Then, $A = (27 + 1) - 4 = 24$

and $Z = (13 + 0) - 2 = 11$

Therefore, residual nucleus is $_{11}Na^{24}$ and the complete nuclear reaction is

$$_{13}Al^{27} + {}_0n^1 \longrightarrow {}_{11}Na^{24} + {}_2He^4$$

(*ii*) $_{15}P^{31} + \gamma \longrightarrow ? + {}_0n^1$

Let the residual nucleus be $_ZY^A$.

Then, $A = (31 + 0) - 1 = 30$

and $Z = (15 + 0) - 0 = 15$

Therefore, residual nucleus is $_{15}P^{30}$ and the complete nuclear reaction is

$$_{15}P^{31} + \gamma \longrightarrow {}_{15}P^{30} + {}_0n^1$$

(*iii*) $_9F^{19} + {}_1H^1 \longrightarrow {}_8O^{16} + ?$

Let the outgoing particle be $_ZO^A$.

Then, $A = (19 + 1) - 16 = 4$

and $Z = (9 + 1) - 8 = 2$

Therefore, outgoing particle is $_2He^4$ (α-particle) and the complete nuclear reaction is

$$_9F^{19} + {}_1H^1 \longrightarrow {}_8O^{16} + {}_2He^4$$

Problem 3.02. Write down the nuclear reaction equation :

(*a*) When neutrons bombard $_{16}S^{32}$ nuclei, radioactive phosphorus $_{15}P^{32}$ is produced.

(*b*) When $_{24}Si^{28}$ nuclei are bombarded by neutrons, protons issue out from the target.

Sol. (*a*) Let the outgoing particle be $_ZO^A$.

Then, nuclear reaction becomes

$$_{16}S^{32} + {}_0n^1 \longrightarrow {}_{15}P^{32} + {}_ZO^A$$

Now, $A = (32 + 1) - 32 = 1$

and $Z = (16 + 0) - 15 = 1$

Therefore, the outgoing particle is $_1H^1$ (proton) and the complete nuclear reaction is

$$_{14}S^{32} + {}_0n^1 \longrightarrow {}_{15}P^{32} + {}_1H^1$$

(*b*) Let the residual nucleus be $_ZY^A$. Then, nuclear reaction becomes $_{16}Si^{28} + {}_0n^1 \longrightarrow {}_ZY^A + {}_1H^1$

Now, $A = (28 + 1) - 1 = 28$

and $Z = (14 + 0) - 1 = 13$

Therefore, the residual nucleus is $_{13}Al^{28}$. The complete nuclear reaction is

$$_{14}Si^{28} + {}_0n^1 \longrightarrow {}_{13}Al^{28} + {}_1H^1$$

Type B. On Q-value of a Nuclear reaction

Problem 3.03. Calculate the energy released in the reaction :

$$_3Li^6 + {}_0n^1 \longrightarrow {}_2He^4 + {}_1H^3$$

Given that mass of $_3Li^6$ = 6·015126 a.m.u. ; mass of $_2He^4$ = 4·002603 a.m.u. mass of $_1H^3$ = 3·016049 a.m.u. ; mass of $_0n^1$ = 1·008665 a.m.u. and 1 a.m.u. = 931 MeV.

(*C.B.S.E. 2002*)

Sol. The nuclear reaction is

$$_3Li^6 + {}_0n^1 \longrightarrow {}_2He^4 + {}_1H^3$$

Total mass of reactants ($_3Li^6$ and $_0n^1$) = 6·015126 + 1·008665 = 7·023791 a.m.u.

Total mass of products ($_2He^4$ and $_1H^3$) = 4·002603 + 3·016049 = 7·018652 a.m.u.

Decrease in mass = 7·023791 – 7·018652 = 0·005139 a.m.u.

Therefore, energy released = 0·005139 × 931 = **4·78 MeV**

Type C. On Nuclear fission

Problem. 3.04. How much U^{235} is consumed in a day in an atomic power house operating at 400 MW, provided the whole of the mass of U^{235} is converted into energy ?

(*P.S.S.C.E. 1998 S*)

Sol. Here, rate of production of energy at atomic power house,

$$P = 400 \text{ MW} = 400 \times 10^6 \text{ J s}^{-1}$$

Therefore, total energy produced in a day *i.e.* 24 × 60 × 60 s,

$$E = P \times 24 \times 60 \times 60 = 400 \times 10^6 \times 24 \times 60 \times 60$$
$$= 3\cdot456 \times 10^{13} \text{ J}$$

If mass of U^{235} consumed per day is *m* (kg) so as to produce the required amount of energy, then

$$E = m\,c^2$$

or $3\cdot456 \times 10^{13} = m\,c^2$

or $$m = \frac{3\cdot456\times10^{13}}{c^2} = \frac{3\cdot456\times10^{13}}{(3\times10^8)^2}$$

$$= 0\cdot384\times10^{-3} \text{ kg} = 0\cdot384 \text{ g}$$

Problem 3.05. The energy released by fission of one U^{235} atom is 200 MeV. Calculate the energy released in kWh, when 1 gram of U^{235} undergoes fission.

Sol. Now, number of atoms in 1 g of U^{235}

$$= \frac{\text{Avogadro number}}{\text{atomic weight}} = \frac{6\cdot023\times10^{23}}{235}$$

Energy released per fission = 200 MeV

Therefore, energy released on fission of 1 g of U^{235}

$$= \frac{6\cdot023\times10^{23}\times200}{235} = 5\cdot126\times10^{23} \text{ MeV}$$

$$= 5\cdot126 \times 10^{23} \times 1\cdot6 \times 10^{-13} \text{ J} = 8\cdot2 \times 10^{10} \text{ W s}$$

$$(\because 1 \text{ J} = 1 \text{ W s})$$

$$= \frac{8\cdot2\times10^{10}}{1000} = 8\cdot2\times10^7 \text{ kW s}$$

$$= \frac{8\cdot2\times10^7}{3600} = \mathbf{2\cdot278 \times 10^4 \text{ kW h}}$$

Problem 3.06. It is estimated that the energy released in the atomic bomb explosion at Hiroshima was 7·6 × 10^{13} J. If on the average 200 MeV energy was released on fission of one $_{92}U^{235}$ atom, calculate (*i*) the number of uranium atoms fissioned, (*ii*) the mass of uranium used for the bomb.

Sol. Here, total energy released, E = 7·6 × 10^{13} J

Energy released per fission = 200 MeV = 200 × 1·6 × 10^{-13}

$$= 3\cdot2 \times 10^{-11} \text{ J}$$

(*i*) Number of U^{235} atoms fissioned,

$$n = \frac{7\cdot6\times10^{13}}{3\cdot2\times10^{-11}} = 2\cdot375 \times 10^{24}$$

(*ii*) Mass of U^{235} used $= \frac{235}{\text{Avogadro number}} \times n$

$$= \frac{235\times2\cdot375\times10^{24}}{6\cdot023\times10^{23}} = \mathbf{926\cdot66 \text{ g}}$$

Problem 3.07. A slow neutron strikes a nucleus of $_{92}U^{235}$ splitting it into lighter nuclei of barium and krypton and releasing three neutrons. Write the corresponding nuclear reaction. Also calculate the energy released in this reaction. Given, $m(_{92}U^{235})$ = 235·043933 a.m.u., $m(_0n^1)$ = 1·008665 a.m.u., $m(_{56}Ba^{141})$ = 140·917700 a.m.u. $m(_{36}Kr^{92})$ = 91·895400 a.m.u.

(*C.B.S.E. 1995*)

Sol. The nuclear reaction can be represented as

$$_{92}U^{235} + {}_0n^1 \longrightarrow {}_{56}Ba^{141} + {}_{36}Kr^{92} + 3\,{}_0n^1 + Q$$

If $m_N(_{92}U^{235})$, $m_N(_{56}Ba^{141})$, $m_N(_{36}Kr^{92})$ represent masses of $_{92}U^{235}$, $_{56}Ba^{141}$ and $_{36}Kr^{92}$ nuclei respectively and $m(_0n^1)$, the mass of neutron, then energy released is given by

$$Q = [m_N(_{92}U^{235}) + m(_0n^1) - m_N(_{56}Ba^{141}) - m_N(_{36}Kr^{92}) - 3\,m(_0n^1)] \times 931\cdot5$$

$$= [m_N(_{92}U^{235}) - m_N(_{56}Ba^{141}) - m_N(_{36}Kr^{92}) - 2\,m(_0n^1)] \times 931\cdot5 \quad ...(i)$$

If $m(_{92}U^{235})$, $m(_{56}Ba^{141})$ and $m(_{36}Kr^{92})$ represent masses of $_{92}U^{235}$, $_{56}Ba^{141}$ and $_{36}Kr^{92}$ atoms respectively, then equation (*i*) may be expressed as

$$Q = [\{m(_{92}U^{235}) - 92m_e\} - \{m(_{56}Ba^{141}) - 56m_e\} - \{m(_{36}Kr^{92}) - 36\,m_e\} - 2\,m(_0n^1)] \times 931\cdot5$$

$$= [m(_{92}U^{235}) - m(_{56}Ba^{141}) - m(_{36}Kr^{92}) - 2\,m(_0n^1)] \times 931\cdot5$$

$$= [235\cdot043933 - 140\cdot917700 - 91\cdot895400 - 2 \times 1\cdot008665] \times 931\cdot5 = 0\cdot2135 \times 931\cdot5$$

$$= \mathbf{198\cdot88 \text{ MeV}}$$

Note. It is not mentioned in the problem as to whether the given masses are atomic masses or nuclear masses. In case, the given masses are nuclear masses, the solution is quite simple. The problem has been solved by considering the given masses as atomic masses.

Type D. On Nuclear fusion

Problem 3.08. Assuming that four protons combine to form a helium nucleus and two positrons each of mass 0·000549 a.m.u., calculate the energy released. Given, mass of $_1H^1$ = 1· 007825 a.m.u. and mass of $_2He^4$ = 4·002603 a.m.u.

Sol. The nuclear fusion reaction can be written as :

$$_1H^1 + {}_1H^1 + {}_1H^1 + {}_1H^1 \longrightarrow {}_2He^4 + 2\,{}_1e^0 + Q$$

If $m_N(_1H^1)$ and $m_N(_2He^4)$ represent the masses of $_1H^1$ and $_2He^4$ nuclei respectively, then

$$Q = [4\,m_N(_1H^1) - m_N(_2He^4) - 2\,m_e] \times 931\cdot5 \text{ MeV} \quad ...(i)$$

Here, m_e represents the mass of the positron ($_1e^0$).

Here, $m_N(_1H^1)$ = 1·007825 a.m.u. ;

$m_N(_2He^4)$ 4·002603 a.m.u. ; m_e = 0·000549 a.m.u.

Substituting for $m_N({}_1He^1)$, $m_N({}_2He^4)$ and m_e in equation
we have

$$Q = [4 \times 1{\cdot}007825 - 4{\cdot}002603 - 2 \times 0{\cdot}000549] \times 931{\cdot}5$$
$$= 0{\cdot}027599 \times 931{\cdot}5 = \mathbf{25{\cdot}71\ MeV}$$

Problem 3.09. Bombardment of lithium with protons es rise to the following reaction :

$${}_3Li^7 + {}_1H^1 \longrightarrow {}_2He^4 + {}_2He^4 + \text{energy}$$

The atomic masses of lithium, hydrogen and helium 7·016 a.m.u., 1·008 a.m.u. and 4·004 a.m.u. respectively. d the initial energy of each α-particle. Given, 1 a.m.u. 31 MeV. *(I.S.C.E. 1995)*

Sol. If $m_N({}_3Li^7)$, $m_N({}_1Li^1)$ and $m_N({}_2He^4)$ are masses of ^{7}, ${}_1H^1$ and ${}_2He^4$ nuclei respectively, then Q-value of the reaction is given by

$$Q = [m_N({}_3Li^7) + m_N({}_1H^1) - 2\,m_N({}_2He^4)] \times 931$$

If $m\,({}_3Li^7)$, $m\,({}_1H^1)$ and $m\,({}_2He^4)$ are atomic masses of lithium, hydrogen and helium and m_e, the mass of an electron, then

$$Q = [\{m({}_3Li^7) - 3\,m_e\} + \{m({}_1H^1) - m_e\} - 2\,\{m({}_2He^4) - 2\,m_e\}] \times 931$$
$$= [m({}_3Li^7) + m({}_1H^1) - 2\,m({}_2He^4)\,] \times 931$$

Here, $m({}_3Li^7) = 7{\cdot}016$ a.m.u. ; $m({}_1H^1) = 1{\cdot}008$ a.m.u. ;
$m({}_2He^4) = 4{\cdot}004$ a.m.u.

Also, 1 a.m.u. = 931 MeV

$$\therefore \quad Q = [7{\cdot}016 + 1{\cdot}008 - 2 \times 4{\cdot}004] \times 931$$
$$= 0{\cdot}016 \times 931 = \mathbf{14{\cdot}896\ MeV}$$

abc TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 3.10. Consider one of the fission reactions of U^{235} by thermal neutrons :

$${}_{92}U^{235} + {}_0n^1 \longrightarrow {}_{38}Sr^{94} + {}_{54}Xe^{140} + 2\,{}_0n^1$$

e fission fragments are, however, not stable. They dergo successive β-decays, until ${}_{38}Sr^{94}$ becomes ${}_{40}Zr^{94}$ d ${}_{54}Xe^{140}$ becomes ${}_{58}Ce^{140}$. Estimate the total energy eased in the process. Is all that energy available as etic energy of the fission products (Zr and Ce) ? u are given that : mass of U^{235} atom = 235·0439 a.m.u. ; ass of neutron, m_n = 1·00866 a.m.u. ; mass of Zr^{94} atom = 9065 a.m.u. ; mass of Ce^{140} atom = 139·9055 a.m.u. *(Text Problem)*

Sol. The ultimate fission of ${}_{92}U^{235}$ may be represented

$${}_{92}U^{235} + {}_0n^1 \longrightarrow {}_{40}Zr^{94} + {}_{58}Ce^{140} + 6\,{}_1e^0 + 2\,{}_0n^1 + Q$$

If $m_N({}_{92}U^{235})$, $m_N({}_{40}Zr^{94})$ and $m_N({}_{58}Ce^{140})$ represent clear masses, then

$$Q = [\{m_N({}_{92}U^{235}) + m_n\} - \{m_N({}_{40}Zr^{94}) - m_N({}_{58}Ce^{140}) + 6\,m_e + 2\,m_n\}] \times 931{\cdot}5$$

$$\text{or } Q = [m_N({}_{92}U^{235}) + m_N({}_{40}Zr^{94}) - m_N({}_{58}Ce^{140}) - 6\,m_e - m_n] \times 931{\cdot}5 \quad ...(i)$$

Here, instead of nuclear masses, the mass of ${}_{92}U^{235}$, Zr^{94} and ${}_{58}Ce^{140}$, atoms have been given.

Therefore, nuclear masses of ${}_{92}U^{235}$, ${}_{40}Zr^{94}$ and ${}_{58}Ce^{140}$ oms may be found by subtracting mass of 92 electrons, electrons and 58 electrons respectively from their atomic asses.

If $m({}_{92}U^{235})$, $m({}_{40}Zr^{94})$ and $m({}_{58}Ce^{140})$ represent atomic asses, then equation (*i*) may be expressed as

$$Q = [\{m({}_{92}U^{235}) - 92\,m_e\} - \{m({}_{40}Zr^{94}) - 40\,m_e\} - \{m({}_{58}Ce^{140}) - 58\,m_e\} - 6\,m_e - m_n] \times 931{\cdot}5$$
$$= [m({}_{92}U^{235}) - m({}_{40}Zr^{94}) - m({}_{58}Ce^{140}) - m_n] \times 931{\cdot}5$$
$$= [235{\cdot}0439 - 93{\cdot}9065 - 139{\cdot}9055 - 1{\cdot}00866] \times 931{\cdot}5$$
$$= 0{\cdot}22324 \times 931{\cdot}5 = \mathbf{207{\cdot}95\ MeV}$$

All the available energy does not appear as the kinetic nergy of fission products. It is partly carried by neutrons and ectrons produced.

Problem 3.11. Consider the so called D-T reaction (deuterium-tritium fusion reaction), which may be the basic reaction of a future thermonuclear fusion reactor :

$${}_1H^2 + {}_1H^3 \longrightarrow {}_2He^4 + {}_0n^1$$

(*a*) Determine the amount of energy in MeV released in the reaction from the data :

mass of ${}_1H^2$ atom = 2·014102 a.m.u. ; mass of ${}_1H^3$ atom = 3·016049 a.m.u. ; mass of ${}_2He^4$ atom = 4·002603 a.m.u. ; mass of neutron, m_n = 1·008665 a.m.u.

(*b*) Consider the radius of both deuterium and tritium to be approximately 1·5 × 10^{-15} m. What is the kinetic energy needed to overcome coulomb repulsion ? To what temperature must the gases be heated to initiate the reaction ? *(Text Problem)*

Sol. (*a*) The D-T reaction is

$${}_1H^2 + {}_1H^3 \longrightarrow {}_2He^4 + {}_0n^1 + Q$$

If $m_N({}_1H^2)$, $m_N({}_1H^3)$ and $m_N({}_2He^4)$ represent nuclear masses, then

$$Q = [m_N({}_1H^2) + m_N({}_1H^3) - m_N({}_2He^4) - m_n] \times 931{\cdot}5 \text{ MeV} \quad ...(i)$$

Here, instead of nuclear masses, the masses of ${}_1H^2$, ${}_1H^3$ and ${}_2He^4$ atoms have been given. Therefore, nuclear masses of ${}_1H^2$, ${}_1H^3$ and ${}_2He^4$ atoms may be found by subtracting mass of 1 electron, 1 electron and 2 electrons respectively from their atomic masses.

If $m({}_1H^2)$, $m({}_1H^3)$ and $m({}_2He^4)$ represent atomic masses, then equation (*i*) may be expressed as

$$Q = [\{m({}_1H^2) - m_e\} + \{m({}_1H^3) - m_e\} - \{m({}_2He^4) - 2m_e\} - m_n] \times 931{\cdot}5$$
$$= [m({}_1H^2) + m({}_1H^2) - m({}_2He^4) - m_n] \times 931{\cdot}5$$
$$= [2{\cdot}014102 + 3{\cdot}016049 - 4{\cdot}002603 - 1{\cdot}008665] \times 931{\cdot}5$$
$$= 0{\cdot}018883 \times 931{\cdot}5 = \mathbf{17{\cdot}59\ MeV}$$

(*b*) The P.E. of the D-T system, when the two nuclei almost come in contact with each other is given by

$$P.E. = \frac{1}{4\pi\varepsilon_0} \cdot \frac{q_1\,q_2}{r}$$

Here, $q_1 = 1{\cdot}6 \times 10^{-19}$ C (charge on deutrium nucleus)
$q_2 = 1{\cdot}6 \times 10^{-19}$ C (charge on tritium nucleus)
$r = 2 \times 1{\cdot}5 \times 10^{-15}$
(sum of the radii of two nuclei)

$$\text{Therefore, P.E.} = 9 \times 10^9 \times \frac{(1{\cdot}6 \times 10^{-19})^2}{2 \times 1{\cdot}5 \times 10^{-15}}$$
$$= 7{\cdot}68 \times 10^{-14}\ J$$

The kinetic energy needed to overcome Coulomb's repulsion is equal to the potential energy.

Therefore, the required kinetic energy = 7·68 × 10^{-14} J

At temperature T, the system will possess kinetic energy equal to $\frac{3}{2}$ k T, where k is Boltzmann's constant.

Therefore, required temperature is given by

$$\frac{3}{2}kT = 7\cdot68\times10^{-14}\,\text{J}$$

or $$T = \frac{2}{3}\times\frac{7\cdot68\times10^{-14}}{k} = \frac{2\times7\cdot68\times10^{-14}}{3\times1\cdot38\times10^{-23}}$$

$$= 3\cdot71\times10^{9}\,\text{K}$$

FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 3.01. In the nuclear decay reaction

$$_1H^1 \longrightarrow {}_0n^1 + {}_QX^P,$$ (*I.S.C.E. 1995*)

find P, Q and hence identify X.

Ans. Now, $P + 1 = 1$ or $P = 0$

Also, $Q + 0 = 1$ or $Q = 1$

Therefore, $_QX^P$ is positron ($_1e^0$).

Q. 3.02. U^{238} has atomic mass number of 92. It decays by emitting an alpha particle to form an isotope of thorium (Th). Write down an equation to represent this. (*I.S.C.E. 1997*)

Ans. $_{92}U^{238} \longrightarrow {}_{90}Th^{234} + {}_2He^4$

Q. 3.03. Complete the following nuclear reaction :

$$_5B^{10} + (?) \longrightarrow {}_3Li^7 + {}_2He^4$$ (*H.P.S.S.C.E. 1998 S*)

Ans. Let $_ZX^A$ be the unknown bombarding particle.

Now, $5 + Z = 3 + 2$ or $Z = 0$

Also, $10 + A = 7 + 4$ or $A = 1$

Therefore, the unknown bombarding particle is $_0n^1$ **(neutron).**

Q. 3.04. When $_3Li^7$ is bombarded with a certain particle, two alpha aprticles are produced. Identify the bombarding particle. (*I.S.C.E. 1998*)

Ans. Let $_ZX^A$ be unknown particle. Then,

$$_3Li^7 + {}_ZX^A \longrightarrow {}_2He^4 + {}_2He^4$$

By proceeding as in VSQ 3.01 or 3.02, it follows that the unknown particle is $_1H^1$ **(proton).**

Q. 3.05. What do you mean by Q-value of a nuclear reaction ? (*P.S.S.C.E. 2002, 2000, 1999*)

Ans. Q-value of a nuclear reaction is equal to the energy equivalent of the difference in masses of the reacting nuclei and the product nuclei. Mathematically,

$$Q = [\text{mass of reacting nuclei} - \text{mass of product nuclei}] \times 931\text{ MeV}$$

Q. 3.06. What do you mean by fissile material ?

Ans. The material which can undergo nuclear fission easily is called fissile material.

Q. 3.07. What do you mean by transuranic elements ?

Ans. The elements having atomic number greater than that of uranium *i.e.* 92 are called transuranic elements.

Q. 3.08. What is the condition for a nuclear fission reaction to act as a real source of energy ?

Ans. It should be a sustained chain reaction.

Q. 3.09. What is a nuclear chain reaction ?

Ans. A nuclear reaction in which the projectile used to carry out the nuclear fission reaction gets multiplied as more and more such fission reactions take place, is called a nuclear chain reaction.

Q. 3.10. A chain reaction dies out. State the reasons, why this could happen.

Ans. A nuclear chain reaction dies out, when the neutrons produced are so fast that they escape the uranium block without interacting or when the neutrons are lost du to the extremely small size of the block.

Q. 3.11. Define critical mass for nuclear chain reactio (*P.S.S.C.E. 2002, 2000, 199*

Ans. Refer to section 3.06.

Q. 3.12. What are the essential parts of a nuclea reactor ? (*Pre-degree Kerala, 1991*

Ans. Nuclear fuel, moderator, control rods, protectiv shield and the coolant.

Q. 3.13. Why is heavy water used as a moderator in nuclear reactor ? (*C.B.S.E. 2001 ; H.P.S.S.C.E. 199*

Ans. In case, the neutrons produced are fast, they ma escape the uranium block without causing fission. Whe heavy water is used, the neutrons lose energy on collisio with the water molecules, get slowed down and becom suitable for carrying out fission reaction.

Q. 3.14. Write any one equation representing nuclea fusion reaction. (*C.B.S.E. 199*

Ans. Example of fusion reaction :

$$_1H^2 + {}_1H^2 \longrightarrow {}_2He^4 + 24\text{ MeV}$$

Q. 3.15. A fusion reaction is more energetic than fission reaction. Comment.

Ans. In a nuclear fusion reaction, the energy liberate per unit mass of the nuclei taking part in the fusion reactio is many times larger than the energy liberated in a fissio reaction.

Q. 3.16. Nuclear fusion reactions are also known a thermonuclear reactions. Why ?

Ans. Refer to VSQ 3.16.

Q. 3.17. Explain one similarity and one dissimilarit between nuclear fission and fusion. (*P.S.S.C.E. 199*

Ans. Nuclear fission and fusion are similar in the sens that both are tremendous sources of energy. On the othe hand, the two processes are dissimilar in the sense that i fission, a heavy nucleus splits into two lighter fragments while in fusion, two light nuclei unite to form a heavier on

Q. 3.18. What is the source of solar energy ? (*H.P.S.S.C.E. 199*

Or

Name the principal source of the sun's energy. (*I.S.C.E. 199*

Or

Name the phenomenon by which energy is produce in a star. (*P.S.S.C.E. 1997 S*

Ans. Nuclear fusion reactions taking place in the sun.

Q. 3.19. The sun is constantly losing mass due t thermonuclear fusion. Comment.

Ans. In each fusion reaction taking place in the sun, ther is a small decrease in mass, which then appears as therma energy. For this reason, the sun is constantly losing mass du to thermonuclear fusion reactions.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS With Answers/Hints

Q. 3.01. What are nuclear reactions ? State the laws eyed by these reactions. Give one example of nuclear ction. (*P.S.S.C.E. 1999*)

Ans. Nuclear reaction. The reaction taking place inside nucleus is called a nuclear reaction.

In a nuclear reaction, following laws are obeyed :

1. Mass number is conserved. **2.** Charge number is served. **3.** Spin quantum number is conserved.

Example. $_4Be^9 + {}_2He^4 \longrightarrow {}_6C^{12} + {}_0n^1$

Q. 3.02. A neutron strikes a $_5B^{10}$ nucleus with the sub- uent emission of an alpha particle. Write the corres- nding nuclear reaction. Find the atomic number, mass mber and the chemical name of the remaining nucleus. (*C.B.S.E. 1995 S*)

Sol. Let $_ZX^A$ be the residual nucleus. Then, the nuclear ction may be expressed as

$$_0n^1 + {}_5B^{10} \longrightarrow {}_ZX^A + {}_2He^4$$

Since the nucleon number is conserved, we have

$$A + 4 = 1 + 10 \quad \text{or} \quad A = 7$$

Also, the proton number is separately conserved. There- e,

$$Z + 2 = 0 + 5 \quad \text{or} \quad Z = 3$$

The element having Z = 3 and A = 7 is **lithium (Li)**. ere-fore, the nuclear reaction may be expressed as

$$_0n^1 + {}_5B^{10} \longrightarrow {}_3Li^7 + {}_2He^4$$

Q. 3.03. What are alpha particles ? In the reaction

$$_ZX^A \longrightarrow Y + {}_2He^4,$$

give the atomic number and mass number of Y. (*H.S.S.C.E. 2002*)

Ans. Alpha particle. It is the nucleus of helium atom *i.e.* ntains two protons and two neutrons.

Atomic number of Y = Z – 2

and mass number of Y = A – 4

Q. 3.04. What is nuclear fission ? Give one represen- ive equation. (*H.S.S.C.E. 2002*)

Ans. Nuclear fission. Refer to section 3.05.

Example :

$$_{92}U^{235} + {}_0n^1 \longrightarrow {}_{56}Ba^{141} + {}_{56}Kr^{92} + 3\,{}_0n^1 + \text{energy}$$

Q. 3.05. Explain the term chain reaction with a suitable ample. (*C.B.S.E. 1992*)

Ans. Refer to section 3.06.

Q. 3.06. Uranium $_{92}U^{238}$ is not suitable for chain action. Why ? (*H.P.S.S.C.E. 2001, 1995*)

Ans. The natural uranium consists of three isotopes mely U^{233}, U^{235} and U^{238}. The three isotopes have relative undances of 0·006%, 0·714% and 99·28% respectively. The ow moving neutron having energy of the order of 0·025 eV n cause the fission of U^{235} nuclei but the fission of U^{238} clei can be carried out with fast neutrons having energy ore than 1 MeV.

The natural uranium contains practically U^{238} nuclei, as e percentage of U^{235} nuclei is very small. Therefore, when eutrons of energy even greater than 1 MeV are used to carry ut the fission of U^{238} nuclei, the secondary neutrons get owed down on colliding against U^{238} nuclei and they are longer capable of causing further fission of U^{238} nuclei. For is reason, U^{238} is not suitable for chain reaction.

Q. 3.07. What is critical size and critical mass as regards to nuclear fission ?

Ans. During nuclear fission of U^{235}, three neutrons are produced in every fission reaction. These neutrons carry out the fission of the other U^{235} nuclei in the U^{235} block. In case, the size of U^{235} block is small, a few neutron may be lost from the block without causing fission. In case, the number of neutrons lost per second is just equal to the number of neutrons produced per second, then the size of the U^{235} block is called the critical size and the corresponding mass of the block is called critical mass.

Q. 3.08. What are thermal neutrons ?
(*P.S.S.C.E. 1999 S ; H.S.S.C.E. 1999 S ; C.B.S.E. 1993*)

Ans. The neutrons which have been slowed down as a result of the collisions against the hydrogen nuclei of the moderator are called thermal neutrons. Such neutrons possess energy of about 0·025 eV, which corresponds to the energy of the neutron at room temperature $\left(\frac{3}{2}kT\right)$. Such neutrons can cause the fission of $_{92}U^{235}$ nuclei.

Q. 3.09. What is heavy water ?

Ans. Two deutron atoms and an oxygen atom combine to form heavy water. Symbollically, heavy water is represented as D_2O. In a nuclear reactor, heavy water is used as moderator to slow down the neutrons.

Q. 3.10. Explain the role played by the moderator in a nuclear reactor. (*H.P.S.S.C.E. 2000*)

Ans. In a nuclear reactor, the fast neutrons may escape. So that a sustained nuclear chain reaction can take place, neutrons are slowed down by using graphite rods or heavy water. Such materials used to slow down the neutrons are called moderator.

Q. 3.11. Why are control rods made of cadmium in a nuclear reactor ?

Ans. Cadmium can easily absorb neutrons. In a chain reaction, if all the neutrons produced are available to cause the fission of Uranium atoms, then the fission reaction may take place at an uncontrolled rate. The cadmium rods are used to absorb a suitable fraction of the neutrons produced and a controlled chain reaction is obtained.

Q. 3.12. What is the purpose of (*i*) moderator and (*ii*) controller in a nuclear reactor ? (*I.S.C.E. 1998*)

Ans. Moderator. Refer to SAQ 3.10.

Controller. Refer to SAQ 3.11.

Q. 3.13. What is neutron reproduction factor ? Explain.

Ans. Refer to section 3.06.

Q. 3.14. Name a few safety problems that a nuclear engineer must cope with in designing a nuclear reactor.

Ans. The protective shield of the nuclear reactor should be strong enough to prevent the nuclear radiation from spreading to nearby space. Further, the nuclear waste in the reactor may still contain radioisotopes capable of emitting harmful radiation. Therefore, nuclear waste should be disposed off very carefully.

Q. 3.15. What is a nuclear fusion reaction ? Why is nuclear fusion difficult to carry out ?

Ans. Nuclear fusion reaction. Refer to section 3.08.

The fusion reaction requires very high temperature ($10^6 - 10^7$ K) condition and it has to be obtained by causing explosion due to the fission process. Further, due to very high temperature, no material wall can sustain in the region, where fusion is to be carried out.

Q. 3.16. A neutron is absorbed by a $_3Li^6$ nucleus with subsequent emission of an alpha particle. Write the corresponding nuclear reaction. Calculate the energy released in this reaction.

Given that $m\ (_3Li^6)$ = 6·015126 a.m.u. ; $m\ (_2He^4)$ = 4·002604 a.m.u. ; m_n = 1·008665 a.m.u. ; $m\ (_1H^3)$ = 3·016049 a.m.u. (*C.B.S.E. 1995*)

Sol. The nuclear reaction may be expressed as

$$_0n^1 + {_3Li^6} \longrightarrow {_1H^3} + {_2He^4} + Q,$$

where Q is the energy released.

If $m_N(_3Li^6)$, $m_N(_1H^3)$ and $m_N(_2He^4)$ represent nuclear masses, then

$$Q = [m_n + m_N(_3Li^6) - m_N(_1H^3) - m_N(_2He^4)] \times 931{\cdot}5$$
$$= [m_N + \{m(_3Li^6) - 3\ m_e\} - \{m(_1H^3) - m_e\} - \{m(_2He^4) - 2\ m_e\}] \times 931{\cdot}5$$
$$= [m_n + m(_3Li^6) - m(_1H^3) - m(_2He^4)] \times 931{\cdot}5$$
$$= [1{\cdot}008665 + 6{\cdot}015126 - 3{\cdot}016049 - 4{\cdot}002604] \times 931{\cdot}5$$
$$= 4{\cdot}786 \text{ MeV}$$

Q. 3.17. Explain, why nuclear fission should precede nuclear fusion.

Ans. The nuclear fusion reactions can take place under very high temperature condition, which is very difficult to obtain, However, the fusion reaction can be triggered atomic explosion involving nuclear fission. Once the fusi begins, the energy liberated can maintain the minimu required temperature and the fusion reaction continues. It for this reason that nuclear fission should precede nucle fusion.

Q. 3.18. Differentiate between nuclear fission a fusion.

Ans. Nuclear fission and fusion have the followi points of differences :

1. In a nuclear fission reaction, a heavy nucleus splits in two lighter nuclei, whereas in a nuclear fusion reaction, tw light nuclei unite to form a heavier nucleus.

2. The energy released per nucleon is very high in ca of nuclear fusion reaction in comparison to that in nucle fusion reaction.

3. The nuclear fusion reaction can be carried out o under very high temperature condition, while in case nuclear fission reaction, there is no such requirement.

Q. 3.19. Explain the source of energy in stars.

(*P.S.S.C.E. 20*

Or

Explain the production of energy in stars.

(*P.S.S.C.E. 1997, 20*

Ans. Refer to section 3.09.

Q. 3.20. How is the enormous amount of energy in s produced ? (*Pre-degree Kerala, 19*

Ans. Refer to section 3.09.

TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 3.01. If both the number of protons and the number of neutrons are conserved in each nuclear reaction, in what way is mass converted into energy (or vice-versa) in a nuclear reaction ? (*Text Question*)

Ans. The total rest mass of protons and neutrons is same on the two sides of the nuclear reaction as their number is conserved. But the total binding energy of nuclei on the two sides need not be equal. The difference in these energies appears as the energy released or absorbed (Q-value of the reaction). Since binding energy contributes to mass, we say that the difference in the total mass of the nuclei on the two sides gets converted into energy and vice-versa.

Q. 3.02. After a series of alpha and beta decays, plutonium-239 ($_{94}Pu^{239}$) becomes lead-207 ($_{82}Pb^{207}$). How many alpha and beta particles are emitted in the complete decay scheme ? State the reason in support of your answer.

Sol. Here, parent nucleus = $_{94}Pu^{239}$

daughter nucleus = $_{82}Pb^{207}$

When α-decay takes place, mass number decreases by 4 units, while atomic number by 2 units. On the other hand, when β-decay takes place, mass number remains unchanged and atomic number increases by one unit.

Thus, mass number changes (decreases) only in α-dec

In the given decay, mass number has decreased by 2 – 207 *i.e.* 32.

Therefore, number of α-particle emitted = 32/4 = 8

Due to emission of 8 α-particles, the atomic numb should decrease by 8 × 2 = 16 *i.e.* atomic number should ha become 94 – 16 = 78. Since, atomic number of daugh nucleus is 82, the plutonium must have emitted β-particl As in a β-decay, atomic number increases by one unit, number of β-particles emitted = 82 – 78 = 4.

Q. 3.03. Why is the neutron so effective as a bo barding particle ?

Ans. If we use positively charged particles such proton, deutron or α-particle, they experience large repulsi due to atomic nuclei. On the other hand, the negativ charged particles such as electron will be repelled by electron cloud around the nucleus.

However, neutrons having no charge can penetrate target without being repelled by the atomic nucleus or electron cloud. The neutron increases the neutron to prot ratio of the nucleus and tends to make it unstable and he causes the nuclear reaction.

FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. What is a nuclear reaction ? State the conservation laws obeyed by a nuclear reaction.
2. What is a nuclear reaction ? Why do you mean by Q-value of a nuclear reaction ?
3. Explain the phenomenon of fission. Give one repres tative equation. (*H.S.S.C.E. 1998 ; C.B.S.E. 19*
4. What is nuclear fission ? What is the source of energy nuclear fission ? (*Pre-degree Kerala, 19*

5. What is nuclear fission ? Describe a chain reaction.
6. Explain fission and state what is meant by fusion. *(I.S.C.E. 1997)*
7. In a controlled thermal fission reactor, what is the function of (*i*) the moderator, (*ii*) the control rods, (*iii*) the coolant and (*iv*) the heavy water ? *(C.B.S.E. 2001 S)*
8. What is 'nuclear fission' ? Give an example to illustrate it. What is the importance of fission phenomenon ? *(H.S.S.C.E. 2002)*
9. Draw a labelled diagram of a nuclear reactor and also write the functions of each part. *(P.S.S.C.E. 2001)*
10. What is nuclear fusion ? In what sense, is it different from nuclear fission ?
11. Distinguish between nuclear fusion and nuclear fission reactions. *(P.S.S.C.E. 2002)*
12. Explain the source of energy in sun. *(C.B.S.E. 2000 ; H.P.S.S.C.E. 2000)*
13. Explain energy generation in stars. *(H.S.S.C.E. 1999 ; C.B.S.E. 1995)*
14. Explain briefly about nuclear holocaust. *(P.S.S.C.E. 2001)*

FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. Explain the principle, construction and working of a nuclear reactor. *(P.S.S.C.E. 2002)*
2. With the help of a labelled diagram, describe the construction and working of a nuclear reactor. *(H.S.S.C.E. 2001)*
3. Explain the principle involved in a nuclear reactor. Name the main components of a nuclear reactor and state the function of each component. *(H.S.S.C.E. 2001)*
4. Discuss the basic principle of a nuclear reactor as an example of controlled chain reaction. *(H.S.S.C.E. 2000)*
5. Explain the process of release of energy in a nuclear reactor. Draw a labelled diagram of a nuclear reactor and write the function of each part. *(C.B.S.E. 1997)*
6. What is nuclear fission and nuclear fusion ? Give one example, each of fission and fusion. What is the cause of fusion ? *(H.P.S.S.C.E. 1998 S)*

FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

pe A. On Nuclear reaction

1. The nucleus of a polonium atom is represented as $_{84}Po^{218}$. What do you mean by this ? Due to radioactivity, an alpha particle and two beta particles are ejected from it in succession. State the nuclear structure of the atoms formed at each stage.
   [Ans. Z = 84 and A = 218 ; $_{82}Pb^{214}$, $_{83}Bi^{214}$, $_{84}Po^{214}$]
2. An aluminium nucleus ($_{13}Al^{27}$) when bombarded by a proton, emits an α-particle and converts to the nucleus of another element. Write down the equation of this nuclear reaction. Of what element is the changed nucleus of this reaction ? What are the number of protons and that of neutrons in the changed nucleus ?
   [**Ans.** $_{13}Al^{27} + {_1H^1} \longrightarrow {_{12}Mg^{24}} + {_2He^4}$; Magnesium ; 12, 12]
3. Calculate the energy generated in kilowatt hours, when 100 g of $_3Li^7$ are converted into $_2He^4$ by proton bombardment. Given : mass of $_3Li^7$ atom = 7·0183 a.m.u., mass of $_2He^4$ atom = 4·0040 a.m.u., mass of $_1H^1$ atom = 1·0081 a.m.u.
   [**Ans.** $6{\cdot}547 \times 10^6$ kWh]

pe B. On Nuclear fission

4. In the hypothetical fission reaction :
   $$_{92}X^{236} \longrightarrow {_aY^{141}} + {_{36}Z^b} + 3\,{_0n^1}$$
   What are the values of the numbers *a* and *b* ? Calculate the total energy released per nuclear fission in MeV units, when the masses in a.m.u. units are of neutron = 1·009, of X-nucleus = 235·891, of Y-nucleus = 140·673 and of Z nucleus 91·791. *(C.B.S.E. 2001 S)*
   [**Ans.** 56, 92, 372·4 MeV]
5. If 200 MeV energy is released in the fission of a single nucleus of $_{92}U^{235}$, how many fissions must occur per second to produce a power of 1 kW ?
   (P.S.S.C.E. 1999, 1996 S) [**Ans.** $3{\cdot}125 \times 10^{13}\ s^{-1}$]
6. Calculate the number of fission of U^{235} taking place per hour in a nuclear reactor, which develops a power of 10^6 kW. Given that the average energy released per fission is 200 MeV. [**Ans.** $1{\cdot}125 \times 10^{22}$]
7. Calculate the energy released by the fission of 2 g of $_{92}U^{235}$ in joule. Given, that energy released per fission is 200 MeV.
   [**Ans.** $1{\cdot}64 \times 10^{11}$ J]
8. What is the power output of $_{92}U^{235}$ reactor, if it takes 30 days to use up 2 kg of fuel and if each fission gives 185 MeV of usable energy ? *(Roorkee 1988)*
   [**Ans.** $5{\cdot}85 \times 10^4$ kW]
9. Suppose that India has a target of producing by 2000 A.D. 100,000 MW of electric power, 10% of which is to be obtained from nuclear power plants. Suppose, we are given that on an average, the efficiency of utilization (*i.e.* conversion of electric energy produced in a reactor) is 25%. How much amount of fissionable uranium would our country need per year at the turn of this century ? Take the heat energy per fission of U^{235} to be about 200 MeV. Given, Avogadro number = $6{\cdot}023 \times 10^{23}\ mol^{-1}$.
   (Text Problem) [**Ans.** $1{\cdot}538 \times 10^4$ kg]

Type C. On Nuclear fusion

10. Consider the following reaction :
    $$_1H^2 + {_1H^2} \longrightarrow {_2He^4} + Q$$
    If mass of the deuterium atom = 2·0141 a.m.u. and mass of helium atom = 4·0024 a.m.u., find the energy released in the reaction. *(I.I.T. 1996)* [**Ans.** 24·02 MeV]
11. In a star, three α-particles join in succession to form $_6C^{12}$ nucleus. How much energy is evolved in this reaction ? Take mass of $_6C^{12}$ nucleus as 12·000000 a.m.u. and that of α-particle as 4·002603 a.m.u. [**Ans.** 7·27 MeV]
12. The sun is believed to be getting its energy from the fusion of four protons to form a helium nucleus and a pair of positrons. Calculate the release of energy per fusion in MeV. Mass of a proton = 1·007825 a.m.u. ; mass of positron = 0·000549 a.m.u. ; mass of helium nucleus = 4·002603 a.m.u. ; 1 a.m.u. is equivalent to 931 MeV.
    (Pre-degree Kerala, 1994) [**Ans.** 25·695 MeV]

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. $_{84}Po^{218} \xrightarrow{\alpha-\text{decay}} {}_{82}Po^{214} \xrightarrow{\beta-\text{decay}}$

$$_{83}Bi^{214} \xrightarrow{\beta-\text{decay}} {}_{84}Po^{214}$$

2. Proceed as in problem no. 1.
3. The nuclear reaction takes place as below :

$$_3Li^7 + {}_1H^1 \longrightarrow 2\ {}_2He^4 + Q$$

$$\therefore \quad Q = [m({}_3Li^7) + m({}_1H^1) - 2\,m({}_2He^4)] \times 931$$
$$= [7{\cdot}0183 + 1{\cdot}0081 - 2 \times 4{\cdot}0040] \times 931$$
$$= 17{\cdot}13 \text{ MeV}$$

Now, number of $_3Li^7$ nuclei in 100 g

$$n = \frac{6 \cdot 02 \times 10^{23}}{7} \times 100 = 8 \cdot 6 \times 10^{24}$$

Therefore, total energy released, when 100 g of Li^7 is converted into He^4 nuclei

$$= n\,Q = 8{\cdot}6 \times 10^{24} \times 17{\cdot}13 \text{ MeV}$$
$$= 8{\cdot}6 \times 10^{24} \times 17{\cdot}13 \times 1{\cdot}6 \times 10^{-13} \text{ J (or Ws)}$$
$$= \frac{8 \cdot 6 \times 10^{24} \times 17 \cdot 13 \times 1 \cdot 6 \times 10^{-13}}{1000 \times 60 \times 60}$$
$$= \mathbf{6{\cdot}547 \times 10^6 \text{ kWh}}$$

4. $_{92}X^{236} \longrightarrow {}_aY^{141} + {}_{36}Z^b + 3\ {}_0n^1$

Obviously, $92 = a + 36$ or $a = 56$

Also, $236 = 141 + b + 3 \times 1$ or $b = 92$

$$Q = [m_X - (m_Y + m_Z + 3\,m_n)] \times 931$$
$$= [235{\cdot}891 - (140{\cdot}673 + 91{\cdot}791 + 3 \times 1{\cdot}009)] \times 931$$
$$= \mathbf{372{\cdot}4 \text{ MeV}}$$

5. Here, $P = 1 \text{ kW} = 10^3 \text{ W} = 10^3 \text{ J s}^{-1}$

Energy released in fission of one U^{235} nucleus,

$$Q = 200 \text{ MeV} = 200 \times 1{\cdot}6 \times 10^{-13} \text{ J}$$

Therefore, number of fission that should occur per second,

$$n = \frac{P}{Q} = \frac{10^3}{200 \times 1 \cdot 6 \times 10^{-13}} = \mathbf{3{\cdot}125 \times 10^{13} \text{ s}^{-1}}$$

6. Proceed as in problem no. 5.
7. Number of U^{235} nuclei in 2 g,

$$N = \frac{6 \cdot 02 \times 10^{23} \times 2}{235}$$

Therefore, energy released,

$$E = N \times 200 = \frac{6 \cdot 02 \times 10^{23} \times 2}{235} \times 200 \text{ MeV}$$
$$= \frac{6 \cdot 02 \times 10^{23} \times 2 \times 200 \times 1 \cdot 6 \times 10^{-13}}{235}$$
$$= \mathbf{1{\cdot}64 \times 10^{11} \text{ J}}$$

8. Mass of U^{235} used per second in the reactor,

$$m = \frac{2 \times 10^3}{30 \times 24 \times 60 \times 60} = 7 \cdot 716 \times 10^{-14} \text{ g}$$

Therefore, number of fission reactions per second

$$= \frac{6 \cdot 02 \times 10^{23}}{235} \times m$$
$$= \frac{6 \cdot 02 \times 10^{23} \times 7 \cdot 716 \times 10^{-4}}{235} = 1 \cdot 9766 \times 10^{18}$$

Therefore, usable energy released per second or power of nuclear reactor

$$= 1{\cdot}9766 \times 10^{18} \times 185 \text{ MeV s}^{-1}$$
$$= 1{\cdot}9766 \times 10^{18} \times 185 \times 1{\cdot}6 \times 10^{-13} \text{ J s}^{-1}$$
$$= 5{\cdot}85 \times 10^7 \text{ W} = \mathbf{5{\cdot}85 \times 10^4 \text{ kW}}$$

9. Energy released per fission = 200 MeV

Efficiency of utilization = 25%

Therefore, electrical energy produced per fission

$$= \frac{25}{100} \times 200 = 50 \text{ MeV}$$
$$= 50 \times 1{\cdot}6 \times 10^{-13} = 8{\cdot}0 \times 10^{-12} \text{ J}$$

Target of electric power = 100,000 MW

Electric power to be obtained from nuclear plants

$$= \frac{10}{100} \times 100{,}000 = 10{,}000 \text{ MW} = 10^{10} \text{ J s}^{-1}$$

Electric energy required in one year

$$= 10^{10} \times 60 \times 60 \times 24 \times 365 \text{ J}$$

Therefore, number of fission reactions required per ye

$$= \frac{10^{10} \times 60 \times 60 \times 24 \times 365}{8 \cdot 0 \times 10^{-12}} = 3 \cdot 942 \times 10^{28}$$

Hence, mass of U^{235} needed per year

$$= \frac{235}{6 \cdot 023 \times 10^{23}} \times 3 \cdot 942 \times 10^{28}$$
$$= 1{\cdot}538 \times 10^7 \text{ g} = \mathbf{1{\cdot}538 \times 10^4 \text{ kg}}$$

10. $Q = [2\,m({}_1H^2) - m({}_2He^4)] \times 931$

$$= (2 \times 2{\cdot}0141 - 4{\cdot}0024) \times 931 = \mathbf{24{\cdot}02 \text{ MeV}}$$

11. Proceed as in problem no. 10.
12. Proceed as in problem no. 10.

Competitive Examination File (Unit VIII)

REVISION AT A GLANCE

Chapter 1. Structure of Nucleus

☐ **Thomson's atom model.** In a sphere, the positive charge is uniformly distributed over the entire sphere and the electrons e embedded in it. The oscillations of electrons about their equilibrium positions give rise to radiations of definite frequency.

☐ **Rutherford's atom model.** Practically, entire mass of the atom and all its positive charge are concentrated in a small ntral core, while the electrons revolve around it. The central positive and massive core is called nucleus.

☐ **Isotopes.** *The atoms of an element (same atomic number) having different mass number are called isotopes.*

☐ **Isobars.** *The atoms of different elements (different atomic number) having the same mass number are called isobars.*

☐ **Atomic mass unit (a.m.u.).** *It is defined as* $\frac{1}{12}$ *th of the mass of one* $_6C^{12}$ *atom.* Its value is given by

$$\mathbf{1\ am.u. = 1{\cdot}660565 \times 10^{-27}\ kg = 931{\cdot}5\ MeV}$$

☐ **Nuclear size.** From scattering experiments, it is found that volume of a nucleus is always directly proportional to its ass number. It leads to the expression for nuclear radius as

$$R = R_0 A^{1/3},$$

here $R_0 = 1{\cdot}1 \times 10^{-15}$ m is known as ***nuclear unit radius.***

☐ **Nuclear density.** The density of nuclear matter is independent of the mass number of the nucleus and it is found to e of the order of 10^{17} kg m^{-3}.

☐ **Nuclear forces.** *The forces holding the nucleons together inside the nucleus are called nuclear forces.* These forces are short nge, basically very strong, charge independent, charge symmetric, spin dependent and non- central forces. These forces ist between nucleons due to exhcange of π-mesons (π^0, π^+ and π^-).

☐ **Mass defect.** *The difference between the sum of the masses of nucleons constituting a nucleus and the rest mass of the nucleus called mass defect.*

Mathematically : $\Delta m = [Z\, m_p + (A - Z)\, m_n] - m_N(_ZX^A)$

$= [Z\, m(_1H^1) + (A - Z)\, m_n] - m(_ZX^A)$

Here, $m_N(_ZX^A)$, $m(_ZX^A)$ and $m(_1H^1)$ represent mass of the nucleus of atom $_ZX^A$, mass of atom $_ZX^A$ and mass of hydrogen om respectively.

☐ **Binding energy.** *The energy equivalent to mass defect of the nucleus is called its binding energy.*

Mathematically : B.E. = $\Delta m \times 931{\cdot}5$ (in MeV)

☐ **Binding energy per nucleon.** *The average energy required to extract one nucleon from the nucleus is called its binding energy r nucleon.*

Mathematically : B.E. per nucleon $= \dfrac{\text{B.E.}}{A}$

☐ **Packing fraction.** *It is defined as mass defect per nucleon of the nucleus.*

Mathematically : Packing fraction $= \dfrac{\Delta m}{A}$

ome Useful Facts :

1. Rutherford α-scattering experiment established the existence of nucleus.
2. Neutron is unstable particle outside the nucleus.
3. Nuclear density is same for all nuclei *i.e.* independent of mass number of the nucleus.

Chapter 2. Radioactivity

☐ **Radioactivity.** *The spontaneous transformation of an element into another with the emission of radiations, such as α, β and rays is called radioactivity.*

☐ **Radioactive decay law.** *The number of atoms of a radioactive sample disintegrating per second at any time is directly proportional the number of atoms present at that time.*

Mathematically : $\dfrac{dN}{dt} = -\lambda N,$

here λ is called ***decay constant*** of the radioactive substance.

The above law may be expressed as

$$N = N_0\, e^{-\lambda t}$$

☐ **Radioactive decay constant.** *It is defined as the reciprocal of the time during which the number of atoms of a radioactive substance creases to* $\frac{1}{e}$ *th of their original number.*

☐ **Activity of a radioactive substance.** *It is defined as the rate at which the nuclei of the atoms in the sample disintegrate.*

Mathematically : $R = -\frac{dN}{dt}$

The radioactive decay law can be expressed as

$$R = R_0 e^{-\lambda t}$$

Units of activity : **1 curie (ci) = 3·7 × 10^{10} disintegrations s^{-1}**

1 rutherford (rd) = 10^6 disintegrations s^{-1}

☐ **Half-life.** *The half-life of a radioactive substance is defined as the time during which half of the atoms of a radioactive substan will disintegrate.*

Mathematically : $T = \frac{0 \cdot 693}{\lambda}$

☐ **Average-life.** *It is defined as the average time for which the atoms of the radioactive substance exist.*

Mathematically : $T_a = \frac{1}{\lambda}$

It follows that $T = 0 \cdot 693\, T_a$

☐ **α-decay.** It is represented by

$$_{Z}X^{A} \longrightarrow {}_{Z-2}Y^{A-4} + {}_{2}He^{4} + Q$$

☐ **β-decay.** It is represented by

$$_{Z}X^{A} \longrightarrow {}_{Z+1}Y^{A} + {}_{-1}e^{0} + \overline{\nu} + Q$$

☐ **γ-decay.** When on α or β-decay, the nucleus is left in excited state ; the nucleus goes to lower state or ground state b the emission of γ-ray (radiation of very short wavelength).

Some Useful Facts :

1. The total life of a radioactive sample is infinite.
2. After a time t (= n T), the fraction of the radioactive atoms left behind,

$$\frac{N}{N_0} = \left(\frac{1}{2}\right)^n = \left(\frac{1}{2}\right)^{t/T}$$

3. After a time t (= n T), the fractional activity of a radioactive sample.

$$\frac{R}{R_0} = \left(\frac{1}{2}\right)^n = \left(\frac{1}{2}\right)^{t/T}$$

4. β-ray spectrum is continuous in nature, while in α-ray and γ-ray spectrum, the emitted energy has only discrete value

Chapter 3. Nuclear Reactions

☐ **Nuclear fission.** *The process of splitting of a heavy nucleus into two nuclei of nearly comparable masses with liberation of energ is called nuclear fission.*

☐ **Nuclear chain reaction.** *A nuclear reaction in which the projectile used to carry out the fission reaction (such as neutron U^{235} fission reaction) gets multiplied as more and more such fission reactions take place, is called nuclear chain reaction.*

☐ **Critical size.** *The fissionable material is said to be of critical size, if the number of neutrons lost per second is just equal to t number of neutrons produced per second in the block.*

The mass of the fissionable material having critical size is called ***critical mass.***

☐ **Nuclear reactor.** *The practical arrangement for carrying out controlled fission reaction so as to continuously obtain nucle energy is called a nuclear reactor.*

☐ **Nuclear fusion.** *When two or more light nuclei fuse together to form a heavy nucleus with the liberation of energy, the proce is called nuclear fusion.*

Some Useful Facts :

1. When nuclear fission and fusion reactions occur, in both cases, there is a decrease in nuclear mass.
2. Thermonuclear fusion reactions are source of stellar energy.

NUMERICAL PROBLEMS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Structure of Nucleus

Problem 1.01. The binding energies per nucleon for deutron ($_1H^2$) and helium ($_2He^4$) are 1·1 MeV and 7·0 MeV respectively. Calculate the energy released, when two deutrons fuse to form a helium nucleus ($_2He^4$).

(I.I.T. 1988)

Thought Process

The energy released in the fusion reaction is equal to t difference of final and initial binding energies.

Sol. Here, $\frac{\text{B.E.}}{\text{A}}$ of ${}_1\text{H}^2$ nucleus $= 1\cdot1$ MeV ;

$\frac{\text{B.E.}}{\text{A}}$ of ${}_2\text{He}^4$ nucleus $= 7\cdot0$ MeV

The fusion reaction may be represented as

$${}_1\text{H}^2 + {}_1\text{H}^2 \longrightarrow {}_2\text{He}^4 + \text{Q}$$

Therefore, total B.E. of ${}_1\text{H}^2$ nucleus

$$= 1\cdot1 \times 2 = 2\cdot2 \text{ MeV}$$

Hence, total initial B.E.

$$= 2\cdot2 + 2\cdot2 = 4\cdot4 \text{ MeV}$$

Also, total B.E. of ${}_2\text{He}^4$ nucleus

$$= 7\cdot0 \times 4 = 28\cdot0 \text{ MeV}$$

Therefore, energy released,

$$\text{Q} = 2830 - 4\cdot4 = \mathbf{23\cdot6\ MeV}$$

Chapter 2. Radioactivity

Problem 2.01. How many alpha and beta-particles are emitted, when uranium nucleus (${}_{92}\text{U}^{238}$) decays to lead (${}_{82}\text{Pb}^{206}$) ? *(M.N.R. 1987 ; I.I.T. 1985)*

Thought Process

The mass number in radioactive decay decreases only due to α-decay. For one α-particle emitted, mass number decreases by 4. On the other hand, the atomic number decreases by 2 on emission of an α-particle and increases by 1 on emission of a β-particle.

Sol. Let n_1 and n_2 be the number of α-and β-particles respectively, which transform a ${}_{92}\text{U}^{238}$ nucleus into ${}_{82}\text{Pb}^{206}$.

From principle of conservation of mass number :

$$238 - n_1 \times 4 = 206 \qquad \text{or} \qquad n_1 = 8$$

From principle of conservation of atomic number :

$$92 - n_1 \times 2 + n_2 \times 1 = 82 \qquad \text{or} \qquad 92 - 8 + n_2 = 82$$

or $\qquad n_2 = 6$

Problem 2.02. There is a stream of neutrons with a kinetic energy of 0·0327 eV. If the half life of neutrons is 700 s, what fraction of neutrons will decay before they travel a distance of 10 m ?

Given, mass of neutron = $1\cdot675 \times 10^{-27}$ kg . *(I.I.T. 1986)*

Sol. Here, half life of neutrons, T = 700 s ;

mass of neutron, $m = 1\cdot675 \times 10^{-27}$ kg ;

and kinetic energy of a neutron,

$$\frac{1}{2} m v^2 = 0\cdot0327 \text{ eV} = 0\cdot0327 \times 1\cdot6 \times 10^{-19} \text{ J}$$

or $\quad \frac{1}{2} \times 1\cdot675 \times 10^{-27}\, v^2 = 0\cdot0327 \times 1\cdot6 \times 10^{-19}$

or $\quad v = \sqrt{\frac{2 \times 0\cdot327 \times 1\cdot6 \times 10^{-19}}{1\cdot675 \times 10^{-27}}} = 2\cdot5 \times 10^3 \text{ m s}^{-1}$

Therefore, time taken by neutron to travel 10 m,

$$t = \frac{10}{2\cdot5 \times 10^3} = 4 \times 10^{-3} \text{ s}$$

Fraction of neutrons, that will be left after time t, is given by

$$\frac{\text{N}}{\text{N}_0} = \left(\frac{1}{2}\right)^{t/\text{T}} 1/2 = \left(\frac{1}{2}\right)^{\frac{4 \times 10^{-3}}{700}} = (0\cdot5)^{5\cdot7 \times 10^{-6}}$$

$$= 0\cdot999952$$

Therefore, fraction of neutrons that will decay in time t,

$$1 - \frac{\text{N}}{\text{N}_0} = 1 - 05999952 = 0\cdot000048 = \mathbf{4\cdot8 \times 10^{-5}}$$

Problem 2.03. Some amount of a radioactive substance (half-life = 10 days) is spread inside a room and consequently, the level of radiation becomes 50 times the permissible level for normal occupancy of the room. After how many days, the room will be safe for occupation ? *(M.N.R. 1992)*

Thought Process

The time t after which the level of radiation will become $\frac{1}{50}$ th of the present level is given by (in terms of half-life T)

$$\frac{\text{N}}{\text{N}_0} = \left(\frac{1}{2}\right)^{t/\text{T}}$$

Sol. Here, half-life of the radioactive substance,

$$\text{T} = 10 \text{ days}$$

Consider that the total number of radioactive atoms spread in the room are N_0 in number and due to their presence, the level of radiation is 50 times the permissible level. Suppose that the room becomes worth normal occupancy in time t. Obviously, in time t, the number of radioactive atoms in the room will become

$$\text{N} = \frac{\text{N}_0}{50}$$

or $$\frac{\text{N}}{\text{N}_0} = \frac{1}{50} \qquad ...(i)$$

If T is half-life of the radiation sample, then

$$\left(\frac{\text{N}}{\text{N}_0}\right) = \left(\frac{1}{2}\right)^{t/\text{T}} \qquad ...(ii)$$

From equations (*i*) and (*ii*), we have

$$\left(\frac{1}{2}\right)^{t/\text{T}} = \frac{1}{50} \text{ or } (0\cdot5)^{t/\text{T}} = 0\cdot02$$

Taking logarithm of both sides, we have

$$\frac{t}{\text{T}} \log 0\cdot5 = \log 0\cdot02 \text{ or } t = \frac{\log 0\cdot02}{\log 0\cdot5} \times \text{T}$$

or $\quad t = \frac{\bar{2}\cdot3010}{\bar{1}\cdot6910} \times \text{T} = \frac{-1\cdot6990}{-0\cdot3010} \times 10 = \mathbf{56\cdot45\ days}$

Problem 2.04. A count rate meter is used to measure the activity of a given sample. At one instant, the meter shows 4750 counts min^{-1}. Five minutes later, it shows 2700 counts min^{-1}. Find (*a*) the decay constant and (*b*) the half-life of the sample. (Given, $\log_{10} 1\cdot760 = 0\cdot2455$). *(Roorkee, 1986 ; M.N.R. 1985)*

Sol. (*a*) Let N_0 and N be the number of the nuclei present in the sample at $t = 0$ and at $t = 5$ min respectively.

Here, activity at $t = 0$, $R_0 = 4750$ counts min^{-1}

and activity at $t = 5$ min, $R = 2700$ counts min^{-1},

According to radioactive decay law,

activity at $t = 0$, $R_0 = \lambda N_0$

$$\therefore \quad 4750 = \lambda N_0 \qquad ...(i)$$

Also, activity at $t = 5$ min, $R = \lambda N$

$$\therefore \quad 2700 = \lambda N \qquad ...(ii)$$

Dividing equation (*i*) by (*ii*), we have

$$\frac{4750}{2700} = \frac{\lambda N_0}{\lambda N}$$

$$\text{or} \quad \frac{N_0}{N} = 1{\cdot}760 \qquad ...(iii)$$

But the number of nuclei left after $t = 5$ min is given by

$$N = N_0 e^{-\lambda \times 5}$$

$$\text{or} \quad \frac{N_0}{N} = e^{5\lambda} \qquad ...(iv)$$

From equations (*iii*) and (*iv*), we have

$$e^{5\lambda} = 1{\cdot}760$$

$$\text{or } \lambda = \frac{1}{5}\log_e 1{\cdot}760 = \frac{1}{5} \times 2{\cdot}3036 \log_{10} 1{\cdot}760$$

$$= \frac{2{\cdot}3026 \times 0{\cdot}2455}{5} = \mathbf{0{\cdot}113\ min^{-1}}$$

(*b*) Half-life, $T = \dfrac{0{\cdot}693}{\lambda} = \dfrac{0{\cdot}693}{0{\cdot}113} = \mathbf{6{\cdot}13\ min}$

Problem 2.05. A small quantity of solution containing Na^{24} radionuclide (half-life = 15 hours) of activity 1·0 μci is injected into the blood of a person. A sample of blood of volume 1 cm^3 taken after 5 hours shows an activity of 296 disintegrations min^{-1}. Determine the total volume of blood in the body of the person. Assume that the radioactive solution mixes uniformly in the blood of the person.

Given, 1 curie = 3·7 × 10^{10}disintegrations s^{-1}.

(*I.I.T. 1994*)

Sol. Here, half-life of Na^{24} ;

$$T = 15 \text{ hours} = 15 \times 60 \times 60 \text{ s}$$

Consider that the small quantity of Na^{24} solution injected into the blood of the person contains total nuclei of Na^{24} equal to N_0 at the time $t = 0$.

Initial activity of Na^{24} solution,

$$R_0 = 1\ \mu ci = 10^{-6} \times 3{\cdot}7 \times 10^{10}$$

$$= 3{\cdot}7 \times 10^4 \text{ disintegration s}^{-1}$$

$$\text{Now,} \quad R_0 = \lambda N_0 = \frac{0{\cdot}693}{T} N_0$$

$$\text{or} \quad N_0 = \frac{T}{0{\cdot}693} \times R_0 = \frac{15 \times 60 \times 60}{0{\cdot}693} \times 3{\cdot}7 \times 10^4$$

$$= 2{\cdot}833 \times 10^9$$

Suppose that at the time $t = 0$, 1 cm^3 sample of blood contained Na^{24} nuclei equal to N_0'. Further suppose that the number of Na^{24} nuclei in 1 cm^3 sample reduces to N′ in time $t = 5$ hours. Then, activity of 1 cm^3 sample of the blood at $t = 5$ h is given by

$$R' = \lambda N' = \frac{0{\cdot}693}{T} N'$$

$$\text{or} \quad N' = \frac{T}{0{\cdot}693} \times R'$$

But $R' = 296$ disintegrations min^{-1}

$$= \frac{296}{60} = 4{\cdot}933 \text{ disintegration s}^{-1}$$

$$\therefore \quad N' = \frac{T}{0{\cdot}693} \times R' = \frac{15 \times 60 \times 60}{0{\cdot}693} \times 4{\cdot}993 = 3{\cdot}844 \times 10^5$$

$$\text{Now,} \quad \frac{N'}{N_0} = \left(\frac{1}{2}\right)^{t/T}$$

$$\text{or} \quad N_0' = N' \times (2)^{t/T} = 3{\cdot}844 \times 10^5 \times (2)^{5/15}$$

$$= 3{\cdot}844 \times 10^5 \times 2^{1/3}$$

$$= 3{\cdot}844 \times 10^4 \times 1{\cdot}26 = 4{\cdot}843 \times 10^5$$

Therefore, volume of blood in the body of the person,

$$V = \frac{N_0}{N_0'} = \frac{2{\cdot}883 \times 10^9}{4{\cdot}843 \times 10^5} = \mathbf{5{\cdot}95 \times 10^3\ cm^3}$$

Problem 2.06. A radioactive nucleus X decays to a nucleus Y with decay constant $\lambda_X = 0{\cdot}1\ s^{-1}$. Y further decays to a stable nucleus Z with a decay constant $\lambda_Y = 1/30\ s^{-1}$. Initially, there are only X nuclei and their number is $N_0 = 10^{20}$. Set up the rate equations for the populations of X, Y and Z. The population of the Y nucleus as a function time is given by

$$N_Y = \frac{N_0 \lambda_X}{\lambda_X - \lambda_Y}\left(e^{-\lambda_Y t} - e^{-\lambda_X t}\right)$$

Find the time at which N_Y is maximum and determine the populations X and Y at that instant. (*I.I.T. 2001*)

Sol. Here, number of X-nuclei at $t = 0$, $N_0 = 10^{20}$

decay constant of X-nuclei, $\lambda_X = 0{\cdot}1$ s^{-1}

and decay constant of Y-nuclei, $\lambda_Y = 1/30$ s^{-1}

At $t = 0$, number of both Y and Z-nuclei are zero.

According to law of radioactivity, rate equation for the population of X-nuclei,

$$\frac{dN_X}{dt} = -\lambda_X N_X \qquad ...(i)$$

The number of Y-nuclei decreases because of its decay but at the same time increases due to decay of X-nuclei into it.

$$\therefore \quad \frac{dN_Y}{dt} = \lambda_X N_X - \lambda_Y N_Y \qquad ...(ii)$$

Since Z-nuclei formed due to the decay of Y-nuclei are stable, their number goes on increasing with the passage of time.

$$\therefore \quad \frac{dN_Z}{dt} = \lambda_Y N_Y \qquad ...(iii)$$

Now, population of Y-nuclei as a function of time is given by

$$N_Y = \frac{N_0 \lambda_X}{\lambda_X - \lambda_Y}\left(e^{-\lambda_Y t} - e^{-\lambda_X t}\right) \qquad ...(iv)$$

For N_Y to be maximum,

$$\frac{dN_Y}{dt} = 0 \qquad ...(v)$$

From equations (*ii*) from (*v*), we have

$$\lambda_X N_X = \lambda_Y N_Y \qquad ...(vi)$$

$$\text{Now,} \quad N_X = N_0 e^{-\lambda_X t} \qquad ...(vii)$$

Using equations (*iv*) and (*vii*), equation (*vi*) becomes

$$\lambda_X N_0 e^{-\lambda_X t} = \lambda_Y \frac{N_0 \lambda_X}{\lambda_X - \lambda_Y}\left[e^{-\lambda_Y t} - e^{-\lambda_X t}\right]$$

$$\text{or} \quad \frac{\lambda_X - \lambda_Y}{\lambda_Y} e^{-\lambda_X t} = \left[e^{-\lambda_Y t} - e^{-\lambda_X t}\right]$$

$$\text{or} \quad \left[\frac{\lambda_X}{\lambda_Y} - 1\right] e^{-\lambda_X t} = e^{-\lambda_X t}\left[\frac{e^{-\lambda_Y t}}{e^{-\lambda_X t}} - 1\right]$$

$$\text{or} \quad \frac{\lambda_X}{\lambda_Y} = e^{(\lambda_X - \lambda_Y)t}$$

$$\text{or} \quad (\lambda_X - \lambda_Y)t = \log_e \frac{\lambda_X}{\lambda_Y}$$

$$\text{or} \quad t = \frac{1}{\lambda_X - \lambda_Y} \log_e \frac{\lambda_X}{\lambda_Y} = \frac{1}{0{\cdot}1 - 1/30} \log_e \frac{0{\cdot}1}{1/30}$$

$$= 15 \log_e 3$$

$$= 15 \times 2{\cdot}303 \log_{10} 3 = 15 \times 2{\cdot}303 \times 0{\cdot}4771$$

$$= \mathbf{16{\cdot}48\ s}$$

To find populations of X and Y at t = 16·48 s :

Again, $N_X = N_0 e^{-\lambda_X t}$

$$\therefore \quad N_X (\text{at } t = 16{\cdot}48 \text{ s}) = 10^{20} \times e^{-0{\cdot}1 \times 16{\cdot}48}$$

$$= 10^{20} \times e^{-16{\cdot}48} = \mathbf{1{\cdot}924 \times 10^{19}}$$

From equation (*vi*), we have

$$N_Y = \frac{\lambda_X}{\lambda_Y} N_X$$

$$\therefore N_Y (\text{at } t = 16{\cdot}48 \text{ s}) = \frac{\lambda_X}{\lambda_Y} N_X (\text{at } t = 16{\cdot}48 \text{ s})$$

$$= \frac{0{\cdot}1}{1/30} \times 1{\cdot}924 \times 10^{19} = 5{\cdot}572 \times 10^{19}$$

Problem 2.07. Nuclei of a radioactive element A are being produced at a constant rate α. The element has a decay constant λ. At time $t = 0$, there are N_0 nuclei of the element.

(*a*) Calculate the number N of nuclei of A at time *t*.

(*b*) If $= 2 N_0 \lambda$, calculate the number of nuclei of A after one half-life of A, and also the limiting value of N as $t \to \infty$. (*I.I.T. 1998*)

Sol. (*a*) Let N_0 and N be the number of nuclei of radioactive element A at times $t = 0$ and $t = t$ respectively. Then, according to radioactive decay law,

$$\frac{dN}{dt} = -\lambda N$$

Since the rate at which nuclei of radioactive element A are produced is α, the net rate of decay of the nuclei of radioactive element A,

$$\frac{dN}{dt} = -\lambda N + \alpha = \alpha - \lambda N$$

$$\text{or} \quad \frac{dN}{\alpha - N} = dt$$

Integrating both sides within proper limits, we have

$$\int_{N_0}^{N} \frac{dN}{\alpha - N} = \int_0^t dt \quad \text{or} \quad \left| -\frac{1}{\lambda} \log_e (\alpha - \lambda N) \right|_{N_0}^{N} = \left| t \right|_0^t$$

$$\text{or} \quad -\frac{1}{\lambda} \log_e (\alpha - \lambda N) - \left[-\frac{1}{\lambda} \log_e (\alpha - \lambda N_0) \right] = t - 0$$

$$\text{or} \quad \frac{1}{\lambda} \log_e \frac{\alpha - \lambda N_0}{\alpha - \lambda N} = t \quad \text{or} \quad \frac{\alpha - \lambda N_0}{\alpha - \lambda N} = e^{\lambda t}$$

$$\text{or } \alpha = \lambda N = (\alpha - \lambda N_0) e^{-\lambda t}$$

$$\text{or} \quad N = \frac{1}{\lambda}\left[\alpha - (\alpha - \lambda N_0) e^{-\lambda t}\right] \qquad \text{...}(i)$$

It gives the number of nuclei of the radioactive element A at time *t*.

(*b*) Now, $\alpha = 2 N_0 \lambda$

Therefore, from equation (*i*), number of nuclei of element at time *t*,

$$N = \frac{1}{\lambda}\left[2 N_0 \lambda - \lambda N_0) e^{-\lambda t}\right]$$

$$\text{or} \quad N = N_0 (2 - e^{-\lambda t}) \qquad \text{...}(ii)$$

Therefore, number of nuclei of element A after one half-life of A can be found by setting $t = T = \frac{\log_e 2}{\lambda}$ *i.e.*

$$N = N_0 (2 - e^{-\lambda \times \log_e 2/\lambda}) = N_0 (2 - e^{-\log_e 2})$$

$$= N_0 \left(2 - \frac{1}{2}\right) = \frac{\mathbf{3}}{\mathbf{2}} \mathbf{N_0}$$

Also, number of nuclei of element A, when $t \to \infty$ is given by

$$N = \underset{t \to \infty}{\text{Lt}} [N_0 (2 - e^{-\lambda t})] = N_0 (2 - 0) = \mathbf{2 N_0}$$

Problem 2.08. A nucleus at rest undergoes a decay emitting an α-particle having de-Broglie wavelength $\lambda = 5{\cdot}76 \times 10^{-15}$ m. If the mass of the daughter nucleus is 223·60 a.m.u. and that of the α-particle is 4·002 a.m.u., determine the total kinetic energy in the final state. Hence, obtain the mass of the parent nucleus in a.m.u. (1 a.m.u. = 931·470 MeV) (*I.I.T. 2001*)

Sol. Suppose that mass of parent nucleus X is M and it decays into daughter nucleus Y of mass M_1 by emitting α-particle of mass M_2. The decay takes place as shown in Fig. 2.01.

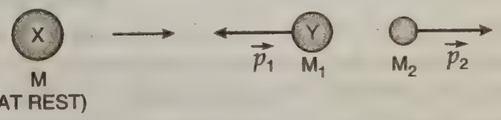

Fig. 2.01

Let $\vec{p}_1$ and $\vec{p}_2$ be linear momentum of daughter nucleus and α-particle respectively. Since parent nucleus is at rest, from the conservation of linear momentum,

$$\vec{p}_1 + \vec{p}_2 = 0 \quad \text{or} \quad |\vec{p}_1| = |\vec{p}_2|$$

Here, $M_1 = 223{\cdot}610$ a.m.u.

$$= 223{\cdot}610 \times 1{\cdot}67 \times 10^{-27} = 3{\cdot}734 \times 10^{-25} \text{ kg}$$

$M_2 = 4{\cdot}002$ a.m.u.

$$= 4{\cdot}002 \times 1{\cdot}67 \times 10^{-27} = 6{\cdot}683 \times 10^{-27} \text{ kg}$$

Now, de-Broglie wavelength of α-particle,

$$\lambda = 5{\cdot}76 \times 10^{-15} \text{ m}$$

$$\therefore \quad p_2 = \frac{h}{\lambda} = \frac{6{\cdot}62 \times 10^{-34}}{5{\cdot}76 \times 10^{-15}} = 1{\cdot}149 \times 10^{-19} \text{ kg m s}^{-1}$$

Also, $p_1 = 1{\cdot}149 \times 10^{-19}$ kg m s^{-1}

Let T_1 and T_2 be kinetic energy of daughter nucleus and α-particle respectively. Then,

$$T_1 = \frac{p_1^2}{2M_1} = \frac{(1{\cdot}149 \times 10^{-19})^2}{2 \times 3{\cdot}734 \times 10^{-25}} = \mathbf{0{\cdot}177 \times 10^{-13}\ J}$$

$$\text{and} \quad T_2 = \frac{p_2^2}{2M_2} = \frac{(1{\cdot}149 \times 10^{-19})^2}{2 \times 6{\cdot}683 \times 10^{-27}} = 9{\cdot}877 \times 10^{-13}\text{ J}$$

Therefore, total kinetic energy of the final state,

$$T = T_1 + T_2 = 0{\cdot}177 \times 10^{-13} + 9{\cdot}877 \times 10^{-13}$$
$$= 10{\cdot}054 \times 10^{-13}\text{ J}$$
$$= \frac{10{\cdot}054 \times 10^{-13}}{1{\cdot}6 \times 10^{-13}} = \mathbf{6{\cdot}284\ MeV}$$

If Δm is mass defect, then

$$M = (M_1 + M_2) - \Delta m$$

Now, Δm = mass equivalent to total kinetic energy of

the final state $= \dfrac{6{\cdot}284}{931{\cdot}470} = 0{\cdot}0067$ a.m.u.

Hence, M = (223·610 + 4·002) – 0·0067 = **227·605 a.m.u.**

Problem 2.09. In the chemical analysis of a rock, the mass ratio of two radioactive isotopes is found to be 100 : 1. The mean lives of the two isotopes are 4 × 10⁹ years and 2 × 10⁹ years respectively. If it is assumed that at the time of formation, the atoms of both the two isotopes were in equal proportion, calculate the age of the rock. The ratio of the atomic weights of two isotopes is 1·02 : 1.

(Roorkee, 1987)

Sol. Let M_A and M_B be the atomic weights of the two radioisotopes A and B present in the rock. Let mass of an atom of the two isotopes be m_A and m_B respectively.

Since mass of an atom is directly proportional to the atomic weight of the element, we have

$$\frac{m_A}{m_B} = \frac{M_A}{M_B} = \frac{1{\cdot}02}{1} \qquad \ldots(i)$$

If λ_A and λ_B are decay constant of the two radioactive isotopes, then

$$\lambda_A = \frac{1}{\text{mean life of A}} = \frac{1}{4 \times 10^9} = 2{\cdot}5 \times 10^{-10}\text{ year}^{-1}$$

$$\text{and } \lambda_B = \frac{1}{2 \times 10^9} = 5\ 10^{-10}\text{ year}^{-1}$$

Let at the time of formation of the rock *i.e.* at $t = 0$, the number of atoms of the two isotopes in the rock are N_{0A} and N_{0B} respectively. Since at the time of formation of the rock, the atoms of the two isotopes are in equal proportions,

$$\frac{N_{0A}}{N_{0B}} = 1 \qquad \ldots(ii)$$

Today, after time t (the age of the rock), suppose that the number of atoms of the two radioisotopes in the rock become N_A and N_B respectively. Since the mass ratio of the two isotopes is found to be 100 : 1,

$$\frac{\text{mass of radioisotope A at time } t}{\text{mass of radioisotope B at time } t} = \frac{m_A \times N_A}{m_B \times N_B}$$
$$= \frac{100}{1} = 100$$

$$\text{or} \quad \frac{N_A}{N_B} = 100 \times \frac{m_B}{m_A} = 100 \times \frac{1}{1{\cdot}02} = 98{\cdot}04$$

$$\text{But} \quad \frac{N_A}{N_B} = \frac{N_{0A}\, e^{-\lambda_A t}}{N_{0B}\, e^{-\lambda_B t}} = 1 \times e^{(\lambda_B - \lambda_A)t} \quad \left(\because \frac{N_{0A}}{N_{0B}} = 1\right)$$

$$\therefore \quad e^{(\lambda_B - \lambda_A)t} = \frac{N_A}{N_B}$$

$$\text{or} \quad e^{(5 \times 10^{-10} - 2{\cdot}5 \times 10^{-10})t} = 98{\cdot}04$$

$$\text{or} \quad e^{2{\cdot}5 \times 10^{-10}\, t} = 98{\cdot}04$$

$$\text{or} \quad 2{\cdot}5 \times 10^{-10}\, t = \log_e 98{\cdot}04 = 2{\cdot}3026 \log_{10} 98{\cdot}4$$
$$= 4{\cdot}5890$$

$$\text{or} \quad t = \frac{4{\cdot}5890}{2{\cdot}5 \times 10^{-10}} = \mathbf{18{\cdot}36 \times 10^9\ years}$$

Chapter 3. Nuclear Reactions

Problem 3.01. What is the power output of a $_{92}U^{235}$ reactor, if it takes 30 days to use up 2 kg of fuel and of each fission gives 185 MeV of usable energy ? *(Roorkee, 1988)*

Sol. Since 235 g *i.e.* 235 × 10⁻³ kg of U^{235} contains nuclei equal to Avogadro number (= 6·02 × 10²³),

the number of U^{235} nuclei used in the reactor in 30 days

$$= \frac{6{\cdot}023 \times 10^{23}}{235 \times 10^{-3}} \times 2 = 5{\cdot}1234 \times 10^{24}$$

Usable energy released during each fission = 185 MeV

Therefore, energy output of the reactor in 30 days

$$= 5{\cdot}1234 \times 10^{24} \times 185 = 9{\cdot}48 \times 10^{26}\text{ MeV}$$
$$= 9{\cdot}48 \times 10^{26} \times 1{\cdot}6 \times 10^{-13} = 1{\cdot}517 \times 10^{14}\text{ J}$$

Hence, power output of the reactor = energy released per second

$$= \frac{1{\cdot}517 \times 10^{14}}{30 \times 24 \times 60 \times 60}\text{ W} = 58{\cdot}53 \times 10^6\text{ W} = \mathbf{58{\cdot}53\ MW}$$

Problem 3.02. In a nuclear reactor U^{235} undergoes fission liberating 200 MeV of energy. The reactor has a 10% efficiency and produces 1000 MW power. If the reactor is to function for 10 years, find the total mass of uranium required. *(I.I.T. 2001)*

Sol. Here, power of the nuclear reactor,

$$P = 1000\text{ MW} = 10^9\text{ W} = 10^9\text{ J s}^{-1}$$

Time for which reactor is to function,

$$t = 10\text{ years} = 10 \times 365 \times 24 \times 60 \times 60 = 3{\cdot}1536 \times 10^8\text{ s}$$

Therefore, energy to be delivered by reactor in 10 years,

$$W = P \times t = 10^9 \times 3{\cdot}15\,36 \times 10^8 = 3{\cdot}1536 \times 10^{17}\text{ J}$$

$$\text{Efficiency of reactor, } \eta = 10\% = \frac{1}{10}$$

Hence, actual energy, the reactor is required to produce,

$$W' = \frac{W}{\eta} = 3{\cdot}1536 \times 10^{17} \times 10 = 3{\cdot}1536 \times 10^{18}\text{ J}$$

Energy liberated on fission of one U^{235} atom,

$$E = 200 \text{ MeV} = 200 \times 1{\cdot}6 \times 10^{-13} = 3{\cdot}2 \times 10^{-11} \text{ J}$$

Therefore, number of U^{235} atoms required to produce the needed energy,

$$n = \frac{W'}{E} = \frac{3{\cdot}1536 \times 10^{18}}{3{\cdot}2 \times 10^{-11}} = 9{\cdot}855 \times 10^{28}$$

Number of moles of U^{235} needed,

$$\mu = \frac{n}{\text{Avogadro number}}$$

$$= \frac{9{\cdot}855 \times 10^{28}}{6{\cdot}02 \times 10^{23}} = 1{\cdot}637 \times 10^{5}$$

Hence, mass of U^{235} needed,

$$m = \mu \times 235 = 1{\cdot}637 \times 10^{5} \times 235 \text{ g}$$

$$= \frac{1{\cdot}637 \times 10^{5} \times 235}{10^{3}} = \mathbf{3{\cdot}847 \times 10^{4}\ kg}$$

Problem 3.03. It is proposed to use the nuclear reaction :

$$_1H^2 + {}_1H^2 \longrightarrow {}_2He^4$$

in a nuclear reactor of 200 MW rating. If the energy from the above reaction is used with a 25% efficiency in the reactor, how many grams of deuterium fuel will be needed per day ? The masses of $_1H^2$ and $_2He^4$ nuclei are 2·0141 a.m.u. and 4·0026 a.m.u. respectively. *(I.I.T. 1990)*

Sol. The fusion reaction used in reactor is

$$_1H^2 + {}_1H^2 \longrightarrow {}_2He^4$$

Therefore, energy released per fusion reaction,

$$E = \left[m_N\left({}_1H^2\right) + m_N\left({}_1H^2\right) - m_N\left({}_2He^4\right)\right] \times 931{\cdot}5$$

$$= (2{\cdot}0141 + 2{\cdot}0141 - 4{\cdot}0026) \times 931{\cdot}5$$

or $\quad E = 23{\cdot}846$ MeV

Power rating of the reactor,

$$P = 200 \text{ MW} = 200 \times 10^{6} \text{ J s}^{-1}$$

Energy to be produced per day,

$$W = P \times t = 200 \times 10^{6} \times 24 \times 60 \times 60 = 1{\cdot}728 \times 10^{13} \text{ J}$$

Now, efficiency of the reactor, $\eta = 25\% = \frac{25}{100} = \frac{1}{4}$

Hence, actual energy, the reactor is required to produce per day,

$$W' = \frac{W}{\eta} = \frac{1{\cdot}728 \times 10^{13}}{1/4} = 6{\cdot}912 \times 10^{13} \text{ J}$$

$$= \frac{6{\cdot}912 \times 10^{13}}{1{\cdot}6 \times 10^{-13}} = 4{\cdot}32 \times 10^{26} \text{ MeV}$$

Therefore, number of fusion reactions needed per day,

$$n = \frac{W'}{E} = \frac{4{\cdot}32 \times 10^{26}}{23{\cdot}846} = 1{\cdot}81 \times 10^{25}$$

Since in one fusion reaction, two deutrons are required, the number of deutrons needed per day,

$$N = n \times 2 = 1{\cdot}81 \times 10^{25} \times 2 = 3{\cdot}62 \times 10^{25}$$

Since a mass of 2 g of $_1H^2$ contains number of deuterium nuclei equal to Avogadro number *i.e.* $6{\cdot}02 \times 10^{23}$, mass of deuterium needed per day,

$$m = \frac{N}{\text{Avogadro number}} = \frac{3{\cdot}62 \times 10^{25}}{6{\cdot}02 \times 10^{23}} \times 2$$

$$= \mathbf{120{\cdot}266\ g}$$

MULTIPLE CHOICE QUESTIONS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Structure of Nucleus

PART I. TEXT-BASED QUESTIONS

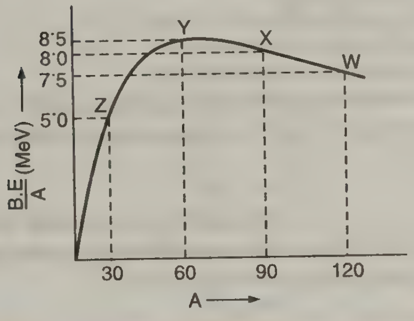
1. **Rutherford α-scattering experiment concludes that**
   (A) electrons are revolving around the nucleus.
   (B) there is heavy mass at centre.
   (C) electrons are scattered in space.
   (D) velocity of all electrons is same. *(A.F.M.C. 1997)*
2. **Rutherford's model of the atom was unstable, because**
   (A) nuclei will break down.
   (B) electrons move in circular orbits.
   (C) orbitting electrons radiate energy.
   (D) electrons are repelled by the nucleus. *(C.E.T. 1999)*
3. **Outside a nucleus,**
   (A) neutron is stable.
   (B) proton and neutron are stable.
   (C) neutron is unstable.
   (D) neither neutron nor proton is stable.
4. **The energy equivalent of one atomic mass unit is**
   (A) $1\cdot6 \times 10^{-19}$ J (B) $6\cdot02 \times 10^{23}$ J
   (C) 931 MeV (D) 9·31 MeV *(C.B.S.E. 1992)*
5. **Nuclei having equal difference in the number of neutrons and protons are called**
   (A) isotopes (B) isobars
   (C) isotones (D) isodiaspheres. *(A.F.M.C. 1998)*
6. **The mass number of He is 4 and that of sulphur is 32. The radius of sulphur nucleus is larger than that of helium by the factor of**
   (A) 8 (B) $\sqrt{8}$
   (C) 4 (D) 2 *(C.B.S.E. 1995)*
7. **The mass density of a nucleus varies with mass number A as**
   (A) A^2 (B) A
   (C) constant (D) 1/A *(C.B.S.E. 1992)*
8. **Order of the magnitude of the density of uranium nucleus is [$m_p = 1\cdot67 \times 10^{-27}$ kg]**
   (A) 10^{20} kg m^{-3} (B) 10^{17} kg m^{-3}
   (C) 10^{14} kg m^{-3} (D) 10^{11} kg m^{-3} *(I.I.T. 1999)*
9. **The origin of nuclear force is ascribed to the exchange of the following particle between a pair of nucleons**
   (A) mu-meson (B) π-meson
   (C) electron (D) photon
10. **The binding energy per nucleon is almost constant for many nuclei. It shows that nuclear forces are**
    (A) short range in nature.
    (B) attractive in nature.
    (C) charge independent.
    (D) saturated in nature.
11. **Which of the following nuclei is most stable ?**
    (A) odd-even (B) even-odd
    (C) even-even (D) odd-odd.
12. **m_p and m_n are masses of proton and neutron respectively. An element of mass M has Z protons and N neutrons. Then,**
    (A) $M > Z\,m_p + N\,m_n$ (B) $M = Z\,m_p + N\,m_n$
    (C) $M < Z\,m_p + N\,m_n$
    (D) The mass M may be greater than, less than or equal to $Z\,m_p + N\,m_n$, depending on nature of element. *(C.B.S.E. 2001)*
13. **The mass defect of an atom of mass M, atomic number Z and mass number A is given by**
    (A) $\frac{M}{A}$ (B) $\frac{M}{ZA}$
    (C) $(A-Z)\,m_p$
    (D) $[Z\,m_p + (A-Z)\,m_n + Z\,m_e] - M$ *(Karnataka Entrance, 1992, 1988)*
14. **The packing fraction for $_7N^{14}$ isotope, whose mass is 14·003 a.m.u., is**
    (A) $7\cdot8 \times 10^{-3}$ (B) $2\cdot1 \times 10^{-4}$
    (C) 1·0002 (D 0·9 *(Karnataka Entrance, 1986)*
15. **The average binding energy of a nucleon inside an atomic nucleus is about**
    (A) 8 MeV (B) 8 eV
    (C) 8 joule (D) 8 erg *(C.B.S.E. 1992)*
16. **The binding energy per nucleon is maximum in the case of**
    (A) $_2He^4$ (B) $_{26}Fe^{56}$
    (C) $_{56}Ba^{141}$ (D) $_{92}U^{235}$ *(C.B.S.E. 1993)*
17. **The mass defect for the nucleus of helium is 0·0303 a.m.u. What is the binding energy per nucleon for helium in MeV ?**
    (A) 28 (B) 7
    (C) 4 (D) 1 *(N.C.E.R.T. 1990)*
18. **The binding energies per nucleon for a deutron and an α-particle are x_1 and x_2 respectively. The energy Q released in reaction**
    $_1H^2 + {_1H^2} \longrightarrow {_2He^4} + Q$ is
    (A) $2\,(x_1 - x_2)$ (B) $2\,(x_1 + x_2)$
    (C) $4\,(x_1 + x_2)$ (D) $4\,(x_1 - x_2)$ *(C.B.S.E. 1995)*
19. **The binding energy of hydrogen atom is**
    (A) 1·0 eV (B) infinite
    (C) – 13·6 eV (D) zero *(Karnataka Entrance, 1988)*

PART II. THOUGHT-BASED QUESTIONS

20. **The atomic weight of boron is 10·81 and it has two isotopes $_5B^{10}$ and $_5B^{11}$. The ratio of $_5B^{10}$ to $_5B^{11}$ in nature would be**
    (A) 19 : 81 (B) 81 : 19
    (C) 15 : 16 (D) 10 : 11 *(Karnataka Entrance, 1994)*
21. **Let m_p be the mass of a proton, m_n the mass of a neutron, M_1 the mass of a $_{10}Ne^{20}$ nucleus and M_2 the mass of a $_{20}Ca^{40}$ nucleus. Then,**
    (A) $M_2 = 2\,M_1$ (B) $M_2 > 2\,M_1$
    (C) $M_2 < 2\,M_1$ (D) $M_1 < 10\,(m_n + m_p)$ *(I.I.T. 1998)*
22. **If the elements with principal quantum number $n > 4$, were not allowed in nature, the number of possible elements would be**
    (A) 60 (B) 32
    (C) 4 (D) 64 *(I.I.T. 1983)*
23. **The mass number of a nucleus is**
    (A) always less than its atomic number.
    (B) always more than its atomic number.
    (C) sometimes equal to its atomic number.
    (D) sometimes more than and sometimes equal to its atomic number. *(I.I.T. 1986)*

24. **The atomic mass of an element is fractional, because**
(A) it contains electrons.
(B) of uncertainty principle.
(C) it may have isotopes.
(D) it may have isobars.

25. **Binding energy per nucleon versus mass number curve for nuclei is shown in the figure. W, X, Y, Z are four nuclei indicated on the curve. The energy, the process would release, is**



(A) $Y \rightarrow 2Z$ (B) $W \rightarrow X + Z$
(C) $W \rightarrow 2Y$ (D) $X \rightarrow Y + Z$ *(I.I.T. 1999)*

26. **The mass of an α-particle is**
(A) less than the sum of the masses of two protons and two neutrons.
(B) equal to mass of four protons.
(C) equal to mass of four neutrons.
(D) equal to sum of masses of two protons and two neutrons.   *(C.B.S.E. 1992)*

Chapter 2. Radioactivity

PART I. TEXT-BASED QUESTIONS

1. **Which of the following is a correct statement ?**
(A) Beta rays are same as cathode rays.
(B) Gamma rays are high energy neutrons.
(C) Alpha particles are singly ionised helium atoms.
(D) protons and neutrons have exactly the same mass.   *(I.I.T. 1999)*

2. **Which of the following is positively charged ?**
(A) α-particle   (B) β-particle
(C) γ-rays   (D) X-rays   *(C.B.S.E. 2001)*

3. **If I_1, I_2 and I_3 are ionising powers of α, β and γ-rays, then**
(A) $I_1 > I_2 > I_3$ (B) $I_1 < I_2 < I_3$
(C) $I_1 > I_2$ but $I_2 < I_3$ (D) $I_1 < I_2$ but $I_2 > I_3$.

4. **In a given reaction :**

$${}_{Z}X^{A} \longrightarrow {}_{Z+1}Y^{A} \longrightarrow {}_{Z-1}K^{A-4} \dashrightarrow {}_{Z-1}K^{A-4},$$

the radioactive radiations are emitted in the sequence of
(A) α, β, γ (B) γ, α, β
(C) β, α, γ (D) γ, β, α
(C.B.S.E. 1993 ; similar C.P.M.T. 1990)

5. **Ne^{22} nucleus, after absorbing energy, decays into two α-particles and an unknown nucleus. The unknown nucleus is**
(A) nitrogen   (B) carbon
(C) boron   (D) oxygen.   *(I.I.T. 1999)*

6. **A nucleus ${}_{n}Y^{m}$ emits one α and two β-particles. The resulting nucleus is**
(A) ${}_{n-2}X^{m-4}$ (B) ${}_{n-1}X^{m-4}$
(C) ${}_{n-4}Z^{m-4}$ (D) ${}_{n}X^{m-4}$ *(C.B.S.E. 1998)*

7. **The radioactive nucleus ${}_{92}U^{238}$ emits an α-particle and the daughter nucleus a β-particle. The charge number and the mass of the final nucleus are**
(A) 91, 234   (B) 92, 234
(C) 90, 234   (D) 93, 234

8. **After one α and two β-emissions :**
(A) mass number reduces by 2.
(B) mass number reduces by 4.
(C) mass number reduces by 6.
(D) atomic number remains unchanged.   *(C.B.S.E. 1999)*

9. **What is the respective number of α and β particles emitted in the following radioactive decay ?**

$${}_{92}X^{200} \longrightarrow {}_{80}Y^{168}$$

(A) 6 and 8   (B) 6 and 6
(C) 8 and 8   (D) 8 and 6.   *(C.B.S.E. 1995)*

10. **The half life of I^{131} is 8 days. Given a sample of I^{131} at time $t = 0$, we can assert that**
(A) no nucleus will decay before $t = 4$ days.
(B) no nucleus will decay before $t = 8$ days.
(C) all nuclei will decay before $t = 16$ days.
(D) a given nucleus may decay at any time after $t = 0$.
(I.I.T. 1998)

11. **In which radioactive disintegration, a neutron is dissociated into a proton and an electron ?**
(A) He^{++} emission.   (B) β-emission.
(C) γ-emission.   (D) positron emission.
(A.F.M.C. 1995)

12. **Half-life of a radioactive element depends upon**
(A) the amount of element present.
(B) temperature.
(C) pressure.
(D) nature of material.   *(A.F.M.C. 1996 ; N.C.E.R.T. 1978)*

13. **A radioactive sample with a half life of 1 month has the label : `Activity = 2 μci on 1.8.1991'. What was its activity two months earlier ?**
(A) 1·0 μci   (B) 0·5 μci
(C) 4 μci   (D) 8 μci   *(C.B.S.E. 1992)*

14. **The decay constant of radioactive element radium is $4{\cdot}28 \times 10^{-4}$ year^{-1}. Its half-life will be**
(A) 2000 years   (B) 1240 years
(C) 63 years   (D) 1620 years
(A.F.M.C. 1998)

15. **If 10% of a radioactive material decays in 5 days, then the amount of original material left after 20 days is approximately :**
(A) 60%   (B) 65%
(C) 70%   (D) 75%   *(A.F.M.C. 1998)*

16. **If the half-life period of a radioactive substance is 225·8 min, then the value of the decay constant is**
(A) $3{\cdot}1 \times 10^{-3}$ min^{-1}.   (B) $3{\cdot}1 \times 10^{-4}$ min^{-1}.
(C) $3{\cdot}1 \times 10^{-6}$ min^{-1}.   (D) $3{\cdot}1 \times 10^{-9}$ min^{-1}.
(C.B.S.E. 1999 ; A.F.M.C. 1997)

17. **Half-lives of two radioactive substances A and B are 20 min and 40 min respectively. Initially, the samples of A and B have equal number of nuclei. After 80 min, the ratio of remaining number of A and B nuclei is**
(A) 1 : 16   (B) 1 : 4
(C) 1 : 1   (D) 4 : 1   *(C.B.S.E. 1998)*

18. **A radioactive element has half-life period 1600 years. After 6400 years, what amount will remain ?**

(A) $\frac{1}{2}$ (B) $\frac{1}{16}$

(C) $\frac{1}{8}$ (D) $\frac{1}{4}$ *(C.B.S.E. 1993)*

19. **After a time equal to five half-lives, the amount of radioactive material remaining undecayed is :**

(A) 20% (B) 10%

(C) 5% (D) 3%

(A.F.M.C. 1996 ; N.C.E.R.T. 1990)

20. **A sample of radioactive element contains 4×10^{10} active nuclei. If half-life of element is 10 days, then the number of decayed nuclei after 30 days is**

(A) $0{\cdot}5 \times 10^{10}$ (B) 2×10^{10}

(C) $3{\cdot}5 \times 10^{10}$ (D) 1×10^{10} *(C.B.S.E. 2002)*

21. **Half-life period of a radioactive substance is 6 h. After 24 h, activity is 0·01 μci. What was the initial activity ?**

(A) 0·04 μci (B) 0·08 μci

(C) 0·24 μci (D) 0·16 μci *(C.B.S.E. 2001)*

22. **The half life of At^{215} is 100 μs. The time taken for the radioactivity of a sample of At^{215} to decay to 1/16th of its initial value is**

(A) 400 μs (B) 6·3 μs

(C) 40 μs (D) 300 μs *(I.I.T. 2002)*

23. **Half-life of a radioactive substance is 12·5 h and its mass is 256 g. After what time, the amount of remaining substance is 1 g ?**

(A) 75 h (B) 100 h

(C) 125 h (D) 150 h *(C.B.S.E. 2001)*

24. **The half-life of a radioactive material is 3 h. If the initial amount is 300 g, then after 18h, it will remain**

(A) 4·68 g (B) 46·8 g

(C) 9·375 g (D) 93·75 g *(C.B.S.E. 2000)*

25. **The half-life of radioactive radon is 3·8 days. The time at the end of which $\frac{1}{20}$ th of the radon sample will remain undecayed is (given $\log_{10} e = 0{\cdot}4343$)**

(A) 13·8 days (B) 16·4 days

(C) 33 days (D) 76 days. *(I.I.T. 1981)*

26. **The relationship between desintegration constant (λ) and half-life (T) will be :**

(A) $\lambda = \frac{\log_{10} 2}{T}$ (B) $\lambda = \frac{\log_e 2}{T}$

(C) $\lambda = \frac{T}{\log_e 2}$ (D) $\lambda = \frac{\log_e 2}{T}$ *(C.B.S.E. 2000)*

27. **If the decay constant of a radioactive substance is λ, then its half-life and mean-life are respectively**

(A) $\frac{1}{\lambda}$ and $\frac{\log_e 2}{\lambda}$ (B) $\frac{\log_e 2}{\lambda}$ and $\frac{1}{\lambda}$

(C) $\lambda \log_e 2$ and $\frac{1}{\lambda}$ (D) $\frac{\lambda}{\log_e 2}$ and $\frac{1}{\lambda}$

(M.N.R., 1990 ; I.I.T. 1989)

28. **The half life of a radioactive substance as compared to its mean life is**

(A) smaller and 69·3%.

(B) smaller and 30·7%.

(C) larger and 30·7%.

(D) larger and 69·3%. *(C.E.T. 1998)*

29. **The electron emitted in beta radiation originates from**

(A) inner orbits of atoms

(B) free electrons existing in nuclei

(C) decay of a neutron in a nucleus

(D) photon escaping from the nucleus. *(I.I.T. 2001)*

30. **Beta rays emitted by a radioactive material are**

(A) electromagnetic radiations.

(B) the electrons orbiting around the nucleus.

(C) charged particles emitted by nucleus.

(D) neutral particles. *(I.I.T. 1983)*

31. **Neutrino is a particle with**

(A) chargeless property and has no spin.

(B) chargeless property and has spin.

(C) charged like electron and has spin.

(D) the same as neutron. *(Karnataka Entrance, 1993)*

32. **The nucleus of $_{48}Cd^{115}$, after two successive β^-- decays will give**

(A) $_{46}Pa^{115}$ (B) $_{49}In^{114}$

(C) $_{50}Sn^{113}$ (D) $_{50}Sn^{115}$ *(C.B.S.E. 1992)*

33. **The nucleus $_6C^{12}$ absorbs an energetic neutron and emits a β-particle. The resulting nucleus is**

(A) $_7N^{14}$ (B) $_5B^{13}$

(C) $_7N^{13}$ (D) $_6C^{13}$ *(C.B.S.E. 1990)*

34. **A positron has the same mass as**

(A) proton (B) α-particle

(C) neutron (D) electron. *(A.F.M.C. 1993)*

35. **Which one of the following represents a γ-decay ?**

(A) ${}_ZX^A + \gamma \longrightarrow {}_{Z-1}Y^A + a + b$

(B) ${}_ZX^A + {}_0n^1 \longrightarrow {}_{Z-2}Y^{A-3} + c$

(C) ${}_ZX^A \longrightarrow {}_ZX^A + f$

(D) ${}_ZX^A + {}_{-1}e^0 \longrightarrow {}_{Z-1}Y^A + g$ *(I.I.T. 2002)*

36. **The radioactive isotope used to study thyroid gland is**

(A) carbon. (B) cobalt.

(C) iron. (D) iodine.

(Karnataka Entrance, 1993)

PART II. THOUGHT-BASED QUESTIONS

37. **The same radioactive nucleus may emit**

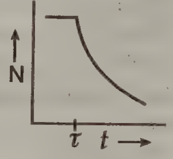
(A) either α or β and γ at a time.

(B) all the three α, β and γ one after another.

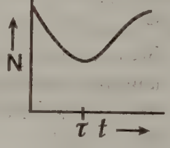
(C) all the three α, β and γ simultaneously.

(D) only α and β simultaneously. *(I.I.T. 1986)*

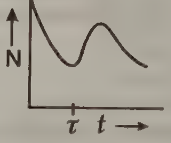
38. **A radioactive sample consists of two distinct species having equal number of atoms initially. The mean life of one species is τ and that of the other is 5 τ. The decay products in both cases are stable. A plot is made of the total number of radioactive nuclei as a function of time. Which of the following figures best represents the form of the plot ?**



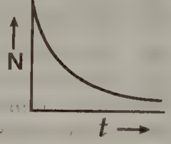
(A)



(B)



(C)



(D)

(I.I.T. 2001)

39. **The counting rate observed from a radioactive source at $t = 0$ was 1600 counts s^{-1} and at $t = 8$ s, it was 100 counts**

s^{-1}. The counting rate (counts s^{-1}) observed at $t = 6$ s will be

(A) 400
(B) 300
(C) 200
(D) 150 *(M.N.R. 1991)*

40. The count rate of a Geiger Muller counter for the radiation of the radioactive material of half-life 30 min decreases to 5 s^{-1} after 2 hours. The initial count rate was

(A) 20 s^{-1}
(B) 25 s^{-1}
(C) 80 s^{-1}
(D) 625 s^{-1}

(A.F.M.C. 1997 ; C.B.S.E. 1995)

41. What is the mass of one curie of U^{234} ?

(A) $1{\cdot}438 \times 10^{-11}$ g
(B) $2{\cdot}348 \times 10^{-11}$ g
(C) $3{\cdot}7 \times 10^{-10}$ g
(D) $6{\cdot}25 \times 10^{-34}$ g

(M.N.R. 1985)

42. Radon –220 will eventually decay to bismuth – 212 as

$$_{86}Rn^{210} \rightarrow {}_{84}Po^{216} + {}_{2}He^{4} \text{ ; half- life = 55 s}$$
$$_{84}Po^{216} \rightarrow {}_{82}Pb^{212} + {}_{2}He^{4} \text{ ; half-life = 0·16 s}$$
$$_{82}Pb^{212} \rightarrow {}_{83}Bi^{212} + {}_{-1}e^{0} \text{ ; half-life = 10·6 h}$$

If a certain mass of radon-220 is allowed to decay in a certain container, after five minutes, the element with the greatest mass will be

(A) radon
(B) polonium
(C) lead
(D) bismuth

(Karnataka Entrance, 1992, 1989)

43. A freshly prepared radioactive source of half- life 2 hours emits radiation of intensity, which is 64 times the permissible safe level. The minimum time after which it would be possible to work safely with the source is

(A) 6 hours
(B) 12 hours
(C) 24 hours
(D) 128 hours *(I.I.T. 1988)*

44. The half-life period of a radioactive element X is same as the mean-life time of another radioactive element Y. Initially, both of them have the same number of atoms. Then,

(A) X and Y have the same decay rate initially.
(B) X and Y decay at the same rate always.
(C) Y will decay at a faster rate than X.
(D) X will decay at a faster rate than Y. *(I.I.T. 1999)*

45. Two radioactive materials X_1 and X_2 have decay constants $10\,\lambda$ and λ respectively. If initially, they have the same number of nuclei, then the ratio of the number of nuclei of X_1 to that of X_2 will be $1/e$ after a time

(A) $1/10\,\lambda$
(B) $1/11\,\lambda$
(C) $11/10\,\lambda$
(D) $1/9\,\lambda$ *(I.I.T. 2000)*

46. Carbon-14 decays with a half-life of about 5,800 years. In a sample of bone, the ratio of carbon-14 to carbon-12 is found to be 1/4 of what it is in free air. This bone may belong to a period about *x* centuries ago, where *x* is nearest to :

(A) 2 × 58
(B) 58
(C) 58/2
(D) 3 × 58

(Karnataka Entrance, 1994)

Chapter 3. Nuclear Reactions

PART I. TEXT-BASED QUESTIONS

1. In the nuclear reaction :

$$_{6}C^{11} \longrightarrow {}_{5}B^{11} + \beta^{+} + X,$$

what does X stand for ?

(A) An electron
(B) A proton
(C) A neutron
(D) A neutrino *(I.I.T. 1992)*

2. When a deuterium is bombarded on $_{8}O^{16}$ nucleus, an α-particle is emitted. Then the product nucleus is

(A) $_{7}N^{13}$
(B) $_{5}B^{10}$
(C) $_{4}Be^{9}$
(D) $_{7}N^{14}$ *(C.B.S.E. 2002)*

3. A nuclear decay is expressed as :

$$_{6}C^{11} \longrightarrow {}_{5}B^{11} + \beta^{+} + X$$

Then the unknown particle X is :

(A) neutron
(B) antineutrino
(C) proton
(D) neutrino *(C.B.S.E. 2000)*

4. The element X, when bombarded by neutron produces an α-particle and $_{3}Li^{7}$. The element X is

(A) $_{2}He^{4}$
(B) $_{5}B^{10}$
(C) $_{5}B^{9}$
(D) $_{4}Be^{11}$ *(C.B.S.E. 2001)*

5. Which of the following is not a mode of radioactive decay ?

(A) Position emission
(B) Electron capture
(C) Fusion
(D) Alpha decay *(N.C.E.R.T. 1978)*

6. Complete the equation for the following fission process :

$$_{92}U^{235} + {}_{0}n^{1} \longrightarrow {}_{38}Sr^{90} + \ldots\ldots$$

(A) $_{54}Xe^{146}$
(B) $_{54}Xe^{145} + {}_{0}n^{1}$
(C) $_{54}Xe^{143} + 3\,{}_{0}n^{1}$
(D) $_{54}Xe^{142} + {}_{0}n^{1}$

(C.B.S.E. 1998)

7. Nuclear fission can be explained by :

(A) proton-proton cycle
(B) shell model of nucleus
(C) liquid drop model of nucleus
(D) independent of nuclear model of nucleus

(C.B.S.E. 20

8. In nuclear fission process, energy is released, because

(A) mass of particles is more than mass of nucleus
(B) total binding energy of products formed due to nuclear fission is more than the parent fissionable material
(C) total binding energy of products formed due to nucl fission is less than parent fissionable material.
(D) mass of some particles is converted into energy.

(C.B.S.E. 2001)

9. Energy released in the fission of a single U^{235} nucleus is 200 MeV. The fission rate of a U^{235} fuelled reactor operating at a power level of 5 W is

(A) $1{\cdot}56 \times 10^{10}\ s^{-1}$
(B) $1{\cdot}56 \times 10^{11}\ s^{-1}$
(C) $1{\cdot}56 \times 10^{16}\ s^{-1}$
(D) $1{\cdot}56 \times 10^{17}\ s^{-1}$

(C.B.S.E. 1993)

10. The most abundant isotope of natural uranium is

(A) $_{92}U^{238}$
(B) $_{92}U^{235}$
(C) $_{92}U^{234}$
(D) none of the above.

11. The critical mass of a fission reaction is

(A) the mass to start a nuclear fission reaction.
(B) the minimum mass for the chain reaction.
(C) the size of the reactor core.
(D) the size of the fuel + the size of the moderator.

(Karnataka Entrance, 1990, 1989)

12. Which of the following arc suitable for the fusion process ?

(A) light nuclei
(B) heavy nuclei
(C) elements lying in the middle of periodic table
(D) elements lying in the middle of binding energy curve.

(C.B.S.E. 2002)

13. In the fusion reaction

$$_{1}H^{2} + {}_{1}H^{2} \longrightarrow {}_{1}H^{3} + {}_{1}H^{1} + Q,$$

about 4 MeV of energy is released. How much energy will approximately be released, if all the atoms of 1 kg of deuterium could undergo fusion ?

(A) 2×10^7 kWh (B) $9{\cdot}6 \times 10^{13}$ J
(C) 6×10^{27} calories (D) 8×10^{23} MeV *(M.N.R. 1985)*

14. Which of the following is used as moderator in nuclear reaction ?
(A) Uranium (B) Heavy water
(C) Cadmium (D) Plutonium *(C.B.S.E. 1997)*

15. In a nuclear reactor, cadmium rods are used to
(A) speed up neutrons.
(B) slow down neutrons.
(C) absorb some neutrons.
(D) take out nuclear energy.
(Karnataka Entrance, 1993, 1988)

16. Sharavathy hydroelectric project is expected to produce about 1000 MW of power. This is equivalent to the conversion of a certain mass of matter into energy completely, say in a reactor. This amount is
(A) 4 kg per second
(B) 4 tons per hour
(C) 0·01 mg per second
(D) 10·2 mg per second. *(Karnataka Entrance, 1992, 1988)*

17. Fusion reactions take place at hight temperature, because
(A) atoms are ionised at high temperature.
(B) molecules break up at high temperature.
(C) nuclei break up at high temperature.
(D) kinetic energy is high enough to overcome repulsion between nuclei. *(S.C.R.A. 1996)*

18. Hydrogen bomb is based upon
(A) fission (B) fusion
(C) fission and fusion (D) none of the above.

19. The energy released in a typical nuclear fusion reaction is approximately
(A) 24 MeV (B) 200 MeV
(C) 800 MeV (D) 1050 MeV *(I.I.T. 1992)*

20. Energy generation in stars in mainly due to
(A) nuclear fusion. (B) nuclear fission.
(C) gravitational pull. (D) chemical reactions.
(C.E.T. 1998)

21. Solar energy is due to
(A) fusion reactions. (B) fission reactions.
(C) combustion reactions.
(D) chemical reactions. *(C.B.S.E. 1992)*

22. In case of an artificial radioactive transformation as give by

$$_{15}P^{30} \rightarrow {}_{14}Si^{30} + X,$$

the emitted particle X is
(A) neutron. (B) proton.
(C) electron. (D) positron.
(Karnataka ,1990

PART II. THOUGHT-BASED QUESTIONS

23. Consider the fission reaction :

$$_{92}U^{236} \longrightarrow X^{117} + Y^{117} + 2\,{}_0n^1$$

***i.e.* two nuclei of same mass number 117 are formed alon with two neutrons. The binding energy per nucleon of and Y is 8·5 MeV, whereas that of U^{236} is 7·6 MeV. The tot energy liberated will be about :**
(A) 2 MeV (B) 20 MeV
(C) 200 MeV (D) 2000 MeV *(C.P.M.T. 197*

24. Which of the following undergo fission reaction easily b slow moving neutrons ?
(A) U^{235}, Pu^{239} (B) Pu^{239}, Th^{234}
(C) U^{238}, Rn^{232} (D) Th^{234}, U^{238}

25. From the following equations, pick out the possibl nuclear fusion reactions :
(A) $_6C^{13} + {}_1H^1 \longrightarrow {}_6C^{14} + 4{\cdot}3$ MeV
(B) $_6C^{12} + {}_1H^1 \longrightarrow {}_7N^{13} + 2$ MeV
(C) $_7N^{14} + {}_1H^1 \longrightarrow {}_8O^{15} + 7{\cdot}3$ MeV
(D) $_{92}U^{235} + {}_0n^1 \longrightarrow {}_{54}Xe^{140} + {}_{38}Sr^{94} + 2\,{}_0n^1 + \gamma + 200$ Me
(I.I.T. 198

26. A star initially has 10^{40} deutrons. It produces energy via th process

$$_1H^2 + {}_1H^2 \longrightarrow {}_1H^3 + {}_1H^1 \text{ and}$$
$$_1H^2 + {}_1H^3 \longrightarrow {}_2He^4 + {}_0n^1$$

The masses of the nuclei are as follows : $M(H_2) = 2{\cdot}01$ a.m.u., $m_p = 1{\cdot}007$ a.m.u., and $m_n = 1{\cdot}008$ a.m.u., $M(He^4)$ 4·001 a.m.u. If the average power radiated by the star i 10^{16} W, the deutron supply of the star is exhausted in a tim of the order of
(A) 10^6 s (B) 10^8 s
(C) 10^{12} s (D) 10^{16} s *(I.I.T. 199*

SOLIDS & SEMICONDUCTORS DEVICES

1. **Solids**
2. **Semiconductor Devices**

> "Great discoveries and improvements invariably involve the cooperation of many minds. I may be given credit for having blazed the trail but when I look at the subsequent developments I feel the credit is due to others rather than to myself." – **Alexander Grahm Bell**

CHAPTER 1

Solids

1.01. SOLIDS

All solids have the property of elasticity and by virtue of this property, the lids behave as incompressible substances and exhibit rigidity and the mechanical rength. Basically, all solids are made of atoms and molecules but due to the fferent internal arrangement of the molecules inside them, they are divided into o classes ; namely ***crystalline*** and ***amorphous materials***.

1.02. CRYSTALLINE MATERIALS

The crystalline materials are those in which atoms or molecules are arranged in a finite and regular way throughout the body of the crystal and possess a definite external ometrical shape.

A few examples of crystalline substances are quartz, mica, sugar, copper lphate, sodium chloride, etc.

The crystalline substances have the following characteristics :

1. The atoms or molecules constituting a crystalline solid are arranged in a efinite and regular manner inside the crystal. Due to this, crystalline materials have ***efinite external geometrical shape***.

2. The orderly arrangement of atoms and molecules in a crystal extends over large volume of the crystal *i.e.* crystals exhibit a ***long range order*** of the atoms and olecules.

3. Crystalline substances are bounded by ***flat surfaces***.

4. Crystalline substances are ***anisotropic*** *i.e.* the physical properties like *thermal nductivity, electrical conductivity, compressibility*, etc have different values in different irections.

5. Crystalline materials possess uniform chemical composition *i.e.* bonds etween all the ions, atoms or molecules are of equal strength.

6. A crystalline material has a ***sharp melting point***. It is because, all the bonds etween its constituents are of equal strength ; and on heating, all the bonds get uptured suddenly at a fixed temperature. Due to this, the change from solid state the liquid state occurs suddenly.

7. Below the temperature of crystallisation, the crystalline materials are in stable tate. Since a stable state is the state of minimum energy, such a material acquires state of minimum energy on crystallisation.

Watch out !

Majority of solids in nature have ordered internal structure.

1.03. AMORPHOUS MATERIALS

The *amorphous materials are those in which atoms or molecules are arranged in an rregular manner and do not have definite external geometrical shape.* A few examples of morphous materials are glass, rubber, sulphur, etc.

The jargon . . . . .

The word amorphous means shapeless.

The amorphous substances have the following characteristics :

1. The atoms or molecules constituting an amorphous solid are arranged in an rregular manner within the solid. Due to this, the amorphous solids do not have definite external geometrical shape.

2. Since the distribution of atoms or molecules in such solids is random and haotic, such solids are *not bounded by flat surfaces*.

3. The amorphous materials are ***isotropic*** *i.e.* they have same physical properties n all directions.

4. Amorphous solids do not possess uniform chemical composition. Due to this, onds between all the atoms and molecules are not of equal strength.

5. Amorphous solids do not have *sharp melting point*. It is because, bonds between all the atoms and molecules are not of equal strength. On heating, the weaker bonds get ruptured first and the stronger ones later on. Due to this, change of the state does not occur at a fixed temperature.

1.04. CRYSTAL STRUCTURE

In order to make a study of the structure of different types of crystals, it is necessary to acquaint ourselves with the following terms :

Crystal lattice. *A crystal lattice is defined as the infinite array of atoms and molecules in space (three dimensions), such that at every point, an atom or the molecule has got the identical surroundings.*

The Jargon

Lattice means jangla or a frame of criss-cross of wood or iron commonly seen at windows and doors in houses.

Fig. 1.01 shows a two dimensional crystal lattice. Taking P as some arbitrary point representing the position of some atom, we find that along PA, the distance between adjecent points (atoms) is one unit (assuming the interatomic distance as to be one unit). Along PB, the points lie at a fixed distance $\sqrt{2}$ units apart ; while along PC, the points lie at distances of $\sqrt{5}$ units. The same is true for the separation between the points in any other direction and when extended infinitely. It, therefore, satisfies the definition of a two dimensional lattice.

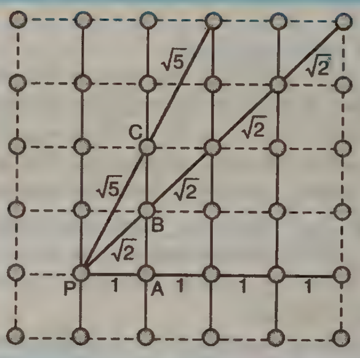

Fig. 1.01.

The actual crystal lattice is three dimensional. The arrangement of atoms in a three dimensional crystal lattice is similar to that in two dimensional crystal lattice explained above.

Unit cells. The entire lattice structure of a crystal is found to consist of identical blocks, called unit cells.

The unit cell is the smallest block or geometrical figure from which the crystal is built up by repetition in three dimensions.

Thus, a unit cell is a *fundamental elementary pattern*, as it is repeated again and again in the three dimensions to form lattice structure of the crystal. Fig. 1.02 represents a unit cell in general.

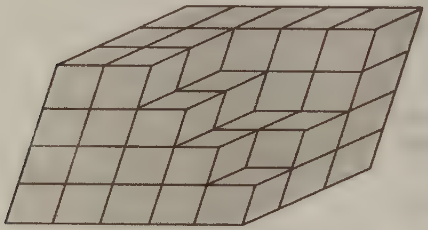

Fig. 1.02.

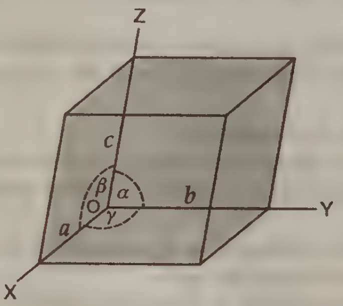

Fig. 1.03.

Fig. 1.03 shows how the entire three-dimensional crystal can be obtained by identically and periodically repeating the same unit cell again and again in three different directions in space.

The following terms are connected with the study of the unit cell of a crystal :

(i) *Crystallographic axes.* *These are the lines drawn parallel to the lines of intersection of any three faces of the unit cell, which do not lie in the same plane.* In Fig. 1.02, OX, OY and OZ are the crystallographic axes.

(ii) *Primitives.* *The three sides of the unit cell are called primitives.* They are denoted by a, b and c and they are also known as ***lattice constants.***

(iii) *Interfacial angles.* *The angles between three crystallographic axes of the unit cell are interfacial angles.* They are denoted by α, β and γ.

The structure of a crystal is fully defined by lattice constants a, b, c and the interfacial angles α, β, γ.

1.05. CRYSTAL SYSTEMS

From the point of view of the shape of the unit cell, all the crystals have been divided into seven crystal systems. In the order of their growth, the seven crystal systems are as given below :

1. Triclinic system. For this system, $a \neq b \neq c$; $\alpha \neq \beta \neq \gamma \neq 90°$. An elementary cell has the form of an oblique parallelopiped. Examples : $CuSO_4$, $K_2Cr_2O_7$, etc.

2. Monoclinic system. For this system, $a \neq b \neq c$; $\alpha = \beta = 90°$; $\gamma \neq 90°$. An elementary cell has the form of a right prism with a parallelogram as its base. Examples : Na_2SO_4, $KClO_3$, $FeSO_4$, etc.

3. Rhombic or Orthorhombic system. For this system, $a \neq b \neq c$; $\alpha = \beta = \gamma =$ 0°; $\gamma \neq 90°$. An elementary cell has the form of a rectangular parallelopiped. xamples : KNO_3, gallanium, mercury chloride, etc.

4. Tetragonal system. For this system, $a = b \neq c$, $\alpha = \beta = \gamma = 90°$. An elementary ell has the form of a right prism with a square base. Examples : $NiSO_4$, white tin, tc.

5. Trigonal or Rhomohedral system. For this system, $a = b = c$; $\alpha = \beta = \gamma \neq 90°$. n elementary cell has the form of a cube deformed by a compression or tension long the diagonal. Examples : As, Sb, Bi, calcite, etc.

6. Hexagonal system. For this system, $a = b \neq c$; $\alpha = \beta = 90°$, $\gamma = 120°$. Three lementary cells brought together form a regular hexagonal prism. Examples ; Zn, nO, Cd, Ni, etc.

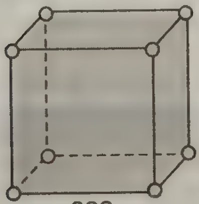
7. Cubic system. For this crystal, $a = b = c$; $\alpha = \beta = \gamma = 90°$. An elementary cell as the form of a cube. Examples : NaCl, KI, Cu, etc.

According to Bravais, who introduced the space lattice idea as early as 1880, here are 14 possible types of space lattices in the above seven crystal systems. It ollows that even for the same crystal system, there may be more than one ***Bravais attices.***

1.06. CUBIC CRYSTAL SYSTEM

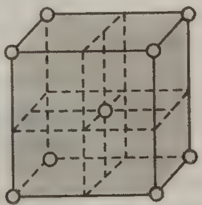
The cubic crystal system is the simplest of all the seven crystal systems. In the ubic crystal system, there are three types of cubic crystals. They are ***Simple Cubic Crystal (SCC), Body Centered Crystal (BCC)*** and ***Face Centered Crystal (FCC).***

(*i*) Simple cubic crystal. It is a crystal, whose unit cell is a cube with one atom r molecule at each of the eight corners of the cube as shown in Fig. 1.04 (*a*). NaCl is n example of simple cubic crystal.



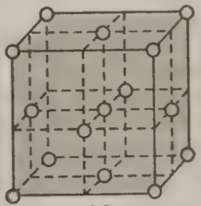
SCC

Fig. 1.04 (*a*)



BCC

Fig. 1.04 (*b*)



FCC

Fig. 1.04 (*c*)

The atom at a corner of the unit cell of SCC is shared by the eight different unit ells. Therefore,

$$\text{effective number of atoms per unit cell of SCC} = 8 \times \frac{1}{8} = 1 \text{ atom}$$

(*ii*) Body-centered cubic crystal. It is a crystal, whose unit cell is a cube with ne atom (or molecule) at each of the eight corners and an additional atom (or molecule) at the centre of the cube [Fig. 1.04 (*b*)]. Sodium, barium, iron, tungsten and uranium belong to this type of structure.

The atom at the centre of the unit cell of BCC completely belongs to that unit ell. Therefore,

$$\text{effective number of atoms per unit cell of BCC} = 8 \times \frac{1}{8} + 1 = 1 + 1 = 2 \text{ atoms}$$

(*iii*) Face-centered cubic crystal. It is a crystal, whose cell is a cube with one atom or molecule at each of the eight corners and one atom at the centre of each of the six faces. Hence, the name face centered cubic crystal. It is shown in Fig. 1.04 (c). Silver, copper, gold, lead, nickel and platinum belong to this type of structure.

The atom at the centre of the face of a cell can be shared by only two unit cells. Therefore,

$$\text{effective number of atoms per unit cell of FCC} = 8 \times \frac{1}{8} + 6 \times \frac{1}{2} = 1 + 3 = 4 \text{ atoms}$$

Since, all the three types of cubic crystals are made of cubic unit cells, we have

$$a = b = c \qquad \text{and} \qquad \alpha = \beta = \gamma = 90°$$

The different Bravais lattices in a crystal system are distinguished from each other due to their different values of ***atomic radius, co-ordination number*** and ***atomic packing factor.***

Atomic radius. *It is defined as half of the distance between the centres of two neighbouring atoms.* It is also called ***lattice constant*** or ***lattice parameter.***

Assuming that atoms in a crystal are spheres of equal sizes and touching each other, it can be shown that atomic radius is equal to $\frac{a}{2}$, $\frac{\sqrt{3}}{4}a$ and $\frac{a}{\sqrt{2}}$ for SCC, BCC and FCC respectively.

Co-ordination number. *The number of atoms in a crystal which surround a particular atom as its nearest neighbours is called co-ordination number.*

It can be proved that co-ordination number for SCC, BCC and FCC are 6, 8 and 12 respectively.

Atomic packing factor. *It is defined as the ratio of the volume occupied by all the atoms in a unit cell to the total volume of the unit cell.*

The calculations show that atomic packing factor for SCC, BCC and FCC are 0·52, 0·68 and 0·74 respectively.

1.07. SINGLE CRYSTALS

The crystal in which, the ordered arrangement of atoms (or molecules) extends throughout the piece of solid, is called a single crystal.

The single crystals are anisotropic in nature *i.e.* their mechanical, thermal, electrical and optical properties are different in different directions. Crystals possess plane facets making angles with one another, depending on the system to which crystal belongs. Such crystals can be easily split along some definite planes, known as ***cleavage planes***. It is found difficult to tear off the crystal in a direction perpendicular to the cleavage planes. It shows that the mechanical strength of single crystal is different in different directions.

Further, the size of a single crystal is usually very small*. It may vary from a fraction of a centimetre to a few centimetres. A very small sized crystal, whose inner features cannot be seen with a naked eye is called a ***monocrystal.***

1.08. POLY CRYSTALS

The crystalline solids, which are made of a large number of monocrystals with well developed faces joined together, are called polycrystals.

The anisotropy and the ordered arrangement of atoms (or molecules) is not observed in polycrystals. It is because, in practice, we come across big crystals, which are a collection of intergrown and randomly oriented fine crystals. The irregular and haphazard form is due to the fact that its normal growth has been restricted by neighbouring crystals. Anisotropy is observed in polycrystals only within the confines of each separately taken minute crystal. By providing special conditions of crystallisation from a solution or a melt, it is possible to obtain a large single crystal.

Watch out !

Single crystals are anisotropic whereas polycrystals are isotropic.

The polycrystal ceramic made from PbO, ZrO_2 and TiO_2 are used in gas lighters and telephone receivers. Ceramic oxides are usually bad conductors but ceramics made from materials like Y_2O_3, BaO and CuO_2 exhibit superconductivity.

1.09. LIQUID CRYSTALS

The organic crystalline solids, which on heating become fluid like, but retain their anisotropic properties are called liquid crystals.

Some organic crystalline solids in certain temperature region acquire a phase between solid and liquid and retain their anisotropic property and long range orientational order of its molecules.

Liquid crystal such as alkyl cyanobiphenyl can change the plane of polarisation of light and such *liquid crystal displays* (LCD) are used in watches and micro calculators. Some materials in liquid crystal phase such as cholesterol esters show a change in colour with temperature. This property is made use of in liquid crystal thermometers.

1.10. ENERGY BANDS IN SOLIDS

In a single free atom, electrons have well defined energy levels. But in a crystal, the atoms do not have well defined energy levels. It is because, in a crystal, there are many atoms and each atom in the crystal is surrounded by neighbouring atoms. Due to this, energy levels of the electrons in the atom get modified. However, the so called modification in the energy levels is not appreciable in case of the electrons in the inner shells but it is considerable in case of electrons in the outermost shell. It is because, electrons in the outermost shell are shared by more than one atom in the crystal.

---

*Considering that a unit cell is of size 5×10^{-8} cm and a single crystal has such 10^4 unit cells, the size of the crystal will be $5 \times 10^{-8} \times 10^4$ *i.e.* 5×10^{-4} cm. Such a small crystal can not be seen with a naked eye.

In order to understand as to how the energy levels get modified, consider a ngle small crystal of silicon made of N atom. An atom of silicon has electronic onfiguration 1 s^2, 2 s^2, 2 p^6, 3 s^2, 3 p^6. The various energy levels of silicon atom can e represented as shown in Fig. 1.05.

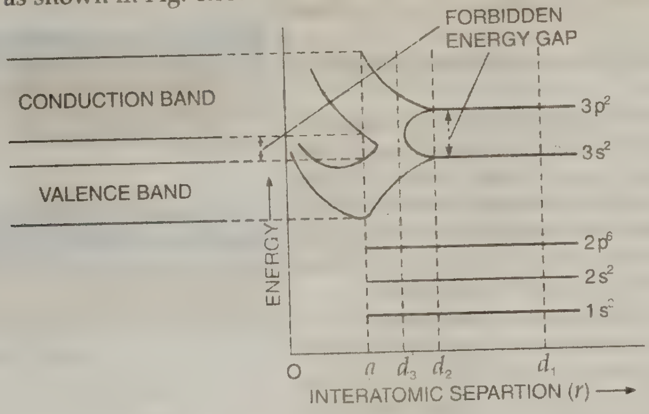


Fig. 1.05.

The outermost shell contains 2 electrons in 3 *s* subshell and 2 electrons in 3 *p* subshell. The 3 *s*-levels (all of the same energy) in the outermost shells of all the N atoms, which are 2 N in number are completely filled by 2 N electrons, while out of total 6 N *p*-levels (all of the same energy) in the outermost shells of N atoms, only 2 N are filled.

Suppose that the interatomic separation between the silicon atoms in the crystal lattice is a and these atoms are brought from the locations $r >> a$ to their actual location $r = a$ by gradually moving the atoms towards each other.

(*i*) When $r = d_1$. At this interatomic separation, electrons in the outermost shell of one atom do not interact with those of the other. Therefore, $r = d_1$, each of N atoms has its own typical energy levels *i.e.* energy levels 1 s^2, 2 s^2, 2 p^6, 3 s^2, 3 p^2 of each atom remain unmodified.

(*ii*) When $r = d_2$. When the interatomic separation is decreased from $r = d_1$, to $r = d_2$, the interaction between the electrons of different atoms in the outermost shells (3 s^2 and 3 p^2) begins. Due to this, the energy of 3 *s* and 3 *p* levels of each atom gets slightly modified, when they are at distance $r = d_2$. Therefore, instead of a single 3 *s* or 3 *p*-level, there occur a large number of closely spaced energy levels. Now, the 2 N *s*-levels will not have same energy but will be spread in small energy band. Similarly, 6 N *p*-levels will also be spread into a small energy band. Due to this, the energy gap between *s* and *p*-levels of an isolated atom reduces.

Watch out !

Energy levels and energy bonds are different terms. A single isolated atom has various energy levels. In a crystal, atoms are packed quite close to each other. Due to interaction between them, energy levels of individual atoms split and form energy bonds.

(*iii*) When $r = d_3$. When the interatomic separation is further decreased, then at $r = d_3$, the energy gap between 3 *s* and 3 *p*-levels completely disappears and all the 8 N levels (2 N of 3 *s*-levels and 6 N of 3 *p*-levels) are distributed in a continuous manner forming an energy band. Now, it is not possible to distinguish between 3 *s* and 3 *p* electrons. One can only say that there are 8 N energy levels, out of which 4 N levels are filled and 4 N levels are empty.

(*iv*) When $r = a$. When the silicon atoms are at the actual interatomic separation a, the energy of the band of 8 N levels splits into two bands, band of 4 N energy levels completely filled with electrons and another band of 4 N empty levels. These two energy bands are separated from each other with a small energy gap. The lower energy band of 4 N filled levels is called the ***valence band***, while the upper energy band of 4 N empty levels is called the ***conduction band***. The energy gap between the valence band and the conduction band is called the ***forbidden energy gap***.

1.11. DISTINCTION BETWEEN METALS, INSULATORS AND SEMI-CONDUCTORS

Metals are good conductors of electricity, insulators do not conduct electricity, while the semiconductors have conductivity inbetween those of metals and insulators. Let us make distinction between condutors, insulators and semiconductors on the basis of band theory of solids.

A solid is a large collection of atoms. The energy levels of an atom get modified due to the presence of other surrounding atoms and the energy levels in the outermost shells of all the atoms form valence band and the conduction band separated by a forbidden energy gap.

The energy band formed by a series of energy levels containing valence electrons is called ***valence band.***

At 0 K, the electrons start filling the energy levels in valence band starting from the lowest one. *The highest energy level, which an electron can occupy in the valence band at 0 K is called* ***Fermi level.***

The lowest unfilled energy band formed just above the valence band is called ***conduction band.***

At 0 K, the Fermi level as well as all the lower energy levels are completely occupied by the electrons. As the temperature rises, the electrons absorb energy and get excited. The excited electrons jump to the higher energy levels. These electrons in the higher energy levels are comparatively at larger distances from the nucleus and are more free as compared to the electrons in the lower energy levels. Depending upon the energy gap between valence band and the conduction band, the solids behave as conductors, insulators and semiconductors as explained below :

Key point

The resistance offered by a semiconductor decreases (in contrast to conducters) with the rise of temperature.

Key point

The conduction band of an insulator is practically empty.

(*a*) Metals. The energy band structure in solids have two possibilities :

(*i*) *The valence band may be completely filled and the conduction band partially filled with an extremely small energy gap between them* [Fig. 1.06 (*a*)]. For example, in sodium, the conduction band is partially filled, while the valence band is completely filled.

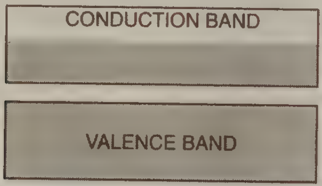

Fig. 1.06 (*a*)

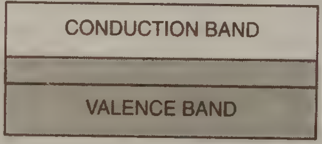

Fig. 1.06 (*b*)

(*ii*) *The valence band is completely filled and the conduction band is empty but the two overlap each other* [Fig. 1.06 (*b*)]. Zinc is an example of band overlap metals.

In both the situations, it can be assumed that there is a single energy band, which is partially filled. Therefore, on applying even a small electric field, the metals conduct electricity.

(*b*) Insulators. In insulators, the forbidden energy gap is quite large [Fig. 1.07]. For example, the forbidden energy gap for diamond is 6 eV, which means that a minimum of 6 eV energy is required to make the electron jump from the completely filled valence band to the conduction band. When electric field is applied across such a solid, the electrons find it difficult to acquire such a large amount of energy and so the conduction band continues to be almost empty. No electron flow occurs *i.e.* no current flows through such solids. So they behave as insulators.

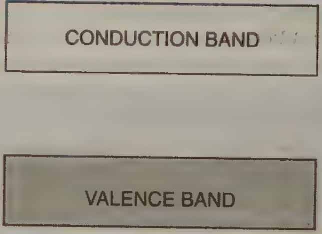

Fig. 1.07.

(*c*) Semiconductors. The energy band structure of the semiconductors is similar to the insulators but in their case ; the size of the forbidden energy gap is much smaller than that for the insulators [Fig. 1.08]. For example, the forbidden band for silicon is 1·1 eV. The electronic structure of the silicon (Si) is similar to that of the diamond, but due to the smaller width of the forbidden energy gap, the electrons in the valence band find it comparatively easier to shift to the conduction band. So, the conductivity of the silicon is inbetween the conductors and the insulators and it is termed as a semiconductor.

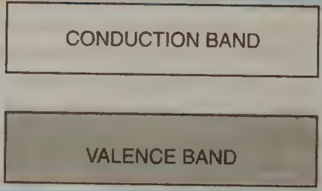

Fig. 1.08.

1.12. CURRENT CARRIERS IN SEMICONDUCTORS

In a pure semiconductor, each atom behaves as if there are 8 electrons in its valence shell (due to formation of covalent bonds) and therefore the entire material behaves as an insulator at low temperatures.

A semiconductor atom needs energy of the order of 1·1 eV to shake off the valence electron. This energy becomes available to the semiconductor even at room temperature. Due to thermal agitation of the crystal structure, electrons from a few covalent bonds come out. The bond from which electron is freed, a vacancy is created there [Fig. 1.09]. The vacancy in the covalent bond (where there should have been an electron) is called a ***hole*.**

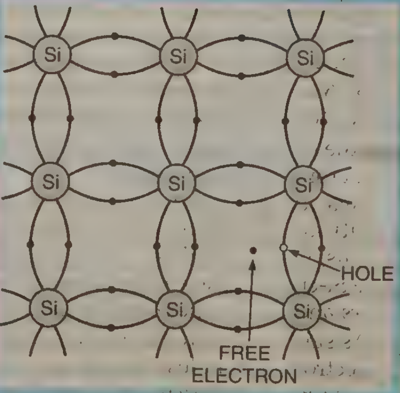

Fig. 1.09.

This hole can be filled by some other electron in a covalent bond. As an electron from a covalent bond moves to fill the hole, the hole is created in the covalent bond from which the electron has moved. In other words, one can say that the hole shifts from one covalent bond to another in a similar way as an electron does in an attempt to fill the hole. Since the direction of movement of the hole is opposite to that of negative electron, a hole behaves as a positive charge carrier. Thus, at room nperature, a pure semiconductor will have electrons and holes wandering in dom directions. These electrons and holes are called ***intrinsic carriers*** and such emiconductor is called ***intrinsic semiconductor.***

Key point

The width of forbidden energy gap between the valence and conduction band distinguishes conductors, semiconductors and insulators from each other.

As the crystal is electrically neutral, the number of free electrons will be equal the number of holes. If we apply potential difference across the semiconductor, e electrons will move towards positive terminal and the holes towards the negative minal of the battery. It may be clearly understood that *electrons and holes are not rrent in themselves but act only as the negative and positive carriers of the current pectively.*

In an intrinsic semiconductor, if $n_e^{(0)}$ denotes the electron number density in nduction band, $n_h^{(0)}$, the hole number density in valence band and n_i, the number nsity or concentration of intrinsic carriers, then

$$n_e^{(0)} = n_h^{(0)} = n_i \qquad \text{...(1.01)}$$

The jargon . . . .

A pure semiconductor is called intrinsic semiconductor. Its small conductivity is due to free electrons and holes created in it due to thermal agitation.

It can be proved that the fraction of the electrons of valence band present in nduction band is given by

$$f \propto e^{-E_g/kT}, \qquad \text{...(1.02)}$$

here k is Boltzmann's constant and E_g is forbidden energy gap. It follows that if e temperature (T) increases, the value of the fraction f will also increase *i.e.* when e temperature of a semiconductor increases, more electrons are raised to nduction band. In other words, the conductivity of the semiconductor increases ith rise in temperature of the semiconductor.

Key point

In an intrinsic semiconductor, the electron and hole concentrations are equal.

Further, when an electron is raised from the valence band to the conduction and, a vacancy is created in the valence band. This vacancy created in the valence and (where electron was present before moving to conduction band) acts as the ole.

1.13. INCREASING THE CONDUCTIVITY OF A SEMICONDUCTOR (Doping)

It follows that a pure semiconductor at room temperature possesses free lectrons and holes but their number is so small that conductivity offered by the ure semiconductor cannot be made of any practical use.

By the addition of impurities to the pure semiconductor in a very small ratio 1 : 10^6), the conductivity of a Si-crystal (or Ge-crystal) can be remarkably improved. *he process of adding impurity to a pure semi conductor crystal (Si or Ge-crystal) so as to nprove its conductivity, is called* ***doping.***

The jargon . . . .

A semiconductor doped with pentavalent or trivalent impurity atoms is called extrinsic semiconductor. Its conductivity is quite large as compared to that of intrinsic semiconductor.

The impurity atoms are of two types :

(i) Pentavalent impurity atoms *i.e.* atoms having 5 valence electrons such as ntimony (Sb) or arsenic (As). Such atoms, when added to a pure semiconductor, roduce excess of free electrons *i.e.* donate electrons to the semiconductor. For this eason, pentavalent impurity atoms are called ***donor impurity*** atoms. The emiconductor so produced is called ***n-type extrinsic semiconductor.***

(ii) Trivalent impurity atoms *i.e.* atoms having 3 valence electrons such as ndium (In) or gallium (Ga). Such atoms on being added to a pure semiconductor, nstead of producing free electrons, accept electrons from the semiconductor. For this reason, trivalent impurity atoms are called ***acceptor impurity*** atoms. The semiconductor so produced is called ***p-type extrinsic semiconductor.***

1.14. n-TYPE (EXTRINSIC) SEMICONDUCTOR

Fig. 1.10 shows the effect of adding pentavalent impurity arsenic to silicon crystal. When the arsenic impurity atoms are added to the silicon crystal in a small ratio (1 : 10^6), its atoms replace the silicon atoms here and there. The four electrons out of the five valence electrons of As-atom take part in covalent bonding with four silicon atoms surrounding it. The fifth electron is set free. Obviously, the extra free electrons created in the crystal will be as many as the number of the pentavalent impurity atoms added. As the pentavalent impurity increases the number of free electrons, it is called ***donor impurity***. The silicon crystal so obtained is termed as ***n-type*** Si-crystal. The electrons so set free in the silicon crystal are called ***extrinsic carriers*** and the *n*-type Si-crystal is called ***n-type extrinsic semiconductor.***

As said earlier, due to thermal agitation, even the pure Si-crystal possesses a few electrons and holes. Therefore, *n- type Si-crystal will have a large number of free electrons (majority carriers) and a small number of holes (minority carriers).*

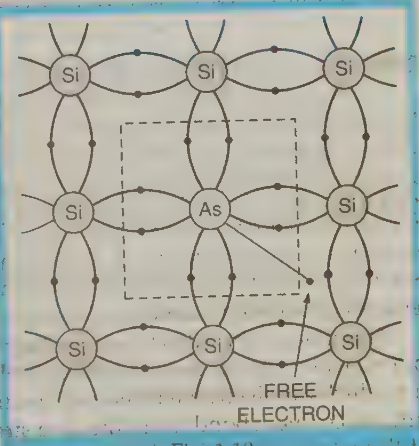

Fig. 1.10.

In the extrinsic *n*-type semiconductor, the fifth electron of the As-atom revolves around the donor atom inside the Si-crystal. As dielectric constant of silicon is very high, it is bound to the donor atom with a very small amount of energy, which is of the order of 0·045 eV. In terms of valence and conduction band, one can think that all such electrons (extrinsic carriers) create a ***donor energy level*** just below (0·045 eV) the conduction band as shown in Fig. 1.11. As the energy gap between donor energy level and the conduction band is very small, the electrons can easily raise themselves to conduction band even at room temperature. Hence, the conductivity of *n*-type extrinsic semiconductor is markedly increased.

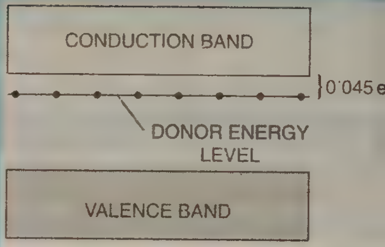

Fig. 1.11.

Key point

Fermi level is *n*-type semi-conducto (also knows as donor energy level) lies i forbidden energy gap and is very close t conduction band.

In a doped or extrinsic semiconductor, the number density of the conduction band (n_e) and the number density of holes in the valence band (n_h) differ from that in a pure semiconductor. If n_i is the number density of electrons in conduction band or the number density of holes in valence band in a pure semiconductor, then it can be proved that

$$n_e \, n_h = n_i^2 \qquad \text{...(1.03)}$$

In *n*-type (extrinsic) semiconductor, the number density of electrons in conduction band is approximately equal to that of donor atoms and very large as compared to number density of holes in valence band. Thus,

$$n_e \approx \mathrm{N}_d >> n_h, \qquad \text{...(1.04)}$$

where N_d represents the number density of donor atoms.

1.15. p-TYPE (EXTRINSIC) SEMICONDUCTOR

Fig. 1.12 shows the effect of adding trivalent impurity indium to silicon crystal. The four silicon atoms surrounding the In-atom, can share one electron each with the In-atom which has got three valence electrons. In an attempt to have 8 electrons in valence shell, the In-atom robs one of the nearby covalent bonds of one electron. Thus, the valence shell of the In-atom possesses 8 electrons but a hole is created in the covalent bond from which electron has been robbed. Thus, for every trivalent impurity atoms added, an extra hole will be created. As the trivalent impurity atoms accept electrons from the silicon crystal, it is called ***acceptor impurity.*** The Si-crystal so obtained is called ***p-type*** as it contains free holes. Each hole is equivalent to positive charge. The holes so created are ***extrinsic carriers*** and the ***p-type*** Si-crystal so obtained is called ***p-type extrinsic semiconductor.***

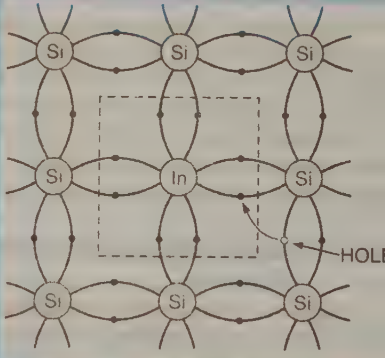

Fig. 1.12.

Again, as the pure Si-crystal also possesses a few electrons and holes, therefore, *the p-type Si-crystal will have a large number of holes (majority carriers) and a small number of electrons (minority carriers).*

In the extrinsic *p*-type Si-crystal, the hole produced revolves round the nucleus of the In-atom. As the hole may be treated as a particle of same mass as electron but having an equal positive charge, it possesses a small positive energy of the order of 0·04 eV. Such holes create an ***acceptor energy level*** just above (≈ 0·04 eV) the top of the valence band [Fig. 1.13]. The electrons from valence band can raise themselves to the acceptor energy level by absorbing thermal energy at room temperature and in turn create holes in the valence band.

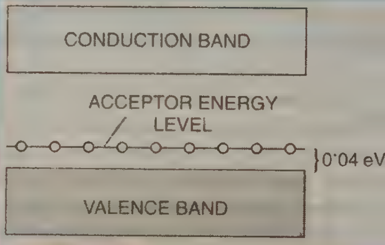

Fig. 1.13.

Key point

Fermi level in *p*-type semi-conductor (also known as acceptor energy level lie in forbidden energy gap and is very clos to valence band.

Number density of valence band holes (n_h) in *p*-type semiconductor is approximately equal to that of the acceptor atoms (N_a) and is very large as compared to the number density of conduction band electrons (N_e). Thus,

$$n_h \approx \mathrm{N}_a >> n_e \qquad \text{...(1.05)}$$

1.16. ELECTRICAL RESISTIVITY OF SEMICONDUCTORS

Consider a block of semiconductor of length *l*, area of cross-section A and having number density of electrons and holes as n_e and n_h respectively. Suppose that on applying a potential difference, say V, a current I flows through it as shown in Fig. 1.14. The electron current (I_e) and the hole current (I_h) constitute the current I flowing through the semiconductor *i.e.*

$$\mathrm{I} = \mathrm{I}_e + \mathrm{I}_h \qquad \text{...(1.06)}$$

If n_e is the number density of conduction band electrons in the semiconductor and v_e, the drift velocity of electrons, then electron current is given by

$$\mathrm{I}_e = e \, n_e \, \mathrm{A} \, v_e \qquad \text{...(1.07)}$$

Also, the hole current ,

$$\mathrm{I}_h = e \, n_h \, \mathrm{A} \, v_h \qquad \text{...(1.08)}$$

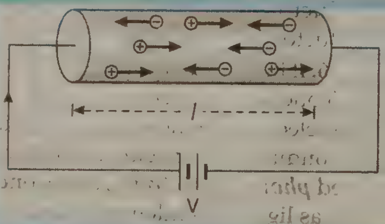

Fig. 1.14.

Using equations (1.07) and (1.08), the equation (1.06) becomes

$$I = e\, n_e\, A\, v_e + e\, n_h\, A\, v_h$$

or $$I = e\, A\,(n_e\, v_e + n_h\, v_h) \qquad \text{...(1.09)}$$

If ρ is the resistivity of the material of the semiconductor, then the resistance fered by the semiconductor to the flow of current is given by

$$R = \rho \frac{l}{A} \qquad \text{...(1.10)}$$

Since V = R I, from equations (1.09) and (1.10), we have

$$V = R\, I = \rho \frac{l}{A} \times e\, A\,(n_e\, v_e + n_h\, v_h)$$

or $$V = \rho\, l\, e\,(n_e\, v_e + n_h\, v_h) \qquad \text{...(1.11)}$$

If E is the electric field set up across the semiconductor, then

$$E = \frac{V}{l} \qquad \text{...(1.12)}$$

From equations (1.11) and (1.12), we have

$$E = \rho\, e\,(n_e\, v_e + n_h\, v_h)$$

or $$\frac{1}{\rho} = e\left(n_e \frac{v_e}{E} + n_h \frac{v_h}{E}\right) \qquad \text{...(1.13)}$$

Key point

For a given applied voltage, conduction current in *n*-type semiconductor is more than that in *p*-type semiconductor. It is because, mobility of electrons is greater than that of holes.

On applying electric field, the drift velocity acquired by the electrons (or holes) per unit trength of electric field is called ***mobility of electrons (or holes)***. Therefore, mobility f electrons and holes is given by

$$\mu_e = \frac{v_e}{E} \quad \text{and} \quad \mu_h = \frac{v_h}{E}$$

$$\therefore \qquad \frac{1}{\rho} = e\,(n_e\, \mu_e + n_h\, \mu_h) \qquad \text{...(1.14)}$$

Also, $\sigma = \frac{1}{\rho}$ is called conductivity of the material of semiconductor.

$$\therefore \qquad \sigma = e\,(n_e\, \mu_e + n_h\, \mu_h) \qquad \text{...(1.15)}$$

It may be pointed out that electron mobility is higher than hole mobility. The mobility of electrons and holes depend weakly on temperature and is independent of their number density. The change in conductivity of a semiconductor is mainly due to changes in carrier concentration.

1.17. SOME IMPORTANT POINTS ABOUT SEMICONDUCTORS

Following points may be noted about the behaviour of semiconductors :

1. At low temperature, a pure semiconductor behaves as an insulator. It becomes slightly conducting at room temperature. It is because, a few electrons in the valence band acquire energy greater than the forbidden energy gap and move to the conduction band.

2. It is very difficult to obtain an extremely pure semiconductor. Therefore, in practice, an intrinsic semiconductor is that in which the concentration of impurity atom is less than the concentration of intrinsic carriers.

3. Very small doping can drastically change the conductivity of intrinsic semiconductors.

4. Electron mobility is greater than the hole mobility in semiconductors.

5. The semiconductors are insulators at low temperature but become slightly conducting at room temperature. Thus, unlike metals, the resistance of semiconductors decreases with increase of temperature.

6. If light of energy greater than forbidden energy gap is incident on an intrinsic semiconductor, the electrons from the valence band move to the conduction band. Thus, electron and hole pairs are created. Due to increase in concentration of carriers, the conductivity of semiconductor increases. This property of semiconductors is called ***photoconductivity***. Semiconductors possessing large photoconductivity are used as light dependent resistors (LDR). Such resistors are used in automatic light control circuits.

Problem 1.01. Find the maximum wavelength of electromagnetic radiation, which can create a hole-electron pair in germanium. Given that forbidden energy gap in germanium is 0·72 eV.

Sol. Here, $E_g = 0\cdot72 \text{ eV} = 0\cdot72 \times 1\cdot6 \times 10^{-19}$ J

The maximum wavelength of radiation, which can create a hole-electron pair in germanium is given by

$$E_g = \frac{hc}{\lambda}$$

or $$\lambda = \frac{hc}{E_g} = \frac{6\cdot62 \times 10^{-34} \times 3 \times 10^{8}}{0\cdot72 \times 1\cdot6 \times 10^{-19}} = \mathbf{1\cdot724 \times 10^{-6}\ m}$$

Problem 1.02. Pure Si at 300 K has equal electron (n_e) and hole (n_h) concentration of 1·5 × 10^{16} m $^{-3}$. Doping by indium increases n_h to 4·5 × 10^{22} m^{-3}. Calculate n_e in the doped silicon. *(C.B.S.E 1990)*

Sol. Here, $n_i = 1\cdot5 \times 10^{16}$ m^{-3} ; $n_h = 4\cdot5 \times 10^{22}$ m^{-3}

Now, $n_e\, n_h = n_i^2$

$$\therefore \quad n_e = \frac{n_i^2}{n_h} = \frac{(1\cdot5 \times 10^{16})^2}{4\cdot5 \times 10^{22}} = \mathbf{5 \times 10^{9}\ m^{-3}}$$

Problem 1.03. A semiconductor is known to have an electron concentration of 8 × 10^{13} cm^{-3} and a hole concentration of 5 × 10^{12} cm^{-3}. (*a*) Is the semiconductor *n*-type or *p*-type ? (*b*) What is the resistivity of the sample, if the electron mobility is 23,000 cm^2 V^{-1}s^{-1} and hole mobility is 100 cm^2 V^{-1} s^{-1} ? Take charge on electron, *e* = 1·6 × 10^{-19} C. *(Text Problem)*

Sol. Here, $n_e = 8 \times 10^{13}$ m^{-3} = 18×10^{19} m^{-3} ;

$n_h = 5 \times 10^{12}$ cm^{-3} = 5×10^{18} m^{-2} ;

$\mu_e = 23{,}000$ cm^3 V^{-1} s^{-1} = $2\cdot3$ m^2 V^{-1} s^{-1} ;

$\mu_h = 100$ cm^2 V^{-1} s^{-1} = $0\cdot01$ m^2 V^{-1} s^{-1} ;

(*a*) Since the semiconductor has greater electr concentration, it is ***n*-type** semiconductor.

(*b*) Now, $$\frac{1}{\rho} = e\,(n_e\,\mu_e + n_h\,\mu_h)$$

$$= 1\cdot6 \times 10^{-19}\,(8 \times 10^{19} \times 2\cdot3 + 5 \times 10^{18} \times 0\cdot01)$$

$$= 1\cdot6 \times 10^{-19}\,(1\cdot84 \times 10^{20} + 5 \times 10^{16}) \approx 29\cdot45 \text{ mho m}$$

or $$\rho = \frac{1}{29\cdot45} = \mathbf{3\cdot396 \times 10^{-2}\ \Omega\ m}$$

Problem 1.04. Determine the number density donor atoms which have to be added to an intrins germanium semiconductor to produce an *n*-type semico ductor of conductivity 5 Ω^{-1} cm^{-1}, given that the mobili of electrons in *n*-type Ge is 3900 cm^2 V^{-1}s^{-1}. Neglect th contribution of holes to conductivity. Take charge o electron, *e* = 1·6 × 10^{-19} C .

Sol. Here, $e = 1\cdot6 \times 10^{-19}$ C ;

$\sigma = 5\ \Omega^{-1}$ cm^{-1} = $500\ \Omega^{-1}$ m^{-1} ;

$\mu_e = 3900$ cm^2 V^{-1} s^{-1} = $0\cdot39$ m^2 V^{-1} s^{-1}

Now, $\sigma = e\, n_e\, \mu_e$ (neglecting contribution of hole

$$\therefore \quad n_e = \frac{\sigma}{e\,\mu_e} = \frac{500}{1\cdot6 \times 10^{-19} \times 0\cdot39}$$

$$= \mathbf{8\cdot013 \times 10^{21}\ m^{-3}}$$

abc TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 1.05. The mean free path of conduction electrons in copper is about 4·2 × 10^{-8} m. Find the electric field which can give 2·4 eV energy (on the average) to a conduction electron in a copper block.

Sol. Let E be the required electric field. Then, force on electron due to electric field,

$$F = e\,E = 1\cdot6 \times 10^{-19}\ E$$

The work done by electric field on electron, before it collides with a copper ion/atom,

$$W = F \times \text{mean free path} = 1\cdot6 \times 10^{-19}\ E \times 4\cdot2 \times 10^{8}$$

$$= 6\cdot72 \times 10^{-27}\ E \text{ (in joule)} = \frac{6\cdot72 \times 10^{-27}\ E}{1\cdot6 \times 10^{-19}}$$

$$= 4\cdot2 \times 10^{-19}\ E \text{ (in eV)}$$

$$\therefore \quad 4\cdot2 \times 10^{-8}\ E = 2\cdot4 \quad \text{or} \quad \mathbf{E = 5\cdot71 \times 10^{7}\ V\ m^{-1}}$$

Problem 1.06. Suppose that the energy liberated in the combination of a hole-electron pair is converted into electromagnetic radiation. If the maximum wavelength of the radiation emitted is 630 m, what is the width of forbidden energy gap ?

Sol. The width of forbidden energy gap is equal to energy of the radiation emitted on the combination of a hole and an electron. Therefore,

$$E_g = \frac{hc}{\lambda} = \frac{6\cdot62 \times 10^{-34} \times 3 \times 10^{8}}{630 \times 10^{-9}} = 3\cdot152 \times 10^{-19}\ \text{J}$$

$$= \frac{3\cdot152 \times 10^{-19}}{1\cdot6 \times 10^{-19}} = \mathbf{1\cdot97\ eV}$$

Problem 1.07. In Fig. 1.14, a battery of e.m.f. 2 V is used The length of the block is 0·1 m and the area is 10^{-4}m^2 If the block is of intrinsic silicon at 300 K, find the electro and hole currents. What will be the magnitude of the tota current ? What will be the magnitude of the total current if germanium is used instead of silicon ?

Given that for Si : $\mu_e = 0\cdot135$ m^2 V^{-1}s^{-1} ;

$\mu_h = 0\cdot048$ m^2 V^{-1} s^{-1} ;

intrinsic carrier concentration, $n_i = 1\cdot5 \times 10^{16}$ m^{-3}

and for Ge : $\mu_e = 0\cdot39$ m^2 V^{-1} s^{-1} ;

$\mu_h = 0\cdot19$ m^2 V^{-1} s^{-1} ;

$n_i = 2\cdot4 \times 10^{19}$ m^{-3}. *(Text Problem)*

Sol. Here, A = 10^{-4} m^2 ; $l = 0\cdot1$ m ; V = 2 volt ; T = 300 K ;

For Si : $\mu_e = 0\cdot135$ m^2 V^{-1} s^{-1} ;

$n_i = n_e = n_h = 1\cdot5 \times 10^{15}$ m^{-3} ;

$\mu_h = 0\cdot048$ m^2 V^{-1} s^{-1}

Now, $$E = \frac{V}{l} = \frac{2}{0\cdot1} = 20 \text{ V m}^{-1}$$

Now, $v_e = \mu_e\, E = 0\cdot135 \times 20 = 2\cdot7$ m s^{-1}

and $v_h = \mu_h\, E = 0\cdot048 \times 20 = 0\cdot96$ m s^{-1}

Now, electron current.

$$I_e = e\,A\,n_e\,v_e = 1{\cdot}6\times10^{-19}\times10^{-4}\times1{\cdot}5\times10^{16}\times2{\cdot}7$$
$$= \mathbf{6{\cdot}48\times10^{-7}\ A}$$

and hole current, $I_h = e\,A\,n_h\,v_h$

$$= 1{\cdot}6\times10^{-19}\times10^{-4}\times1{\cdot}5\times10^{16}\times0{\cdot}96$$
$$= \mathbf{2{\cdot}304\times10^{-7}\ A}$$

Therefore, total current, $I = I_e + I_h$

$$= 6{\cdot}48\times10^{-7} + 2{\cdot}304\times10^{-7} = \mathbf{8{\cdot}784\times10^{-7}\ A}$$

For Ge : $\mu_e = 0{\cdot}39\ m^2V^{-1}s^{-1}$; $\mu_h = 0{\cdot}19\ m^2V^{-1}s^{-1}$;

$$n_e = n_h = n_i = 2{\cdot}4\times10^{19}\ m^{-3}$$

$$v_e = \mu_e\,E = 0{\cdot}39\times20 = 7{\cdot}8\ m\,s^{-1},$$
$$v_h = \mu_h\,E = 0{\cdot}19\times20 = 3{\cdot}8\ m\,s^{-1}$$

$\therefore$ $I_e = e\,A\,n_e\,v_e$

$$= 1{\cdot}6\times10^{-19}\times10^{-4}\times2{\cdot}4\times10^{19}\times7{\cdot}8$$
$$= \mathbf{2{\cdot}995\times10^{-3}\ A}$$

$I_h = e\,A\,n_h\,v_h$

$$= 1{\cdot}6\times10^{-19}\times10^{-4}\times2{\cdot}4\times10^{19}\times3{\cdot}8$$
$$= \mathbf{1{\cdot}459\times10^{-3}\ A}$$

$\therefore$ $I = I_e + I_h = 2{\cdot}995\times10^{-3} + 1{\cdot}459\times10^{-3}$

$$= \mathbf{4{\cdot}454\times10^{-3}\ A}$$

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. Crystalline substances have a sharp melting point. Why ?

Ans. It is because all the bonds in a crystal get ruptured at a unique fixed temperature for that crystal. At this fixed temperature, called melting point, the crystal changes into liquid state.

Q. 1.02. Fill in the blanks :

(*i*) Majority of the solids in nature have .... internal structure (ordered, disordered).

(*ii*) All crystals are .... (isotropic, anisotropic).

(*iii*) If the physical properties of a solid do not depend on the direction, the solid is known as .... (isotropic, anisotropic).

(*iv*) The polycrystalline solids show .... properties, while the monocrystals have .... properties. (isotropic, anistropic)

(*v*) Within the liquid crystal phase, some materials show a change in .... with the change in temperature. (colour, shape).

(*vi*) Physical properties of amorphous solids are identical in .... directions and therefore they are of .... nature. (all, some, isotropic, anisotropic).

(*vii*) The liquid crystal displays (LCD) are based on the principle that they .... (emit light, change the plane of polarisation of polarised light).

(*viii*) Ceramics are .... solids (polycrystalline, amorphous).

(*ix*) Ceramic solids are .... insulators (generally, always).

(*x*) The structure of NaCl is .... (cubic, hexagonal). (*Text Question*)

Ans. (*i*) ordered (*ii*) isotropic (*iii*) isotropic (*iv*) isotropic, anisotropic (*v*) colour (*vi*) all, isotropic (*vii*) change the plane of polarisation of polarised light (*viii*) polycrystalline (*ix*) generally (*x*) cubic

Q. 1.03. Name the seven crystal systems.

Ans. (*i*) Triclinic system (*ii*) Monoclinic system (*iii*) Rhombic system (*iv*) Tetragonal system (*v*) Trigonal system (*vi*) Hexagonal system and (*vii*) Cubic system.

Q. 1.04. What is the electron configuration in various orbits of silicon and germanium ?

Ans. *For silicon* : $1s^2\,2\,s^2\,2\,p^6\,3\,s^2\,3\,p^2$

For germanium : $1s^2\,2\,s^2\,2\,p^6\,3\,s^2\,3\,p^6\,3\,d^{10}\,4\,s^2\,4\,p^2$

Q. 1.05. Name the charge carriers in the following at room temperature : (*i*) Conductor (*ii*) Intrinsic semiconductor (*iii*) Insulator. (*I.S.C.E. 1997*)

Ans. (*i*) Electrons (*ii*) Electrons and holes (*iii*) None.

Q. 1.06. What is valence band ?

Ans. The energy band formed by a series of energy levels containing the valence electrons is known as valence band.

Q. 1.07. What is conduction band ?

Ans. The lowest unfilled energy band lying just above the valence band is called conduction band.

Q. 1.08. What is Fermi energy level ? (*P.S.S.C.E. 2002*)

Ans. The highest energy level, which an electron can occupy in the valence band at 0 K is called Fermi energy level.

Q. 1.09. Fill in the blanks :

(*i*) When two isolated atoms are brought close to each other such that the distance between them is .... (comparable to, much larger than) lattice spacing, the .... (energy bands, energy levels) of the outermost electrons is split into .... (very large, very small) number of levels, called .... (energy gap, energy bands).

(*ii*) The energy band in solids is an outcome of .... (Pauli's exclusion principle, Coulomb's law).

(*iii*) The forbidden energy gap in case of a semi-conductor is .... as compared to that of an insulator (smaller, greater).

(*iv*) The conduction band of an insulator is .... empty. (partially, practically). (*Text Question*)

Ans. (*i*) comparable to, energy levels, very large, energy bands (*ii*) Pauli's exclusion principle (*iii*) smaller (*iv*) practically.

Q. 1.10. Give the ratio of the number of holes and the number of conduction electrons in an instrinsic semiconductor. (C.B.S.E 1997)

Ans. It is 1.

Q. 1.11. Draw an energy-band diagram for an intrinsic semiconductor. (C.B.S.E 1998)

Ans. Refer to Fig. 1.08.

Q. 1.12. What is doping ? (*H.P.S.S.C.E. 2001, 1997 ; I.S.C.E. 1995*)

Ans. The process of adding trivalent or pentavalent atoms to a pure semiconductor in a very small ratio (1 : 10^6) is called doping.

Q. 1.13. What type of impurity is added to obtain *n*-type semiconductor ? (*H.P.S.S.C.E. 1999 S*)

Ans. Pentavalent atoms, such as arsenic.

Q. 1.14. Doping of silicon with indium leads to which type of semiconductor ? (*C.B.S.E. Sample Q. Paper*)

Ans. Doping of silicon with indium leads to *p*-type semiconductor.

Q. 1.15. What type of charge carriers are there in an *n*-type semiconductor ? (*C.B.S.E 1997*)

Ans. Both electrons and holes exist as charge carriers in an *n*-type semiconductor. However, electrons are majority charge carriers, while holes are minority charge carriers.

Q. 1.16. What type of charge carriers are there in a *p*-type semi-conductor ? (*H.S.S.C.E. 1999, 1998*)

Ans. Both holes (majority carriers) and electrons (minority carriers).

Q. 1.17. What is electron mobility ?

Ans. It is defined as the drift velocity acquired by the electrons per unit applied electric field.

Q. 1.18. Fill in the blanks :

(*i*) In an intrinsic semiconductor, the electron and hole concentrations are .... (equal, unequal)

(*ii*) When a block of semiconductor is connected to a battery by a metallic wire, the current flow in the wire is due to the motion of .... in the wire. (electrons, electrons and holes)

(*iii*) The doping of an intrinsic semiconductor with certain type of impurity atoms causes an .... in its electric conductivity. (decrease, increase)

(*iv*) When a battery is connected to a *p*-type semi-conductor with metallic wire, the current in the semi-conductor is predominantly due to .... (electrons, holes)

(*v*) The movement of charge carriers from a region of higher concentration is called .... (drift, diffusion)

(*vi*) The drift velocity of electrons is expected to be .... (equal to, greater than) holes. (*Text Question*)

Ans. (*i*) equal (*ii*) electrons (*iii*) increase (*iv*) holes (*v*) diffusion (*vi*) greater than.

Q. 1.19. What is an extrinsic semiconductor ? (*P.S.S.C.E. 2002, 1998, 1997*)

Ans. A semiconductor doped with a suitable impurit (donor or acceptor), so that it possesses conductivity muc higher than that of pure semiconductor, is called an extrinsi semiconductor.

Q. 1.20. Is the ratio of number of holes and the numbe of conduction electrons in an *n*-type extrinsic semicon ductor more than, less than or equal to 1 ? (*C.B.S.E 1997*

Ans. It is less than 1.

Q. 1.21. Draw energy-band diagram for an *n*-typ extrinsic semiconductor. (*C.B.S.E 1998*

Ans. Refer to Fig. 1.11.

Q. 1.22. Draw the energy band diagram for a *p*-typ seminconductor. (*C.B.S.E. 2001*

Ans. Refer to Fig. 1.13.

Q. 1.23. How does the energy gap of an intrinsi seminconductor vary, when doped with a trivalen impurity ? (*C.B.S.E. 2002*

Ans. When a trivalent impurity is added to an intrinsi semiconductor, an acceptor energy level is created in th forbidden energy gap just above the valence bond. Due t this, electrons from the valence bond are easily transferre to the acceptor energy level.

Q. 1.24. How does conductivity of a semiconducto change with rise in temperature ? (*C.B.S.E 1996 S*

Ans. The conductivity of a semiconductor increases wit temperature.

Q. 1.25. Fill in the blanks :

(*i*) As the temperature rises, the resistance offered b metals .... (increases, decreases)

(*ii*) The semiconductors are .... at absolute zero (conductors, insulators)

(*iii*) The resistance of semiconductors .... with increasing temperature. (decreases, increases) (*Text Question*

Ans. (*i*) increases (*ii*) insulators (*iii*) decreases.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS
With Answers/Hints

Q. 1.01. Distinguish between crystalline and amorphous solids.

Ans. Refer to sections 1.02 and 1.03.

Q. 1.02. What is the shape of the unit cell of a cubic and a hexagonal crystal system ?

Ans. The unit cells of a cubic crystal are cubic in nature *i.e.* $a = b = c$ and $\alpha = \beta = \gamma = 90°$.

The unit cells of a hexagonal crystal are made of three elementary cells, so as to form a hexagonal prism. Therefore, for its unit cell, $a = b \neq c$, $\alpha = \beta = 90°$ and $\gamma = 120°$.

Q. 1.03. What is the difference between a single crystal and a polycrystal ?

Ans. A single crystal is that in which the ordered arrangement of atoms (or molecules) extends throughout the piece of crystal. Its physical properties are different in different directions *i.e.* single cyrstals are ***anisotropic***.

On the other hand, the crystalline solids made of a large number of monocrystals (small sized single crystals) with well developed faces joined together are called polycrystals. They are *isotropic* in nature *i.e.* their physical properties are same in all directions.

Q. 1.04. Distinguish between energy levels and energy bands.

Ans. An isolated atom has various energy levels. In a crystal, atoms are so closely packed that due to interaction between them, splitting of energy levels takes place. The energy levels, then, form energy bands. The energy band formed by a series of energy levels containing the valence electrons is called valence band and the lowest unfilled energy band formed just above the valence band is called conduction band.

Q. 1.05. Distinguish between intrinsic and extrinsic semiconductors ? (*H.S.S.C.E. 2002*)

Ans. A semiconductor free from all types of impurities is called an intrinsic semiconductor. At room temperature, a few covalent bonds break up and the electrons come out. In the bonds, from which electrons come out, vacancies are created. These vacancies in covalent bonds are called *holes*.

n an intrinsic semiconductor, holes and electrons are equal n number and they are free to move about in the emiconductor. On the other hand, a semiconductor doped vith a suitable impurity (donor or acceptor) so that it ossesses conductivity much higher than that of pure emiconductor is called an extrinsic semiconductor. The xtrinsic semiconductor may be of n-type or p-type.

Q. 1.06. Distinguish between insulators, conductors nd semi-conductors in terms of their energy band diagram. *(I.S.C.E. 1998)*

Or

Give the energy band diagram for (*i*) insulators, (*ii*) netals and (*iii*) semi-conductors. *(H.S.S.C.E. 1998)*

Or

Draw a labelled energy band diagram for an insulator, conductor and a semi-conductor. *(I.S.C.E. 1994)*

Ans. Refer to Figs. 1.07, 1.06 and 1.08 respectively.

Q. 1.07. What is meant by doping ? Why is it done ? *(I.S.C.E. 1997)*

Ans. Doping. Refer to VSQ 1.12.

At room temperature, the number of free electrons and holes in a pure semi-conductor is so small that the conductivity offered by it is practically of no use. Doping is done so as to improve the conductivity of a semi-conductor.

Q. 1.08. What is meant by doping ? Draw energy band diagram of a n-type semiconductor. *(H.P.S.S.C.E. 1998 S)*

Ans. Doping. Refer to VSQ 1.12

For energy band diagram, refer to Fig. 1.11.

Q. 1.09. From consideration of energy, show that doping of n-type semiconductor can easily produce transport electrons. *(H.S.S.C.E. 1994)*

Ans. Refer to section 1.14.

Q. 1.10. Distinguish between n-type and p-type semiconductors. *(H.S.S.C.E. 2002)*

Ans. An n-type semiconductor contains a large number of free electrons and a small number of holes. On the other hand, a p-type semiconductor has a large number of holes and a small number of free electrons.

Q. 1.11. Distinguish between n-type and p-type semi-conductors on the basis of energy band diagram. *(C.B.S.E 1994)*

Ans. Refer to Figs. 1.11. and 1.13.

Q. 1.12. For an extrinsic semiconductor, indicate on the energy band diagram the donor and acceptor levels. *(C.B.S.E 1993)*

Ans. Refer to Figs. 1.11 and 1.13.

Q. 1.13. Draw the energy band diagram of a n-type semiconductor. How does the forbidden energy gap of an intrinsic semiconductor vary with increase in temperature ? *(C.B.S.E. 2002)*

Ans. For energy band diagram, refer to Fig. 1.13.

When temperature of a semiconductor is increased, a greater number of electrons are raised from valence to conduction band. It may be considered, as if the width of forbidden energy gap has decreased.

Q. 1.14. Draw the energy band diagram of a p-type semiconductor. How does the forbidden energy gap of an intrinsic semiconductor vary with increase in temperature ? *(C.B.S.E. 2002)*

Ans. For energy band diagram, refer to Fig. 1.11 and for answer to remaining part of the question, refer to SAQ 1.14.

Q. 1.15. What is the effect of rise in temperature on the resistance of conductors (metals) ?

Ans. The number of free electrons in metals is so large that they may be treated to behave as a dense electron gas in the metals. When the temperature increases, the kinetic energy of electrons also increases. With the increase in kinetic energy, the number of collisions between electrons themselves and between electrons and atoms or ions of the metal increases. This increases the resistance of the metal, due to which the conductivity decreases.

Q. 1.16. What is an intrinsic semiconductor ? Why the conductivity of intrinsic semiconductor increases with rise of temperature ? *(H.S.S.C.E. 1993)*

Ans. For intrinsic semi-conductor-refer to SAQ 1.05.

The fraction of the number of electrons raised from valence band to conduction band at temperature T is given by

$$f \propto e^{-E_g/kT},$$

where E_g is value of the forbidden energy gap. It follows that as T is increased, f also increases. The greater number of electrons in conduction band leads to the greater conductivity of the semiconductor.

Q. 1.17. How does the conductivity change with rise in temperature in case of semi-conductors ?

Ans. At 0 K, all semiconductors are insulators. The valence band at 0 K is completely filled and there are no free electrons in conduction band. At room temperature, due to their thermal energy, the electrons jump to the conduction band. When the temperature increases, a large number of electrons cross over the forbidden gap and jump from valence band to conduction band. Hence, conductivity of semiconductor increases with temperature.

Q. 1.18. Explain the effect of temperature variation on the resistivity of pure semiconductors. *(I.S.C.E. 1997)*

Ans. The variation in the resistivity of a pure semi-conductor is mainly due to change in carrier concentration. The fraction of the number of electrons raised from valence band to the conduction band is given by

$$f \propto e^{-E_g/kT}$$

It follows that as temperature (T) increases, the value of fraction f also increases *i.e.* conductivity of the semi-conductor increases. In other words, as temperature of the semi-conductor increases, its resistivity decreases.

Q. 1.19. Why is a semiconductor damaged by a strong current ? *(H.P.S.S.C.E. 1998 ; P.S.S.C.E. 1991)*

Ans. A strong current, when passed through a semiconductor, heats up the semiconductor and the covalent bonds break up. It results in a large number of free electrons. The material, then, behaves just as a conductor. As now the semiconductor no longer possesses the property of low conduction, it is said to be damaged.

TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 1.01. The amorphous substances do not melt at a sharp temperature ; rather they have a softening range. Explain this observation.

Ans. The amorphous substances possess short range order and the bonds between all the atoms and molecules are not of equal strength. On heating, the weak bonds get ruptured first and the stronger bonds later on. Owing to this, these substances do not have sharp melting points.

Q. 1.02. An *n*-type semiconductor has a large number of electrons but still it is electrically neutral. Explain.

Ans. An *n*-type semiconductor is obtained by doping pure Si or Ge-crystal with pentavalent impurity. As the impurity atoms enter into the configuration of the Si-crystal, its four electrons take part in covalent bonding, while the fifth electron is left free. Since each atom of the semiconductor as a whole is electrically neutral ; the *n*-type Ge-crystal, though having large number of free electrons, is electrically neutral.

Q. 1.03. What is donor energy level ? Explain.

Ans. In case of *n*-type Si-crystal, the free electron produced by the donor atom (As-atom) revolves round the nucleus of the donor atom. It possesses a very small negative energy (≈ 0·045 eV)as it is revolving in the background of Si-crystal (having a high value of dielectric constant). All such electrons create an energy level just 0·045 eV below the conduction band. The energy level created by such electrons is called donor energy level. As energy gap between donor energy level and conduction band is very small, electrons can easily cross it and the conductivity of the *n*-type semiconductor is greatly improved.

Q. 1.04. What is acceptor energy level ? Explain.

Ans. In case of *p*-type Si-crystal, the hole produced by th acceptor atom (In-atom) revolves around the nucleus o acceptor atom. As the motion of the hole around the nucleu is equivalent to the motion of a positively charged particle bu of the mass same as that of electron, it possesses a smal positive energy (≈ 0·04 eV). All such electrons create a energy level just 0·04 eV above the valence band. The energ level created by such electrons is called acceptor energy leve As the difference of energy between valence band and th acceptor energy level is very small, the electrons from valenc band can easily raise themselves to the acceptor energy leve It leads to an increase in the conductivity of the *p*-typ semiconductor.

Q. 1.05. What is the difference between hole-curren and electron flow ?

Ans. In a *p*-type semiconductor, there are vacancies calle holes. When such a material conducts, an electron from nearby covalent bond jumps into the vacant place in order t fill it and thereby the hole shifts to the covalent bond fron which the electron has jumped. The movement of hole constitutes the hole-current.

In an *n*-type semiconductor, the free electrons constitut the electron-current.

FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Explain, with neat diagram, formation of energy bands in solids. *(H.S.S.C.E. 1996, 1995)*
2. Draw the energy band diagrams of the following substances :
   (*a*) conductor (*b*) *n*-type semiconductor (*c*) *p*-type semiconductor (*d*) insulator. *(P.S.S.C.E. 1999 S)*
3. What is meant by energy bands in solids ? Draw labelled energy band diagrams to illustrate the behaviour of (*i*) a conductor ; (*ii*) a pure semi-conductor ; and (*iii*) an insulator. *(I.S.C.E. 1995)*
4. With the help of energy band diagrams, distinguish between the conductors, insulators and semiconductors. *(C.B.S.E 1999 S ; P.S.S.C.E. 1996 S)*
5. What is an intrinsic semiconductor ? Give one example. With the help of diagram, explain how you can convert an intrinsic semiconductor into an *n*-type extrinsi semiconductor.
6. What are intrinsic and extrinsic semiconductors ? Explai how an *n*-type semiconductor is obtained.
7. Explain, how an intrinsic semiconductor can be converte into (*i*) *n*-type and (*ii*) *p*-type semiconductor. Give on example of each and their energy band diagrams. *(C.B.S.E. 2001 S*
8. What is meant by doping ? Explain, how it changes th conductivity of the resulting extrinsic semiconductors.
9. What is an extrinsic semiconductor ? Discuss the workin of a donor type semiconductor. *(H.P.S.S.C.E. 1998 S*
10. Compare intrinsic and extrinsic semiconductors. *(P.S.S.C.E. 2002*

FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. Explain the formation of energy bands in solids and hence distinguish between conductors, semiconductors and insulators. *(H.P.S.S.C.E. 1997)*
2. How are energy bands formed in solid ? Explain the behaviour of conductors, insulators and semiconductors on the basis of energy bands. *(P.S.S.C.E. 2002, 2000, 1994 ; H.S.S.C.E. 2001)*
3. Explain the formation of energy bands in solids. Distinguish between conductors, extrinsic and intrinsic semiconductors and insulators on the basis of band theory. *(C.B.S.E 1994)*
4. Explain the formation of energy bands in solids. On th basis of the energy bands diagrams, distinguish betwee (*i*) a metal, (*ii*) an insulator and (*iii*) a semiconductor. *(C.B.S.E 1996, 1990*
5. What do you mean by doping ? State the necessar conditions for doping ? What are the various methods o doping ? *(P.S.S.C.E. 2002*
6. (*a*) Explain, with examples, the formation of energy band in solids.
   (*b*) For an extrinsic semiconductor, mark the donor an acceptor levels in the energy band diagram. *(C.B.S.E 1993*

7. Derive an expression for current through a semiconductor. Obtain expression for electrical resistivity and conductivity of a semiconductor. *(H.S.S.C.E. 2001, 1998 S)*
8. Using the concept of electron and hole current, derive expression for the conductivity of the semiconductor. *(H.P.S.S.C.E. 1999 S ; H.S.S.C.E. 1994)*
9. Derive expression for current through a semiconductor in terms of concentration and mobility of intrinsic carriers. Hence, obtain expression for electrical resistivity of a semiconductor.

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Conductivity of a semiconductor

1. Energy band gap of gallium arsenide phosphate is 1·98 eV. Calculate the wavelength of electromagnetic radiation emitted, when electrons and holes combine in this alloy semiconductor directly. **[Ans.** 6269 Å**]**
2. A semiconductor has equal electron and hole concentration of 6×10^8 m^{-3}. On doping with a certain impurity, electron concentration increases to 8×10^{12} m^{-3}. *(i)* Identify the new semiconductor obtained after doping. *(ii)* Calculate the new hole concentration. *(iii)* How does the energy gap vary with doping ? *(C.B.S.E. 2001)*
   [Ans. *(i) n*-type *(ii)* $4{\cdot}5 \times 10^4$ m^{-3} *(iii)* decreases**]**
3. A semiconductor has equal electron and hole concentrations of 2×10^8 m^{-3}. On doping with a certain impurity, the hole concentration increases to 4×10^{10} m^{-3}. *(i)* What type of semiconductor is obtained on doping ? *(ii)* Calculate the new electron concentration of the semiconductor. *(iii)* How does the energy gap vary with doping ? *(C.B.S.E. 2001)*
   [Ans. *(i) p*-type *(ii)* 10^6 m^{-3} *(iii)* decreases**]**
4. A semiconductor has the electron concentration of 8×10^{13} cm^{-3} and hole concentration 4×10^{12} cm^{-3}. Is this semiconductor *p*-type or *n*-type ? Also calculate the resistivity of this semiconductor. Given, electron mobility = 24000 cm^2 V^{-1} s^{-1} and hole mobility = 200 cm^2 V^{-1} s^{-1}. *(P.S.S.C.E. 2001)*
   [Ans. *n*-type, $3{\cdot}07 \times 10^{-11}$ S m^{-1}**]**
5. A semiconductor has the electron concentration 4×10^{12} cm^{-3} and hole concentration 7×10^{13} cm^{-3}. Is the semiconductor *n*-type or *p*-type ? Also calculate the conductivity of this semiconductor. Given, electron mobility = 22000 cm^2 V^{-1} s^{-1} and hole mobility = 150 cm^2 V^{-1} s^{-1}. *(P.S.S.C.E 2001)*
   [Ans. *p*-type, $1{\cdot}576 \times 10^{-12}$ S m^{-1}**]**
6. A semiconductor has the electron concentration $0{\cdot}45 \times 10^{12}$ m^{-3} and hole concentration 5×10^{20} m^{-3}. Find its conductivity. Given, electron mobility = 0·135 m^2 V^{-1} s^{-1} ; hole mobility = 0·048 m^2 V^{-1} s^{-1} ; $e = 1{\cdot}6 \times 10^{-19}$ C. *(P.S.S.C.E. 1995)* **[Ans.** 3·84 S m^{-1}**]**
7. Predict the effect on the electrical properties of a silicon crystal at room temperature, if every millionth silicon atom is replaced by an atom of indium. Given : concentration in Si-atoms = 5×10^{28} m^{-3} ; intrinsic carrier concentration, $n_i = 1{\cdot}5 \times 10^{16}$ m^{-3} ; μ_e for Si-crystal = 0·135 m^2 V^{-1} s^{-1} ; μ_h for Si-crystal = 0·048 m^2 V^{-1} s^{-1} ; intrinsic conductivity of Si = $4{\cdot}4 \times 10^{-4}$ S m^{-1} ; intrinsic resistivity of Si = 2300 Ω m.
   [Ans. σ = 384 S m^{-1} (becomes very large), ρ = 0·0026 Ω m (becomes very low)**]**
8. Estimate the fraction of electrons, which are excited from the energy band through an energy gap of 1·1 eV at a temperature of 300 K. What is the fraction at 600 K ? Given, Boltzmann's constant, $k = 1{\cdot}38 \times 10^{-23}$ J.
9. In an intrinsic semiconductor, the energy gap E$_g$ of an intrinsic semiconductor is 1·2 eV. Its hole mobility is very much smaller than electron mobility and is independent of temperature. What is the ratio between conductivity at 600 K and that at 300 K ? Assume that the temperature dependence of intrinsic carrier concentration n_i is expressed as

$$n_i = n_0\, e^{-E_g'/kT},$$

where n_0 is a constant and E$_g{}'$ is an energy equal to E$_g$/2. Given, Boltzmann's constant, $k = 8{\cdot}62 \times 10^{-5}$ eV K^{-1}.
[Ans. 10^5**]**

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. Proceed as in solved problem no. 1.01.
2. *(i) n*-type
   (ii) Proceed as in solved problem no. 1.02.
   (iii) Decreases.
3. *(i) p*-type
   (ii) Proceed as in solved problem no. 1.02.
   (iii) Decreases.
4. Proceed as in solved problem no. 1.03.
5. Proceed as in solved problem no. 1.03.
6. $\sigma = e\,(n_e \mu_e + n_h \mu_h)$

$$= 1{\cdot}6 \times 10^{-19}\,(0{\cdot}45 \times 10^{12} \times 0{\cdot}135 + 5 \times 10^{20} \times 0{\cdot}048)$$
$$\approx 1{\cdot}6 \times 10^{-19}\,(5 \times 10^{20} \times 0{\cdot}048) = \mathbf{3{\cdot}84\ S\ m^{-1}}$$

7. Number of indium atoms added to silicon crystal

$$= \frac{5 \times 10^{28}}{10^6} = 5 \times 10^{22}\ \text{m}^{-3}$$

Thus, hole concentration, $n_h = 5 \times 10^{22}$ m^{-3}

Now, electron concentration,

$$n_e = \frac{n_i^2}{n_h} = \frac{(1{\cdot}5 \times 10^{16})^2}{5 \times 10^{22}} = 4{\cdot}5 \times 10^9\ \text{m}^{-3}$$

Hence, conductivity of silicon crystal,

$$\sigma = e\,(n_e \mu_e + n_h \mu_h)$$
$$\doteq 1{\cdot}6 \times 10^{-19}\,(4{\cdot}5 \times 10^9 \times 0{\cdot}135 + 5 \times 10^{22} \times 0{\cdot}048)$$
$$= \mathbf{384\ S\ m^{-1}}\ \textbf{(becomes very large)}$$

Also, resistivity of silicon crystal,

$$\rho = \frac{1}{\sigma} = \frac{1}{384} = \mathbf{0{\cdot}0026\ \Omega\ m}\ \textbf{(becomes very low)}$$

8. Fraction of electrons, which are excited from the energy band through an energy gap E$_g$,

$$\frac{n_i}{n_0} = e^{-E_g/kT}$$

Here, E$_g$ = 1·1 eV = $1{\cdot}1 \times 1{\cdot}6 \times 10^{-19}$ J

Boltzmann's constant, $k = 1{\cdot}38 \times 10^{-23}$ J K^{-1}

At T = 300 K :

$$\therefore \frac{n_i}{n_0} = e^{-\frac{1\cdot1 \times 1\cdot6 \times 10^{-19}}{1\cdot38 \times 10^{-23} \times 300}} = e^{-42\cdot5} = \mathbf{3\cdot49 \times 10^{-19}}$$

At T = 600 K :

$$\therefore \frac{n_i}{n_0} = e^{-\frac{1\cdot1 \times 1\cdot6 \times 10^{-19}}{1\cdot38 \times 10^{-23} \times 600}} = e^{-21\cdot26} = \mathbf{5\cdot85 \times 10^{-10}}$$

9. $E_g' = E_g/2 = 1\cdot2/2 = 0\cdot6$ eV ; $k = 8\cdot62 \times 10^{-5}$ eV K^{-1}

$$\frac{n_i \text{ (at 600 K)}}{n_i \text{ (at 300 K)}} = \frac{n_0\, e^{-E_g'/k \times 600}}{n_0\, e^{-E_g'/k \times 300}} = e^{E_g'/k \times 600}$$

$$= e^{0\cdot6/8\cdot62 \times 10^{-5} \times 600} = e^{11\cdot6}$$

$$= 1{,}09{,}098 \approx \mathbf{10^5}$$

CHAPTER 2

Semiconductor Devices

2.01. FORMATION OF p-n JUNCTION

A *p-n* juntion is a basic semiconductor device.

When a *p*-type crystal is placed in contact with *n*-type crystal so as to form one piece, the assembly so obtained is called ***p-n junction*** or ***junction diode*** or ***crystal diode***. The surface of contact of *p* and *n*-type crystals is called ***junction***. In the *p*-section, holes are the majority carriers ; while in *n*-section, the majority carriers are electrons. Due to the high concentration of different types of charge carriers in the two sections, holes from *p*-region diffuse into *n*-region and electrons from *n*-region diffuse into *p*-region. In both cases, when an electron meets a hole, the two cancel the effect of each other and as a result, a thin layer at the junction becomes devoid of charge carriers. This is called ***depletion layer*** [Fig. 2.01]. The thickness of the depletion layer is of the order of 10^{-6} m.

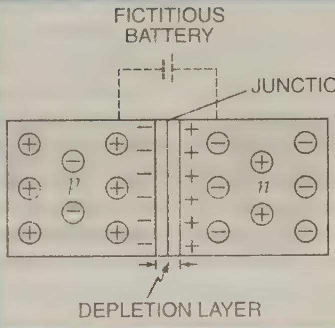

Fig. 2.01.

Key point

An *n*-type semiconductor has a large number of electrons and a *p*-type semiconductor, a large number of holes. But still both are electrically neutral.

Due to the diffusion of holes and electrons, the two sections of the junction diode no longer remain neutral. The *p*-section of the junction diode becomes slightly negative, while the *n*-section is rendered positive. It appears as if some fictitious battery is connected across the junction with its negative pole connected to *p*-region and positive pole connected to *n*-region. The potential difference developed across the junction due to migration of majority charge carriers is called ***potential barrier***. It opposes the further diffusion of charge carriers. The magnitude of the potential barrier is about 0·3 volt for germanium junction diode and about 0·7 volt for silicon junction diode. However, the value of potential barrier depends on the magnitude of doping of the semiconductor crystal.

It may be pointed out that across the junction, a very large electric field is set up due to potential difference developed across it. Taking width of the depletion layer of a silicon junction diode as 10^{-6} and a potential difference of 0·7 V set up across it, the strength of electric field is of the order of

$$E = \frac{0 \cdot 7}{10^{-6}} = 7 \times 10^{-5}\ \text{V m}^{-1}$$

Thus, the formation of *p-n* junction results in a very strong electric field (or potential gradient) across the junction.

2.02. FORWARD AND REVERSE BIASING ON A JUNCTION DIODE

A junction diode can be biased in the following two ways :

1. Forward Bias. *When an external d.c. source is connected to the diode with p-section connected to positive pole and n-section to the negative pole, the junction diode is said to be forward biased* [Fig. 2.02].

Action of p-n junction. When the *p-n* junction is forward biased, the positive holes in the *p*-section are repelled by positive pole of the battery towards the *p-n* junction. Simultaneously, the negative electrons in the *n*-section are repelled by negative pole of the battery towards the junction. However, the movement of electrons and holes across the junction is opposed by the fictious battery voltage (≈ 0·3 V to 0·7 V) developed across the junction. Just near the *p-n* junction, electrons and holes combine and cease to exist as mobile charge carriers after the potential barrier is overcome by the applied potential.

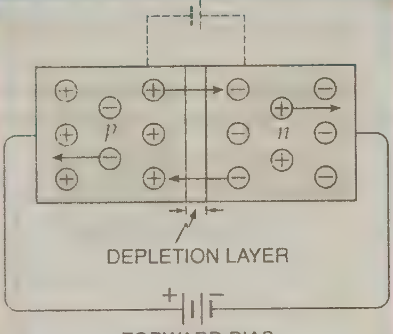

Fig. 2.02.

For each electron-hole combination that takes place near the junction, a covalent bond breaks in the *p*-section near the positive pole of the battery. Of the electron and the hole produced, the electron is captured by the positive terminal, while the hole moves towards the junction. On the other hand, as soon as the hole is created in the *p*-section due to the breaking of a covalent bond, an electron is released from the negative terminal of the battery into the *n*-section to replace the electron lost by the combination with a hole at the junction. These electrons move towards the junction, where they again get neutralised on meeting the new holes coming from left. As a consequence, a relatively large current, called ***forward current*** flows through the junction. The current in the external circuit is due to the electrons and is from negative terminal of battery to positive terminal through the junction diode.

As discussed above, during the forward bias, the applied *d.c.* voltage ***opposes*** the fictitious battery developed across the *p-n* junction. Due to this, the potential drop across the junction decreases and as a result, the diffusion of holes and electrons across the junction increases. It makes the ***depletion layer thin*** and as such, the junction diode offers ***low resistance*** during forward bias.

2. Reverse Bias. *When a battery is connected to junction diode with p-section connected to negative pole and n-section connected to the positive pole, the junction diode is said to be reverse biased* [Fig. 2.03].

Action of p-n junction. When the *p-n* junction is reverse biased, the holes (majority carriers) in the *p*-section get attracted towards the negative terminal of battery and therefore, the holes move away from the junction. At the same time, the electrons (majority carriers) in the *n*-section get attracted towards the positive terminal and move away from the junction. As a very small number of holes and electrons (minority carriers) are left in the vicinity of the junction, practically no flow of current takes place. However, due to thermally generated electron-hole pairs within *p*-region as well as *n*-region, a small current (≈ a few microamperes) still flows. Some covalent bonds always break because of the normal heat energy of the crystal molecules. Electrons liberated by this process in the *p*-region move to the left across the junction, while holes generated in the *n*-region move to the right under the electric field produced by the battery. Thus, a small electron-hole combination current, called ***reverse current*** is maintained by the ***minority carriers.*** If the reverse bias is made very high, all, the covalent bonds near the junction break and a large number of electron-hole pairs are liberated and the reverse current increases abruptly to a relatively high value. The maximum reverse potential difference, which a diode can tolerate without breakdown is called ***reverse break down voltage*** or ***zener voltage***. It is greater for Si than for the Ge. Its value depends upon the density of impurity atoms and may have a value of 1 or 2 volt to several hundred volt.

It may be pointed out that during the reverse bias, the applied d.c. voltage ***aids*** the fictitious battery developed across the junction. Due to this, the potential drop across the junction increases and as a result, the diffusion of holes and electrons across the junction decreases. It makes the ***depletion layer thick*** and the junction diode offers ***high resistance*** during reverse bias.

It may be noted that *the potential barrier opposes the forward current, while it aids the reverse current.*

Key point

When a *p-n* junction is forward biased, the width of depletion layer decreases. As a result, it offers low resistance during forward bias.

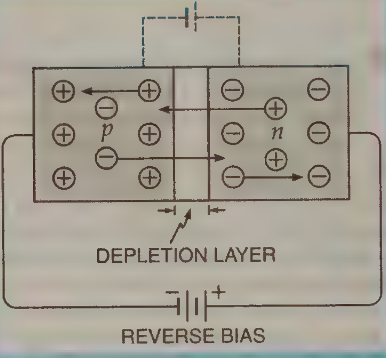

Fig. 2.03.

Key point

When a *p-n* junction is reverse biased, width of depletion layer increases. As a result, it offers high resistance during reverse bias.

2.03. CHARACTERISTICS OF A p-n JUNCTION

Let us now investigate as to how the current flows during forward and reverse bias of a junction diode and then draw the characteristics in the two cases.

Forward bias characteristic. The forward-bias connections of a *p-n* junction are as shown in Fig. 2.04 (*a*). The positive pole of the battery is connected to the *p*-section

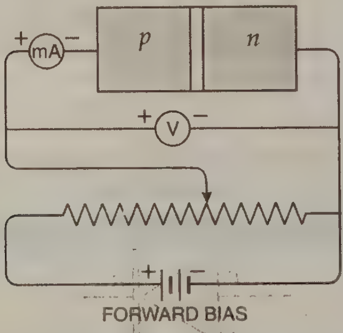

Fig. 2.04 (*a*)

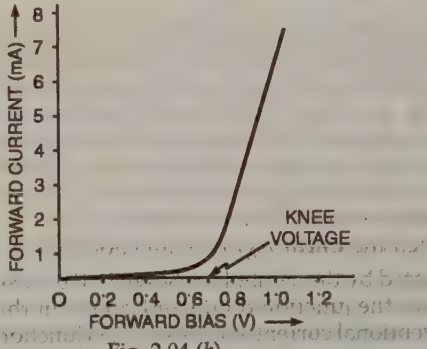

Fig. 2.04 (*b*)

and the negative pole to the *n*-section. In the beginning, when the applied forward bias is low, practically no current flows through the junction diode. It is because, the potential barrier (which is about 0·3V in case of Ge *p-n* junction and 0·7 V in case of Si *p-n* junction) opposes the applied voltage. Therefore, a small forward urrent flows, till the applied forward bias does not become greater than the otential barrier voltage. It is represented by portion OA of the graph between orward bias and the forward current [Fig. 2.04 (*b*)]. As soon as the forward bias ecomes greater than the potential barrier, the forward current increases almost nearly. The point A in the forward characteristic corresponding to the potential arrier appears like a ***knee*** and the forward voltage corresponding to knee point is called ***knee voltage***.

Thus, when a *p-n* junction is forward biased, the current increases linearly and apidly above the knee voltage and the variation in current with increase of forward ias is extremely slow below the knee voltage.

Further, when the *p-n* junction is forward biased, the depletion layer becomes ***hin.*** It is because, the polarity of the external d.c. source *opposes* the fictitious battery eveloped across the junction. As a result, the potential drop across the junction ecreases making the depletion layer thin. It leads to the ***low resistance*** of the junction iode during forward bias.

Key point

In a *p-n* junction, when forward bias is increased even slightly beyond the safe limit, it may get damaged. It is because, number of charge carriers in forward current is very large. Although charge carriers acquire very small kinetic energy and can produce a very small amount of heat, the total heat generated by all the carriers is good enough to rupture the covalent bonds.

Reverse bias characteristic. If the *p*-section is connected to negative terminal nd *n*-section to the positive terminal of the battery, the junction diode is said to be everse biased [Fig. 2.05 (*a*)]. When the *p-n* junction is reverse biased, the current ows due to minority charge carriers and hence a microammeter is used to measure he small current that flows during reverse bias. The reverse bias opposes the ajority carriers but makes the minority carriers to cross the *p-n* junction. Therefore, current of about 1-2 μA is obtained, on applying reverse bias to the *p-n* junction. t remains almost constant till the Zener voltage is reached and then it increases uddenly as shown in Fig. 2.05 (*b*).

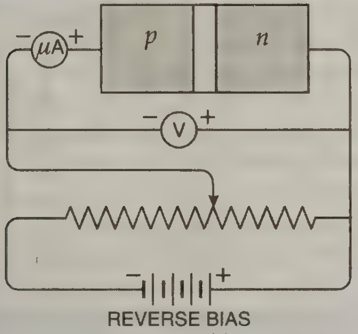

Fig. 2.05 (*a*)

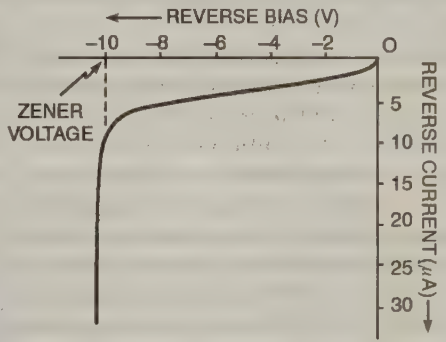

Fig. 2.05 (*b*)

When the *p-n* junction is reverse biased, the depletion layer becomes *thick*. It s because, the external d.c. source in this case ***aids*** the fictitious battery. It results n the increase of potential drop across the junction and the depletion layer appears hick. Because of the increased thickness of the depletion layer, the *p-n* junction offers ***igh resistance*** during reverse bias.

Key point

Static and dynamic resistances mean entirely different terms.

Dynamic resistance. Both the forward bias and reverse bias characteristics of he *p-n* junction have knees and hence Ohm's law is not obeyed. Therefore, the esistance offered by the junction diode depends upon the applied voltage.

The dynamic resistance of a junction diode is defined as the ratio of small change in oltage to the small change in current produced. It is also called ***a.c. resistance*** of the unction diode and is denoted by r_d.

Thus, $$r_d = \frac{\Delta V}{\Delta I} \qquad \text{...(2.01)}$$

The region of the characteristic curve, where dynamic resistance is almost ndependent of the applied voltage, is called the ***linear region*** of junction diode.

Note. 1. The junction diode is represented by the symbol as shown in Fig. 2.06. he arrow-head represents the *p*-section of the junction diode and points in the irection in which the hole current or conventional current will flow, when junction iode is forward biased. The electron current or the electronic current will flow in pposite direction.

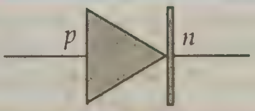

Fig. 2.06.

2. In practice, a Ge junction diode is preferred to Si junction diode. It is because, n case of Ge junction diode, the knee voltage is low (≈ 0·3 V) in comparison to that f Si junction diode (≈ 0·7 V).

2.04. JUNCTION DIODE AS RECTIFIER

An electronic device which converts a.c. power into d.c. power is called a rectifier.

The study of the junction diode characteristics reveals that the junction diode offers a low resistance path, when forward biased ; and a high resistance path, when reverse biased. This feature of the junction diode enables it to be used as a rectifier. The two half cycles of alternating input e.m.f. provide opposite kinds of bias to the junction diode. If the junction diode gets forward biased during first half cycle, it will get reverse biased during the second half cycle and vice-versa. In other words, when an alternating e.m.f. signal is applied across a junction diode, it will conduct only during those alternate half cycles, which bias it in forward direction.

2.05. HALF WAVE RECTIFIER

A rectifier, which rectifies only one half of each a.c. supply cycle, is called a half wave rectifier.

Principle. It is based on the principle that junction diode offers low resistance path, when forward biased ; and high resistance, when reverse biased. When a.c. input is applied to a junction diode, it gets forward biased during one half cycle and reverse biased during the next opposite half cycle. Thus, output is obtained during alternate half cycles of the a.c. input.

Arrangement. The a.c. supply is fed across the primary coil P of a step-down transformer. The secondary coil S of the transformer is connected to the junction diode and a load resistance R_L as shown in Fig. 2.07. The output d.c. voltage is obtained across the load resistance R_L.

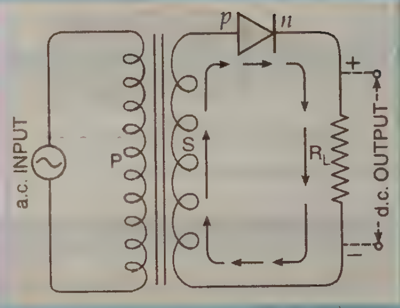

Fig. 2.07.

Theory. Suppose that during the first half of the input cycle, the junction diode gets forward biased. The conventional current will flow in the direction of the arrow-heads. The upper end of R_L will be at positive potential *w.r.t.* the lower end. The magnitude of output across R_L during first half cycle at any time will be proportional to the magnitude of current through R_L *i.e.* proportional to the number of majority carriers crossing the junction, which in turn will be proportional to the magnitude of forward bias and which ultimately depends upon the value of a.c. input at that time. Hence, during the first half of the input cycle, when junction diode conducts, output across R_L will vary in accordance with a.c. input.

During the second half cycle, junction diode will get reverse biased and hence no output will be obtained across R_L. Critically, a small current will flow due to minority carriers and a negligible output will be obtained during this half cycle also. During the next half cycle, output is again obtained as the junction diode gets forward biased. Thus, a half wave rectifier gives discontinuous and pulsating d.c. output across the load resistance as shown in Fig. 2.08. Thus, half wave rectification involves a lot of wastage of energy and hence it is not preferred.

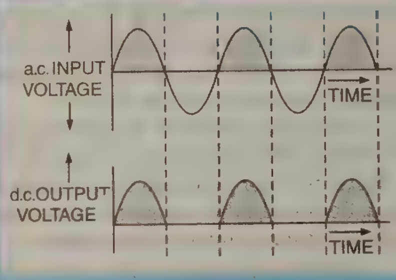

Fig. 2.08.

Note. A small current (≈ a few μA) flows during reverse bias due to minority carriers. As the output across R_L is negligible, the waveform corresponding to small current due to minority carriers has not been shown in Fig. 2.08.

2.06. FULL WAVE RECTIFIER

A rectifier which rectifies both halves of the a.c. input is called a full wave rectifier. To make use of both the halves of input cycle, two junction diodes are used.

Principle. It also works on the principle that a junction diode offers low resistance during forward bias and high resistance, when reverse biased. Here, two diodes are connected in such a manner that if one diode gets forward biased during first half cycle of a.c. input, the other gets reverse biased but when the next opposite half cycle comes, the first diode gets reverse biased and the second forward biased. Thus, output is obtained during both the half cycles of the a.c. input.

Arrangement. The a.c. supply is fed across the primary coil P of a step-down transformer. The two ends of the secondary coil S of the transformer are connected to the *p*-sections of the junction diodes D_1 and D_2. A load resistance R_L is connected across the *n*-sections of the two diodes and the central tapping of the secondary coil [Fig. 2.09]. The d.c. output will be obtained across the load resistance R_L.

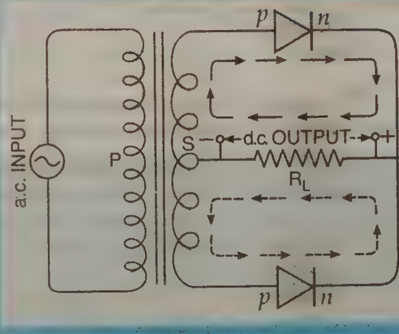

Fig. 2.09.

Theory. Suppose that during first half of the input cycle, upper end of S coil s at positive potential and the lower end is at negative potential. The junction diode D_1 will get forward biased, while the diode D_2 reverse biased. The conventional current due to the diode D_1 will flow along the path of full arrows.

When the second half of the input cycle comes, the situation will be exactly reverse. Now, the junction diode D_2 will conduct and the conventional current will flow along the path of the dotted arrows. Since, current during both the half cycles flows from right to left through the load resistance R_L, the output during both the half cycles will be of the same nature. The right end of the load resistance R_L will be at positive potential *w.r.t.* the left end. As discussed in case of half wave rectifier, the magnitude of output across R_L at any time will vary in accordance with the a.c. input as shown in Fig. 2.10.

Thus, in a full wave rectifier, the output is continuous but pulsating in nature. However, it can be made smooth by using a filter circuit.

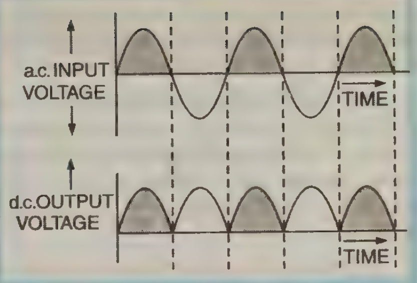

Fig. 2.10

2.07. DIFFERENTTYPES OF JUNCTION DIODES

Junction diodes are of many types and they have a wide range of applications in electronics. A few of them are discussed as below :

1. Zener diode. In the usual junction diodes, when the applied reverse bias increases a particular large value, the reverse current increases suddenly on increasing the reverse bias even slightly. This particular large value of reverse bias is called ***breakdown voltage***. An ordinary junction diode of low power rating will get destroyed on applying reverse bias above its break-down voltage.

*The specially designed junction diodes, which can operate in the reverse breakdown voltage region continuously without being damaged, are called **zener diodes**.*

A zener diode is represented by the symbol as shown in Fig. 2.11.

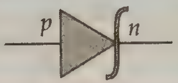

Fig. 2.11

Fig. 2.12 shows the use of zener diode in providing a constant voltage supply. This use of zener diode is based on the fact that in reverse break down (or zener) region, a very small change in voltage across the zener diode produces a very large change in the current through the circuit. If voltage is increased beyond zener voltage; the resistance of the zener diode drops considerably. Consider that the zener diode and a resistor R, called ***dropping resistor*** are connected to a fluctuating d.c. supply (say of a rectifier), such that the zener diode is reverse biased. Whenever voltage across the diode tends to increase, the current through the diode rises out of proportion and causes a sufficient increase in voltage drop across the dropping resistor. As a result, the output voltage lowers back to the normal value. Similarly, when the voltage across the diode tends to decrease, the current through the diode goes down out of proportion, so that the voltage drop across the dropping resistor is much less and now the output voltage is raised to normal.

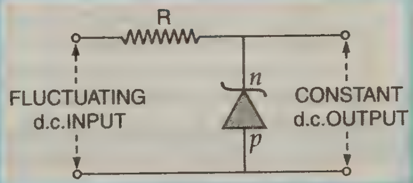

Fig. 2.12

2. Photodiode. In semiconductors, electrons are released from the valence band, when energy is supplied to such electrons. This energy can be supplied in the form of heat or through an accelerating voltage. Light energy can also be used to produce the current in semiconductors.

*A junction diode made from light (or photo) sensitive semiconductor is called **a photodiode**.* It is represented by the symbol as shown in Fig. 2.13 (*a*).

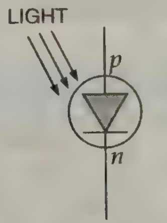

Fig. 2.13. (*a*)

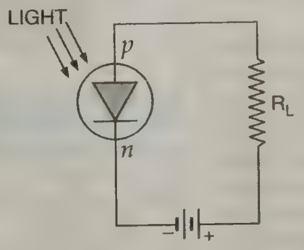

Fig. 2.13. (*b*)

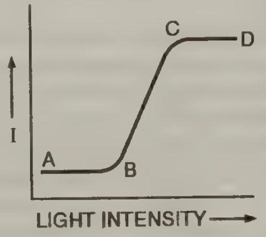

Fig. 2.13. (*c*)

If the photodiode is forward biased [Fig. 2.13 (*b*)], a certain current flows in the circuit as depicted by portion AB of the graph in Fig. 2.13 (*c*). The current AB, that flows when no light is incident, is called ***dark current***. When light of energy *hv* falls on the photodiode, more electrons from valence band move to conduction band, provided $h\nu$ is greater than forbidden energy gap. Due to this, current in the circuit increases. As the intensity of light is increased, the current goes on increasing as indicated by part BC of the graph. A stage comes, when current does not increase with increase in intensity of light and the photodiode is said to be saturated. Portion CD of the graph represents ***saturated current.***

3. Light Emitting Diodes (LED). When a junction diode is forward biased [Fig. 2.14], energy is released at the junction due to recombination of electrons and holes. In case of silicon and germanium diodes, the energy released is in infra-red region. In the junction diode made of gallium arsenide or indium phosphide, the energy is released in visible region. Such a junction diode is called a ***light emitting diode*** or **LED.**

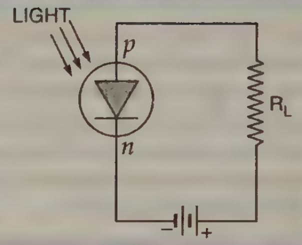

Fig. 2.14.

4. Solar cell. A junction diode, in which one of the p or n-section is made very thin (so that the light energy falling on the diode is not greatly absorbed before reaching the junction), can be used to convert light energy into electric energy. Such junction diodes are called ***solar cells.***

An important application of a solar cell is that a set of solar cells can be used to charge batteries in day time and then to use them during night as a source of electrical energy.

2.08. ADVANTAGES OF SEMICONDUCTOR DIODES OVER VACUUM DIODES

The properties of semiconductor diodes are similar to that of vacuum tube diodes. Following are the main advantages of semiconductor diodes over vacuum tube diodes :

Advantages. 1. There are no filaments in semiconductor diodes and hence no power is needed to heat them so as to cause the emission of electrons.

2. Since no heating is required, the semiconductor diodes are set into operation as soon as the circuit is switched on.

3. During operation, the semiconductor diodes do not produce any humming noise.

4. Semiconductor diodes require low voltage for their operation as compared to vacuum tubes. Thus, the power consumption in semiconductor diodes is very low.

5. Being very small in size, they are very compact.

6. They are shock proof.

7. They much less as compared to vacuum tubes.

8. They have unlimited life.

9. As no vacuum has to be created in semiconductor diodes, they have no vacuum deterioration trouble.

Drawbacks. The main drawbacks of semiconductor diodes is possibility of its breakdown due to rise of temperature and application of high voltage.

2.09. TRANSISTORS

A junction diode can not be used for amplifying a signal. For amplification, another type of semiconductor device called ***transistor*** is used. It is a ***three-section semiconductor.*** The three sections are combined, so that the two at extreme ends have the same type of majority carriers ; while the section that separates them, has the majority carriers of opposite nature. Therefore, a transistor can be n-p-n or p-n-p type. In other words, in an n-p-n transistor, the p-section is sandwitched between two n-sections [Fig. 2.15]. On the other hand, in a p-n-p transistor, the n-section is sandwitched between two p-sections [Fig. 2.16].

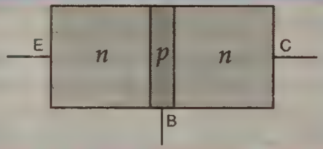

Fig. 2.15.

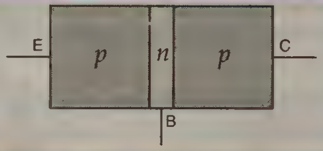

Fig. 2.16

The three sections of the transistor are called ***emitter*** **(E),** ***base*** **(B)** and ***collector*** **(C).** The base of a transistor is made thin and as it is comparatively lightly doped, the number density of majority carriers in the base is always lesser as compared to that in emitter or collector. The emitter supplies the majority carriers for current flow and the collector collects them. The base provides the junctions for proper interaction between the emitter and the collector. The emitter can be, thus, compared to cathode and collector with the plate in a triode valve. The base of the transistor can be compared with the grid of the triode valve, as it performs a function similar to it.

Symbol for transistors. In the symbol for a transistor, the arrow points hole current *i.e.* conventional current. Therefore, the emitter in n-p-n transistor is represented by an arrow pointing away from the base, while the emitter in p-n-p transistor is represented by an arrow pointing towards the base. The symbols for n-p-n and p-n-p transistors are respectively shown in Fig. 2.17 and Fig. 2.18.

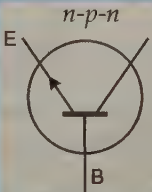

Fig. 2.17.

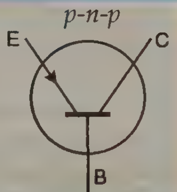

Fig. 2.18.

When a transistor is used in a circuit, the base-emitter junction is always forward biased and the base-collector junction is always reverse biased.

Key point

In a transistor, base is always thin and lightly doped.

2.10. ACTION OFTRANSISTOR

The action of both the types of transistors *i.e.* *n-p-n* and *p-n-p* is similar, except that the majority and minority carriers in the two cases are of opposite nature.

(*a*) Action of *n-p-n* transistor. Fig. 2.19 shows the proper biasing of an *n-p-n* transistor. The *n-type* emitter is forward biased by connecting it to negative pole of the battery V_{ee} (emitter-base battery) and *n*-type collector is reverse biased by connecting it to the positive pole of the battery V_{cc} (collector-base battery).

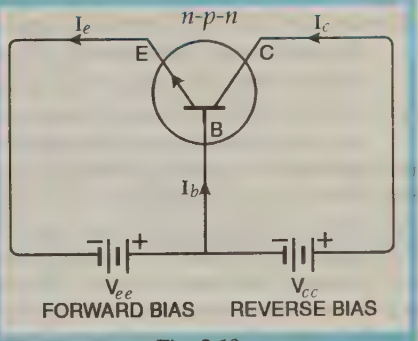

Fig. 2.19.

The majority carriers (which are electrons) in the emitter are repelled towards the base due to the forward bias. The base contains holes as majority carriers but their number density is small as it is doped lightly as compared to emitter or collector. Due to this, the probability of electron-hole combination in base region is very small (≈ 5%). Most of the electrons (≈ 95%) cross into collector region, where they are swept away by the positive terminal of the battery V_{cc} connected to the collector. Corresponding to each *electron that is swept by the collector and that enters the positive pole of the collector-base battery* V_{cc} *, an electron enters the emitter from the negative pole of the emitter-base battery* V_{ee} . Thus, in *n-p-n* transistors, the current is carried inside the transistor as well as external circuit by the electrons. If I_e , I_b and I_c are respectively the ***emitter current, base current*** and ***collector current,*** then

$$I_e = I_b + I_c$$

It may be pointed out that the arrows point in the direction of conventional current or hole current in spite of the fact that in the *n-p-n* transistor, the current is carried by electrons.

(*b*) Action of *p-n-p* transistor. The *p*-type emitter of a *p-n-p* transistor is forward biased by connecting it to positive pole of emitter-base battery V_{ee} and the *p*-type collector is reverse biased by connecting it to the negative pole of the collector-base battery V_{cc} as shown in Fig. 2.20.

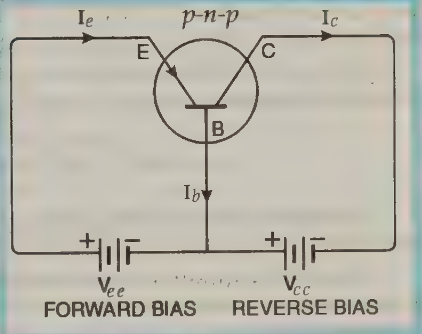

Fig. 2.20

In this case, majority carriers in emitter are holes and they are repelled towards the base due to the forward bias. As base is thin and lightly doped (very small as compared to collector and emitter), it has a low number density of electrons. When holes enter the base region, then only about 5% electron-hole combination takes place. Most of the holes (≈ 95%) reach the collector under the influence of reverse bias. As one hole reaches the collector, an electron leaves the negative pole of collector-base battery V_{cc} and combines with it. At the same time, an electron is released from some covalent bond in the emitter, creating a hole in the emitter. The electron so released, enters the positive pole of the emitter-base battery V_{ee}. Thus, current in *p-n-p* transistor is carried by holes and at the same time their concentration is maintained as explained above.

In this case also,

$$I_e = I_b + I_c$$

2.11. COMMON EMITTER CHARACTERISTICS OF A TRANSISTOR

Common emitter characteristics of a transistor are graphs that are obtained between voltage and current, when emitter is earthed, base is used as input terminal and collector as the output terminal.

Fig. 2.21 shows the experimental arrangement to study the common emitter

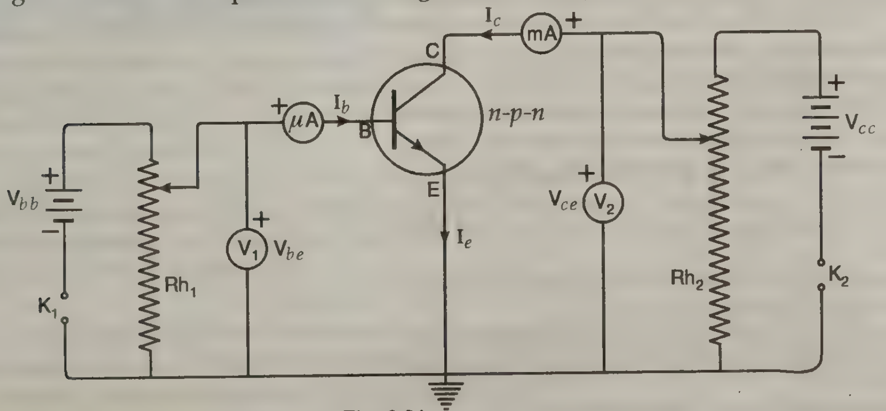

Fig. 2.21.

characteristics of an *n-p-n* transistor. The base-emitter junction is forward biased by using base-emitter battery V_{bb}, while the base-collector junction is reverse biased by using collector-emitter battery V_{cc}. The microammeter and voltmeter in base-emitter circuit measure base current (I_b) and the voltage between base and emitter (V_{be}). Similarly, milliammeter and voltmeter included in collector-emitter circuit measure the collector current (I_c) and voltage between collector and emitter (V_{ce}).

We shall study the following common emitter characteristics :

1. Input characteristics. *These are graphs between base voltage (V_{be}) and the base current (I_b) at different constant values of collector voltages (V_{ce}).*

Let us first plot input characteristic at $V_{ce} = 2$ V. For this, potential divider arrangement in emitter-collector circuit is adjusted, till the voltmeter connected in collector-emitter circuit reads 2 V. It will mean that the voltage between collector and emitter is 2 V *i.e.* collector is at + 2 V *w.r.t.* emitter of the transistor. Now, by making use of potential divider in emitter-base circuit, make base voltage zero. It will be noted that base current is also zero. Now, keeping collector voltage constant at 2 V, start increasing base voltage gradually. It will be found that the base current remains zero as long as the base voltage does not exceed barrier voltage ($\approx 0{\cdot}3$ V or so). As soon as the base voltage becomes greater than the barrier voltage, the current increases slowly and then suddenly to a large value as shown in Fig. 2.22. It is input characteristic at $V_{ce} = 2$ V.

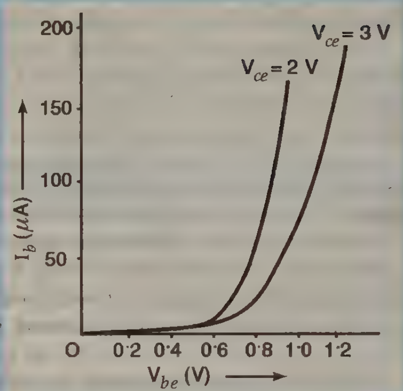

Fig. 2.22.

Similarly, we can draw input characteristic of the transistor at $V_{ce} = 3$ V and so on.

It may be noted that the nature of input characteristics is similar to the forward characteristics of a junction diode.

a.c. input resistance.* *The a.c. input resistance of the transistor in common emitter configuration is defined as the ratio of small change in base voltage to the small change produced in base current at constant collector voltage.* It is denoted by R_{in}.

If ΔV_{be} is small change in base voltage and ΔI_b, small change produced in base current at constant collector voltage V_{ce}, then

$$R_{in} = \left(\frac{\Delta V_{be}}{\Delta I_b}\right)_{V_{ce}} \qquad ...(2.02)$$

2. Output characteristics. *These are graphs between collector voltage (V_{ce}) and the collector current (I_c) at different constant values of base current (I_b).*

Let us first plot output characteristic at say $I_b = 5\,\mu$A. To do so, collector voltage is made zero and voltage between base and emitter is adjusted, till the microammeter in base-emitter circuit reads 50 μA. Now collector voltage is increased gradually and the corresponding collector current is noted. Take care that base current always remains steady at 50 μA. Then, graph between V_{ce} and corresponding values of I_c gives output characteristics at $I_b = 50\,\mu$A. Similarly, output characteristics can be obtained at $I_b = 100\,\mu$A, 200 μA, 300 μA..... . The output characteristic at different constant values of I_b will be as shown in Fig. 2.23.

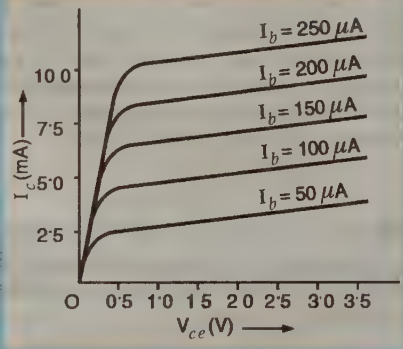

Fig. 2.23.

Following points may be noted about output characteristics :

(*i*) The collector current changes rapidly in beginning, but soon it becomes more or less independent of applied collector-emitter voltage.

(*ii*) For a given value of collector voltage, larger the base current, larger is the collector current.

(*iii*) In audiofrequency amplier circuits, the linear part of the output characteristics is used in order to obtain undistorted output.

a.c. output resistance. *The a.c. output resistance of the transistor in common emitter configuration is defined as the ratio of small change in collector voltage to the small change produced in collector current at constant base current. It is denoted by R_{out}.* Thus,

$$R_{out} = \left(\frac{\Delta V_{ce}}{\Delta I_c}\right)_{I_b} \qquad ...(2.05)$$

3. Transfer characteristics. *These are graphs between the collector current (I_c) and the base current (I_b) at different constant values of collector voltages (V_{ce}).*

Let us plot transfer characteristics at say $V_{ce} = 3$ V. For this, the potential divider arrangement in emitter-collector circuit is adjusted, so that the voltmeter connected in emitter-collector circuit reads 3 V. Now, by making use of potential divider arrangement in emitter-base circuit, the base-emitter voltage (V_{be}) is varied. Due to this, base current will change and consequently the collector current will change. Each time, the base current (I_b) and the corresponding value of the collector current (I_c) is noted. It is ensured that the collector-emitter voltage always remains 3 V. Then, the graph plotted between I_b and I_c is the transfer characteristic of the transistor at $V_{ce} = 3$ V [Fig. 2.24]. It will be found that the graph will be a straight line. It implies that the output current (I_c) varies linearly with the input current (I_b).

---

* a.c. input resistance should be distinguished from d.c. input resistance, $r_{in} = I_{be}/I_b$. It is never used in the analysis of amplifier circuit.

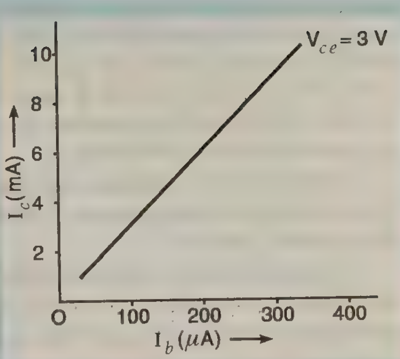

Fig. 2.24.

a.c. current gain. *It is defined as the ratio of change in collector current to the change in base current at constant collector voltage.* It is also called ***current transfer ratio*** and is denoted by β. Therefore,

$$\beta = \left(\frac{\Delta I_c}{\Delta I_b}\right)_{V_{ce}} \qquad ...(2.04)$$

2.12. TRANSISTOR AS AN AMPLIFIER

Like a triode valve, a transistor can also be used as an amplifier, oscillator, detector, etc. As already described, the emitter can be compared with the cathode, the base with the control grid and the collector with the plate of the triode valve. In a triode valve, whereas cathode is always common to input and output circuits ; in a transistor, any of the three sections can be made common to the input and output circuits. Thus, when a transistor is to be used as an amplifier, one may have following three types of the amplifier circuits :

1. ***Common base amplifier,***
2. ***Common emitter amplifier*** and
3. ***Common collector amplifier.***

We shall study only the common base and common emitter amplifiers.

Key point

Irrespective of the configuration (common base, common emitter or common collector), the emitter of a transistor is always forward biased and collector reverse biased.

2.13. COMMON BASE AMPLIFIER

In a common base amplifier, base of the transistor is common to emitter and collector. Let us now discuss the common base amplifier circuits using an *n-p-n* and a *p-n-p* transistor.

(*a*) Amplifier circuit using an *n-p-n* transistor. Fig. 2.25 shows the common base amplifier circuit using an *n-p-n* transistor. The base is made common to both the input and the output circuits.

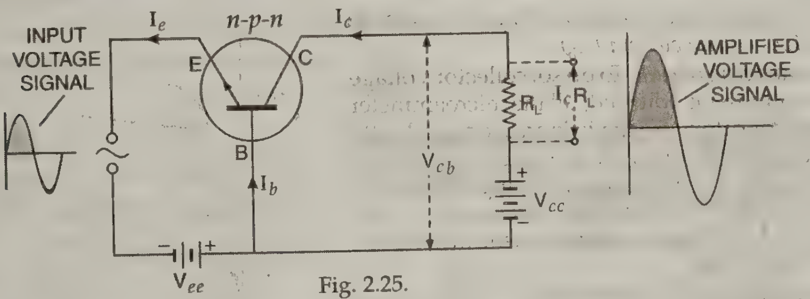

Fig. 2.25.

The emitter is forward biased by using emitter-bias battery V_{ee} and due to this, the resistance of input circuit (R_{in}) is small. The collector is reverse biased by using collector-bias battery V_{cc} and as a result, the resistance of output circuit (R_{out}) is quite large. Thus, $R_{out} > R_{in}$. The low input voltage signal is applied across emitter-base circuit (input circuit) and the amplified output is obtained across the collector and base (output circuit).

Let us assume that I_e, I_b and I_c represent emitter current, base current and collector current respectively, when the applied input signal voltage is zero. The arrows represent the direction of flow of hole current *i.e.* conventional current. According to Kirchhoff's law,

$$I_e = I_b + I_c$$

When current I_c flows in collector circuit, a potential drop equal to R_L will occur across the resistance connected in collector-base circuit and therefore, collector voltage *i.e.* voltage across the collector and base will be

$$V_{cb} = V_{cc} - I_c R_L \qquad ...(2.05)$$

When the input signal is applied in emitter-base circuit, it will change the emitter voltage. Due to this, emitter current will change, which in turn will change collector current and then in accordance with the above equation, the collector voltage will vary. The variation in collector voltage, when input signal is applied, appears as an amplified output.

Phase relation between input and output voltage signal. The output voltage signal obtained across base and collector* is in phase with the input voltage signal as explained below :

Suppose that the first half cycle of input voltage is positive. As the emitter is connected to negative pole of the battery V_{ee}, the first half cycle will reduce the emitter forward voltage. This will make emitter current to decrease and consequently the collector current will also decrease. The decrease in collector current will decrease potential drop across R_L and hence according to equation (2.05), the collector voltage will increase. Since collector is connected to positive pole of the battery V_{cc}, the increase in collector voltage means that collector will become more positive *i.e.* positive output half cycle will be obtained. Thus, *corresponding to positive half cycle of a.c. input, positive output half cycle will be obtained.*

Now, the second half cycle of a.c. input is negative. Therefore, it will make emitter more negative, *i.e.* forward bias will increase. Due to increase in forward bias, emitter current and hence collector current will increase. The increase in collector current will increase the potential drop across R_L. Then, according to equation (2.05), the collector voltage will decrease. As collector is connected to positive pole of the battery V_{cc}, the decrease in collector voltage will make collector less positive *i.e.* negative output half cycle will be produced. Thus, *corresponding to the negative half cycle of a.c. input, negative output half cycle will be produced.* Therefore, input and output voltage signals are in phase with each other as shown in Fig. 2.25, when in a common base amplifier, output is obtained across collector and base.

Self-test Question

The output signal obtained across R_L is out of phase with input signal in a common base amplifier. Explain, why.

a.c. current gain. *It is defined as the ratio of change in collector current to the change in emitter current at constant collector voltage.* It is denoted by α_{ac}.

$$\therefore \qquad \alpha_{cc} = \left(\frac{\Delta I_c}{\Delta I_e}\right)_{V_{cb}} \qquad ...(2.06)$$

a.c. voltage gain. *It is defined as the ratio of change in output voltage to the change in input voltage.* It is denoted by A_v.

Suppose that on applying an a.c. input signal, the input current changes by ΔI_e and correspondingly, the output current changes by ΔI_c. If R_{out} and R_{in} are the resistances of output and input circuits respectively, then

$$A_v = \frac{(\Delta I_c) R_{out}}{(\Delta V_e) R_{in}} = \frac{\Delta I_c}{\Delta I_e} \times \frac{R_{out}}{R_{in}}$$

$$\text{or} \qquad A_v = \alpha_{ac} \times \text{resistance gain,} \qquad ...(2.07)$$

where $\frac{R_{out}}{R_{in}}$ is called ***resistance gain.***

a.c. power gain. *It is defined as the ratio of change in output power to the change in input power.*

Therefore,

$$\text{a.c. power gain} = \frac{\text{change in output power}}{\text{change in input power}} = \frac{(\Delta I_c^2) R_{out}}{(\Delta I_e^2) R_{in}} = \frac{\Delta I_c^2}{\Delta I_e^2} \times \frac{R_{out}}{R_{in}}$$

$$\text{or a.c. power gain} = \alpha_{ac}^2 \times \text{resistance gain} \qquad ...(2.08)$$

(b) Amplifier circuit using *p-n-p* transistor. Fig. 2.26 shows the common base amplifier circuit using a *p-n-p* transistor. The polarities of emitter-bias battery V_{ee} and collector-bias battery V_{cc} are opposite to that in previous case so as to forward bias the emitter and to reverse bias the collector of the *p-n-p* transistor. The basic theory of the circuit making use of a *p-n-p* transistor remains the same as in case of an *n-p-n* transistor circuit. In this case also, the output voltage signal obtained across the collector and the base is in phase with the input voltage signal as explained below :

---

* The output voltage signal may be obtained across R_L. However, in that case, the input and output voltage signals will be out of phase with each other.

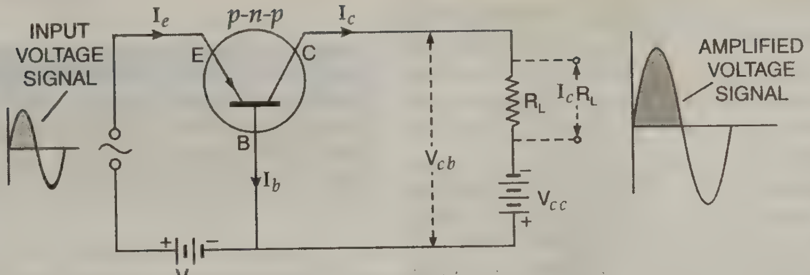

Fig. 2.26.

The first positive half cycle of the input signal increases the forward bias of the emitter. This will increase emitter current and hence the collector current. The increase in collector current will increase the potential drop across R_L and hence according to equation (2.05), the collector voltage will decrease. As collector is connected to negative pole of the battery V_{cc}, the decrease in collector voltage means that it has become less negative *i.e.* positive output signal will be produced. Thus, *corresponding to the positive output half cycle of a.c. input, positive output half cycle will be produced.*

Similarly, we can prove that *corresponding to the negative half cycle of a.c. input, the negative output half cycle will be produced.* Hence, input and output voltage signals are in phase with each other as shown in Fig. 2.26, when output is obtained across collector and base in a common base amplifier.

Note. For higher current and power gain, common emitter amplifier is used.

2.14. COMMON EMITTER AMPLIFIER

In a common emitter amplifier, the emitter of the transistor is common to base and collector. Let us now discuss common emitter amplifier using an *n-p-n* and a *p-n-p* transistor.

(*a*) Amplifier circuit using *n-p-n* transistor. Fig. 2.27 shows the common emitter amplifier circuit using an *n-p-n* transistor.

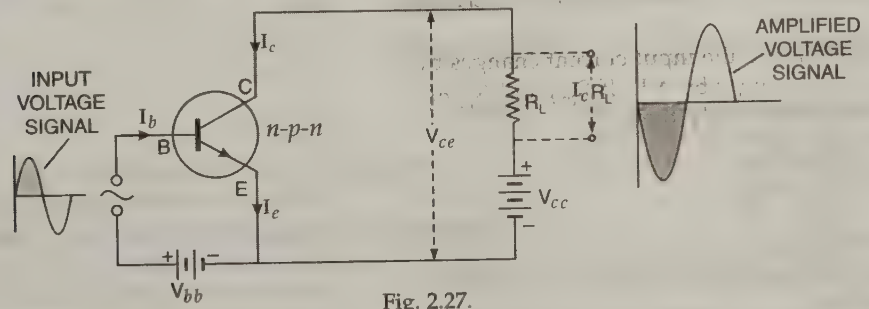

Fig. 2.27.

The emitter is common to both the input and output circuits. The emitter is forward biased by using base bias battery V_{bb} and due to the forward bias, the resistance of input circuit is low. The collector is reverse biased by using collector bias battery V_{cc}. The low input voltage signal is applied in base-emitter circuit (input-circuit) and the amplified output is obtained across the collector and emitter. The arrows point in the direction of the hole current or the conventional current.

The emitter current, base current and collector current are related to each other by the equation,

$$I_e = I_b + I_c \qquad \text{(according to Kirchhoff's first law)}$$

Also, corresponding to collector current I_{cc}, the collector voltage *i.e.* voltage across the collector and emitter will be

$$V_{ce} = V_{cc} - I_c R_L \qquad \text{...(2.09)}$$

The variation in input signal voltage causes variation in emitter current, which in turn produces change in collector current and hence in collector voltage. These variations in collector voltage appear as amplified output voltage.

Phase relation between input and output signals. The input voltage signal and output voltage signal* obtained across collector and emitter are out of phase with each other in common emitter amplifier as explained below :

Suppose that first half cycle of a.c. input voltage is positive. Referring to Fig. 2.27, as base is connected to the positive pole of the battery V_{bb}, it will make base more positive. Thus, negative forward bias of emitter will increase. It will increase the emitter current and hence the collector current. The increase in collector current will increase potential drop across R_L and then according to equation (2.09), the collector voltage V_{ce} will decrease. As collector is connected to positive pole of the battery V_{cc}, the decrease in collector voltage means that collector will become less positive *i.e.* negative output signal will be obtained. Thus, corresponding to positive half cycle of a.c. input, negative output half cycle will be obtained.

Similarly, we can prove that corresponding to negative half cycle of a.c. input, positive output half cycle will be obtained. Therefore, input and output voltage signals are out of phase with each other as shown in Fig. 2.27. From the operation of common emitter amplifier, it follows that a large collector current (output current) flows corresponding to a small base current (input current) in the circuit.

Self-test Question

In a common emitter amplifier, the output voltage signal obtained across R_L is in phase with input voltage signal. Explain, why.

a.c. current gain. *It is defined as the ratio of the change in collector current to the change in base current at constant collector voltage.* It is denoted by β_{ac}.

Therefore, $$\beta_{ac} = \left(\frac{\Delta I_c}{\Delta I_b}\right)_{V_{ce}} \quad \text{...(2.10)}$$

Its value is quite large as compared to 1 and lies between 15 to 50.

Transconductance. *It is defined as the ratio of change in collector current (output current) to the change in base voltage (input voltage) at constant collector voltage.* It is denoted by g_m.

Therefore, $$g_m = \left(\frac{\Delta I_c}{\Delta V_{be}}\right)_{V_{ce}} \quad \text{...(2.11)}$$

It can be expressed in another form as given below :

$$g_m = \frac{\Delta I_c}{\Delta V_{be}} \times \frac{\Delta I_b}{\Delta I_b} = \frac{\Delta I_c}{\Delta I_b} \times \frac{\Delta I_b}{\Delta V_{be}}$$

or $$g_m = \beta_{ac} \times \frac{1}{R_{in}} \quad \text{...(2.12)}$$

a.c. voltage gain. *It is the ratio of the change in output voltage to the change in input voltage.* It is denoted by A_v.

Suppose that on applying an a.c. input signal, the input current changes by ΔI_b and correpondingly, the output current changes by ΔI_c. Then,

$$A_v = \frac{(\Delta I_c) \times R_{out}}{(\Delta I_b) R_{in}} = \frac{\Delta I_c}{\Delta I_b} \times \frac{R_{out}}{R_{in}} \quad \text{...(2.13)}$$

or $$A_v = \beta_{ac} \times \text{resistance gain}$$

Since $\beta_{ac} > \alpha_{ac}$ a.c. voltage gain in common emitter amplifier is very large as compared to that in common-base amplifier.

From equations (2.12) and (2.13), it follows that

$$A_v = g_m R_{out} \quad \text{...(2.14)}$$

a.c. power gain. *It is the ratio of the change in output power to the change in input power.*

$$\text{a.c. power gain} = \frac{\text{change in output power}}{\text{change in input power}} = \frac{(\Delta I_c)^2 R_{out}}{(\Delta I_b)^2 R_{in}}$$

or $$\text{a.c. power gain} = \beta_{ac}^2 \times \text{resistance gain} \quad \text{...(2.15)}$$

As $\beta_{ac}^2 > \alpha_{ac}^2$, a.c. power gain in common emitter amplifier is extremely large as compared to that in case of common base amplifier.

(b) Amplifier circuit using *p-n-p* transistor. Fig. 2.28 shows the common emitter amplifier circuit using a *p-n-p* transistor. The polarities of base-bias battery

---

*The output voltage signal may be obtained across R_c. However in that case, the input and output voltage signals will be in phase with one other.

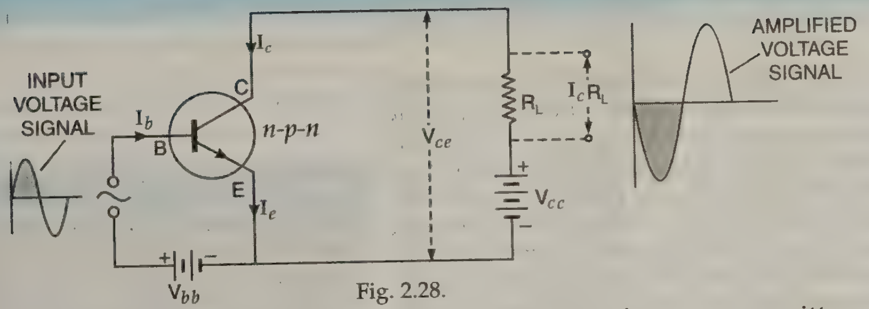

Fig. 2.28.

V_{bb} and collector-bias battery V_{cc} are opposite to those of a common emitter amplifier using *n-p-n* transistor. In this case also, the output signal obtained across the collector and emitter is out of phase with input signal applied across the base and emitter as explained below :

The first positive half cycle of a.c. input will make base less negative as the base is connected to negative pole of the battery V_{bb}. It is equivalent to say that emitter will become less positive. As the forward bias of emitter decreases, the emitter current will decrease, which in turn will decrease the collector current. As the collector current decreases, the potential drop across R_L will decrease and hence according to equation (2.09), the collector voltage V_{ce} will increase. As collector is connected to negative pole of the battery V_{cc}, the increase in collector voltage means that the collector will become negative *i.e.* negative output half cycle will be obtained.

Similarly, we can prove that corresponding to negative half cycle of a.c. input, positive output half cycle will be obtained.

Thus, we conclude that in a common emitter amplifier using *p-n-p* transistor also, *the output and input voltage will be out of phase by* 180° as shown in Fig. 2.28.

2.15. RELATION BETWEEN α AND β

For both the types of amplifier, we have

$$I_e = I_b + I_c$$

Dividing both sides of the above equation by I_c, we get

$$\frac{I_e}{I_c} = \frac{I_b}{I_c} + 1$$

But $\quad \alpha = I_c/I_e \quad$ and $\quad \beta = I_c/I_b$.

$$\therefore \quad \frac{1}{\alpha} = \frac{1}{\beta} + 1 \quad \text{or} \quad \frac{1}{\beta} = \frac{1}{\alpha} - 1 = \frac{1-\alpha}{\alpha}$$

$$\text{or} \quad \beta = \frac{\alpha}{1-\alpha} \qquad \text{...(2.16)}$$

The equation (2.16) is the relation between the current gains of common base and common emitter amplifiers.

Key point

The current gain in a common emmiter amplifier is very large as compared to that in case of a common base amplifier.

2.16. TRANSISTOR AS AN OSCILLATOR

Like a triode valve, a transistor can also be used to produce undamped electromagnetic oscillations. Fig. 2.29 shows the circuit for *p-n-p* transistor as an oscillator in common emitter configuration. The battery is connected in series with the high impedance coil L′ in collector-emitter circuit and a low impedance coil L

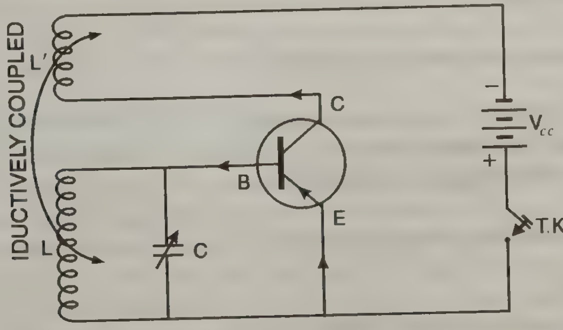

Fig. 2.29.

is connected in the emitter-base circuit. A variable capacitor C of suitable range connected in parallel to the coil L may be used to vary the frequency of the oscillations produced.

Working. When the tapping key (T.K.) is pressed, a very small collector current flows through the coil L′. As the coil L is inductively coupled to the coil L′, due to the change of current and hence change of magnetic flux through the coil L′, a small voltage is induced in the coil L. This small voltage produces a small current to flow in the emitter-base circuit. If due to the induced voltage so produced, the emitter gets *forward biased*, then the small emitter current causes a corresponding increase in the collector current (in a transistor, $I_e = I_b + I_c$). As the collector current rises, the growing magnetic flux linked with the coil L′ increases the induced voltage across the coil L, which in turn will further increase the forward bias of the emitter. This increases the emitter current and hence the collector current increases still further. In this way, the collector current through the coil L′ goes on increasing, till the induced e.m.f. across the coil L attains a saturation value.

Watch out !

The LC-oscillations are produced by the parallel combination of inductor and capacitor. The transistor only keeps amplitude of the oscillations constant by providing right amount of energy at right moment !

As the current reaches saturation value and stops changing, the magnetic flux also stops changing. The emitter current which was being sustained by the induced voltage in coil L begins to decrease, causing collector current to decrease as well. The decreasing collector current through coil L′ will induce voltage in the coil L in the reverse direction, which will further decrease the emitter current. This results in further decrease of the collector current. The 'inertia' of the collapsing flux carries the collector current below its normal value (in the absence of any emitter current).

As the current becomes minimum and stops changing, the magnetic flux also stops changing. In the absence of induced voltage, the collector current starts increasing to its normal value again, causing the induced emitter current once again. This marks the beginning of the next cycle and the process is repeated giving oscillations of constant amplitude because of the *feedback energy* to the L – C circuit proper phase. The frequency of the oscillations produced is given by

$$f = \frac{1}{2\pi\sqrt{LC}} \qquad \text{...(2.17)}$$

The frequency can be varied by changing capacitance of the variable capacitor.

2.17. ADVANTAGES OFTRANSISTORS

Transistors, because of their many merits over vacuum tubes, have practically completely replaced them in all the fields of electronics. Some of the advantages of the transistors over the vacuum tubes are as given below :

Advantages. 1. As transistors have no filaments, hence no power is needed to heat them to cause the emission of electrons.

2. Since no heating is required, transistors are set into operation as soon as the circuit is switched on.

3. During operation, transistors do not produce any humming noise.

4. Transistors require low voltages for their operation as compared to vacuum tubes.

5. Owing to their small sizes, the circuits involving transistors are very compact.

6. Transistors are shock proof.

7. Transistors are cheaper as compared to vacuum tubes.

8. Transistors have almost unlimited life.

9. As no vacuum has to be created in transistors, they have no vacuum deterioration trouble.

Whereas transistors enjoy a number of advantages over the vacuum tubes, they have following drawbacks which put limit on their use in electronic circuits :

Drawbacks. 1. Noise level is higher in transistors as compared to that in the vacuum-tubes.

2. Ordinary semiconductor devices cannot handle as much power as ordinary vacuum tubes can do.

3. In high frequency range, they have poor response.

4. The transistors are temperature-sensitive. The maximum temperature the transistors can withstand, is very low (≈ 50° C). Even a small over-heating spoils the transistor. This is because, at a higher temperature, the covalent bonds break up and the semiconductor piece forming the transistor becomes conducting.

2.18. INTEGRATED CIRCUITS (IC)

Microelectronics is the branch of electronics, which describes the technology that is used to produce electronic circuits of extremely small size, called ***microelectronic circuits*** or ***integrated circuits.*** Integrated circuits consist of whole systems rather than separate electronic components.

Fig. 2.30 (*a*) shows a thin slice of silicon crystal about 0·5 cm in thickness. It is called a ***silicon wafer.*** It may have diameter ranging between 0·25 cm to 10 cm.

Fig. 2.30 (*b*) shows a small part of such a silicon wafer of dimensions 50 mil × 50 mil.* This small portion of the wafer is called a ***silicon chip***. The various components such as resistors, inductors, capacitors, diodes, transistors, logic-gates, etc can be grown over such one silicon chip. For example, a transistor can be constructed in space A of dimensions 6·5 mil × 4 mil, a diode can be constructed in space B of dimensions 4·5 mil × 3 mil and a resistor can be constructed in the portion C of dimensions 12 mil × 2 mil. The components are connected internally to produce a desired circuit.

Fig. 2.30 (*c*) shows the mounting of the silicon chip into a casing. The pins are connected internally to the integrated circuits and the other ends of the pin are used to make external connections.

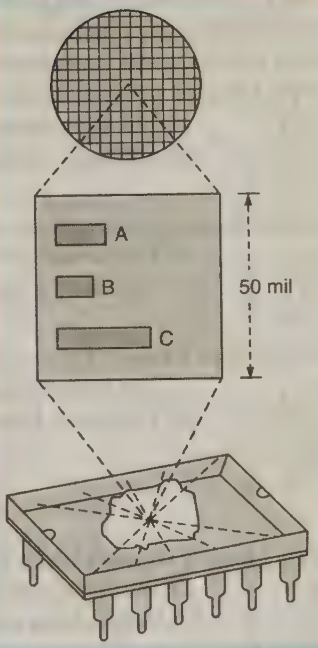

Fig. 2.30

Depending on the number of components fabricated on a chip, the integrated circuits are classified as below :

(i) Medium scale integrated circuits (MSI). Such integrated circuits have about 100 circuit components.

(ii) Large scale integrated circuits (LSI). They have more than 1000 circuit components.

Integrated circuits have following advantages over the conventional electronic circuits :

1. They are highly reliable.
2. They require very small space as compared to conventional electronic circuits.
3. They have lower total cost.

Today, integrated circuits are widely used in televisions, video cassette recorders and computers. Large scale availability of computers in the market has been made possible by the IC technology.

2.19. DIGITAL ELECTRONICS

So far, we have studied analog electronic circuits. In such circuits, the voltage signals vary continuously with time and such signals are called ***continuous*** or ***analog voltage signals***. Fig. 2.31 shows a typical voltage signal varying sinusoidally between 0 and 5 V.

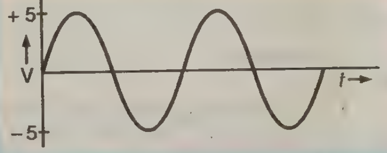

Fig. 2.31

The digital electronic circuits make use of entirely different type of voltage signals. In such signals, the pulse wave form does not vary continuously with time as in analogne voltage signal. Instead, it has only two voltage levels *i.e.* either zero or some constant value of voltage. Such voltage signals are called ***digital voltage signals.*** Fig. 2.32 shows a digital voltage signal, which at any instant will either be equal to 0 V or 5 V.

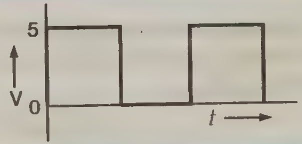

Fig. 2.32.

By representing these two voltage levels by binary numbers 0 and 1, the digital electronics has been developed. The counters, computers, etc are the outcome of digital electronics. We now first learn some elementary ideas about binary number system and then the logic gates, which are the basic building blocks of digital electronics.

2.20. BINARY NUMBER SYSTEM

The binary number system is a code that uses only two digits 0 and 1.

Just as the number next to 9 in decimal number system (0, 1, 2, 3, 4, 5, 6, 7, 8 and 9) is obtained by writing second digit (*i.e.* 1) followed by the first (*i.e.* 0) and it is called 10 ; the number next to 1 in binary number system (0, 1) is obtained by writing second digit (*i.e.* 1) followed by the first (*i.e.* 0) and it is called 10. In other words, the binary representation of decimal digit 2 is 10. Similarly, the decimal digit 3 is represented in binary number system as 11 and so on.

The binary representation of any decimal digit or number can be easily obtained by ***double dabble method***.

---

*The symbol mil stands for milli-inch. Thus, 1 mil = $2{\cdot}54 \times 10^{-3}$ cm.

Double dabble method. To represent a decimal number in binary number system by double dabble method, the following steps are involved :

Step I. Go on dividing the given decimal number by 2, until the quotient is zero.

Step II. Then, the remainders taken in reverse order (obtained in successive divisions) give the binary representation of the given decimal number.

To find binary representation of decimal number 2 :

$$\begin{array}{r|l} 2 & 2 \\ \hline 2 & 1-0 \\ \hline & 0-1 \end{array}$$

(*i*) The remainders in reverse order are 1 and 0.

(*ii*) Therefore, ***binary representation*** of the decimal number 2 is **10.**

To find binary representation of decimal number 3 :

$$\begin{array}{r|l} 2 & 3 \\ \hline 2 & 1-1 \\ \hline & 0-1 \end{array}$$

(*i*) The remainders in reverse order are 1 and 1.

(*ii*) Therefore, ***binary representation*** of the decimal number 3 is **11.**

To find binary representation of decimal number 4 :

$$\begin{array}{r|l} 2 & 4 \\ \hline 2 & 2-0 \\ \hline 2 & 1-0 \\ \hline & 0-1 \end{array}$$

(*i*) The remainders in reverse order are 1, 0 and 0.

(*ii*) Therefore, ***binary representation*** of decimal number 4 is **100.**

……………………………………………………………………………………

……………………………………………………………………………………

To find binary representation of decimal number 9 :

$$\begin{array}{r|l} 2 & 9 \\ \hline 2 & 4-1 \\ \hline 2 & 2-0 \\ \hline 2 & 1-0 \\ \hline & 0-1 \end{array}$$

(*i*) The remainders in reverse order are 1, 0, 0 and 1.

(*ii*) Hence, ***binary representation*** of decimal number 9 is **1001.**

To find binary representation of decimal number say, 37 :

$$\begin{array}{r|l} 2 & 37 \\ \hline 2 & 18-1 \\ \hline 2 & 9-0 \\ \hline 2 & 4-1 \\ \hline 2 & 2-0 \\ \hline 2 & 1-0 \\ \hline & 0-1 \end{array}$$

(*i*) The remainders in reverse order are 1, 0, 0, 1, 0 and i.

(*ii*) Hence, ***binary representation*** of decimal number 37 is **100101.**

The following points may be noted about the binary number system :

1. Each digit of binary number is called a ***bit.***

2. The first digit is called ***least significant bit*** **(LSB),** while the last digit is called ***most significant bit*** **(MSB).** For example, in binary number 110 ; 0 is LSB and 1 is MSB.

3. The binary representation of the decimal number 37 was found to be 10010. The decimal number 37 is represented $(37)_{10}$ and its binary representation is $(100101)_2$. Thus,

$$(37)_{10} = (100101)_2$$

4. In decimal number system, the multiplier of digit in unit place is 10^0, the multiplier of digit in tenth place is 10^1, the multiplier of digit in hundredth place is 10^2, and so on. In binary number system, base is 2. Therefore, in a binary number system, the multipliers of the bits are 2^0, 2^1, 2^2, ... starting from LSB, till MSB is reached. With the help of these multipliers, the decimal representation of a binary number can be easily found as explained in the following two examples :

To find decimal representation of binary number 110 :

$$\begin{pmatrix} 1 & 1 & 0 \\ \text{MSB} & & \text{LSB} \end{pmatrix}_2 = 1\times 2^2 + 1\times 2^1 + 0\times 2^0$$

$$= 4 + 2 + 0 = 6$$

Thus, ***decimal representation*** of binary number 110 is **6.**

To find decimal representation of binary number 10100 :

$$\left(\underset{\text{MSB}}{1}\ \ 0\ \ 1\ \ 0\ \ \underset{\text{LSB}}{0}\right)_2 = 1\times 2^4 + 0\times 2^3 + 1\times 2^2 + 0\times 2^1 \times 2^0$$

$$= 16 + 0 + 4 + 0 + 0 = 20$$

Thus, ***decimal representation*** of binary number 10100 is **20.**

2.21. LOGIC GATES

The logic gates are building blocks of digital electronics. They are used in digital lectronics to change one voltage level (input voltage) into another (output voltage) ccording to some logical statement relating them.

Thus, logic gate is a digital circuit, which works according to some logical relationship etween input and output voltages.

A logic gate may have one or more inputs, but it has only one output. The elation between the possible values of input and output voltages are expressed in he form of a table called ***truth table*** or ***table of combinations.***

Truth table of a logic gate is a table that shows all the input and output possibilities or the logic gate.

George Boole invented a different kind of algebra based on the binary nature f the logic. A logical statement can have only two values, such as **HIGH** or **LOW ; ON** or **OFF ; CLOSED** or **OPEN ; YES** or **NO ; TRUE** or **FALSE** ; etc. The two values f the logical statements are denoted by the binary numbers 1 and 0. The binary umber 1 is used to denote the HIGH value and the number 0 to denote the LOW alue. The logical statements that logic gates follow are called ***Boolean expressions.*** The three basic logic gates of digital electronics, called **OR gate, AND gate** and **NOT gate** follow the following Boolean expressions :

1. In Boolean algebra, the addition sign (+) is referred to as **OR.** The Boolean expression :

$$y = A + B \qquad \text{...(2.18)}$$

is read as y equals A **OR** B.

The OR gate is designed on the basis of Boolean expression (2.18).

2. The multiplication sign (.) is referred to as **AND** in Boolean algebra. The Boolean expression :

$$y = A\,.\,B \qquad \text{...(2.19)}$$

is read as y equals A **AND** B.

The AND gate is designed on the basis of Boolean expression (2.19),

3. The bar sign (–) is referred to as **NOT** in Boolean algebra. The Boolean expression :

$$y = \overline{A} \qquad \text{...(2.20)}$$

is read as y equals **NOT** A.

The NOT operation is also called ***negation*** or ***inversion.*** The NOT gate is designed on the basis of Boolean expression (2.20).

2.22. THE 'OR GATE'

The OR gate is a two inputs and one output logic gate. It combines the inputs A and B with the output y following the Boolean expression

$$y = A + B$$

i.e. y equals A OR B. The OR gate is represented by the symbol shown in Fig. 2.33 (*a*).

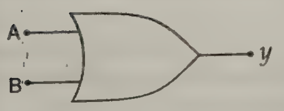

Fig. 2.33. (*a*)

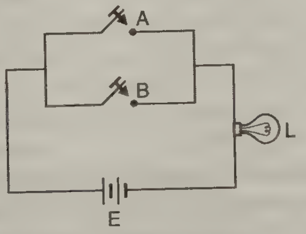

Fig. 2.33. (*b*)

A	B	y
0	0	0
1	0	1
0	1	1
1	1	1

Fig. 2.33. (*c*)

The various possible combinations of the inputs and output of the OR gate can be easily understood with the help of the electrical circuit shown in Fig. 2.33 (*b*). In this electrical circuit, a parallel combination of two switches A and B is connected to a battery and a lamp L.

The following inferences can be easily drawn from the working of the above electrical circuit :

(*a*) If both the switches A and B are **OPEN** (*i.e.* A = 0, B = 0), then the lamp will not glow (*i.e.* $y = 0$).

(*b*) If the switch A is **CLOSED** and B is **OPEN** (*i.e.* A = 1 and B = 0), then the lamp will glow (*i.e.* $y=1$).

(*c*) If the switch A is **OPEN** and B is **CLOSED** (*i.e.* A = 0 and B = 1), then the lamp will glow (*i.e.* $y=1$).

(*d*) If both the switches are **CLOSED** (*i.e.* A = 1, B = 1), then the lamp will glow (*i.e.* $y = 1$).

It follows that in the given electrical circuit, the lamps glows (or output is obtained) even when one of two switches is closed *i.e.* when switch A OR switch B is closed. For this reason, the electrical circuit shown in Fig. 2.33 (*b*) is called OR gate. The various possible input-output combinations for the given electrical circuit *i.e.* OR gate can be written the form of the table given in Fig. 2.33 (*c*). It is called ***truth table of OR gate.***

In practice, the OR gate is realised with the help of the electronic circuit using two diodes D_1 and D_2 as shown in Fig. 2.34. The two diodes play the roles of the switches A and B as explained below :

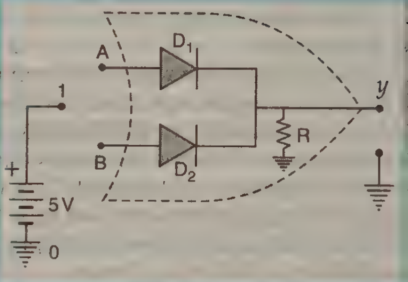

Fig. 2.34.

The input voltage that can be applied at A or B is either 0 or 5 V. There are following possible cases :

(*a*) **A = 0 and B = 0.** When the inputs A and B are connected to earth (0 V), both the diodes D_1 and D_2 do not conduct and hence no voltage develops across resistor and accordingly output y is 0.

(*b*) **A = 1 and B = 0.** When the input A is connected to the positive terminal of battery (5 V) and B is connected to earth (0 V), the junction diode D_1 conducts (as it gets forward biased) while the diode D_2 does not conduct (as it gets reverse biased). If the diodes are ideal ones, output y (due to conduction of diode D_1) will also be 5 V or 1. (In binary number system, the high level of voltage is represented as 1).

(*c*) **A = 0 and B = 1.** In this case, reverse of above will happen *i.e.* the diode D_1 will not conduct and D_2 will conduct. Obviously, the output will again be 5 V or 1.

(*d*) **A = 1 and B = 1.** When A and B are connected to positive terminal of the battery (5 V), both the diodes will conduct. Because the outputs of the two diodes obtained across resistor R are in parallel, the net output y will still be 5 V or 1.

Since input-output combinations of the electronic circuit shown in Fig. 2.34 are same as those of electric circuit shown in Fig. 2.33 (*b*), Fig. 2.33 (*c*) also represents the truth table of the OR gate realised with the help of the electronic circuit shown in Fig. 2.34.

2.23. THE 'AND GATE'

The AND gate is also a two inputs and one output logic gate. It combines the inputs A and B with the output y following the Boolean expression

$$y = A.B$$

i.e. y equals A AND B. The AND gate is represented by the symbol shown in Fig. 2.35 (*a*).

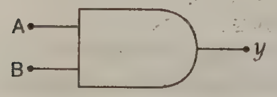

Fig. 2.35. (*a*)

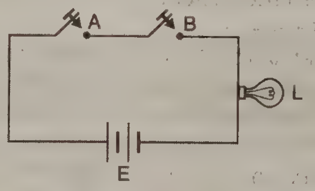

Fig. 2.35. (*b*)

A	B	y
0	0	0
1	0	0
0	1	0
1	1	1

Fig. 2.35. (*c*)

The various possible combinations of the inputs and the outputs of the AND gate can be easily found with the help of the electrical circuit shown in Fig. 2.35 (*b*). Here, a series combination of the switches A and B is connected to a battery and a lamp L. The following conclusions can be easily drawn from the working of the above electrical circuit :

(*a*) If both the switches A and B are **OPEN** (*i.e.* A=0, B=0), then the lamp will not glow (*i.e.* $y = 0$).

(*b*) If the switch A is **CLOSED** and B is **OPEN** (*i.e.* A=1, and B=0), then the lamp ill not glow (*i.e.* $y = 0$).

(*c*) If the switch A is **OPEN** and B is **CLOSED** (*i.e.* A = 0 and B = 1), then also ne lamp will not glow (*i.e* $y = 0$).

(*d*) If both the switches A and B are **CLOSED** (*i.e.* A = 1 and B = 1), then only ne lamp will glow (*i.e.* $y = 1$).

It follows that in the given electrical circuit, the lamp glows (or output is btained), only when both the switches are closed *i.e.* when switches A AND B are losed. For this reason, the electrical circuit shown in Fig. 2.35 (*b*) is called AND gate. he various possible input-output combinations for the given electric circuit *i.e.* AND ate can be written in the form of the table given in Fig. 2.35 (*c*). It is called ***truth able of AND gate.***

The AND gate can be realised by the electronic circuit making use of two ideal unction diodes D_1 and D_2 as shown in Fig. 2.36. The resistor R is connected to ositive terminal of a 5 V battery. The operation of AND gate can be discussed in ollowing four cases :

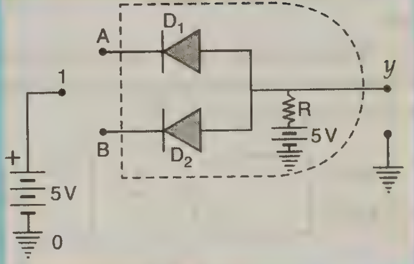

Fig. 2.36.

(*a*) **A = 0 and B = 0.** Both the diodes D_1 and D_2 get forward biased and hence onduct. The output y will be the voltage drop across D_1 or D_2. Since diodes are deal, no voltage drop occurs across the diodes. Hence, the output y is 0.

(*b*) **A = 1 and B = 0.** The diode D_2 will conduct and diode D_1 will remain idle. Now, output y is voltage across D_2 and hence it is 0.

(*c*) **A = 0 and B = 1.** The diode D_1 will conduct, while D_2 will not conduct. Now, utput y is voltage across D_1, which is 0.

(*d*) **A = 1 and B = 1.** Both the diodes will not conduct. The output y will equal attery voltage 5 V *i.e.* equal to 1.

Obviously Fig. 2.35 (*c*) represents the truth table of the AND gate realised with he electronic circuit as shown in Fig. 2.36.

2.24. THE 'NOT GATE'

The NOT gate is a one input and one output logic gate. It combines the input A with the output y following the Boolean expression

$$y = \overline{A}$$

.e. y NOT equals A. The way, the NOT gate gives the output, it is also called ***invertor.*** It is represented by the symbol as shown in Fig. 2.37 (*a*).

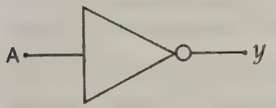

Fig. 2.37. (*a*)

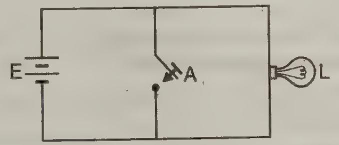

Fig. 2.37. (*b*)

A	y
0	1
1	0

Fig. 2.37. (*c*)

The possible input and output combinations of a NOT gate can be easily discussed with the help of the electrical circuit as shown in Fig. 2.37 (*b*). Here, the switch is connected in parallel to the lamp and the battery. The following conclusions can be easily drawn from the working of the above electrical circuit :

(*a*) If the switch A is **OPEN** (*i.e.* A = 0), the lamp will glow (*i.e.* $y = 1$).

(*b*) If the switch A is **CLOSED** (*i.e.* A = 1), the lamp will not glow (*i.e.* $y = 0$).

It follows that in the given electrical circuit, the lamp glows (or output is obtained), when the switch A is NOT closed. For this reason, the electrical circuit shown in Fig. 2.37 (*b*) is called NOT gate. The two possible input-output combinations can be written in the form of the table as shown in Fig. 2.37 (*c*). It is called ***truth table of the NOT gate.***

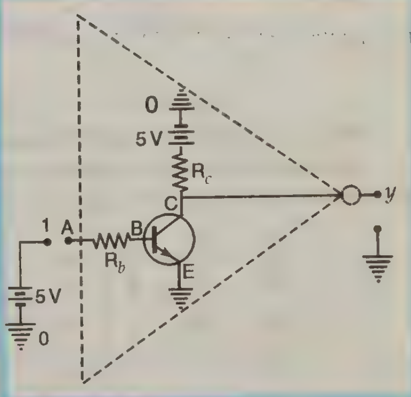

Fig. 2.38.

The NOT gate can be realised by making use of a transistor [Fig. 2.38]. The base (B) of the transistor is connected to A through a resistor R_b, while the emitter (E) is earthed. The collector is earthed through a resistor R_c and a 5 V battery. The operation of NOT gate can be discussed in following two cases :

(*a*) **A = 0.** The base of the transistor also gets earthed. Therefore, base-emitter junction is not forward biased. Since the base current is zero, the collector current is also zero. The transistor is said to be in ***cut-off mode.*** The output y will be equal to the voltage of battery connected to collector *i.e.* 5 V. In other words, when A = 0, $y = 1$.

(*b*) **A = 1.** The base-emitter junction gets forward biased and it leads to a large collector current.* The transistor is said to have gone to ***saturation***. The voltage drop across the resistor R_c is just equal to 5 V and the output y is very nearly 0.

Obviously, Fig. 2.37. (*c*) represents the truth table of the NOT gate achieved by making use of the electronic circuit shown in Fig. 2.38.

2.25. COMBINATION OF GATES

Various combinations of three basic gates *i.e.* OR, AND and NOT give rise to complicated digital circuits. We now discuss a few combinations of these basic gates using their symbols :

1. The NAND gate. *It is a logic circuit in which AND gate is followed by a NOT gate.*

If the ouput (y') of AND gate is connected to the input of NOT gate [Fig. 2.39 (*a*)], the gate so obtained is called NAND gate. The logic symbol of the NAND gate is as shown in Fig. 2.39 (*b*).

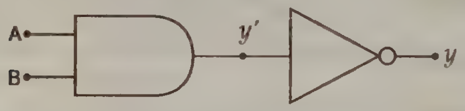

Fig. 2.39. (*a*)

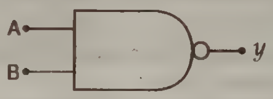

Fig. 2.39. (*b*)

The truth table of NAND gate can be obtained by combining the truth tables of AND and NOT gates. It will be as given in Fig. 2.40 (*a*).

A	B	y'	y
0	0	0	1
1	0	0	1
0	1	0	1
1	1	1	0

Fig. 2.40. (*a*)

A	B	y
0	0	1
1	0	1
0	1	1
1	1	0

Fig. 2.40. (*b*)

The same is equivalent to the truth table given in Fig. 2.40 (*b*).

Boolean expression for the NAND gate is

$$y = \overline{A . B} \qquad ...(2.21)$$

2. The NOR gate. *It is a logic circuit in which OR gate is followed by a NOT gate.* If the output (y') of OR gate is connected to the input of a NOT gate [Fig. 2.41 (*a*)], the gate so obtained is called the NOR gate.

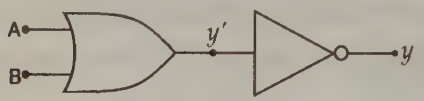

Fig. 2.41. (*a*)

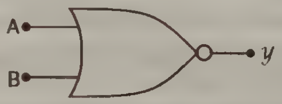

Fig. 2.41. (*b*)

The logic symbol of the NOR gate is shown in Fig. 2.41 (*b*).

The truth table of NOR gate can be obtained by combining the truth tables of OR and NOT gates given in Fig. 2.42 (*a*).

A	B	y'	y
0	0	0	1
1	0	1	0
0	1	1	0
1	1	1	0

Fig. 2.42. (*a*)

A	B	y
0	0	1
1	0	0
0	1	0
1	1	0

Fig. 2.42. (*b*)

---

*The values of resistors R_b and R_c are so selected.

It is equivalent to the truth table given in Fig. 2.42 (*b*). Boolean expression for the NOR gate is

$$y = \overline{A + B} \qquad ...(2.22)$$

2.26. THE NAND GATE–BUILDING BLOCK IN DIGITAL CIRCUITS

The different gates can be obtained by the repeated use of the three basic gates *i.e.* OR, AND and NOT gates. The repeated use of the NAND gate* can produce all the three basic gates. Thus, in digital circuits, NAND gate serves as a building block. Now, we proceed to show how the repeated use of the NAND gate can produce OR, AND and NOT gates.

Self-test Question ?

Explain, how the repeated use of NOR gate can produce all the three basic gates.

1. To produce NOT gate by using NAND gate. Suppose that the two inputs of the NAND gate are joined, so that it has one input [Fig. 2.43 (*a*)].

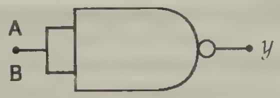

Fig. 2.43. (*a*)

A	B	y
0	0	1
1	1	0

Fig. 2.43. (*b*)

Setting B = A in the truth table of NAND gate, we obtain the truth table as given in Fig. 2.43 (*b*). Since it is the truth table of the NOT gate, it follows that *a NAND gate functions as the NOT gate, when its two inputs are joined.*

2. To produce the AND gate by using the NAND gate. Suppose that the output of the NAND gate is connected to the NOT gate (made from NAND gate by joining the two inputs) as shown in Fig. 2.44 (*a*)

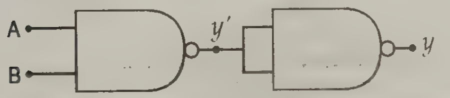

Fig. 2.44. (*a*)

A	B	y'	y
0	0	1	0
1	0	1	0
0	1	1	0
1	1	0	1

Fig. 2.44. (*b*)

The truth table of the combination will be as shown in Fig. 2.44 (*b*). It follows that it is the truth table (read columns A, B and y only) of the AND gate. Hence, when a NAND gate is connected to a NOT gate (made from NAND gate), it functions as the AND gate.

3. To produce the OR gate by using the NAND gates. Suppose that the inputs A and B are connected to the two NOT gates (obtained from the NAND gates). The inputs A and B will get inverted *i.e.* will appear as $\bar{A}$ and $\bar{B}$. These inputs are, then, fed to the NAND gate as shown in Fig. 2.45 (*a*).

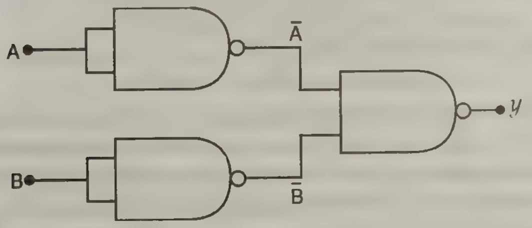

Fig. 2.45. (*a*)

A	B	$\bar{A}$	$\bar{B}$	y
0	0	1	1	0
0	1	1	0	1
1	0	0	1	1
1	1	0	0	1

Fig. 2.45. (*b*)

The truth table of the arrangement will be as shown in Fig. 2.45 (*b*). It follows that it is the truth table of the OR gate (read columns A, B and y only). Hence, *if the inputs A and B after being inverted by using two NOT gates (obtained from the NAND gates) are then fed to the NAND gate, the arrangement functions as the OR gate.*

2.27. THE 'XOR GATE'

An XOR gate is obtained by using OR, AND and NOT gates as shown in Fig. 2.46 (*a*). It is also called **exclusive OR gate** and its logic symbol is as shown in Fig. 2.46 (*b*).

---

*The repeated use of the NOR gate can also produce all the three basic gates and therefore the NOR gate is also the building block of digitial circuits.

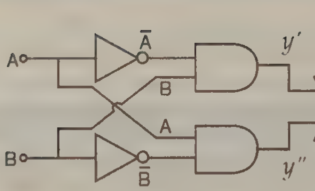

Fig. 2.46. (*a*)

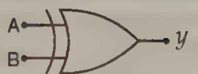

Fig. 2.46. (*b*)

A	B	y
0	0	0
0	1	1
1	0	1
1	1	0

Fig. 2.46. (*c*)

Its truth table is given in Fig. 2.46 (*c*). It follows that output in case of XOR gate is 1, only when inputs are different.

SOLVED NUMERICAL PROBLEMS

Type A. On Junction diode and Zener diode

Problem 2.01. Fig. 2.47 shows a junction diode connected to an external resistance of 100 Ω and a source of e.m.f. of 3·0 V. Assuming that the barrier potential developed in the junction diode is 0·7 V, obtain the current in the circuit.

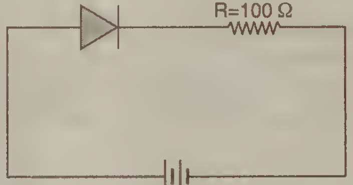

Fig. 2.47.

Sol. Here, e.m.f of source, $E = 3{\cdot}0$ V

Barrier potential developed in the diode, $V_d = 0{\cdot}7$ V

Therefore, potential drop across external resistance,

$$V = E - V_d = 3{\cdot}0 - 0{\cdot}7 = 2{\cdot}3 \text{ V}$$

Hence, current in the circuit,

$$I = \frac{V}{R} = \frac{2\cdot 3}{100} = 2\cdot 3 \times 10^{-2}\,\text{A} = \mathbf{23\ mA}$$

Problem 2.02. A diode used in the circuit shown in Fig. 2.48 has a constant voltage drop of 0·5 V at all currents and a maximum power rating of 100 mW. What should be the value of the resistance R connected in series with diode for obtaining maximum current ? (*C.B.S.E. 1997*)

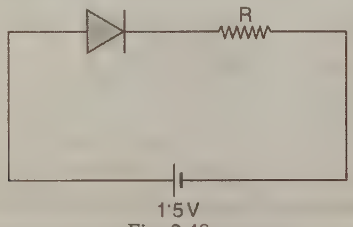

Fig. 2.48.

Sol. Here, e.m.f. of source, $E = 1{\cdot}5$ V

Voltage drop across diode, $V_d = 0{\cdot}1$ V

Maximum power rating of diode, $P = 100$ mW $= 0{\cdot}1$ W

Therefore, maximum current through the diode,

$$I = \frac{P}{V_d} = \frac{0\cdot 1}{0\cdot 5} = 0\cdot 2\text{ A}$$

Potential drop across resistance R,

$$V = E - V_d = 1{\cdot}5 - 0{\cdot}5 = 1{\cdot}0 \text{ V}$$

$$\therefore \qquad R = \frac{V}{I} = \frac{1\cdot 0}{0\cdot 2} = 5\,\Omega$$

Problem 2.03. In the circuit shown in Fig. 2.49, a Zener diode of voltage V_Z (= 6 V) is used to maintain a constant voltage across a load resistance R_L(= 1000 Ω)by using a series resistance R (= 100 Ω). If the e.m.f. of source (E) is 9 V, calculate the value of current through series resistance, Zener diode and load resistance. What is the power being dissipated in Zener diode ?

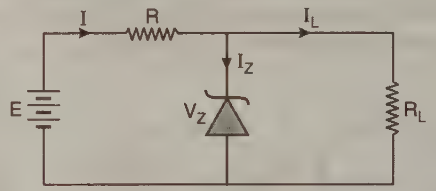

Fig. 2.49.

Sol. Here, $E = 9$ V ; $V_Z = 6$ V ; $R_L = 1000\,\Omega$ and $R = 100\,\Omega$

Potential drop across series resistor,

$$V = E - V_Z = 9 - 6 = 3 \text{ V}$$

Therefore, current through series resistance R,

$$I = \frac{V}{R} = \frac{3}{100} = 0\cdot 03\text{ A}$$

Current through load resistance R_L,

$$I_L = \frac{V_Z}{R_L} = \frac{6}{1000} = 0\cdot 006\text{ A}$$

Therefore, current through Zener diode,

$$I_Z = I - I_L = 0{\cdot}03 - 0{\cdot}006 = 0{\cdot}024 \text{ A}$$

Power dissipated in Zener diode,

$$P_Z = V_Z I_Z = 6 \times 0{\cdot}024 = \mathbf{0{\cdot}144\ W}$$

Problem 2.04. A junction diode of negligible forward resistance is used as a half-wave rectifier. A sinusoidal voltage supply having peak value 50 V is fed to the junction diode and output is obtained across the load resistance R_L. Calculate (*a*) the r.m.s. voltage across R_L and (*b*) reading of a d.c. voltmeter connected across R_L.

Sol. Here, $E_0 = 50$ V

$$\therefore \qquad E_{r.m.s.} = \frac{50}{\sqrt{2}}\text{ V}$$

(*a*) A half-wave rectifier gives output corresponding to alternate half cycles of the a.c. input. Since junction diode is of negligible forward resistance, the r.m.s. value of voltage across R_L during half cycle of conduction is $50/\sqrt{2}$ V. Therefore, r.m.s. value of voltage for a complete cycle (including the non-conducting half cycle) is

$$V_{r.m.s.} = \sqrt{\frac{(50/\sqrt{2})^2 + (0)^2}{2}} = \sqrt{\frac{1250 + 0}{2}} = \sqrt{625}$$
$$= \mathbf{25\ V}$$

(*b*) The d.c. voltmeter connected across R_L would read the average value of voltage across R_L during a complete cycle. Therefore reading of d.c. voltmeter connected across R_L,

$$V_{d.c.} = \frac{2\,E_0/\pi + 0}{2} = \frac{E_0}{\pi} = \frac{50}{\pi} = \mathbf{15{\cdot}92\ V}$$

Type B. On Transistor as an Amplifier

Problem 2.05. For a transistor working as common base amplifier, current gain is 0·96. If the emitter current is 7·2 mA, calculate the base current.

Sol. Here, $\alpha = 0{\cdot}96$; $I_e = 7{\cdot}2$ mA

Now, $\alpha = \dfrac{I_c}{I_e}$ or $I_c = \alpha I_e = 0{\cdot}96 \times 7{\cdot}2 = 6{\cdot}91$ mA

Also, $I_e = I_c + I_b$ or $I_b = I_e - I_c = 7{\cdot}2 - 6{\cdot}91 = \mathbf{0{\cdot}29\ mA}$

Problem 2.06. For a common emitter amplifier, current gain is 70. If the emitter current is 8·8 mA, calculate the collector and base current. Also calculate current gain, when transistor is working as common base amplifier.

Sol. Here, $\beta = 70$; $I_e = 8{\cdot}8$ mA

Now, $\beta = \dfrac{I_c}{I_b}$

or $I_c = \beta I_b = 70\,I_b$

Also, $I_e = I_c + I_b$

or $8{\cdot}8 = 70\,I_b + I_b$

or $I_b = \dfrac{8{\cdot}8}{71} = \mathbf{0{\cdot}124\ mA}$

Again $I_c = 70\,I_b = 70 \times 0{\cdot}124 = \mathbf{8{\cdot}68\ mA}$

We know, $\beta = \dfrac{\alpha}{1-\alpha}$

$\therefore$ $70 = \dfrac{\alpha}{1-\alpha}$ or $\alpha = \dfrac{70}{71} = \mathbf{0{\cdot}986}$

Problem 2.07. The base current of a transistor is 105 μA and collector current is 2·05 mA.

(*a*) Determine the value of β, I_e and α.

(*b*) A change of 27 μA in the base current produces a change of 0·65 mA in the collector current. Find β_{ac}.

Sol. Here, $I_b = 105\ \mu A = 105 \times 10^{-6}$ A ;

$I_c = 2{\cdot}05$ mA $= 2{\cdot}05 \times 10^{-3}$ A ;

(*a*) Now, $\beta = \dfrac{I_c}{I_b} = \dfrac{2{\cdot}05 \times 10^{-3}}{105 \times 10^{-6}} = \mathbf{19{\cdot}5}$

Also, $I_e = I_b + I_c = 105 \times 10^{-6} + 2{\cdot}05 \times 10^{-3}$
$= \mathbf{2{\cdot}155 \times 10^{-3}\ A}$

Further, $\alpha = \dfrac{I_c}{I_e} = \dfrac{2{\cdot}05 \times 10^{-3}}{2{\cdot}05 \times 10^{-3}} = \mathbf{0{\cdot}95}$

(*b*) Here, $\Delta I_b = 27\ \mu A = 27 \times 10^{-6}$ A ;

$\Delta I_c = 0{\cdot}65$ mA $= 650 \times 10^{-6}$ A

Now, $\beta_{ac} = \dfrac{\Delta I_c}{\Delta I_b} = \dfrac{650 \times 10^{-6}}{27 \times 10^{-6}} = \mathbf{24{\cdot}07}$

Problem 2.08. In a silicon transistor, a change of 7·89 mA in the emitter current produces a change of 7·8 mA in the collector current. What change in the base current is necessary to produce an equivalent change in the collector current ?

Sol. Here, $\Delta I_e = 7{\cdot}89$ mA $= 7{\cdot}89 \times 10^{-3}$ A ;

$\Delta I_c = 7{\cdot}8$ mA $= 7{\cdot}8 \times 10^{-3}$ A ;

Now, $\alpha_{ac} = \dfrac{\Delta I_c}{\Delta I_e} = \dfrac{7{\cdot}8 \times 10^{-3}}{7{\cdot}89\ 10^{-3}} = 0{\cdot}9886$

We have, $\beta_{ac} = \dfrac{\alpha_{ac}}{1-\alpha_{ac}} = \dfrac{0{\cdot}9886}{1-0{\cdot}9886} = 86{\cdot}72$

Also, $\beta_{ac} = \dfrac{\Delta I_c}{\Delta I_b}$

or $\Delta I_b = \dfrac{\Delta I_c}{\beta_{ac}}$

Here, $\Delta I_c = 7{\cdot}8 \times 10^{-3}$ A ; $\beta_{ac} = 86{\cdot}72$

$\therefore$ $\Delta I_b = \dfrac{7{\cdot}8 \times 10^{-3}}{86{\cdot}72} = \mathbf{89{\cdot}94 \times 10^{-6}\ A}$

Problem 2.09. In a silicon transistor, the base current is changed by 20 μA. This results in a change of 0·02 V in base to emitter voltage and a change of 2 mA in the collector current.

(*a*) Find the input resistance, β_{ac} and transconductance of the transistor.

(*b*) This transistor is used as an amplifier with the load resistance 5 kΩ. What is the voltage gain of the amplifier ? *(C.B.S.E. 2001)*

Sol. For $\Delta I_b = 20\ \mu A = 20 \times 10^{-6}$ A ;

$\Delta V_{be} = 0{\cdot}02$ V and $\Delta I_c = 2$ mA $= 2 \times 10^{-3}$ A

(*a*) Input resistance

$$= \frac{\Delta V_{be}}{\Delta I_b} = \frac{0{\cdot}02}{20 \times 10^{-6}} = \mathbf{1000\ \Omega}$$

$$\beta = \frac{\Delta I_c}{\Delta I_b} = \frac{2 \times 10^{-3}}{20 \times 10^{-6}} = 100$$

$$g_m = \frac{\Delta I_c}{\Delta V_{be}} = \frac{2 \times 10^{-3}}{0{\cdot}02} = \mathbf{0{\cdot}1\ \Omega^{-1}}$$

(*b*) $R_L = 5\ k\ \Omega = 5000\ \Omega$

Now, voltage gain

$$= \frac{\Delta V_{ce}}{\Delta V_{be}} = \frac{R_L \times \Delta I_c}{\Delta V_{be}} = \frac{5000 \times 2 \times 10^{-3}}{0{\cdot}02} = 500$$

Problem 2.10. The input resistance of a silicon transistor is 665 Ω. Its base current is changed by 15 μA which results in the change in collector current by 2 mA. This transistor is used as a common emitter amplifier with a load resistance of 5 kΩ. Calculate (*i*) current gain '$\beta_{a.c.}$' (*ii*) transconductance 'g_m' and (*iii*) voltage gain 'A_v' of the amplifier. *(C.B.S.E. 2001 S ; C.B.S.E. Sample Paper)*

Sol. Here, $\Delta I_b = 15\ \mu A = 15 \times 10^{-6}$ A ;

$\Delta I_c = 2$ mA $= 2 \times 10^{-3}$ A ;

$R_{in} = 665\ \Omega$; RL $= 5\ k\Omega = 5 \times 10^3\ \Omega$

(*i*) Now, $\beta_{ac} = \dfrac{\Delta I_c}{\Delta I_b} = \dfrac{2 \times 10^{-3}}{15 \times 10^{-6}} = \mathbf{133{\cdot}3}$

(*ii*) Transconductance, $g_m = \dfrac{\beta_{ac}}{R_{in}} = \dfrac{133{\cdot}3}{665} = \mathbf{0{\cdot}2\ \Omega^{-1}}$

(*iii*) Voltage gain, $A_v = g_m R_L = 0{\cdot}2 \times 5 \times 10^3 = 1000$

Problem 2.11. In the circuit shown in Fig. 2.50, the value of β is 100. Find I_b, V_{ce}, V_{be} and V_{bc}, when $I_c = 1{\cdot}5$ mA. Is the transistor in active, cut off or a saturation state ?

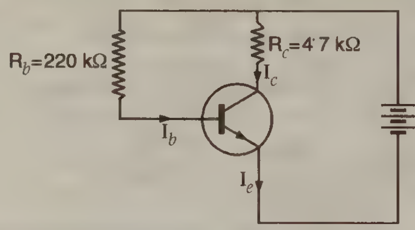

Fig. 2.50.

Sol. Here, $\beta = 100$, $V_{cc} = 24$ V ; $I_c = 1{\cdot}5\text{ mA} = 1{\cdot}5 \times 10^{-3}$ A ;

Now, $\beta = \dfrac{I_c}{I_b}$

or $I_b = \dfrac{I_c}{\beta} = \dfrac{1{\cdot}5 \times 10^{-3}}{100} = \mathbf{1{\cdot}5 \times 10^{-5}\ A}$

Let V_{ce}, V_{be} and V_{bc} be the respective potential drops across collector-emitter ; base-emitter and base-collector junctions. Applying Kirchhoff's second law* to the closed part of the circuit containing R_c and collector-emitter junction, we have

$$V_{ce} = V_{cc} - I_c R_c$$
$$= 24 - 4{\cdot}7 \times 10^3 \times 1{\cdot}5 \times 10^{-3}$$
$$= 24 - 7{\cdot}05 = \mathbf{16{\cdot}95\ V}$$

Applying Kirchhoff's second law to the closed part of the circuit containing R_b and emitter-base junction, we have

$$V_{cc} = V_{be} + I_b R_b$$

or $$V_{be} = V_{cc} - I_b R_b = 24 - 1{\cdot}5 \times 10^{-5} \times 220 \times 10^3$$
$$= 24 - 3{\cdot}3 = \mathbf{20{\cdot}7\ V}$$

Applying Kirchhoff's second law to the closed part of the circuit containing R_b , R_c and base-collector junction, we have

$$V_{be} + I_b R_b - I_c R_c = 0$$

or $$V_{be} = I_c R_c - I_b R_b$$
$$= 1{\cdot}5 \times 10^{-3} \times 4{\cdot}7 \times 10^3 - 1{\cdot}5 \times 10^{-5} \times 220 \times 10^3$$
$$= 7{\cdot}05 - 3{\cdot}3 = \mathbf{3{\cdot}75\ V}$$

The transistor is in ***saturation*** state.

Type C. On Binary algebra

Problem. 2.12. Perform binary addition on the following sets of numbers :

(*a*) 110010 and 111101 **(*b*) 101010 and 010101**

(*Text Problem*)

Sol. (***a***) To find the sum of the given binary numbers 110010 and 111101, we first find their values in decimal number system.

$$(110010)_2 = 1 \times 2^5 + 1 \times 2^4 + 0 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 0 \times 2^0$$
$$= 32 + 16 + 0 + 0 + 2 + 0 = 50$$

and $$(111101)_2 = 1 \times 2^5 + 1 \times 2^4 + 1 \times 2^3 + 1 \times 2^2 + 0 \times 2^1 + 1 \times 2^0$$
$$= 32 + 16 + 8 + 4 + 0 + 1 = 61$$

Therefore, sum of the given two numbers in decimal system is 50 + 61 *i.e.* 111.

The binary representation of the number 111 in decimal system can be found by double dabble method as below :

2	111
2	55 – 1
2	27 – 1
2	13 – 1
2	6 – 1
2	3 – 0
2	1 – 1
	0 – 1

Writing the remainders in inverse order, it follows that $(111)_{10}$ = 110111 *i.e.* addition of binary numbers 110010 and 111101 is equal to **1101111.**

(***b***) $(101010)_2 = 1 \times 2^5 + 0 \times 2^4 + 1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 2^0$

$$= 32 + 0 + 8 + 0 + 2 = 42$$

$$(010101)_2 = 0 \times 2^5 + 1 \times 2^4 + 0 \times 2^3 + 1 \times 2^2 + 0 \times 2^1 + 0 \times 2^0$$
$$= 0 + 16 + 0 + 4 + 0 + 1 = 21$$

The sum of the given two numbers in decimal number system is 42 + 21 *i.e.* 63. By proceeding as above, it can be shown that binary representation of 63 *i.e.* $(63)_{10}$ = 111111. Therefore, addition of binary numbers 101010 and 010101 is equal to **111111.**

Type D. On Logic gates

Problem 2.13. Express by a truth table, the output *y* for all possible inputs A and B for the combination of gates shown in Fig. 2.51. Hence, show that it behaves as a NAND gate.

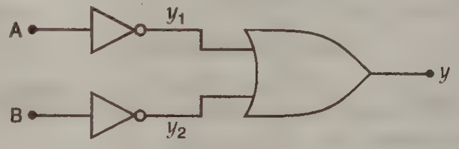

Fig. 2.51.

Sol. Here, outputs y_1 and y_2 of two NOT gates form the two inputs of the OR gate. Let us consider in turn the possibilities for A, B of 0, 0 then 0, 1, then 1, 0 and finally 1, 1. Because of the NOT gates, the column *y*, contains ones, wherever A = 0 and zeroes, where A = 1. Similarly, y_2 is opposite to B. The output *y* of OR gate is 1, if y_1 or y_2 is 1 or both are 1. Hence, the truth table for the given combination of gates is as shown in Fig. 2.52.

A	B	y_1	y_2	y
0	0	1	1	1
1	0	0	1	1
0	1	1	0	1
1	1	0	0	0

≡

A	B	y
0	0	1
1	0	1
0	1	1
1	1	0

Fig. 2.52.

From the completed table showing the relationship between output *y* and the inputs A and B, it follows that it is the truth table for a single NAND gate [refer to Fig. 2.40 (*b*)]. Hence, the combination of gates shown in Fig. 2.51 behaves as NAND gate.

Problem 2.14. Produce the truth table for the combination of gates shown in Fig. 2.53 and hence show that it behaves as XOR gate.

---

*One may use the equation (2.09)

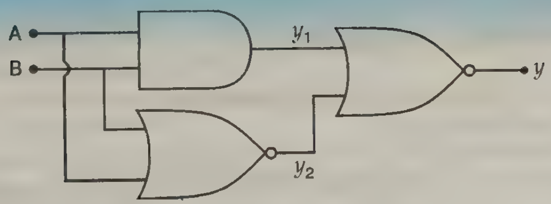

Fig. 2.53.

Sol. Here, the outputs y_1 and y_2 of AND and NOR gates respectively form the two inputs of another NOR gate. Because of NAND gate, the column y_1 contains 1, when both A and B are 1 and the column y_2 contains 1, when both A and B are zero. Hence, the truth table for the given combination of gates is as shown in Fig. 2.54.

A	B	y_1	y_2	y
0	0	0	1	0
1	0	0	0	1
0	1	0	0	1
1	1	1	0	0

≡

A	B	y
0	0	0
1	0	1
0	1	1
1	1	1

Fig. 2.54.

From the completed table showing the relationship between output y and the inputs A and B, it follows that it is the truth table for a single XOR gate [refer to Fig. 2.46 (*c*)]. Hence, the combination of gates shown in Fig. 2.53 behaves as XOR gate.

TECHIE STUFF – CONCEPTUAL NUMERICAL PROBLEMS

For ambitious, brilliant & curious Students

Problem 2.15. Assume that the silicon diode in the circuit shown in Fig. 2.55 requires a minimum current of 1 mA to be above the knee point 0·7 V) of its I-V characteristics. Also assume that the voltage across the diode is independent of current above the knee point.

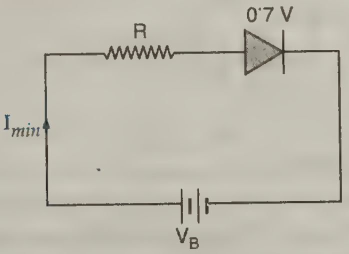

Fig. 2.55.

(*a*) If $V_B = 5$ V, what should be the maximum value of R so that the voltage is above the knee point ?

(*b*) If $V_B = 5$ V, what should be the value of R to establish the current of 5 mA in the circuit ?

(*c*) What is the power dissipated in the resistance R and in the diode, when a current of 5 mA flows in the circuit at $V_B = 6$ V ?

(*d*) If R=1 kΩ, what is the minimum voltage V_B required to keep the diode above the knee point ?

Sol. When current of 1 mA (minimum value) flows through the circuit, the potential drop across the diode becomes 0·7 V for a forward bias of 5 V.

Thus, $V_B = 5$ V ; $I_{min} = 1$ mA 10^{-3} A ;

(*a*) Applying Kirchhoff's second law, we have

$$I_{min} \times R + 0{\cdot}7 = 5$$

or $$10^{-3} \times R = 5 - 0{\cdot}7 = 4{\cdot}3$$

or $$R = \mathbf{4{\cdot}3 \times 10^3\ \Omega}$$

(*b*) Now, $I = 5\text{ mA} = 5 \times 10^{-3}$ A

Again, according to Kirchhoff's second law, we have

$$I \times R + 0{\cdot}7 = 5$$

or $$5 \times 10^{-3} \times R = 5 - 0{\cdot}7 = 4{\cdot}3$$

or $$R = \frac{4 \cdot 3}{5 \times 10^{-3}} = \mathbf{860\ \Omega}$$

(*c*) Now, $V_B = 6$ V ; $I = 5$ mA $= 5 \times 10^{-3}$ A ;

Applying Kirchhoff's second law, we have

$$I \times R + 0{\cdot}7 = 6$$

or $$R = \frac{6 - 0{\cdot}7}{I} = \frac{5{\cdot}3}{5 \times 10^{-3}} = 1060\ \Omega$$

Power dissipated across R = $I^2 R = (5 \times 10^{-3})^2 \times 1060$
$= \mathbf{26{\cdot}5 \times 10^{-3}\ W}$

Power dissipated across diode = $VI = 0{\cdot}7 \times 5 \times 10^{-3}$
$= \mathbf{3{\cdot}5 \times 10^{-3}\ W}$

(*d*) Now, R = 1 kΩ = 1000 Ω ; I = 1 mA = 10^{-3} A ;

P.D. across diode = 0·7 V

$\therefore$ $V_B = IR + 0{\cdot}7 = 10^{-3} \times 1000 + 0{\cdot}7 = \mathbf{1{\cdot}7\ V}$

Problem 2.16. In a *p-n*-junction, the current I can be expressed as

$$I = I_0\left(e^{\frac{eV}{kT}} - 1\right),$$

where I_0 is called the reverse saturation current, V the voltage across the diode and is positive for forward bias and negative for reverse bias and I is the current through the diode, *k* is the Boltzmann's constant ($8{\cdot}6 \times 10^{-5}$ eV K^{-1}) and T is the absolute temperature. If for a diode, $I_0 = 5 \times 10^{-12}$ A and T = 300 K, then

(*a*) what will be the forward current at a forward voltage of 0·6 V ?

(*b*) what will be the increase in the current, if the voltage across the diode is increased to 0·7 V ?

(*c*) what is the dynamic resistance ?

(*d*) what will be the current, if the reverse bias voltage changes from 1 V to 2 V ?

Sol. Here, $I_0 = \times 5\ 10^{-12}$ A ; $k = 8{\cdot}6 \times 10^{-5}$ eV K^{-1}
$= 8{\cdot}6 \times 10^{-5} \times 1{\cdot}6 \times 10^{-19}$ J K^{-1} ;

(*a*) Now, $$I = I_0\left(e^{\frac{eV}{kT}} - 1\right)$$

For V = 0·6 volt, we have

$$I = 5 \times 10^{-12}\left[e^{\frac{1{\cdot}6 \times 10^{-19} \times 0{\cdot}6}{8{\cdot}6 \times 10^{-5} \times 1{\cdot}6 \times 10^{-19} \times 300}} - 1\right]$$

$$= 5 \times 10^{-12} \left[e^{23 \cdot 256} - 1 \right]$$

$$= 5 \times 10^{-12} \; [1 \cdot 256 \times 10^{10} - 1] = \mathbf{0 \cdot 0628 \text{ A}}$$

(*b*) For V = 0·7 volt, we have

$$I = 5 \times 10^{-12} \left[e^{\frac{1 \cdot 6 \times 10^{-19} \times 0 \cdot 7}{8 \cdot 6 \times 10^{-6} \times 1 \cdot 6 \times 10^{-19} \times 300}} - 1 \right]$$

$$= 5 \times 10^{-12} \left[e^{27 \cdot 132} - 1 \right]$$

$$= 5 \times 10^{-12} \; [6 \cdot 054 \times 10^{11} - 1] = \mathbf{3 \cdot 0271 \text{ A}}$$

$$\therefore \qquad \Delta I = 3 \cdot 271 - 0 \cdot 0628 = \mathbf{2 \cdot 9643 \text{ A}}$$

(*c*) Now, $\Delta I = 2 \cdot 9643$ A ; $\Delta V = 0 \cdot 7 - 0 \cdot 6 = 0 \cdot 1$ V

Therefore, dynamic resistance

$$= \frac{\Delta V}{\Delta I} = \frac{0 \cdot 1}{2 \cdot 9643} = \mathbf{0 \cdot 0337 \; \Omega}$$

(*d*) For change in voltage from 1 to 2 V, the current will remain equal to $I_0 = 5 \times 10^{-12}$ A. It shows that the diode possesses practically infinite resistance in reverse biasing.

Problem 2.17. A transistor is used in common-emitter mode in an amplifier circuit. When a signal of 24 mV is added to the base-emitter voltage, the base current changes by 32 μA and collector current by 3·6 mA. The load resistance is 4·8 kΩ. Calculate (*i*) the current gain β, (*ii*) the input resistance R_{be}, (*iii*) the transconductance g_m and (*iv*) voltage gain A_v.

Sol. Here, when $\Delta V_{be} = 23$ mV, $\Delta I_b = 32\ \mu$A and $\Delta I_c = 3 \cdot 6$ mA

(*i*) Now, $$\beta = \frac{\Delta I_c}{\Delta I_b} = \frac{3 \cdot 6 \times 10^{-3}}{32 \times 10^{-6}} = \mathbf{112 \cdot 5}$$

(*ii*) The input resistance R_{be} is given by

$$R_{be} = \frac{\Delta V_{be}}{\Delta I_b} = \frac{24 \times 10^{-3}}{32 \times 10^{-6}} = \mathbf{750 \; \Omega}$$

(*iii*) Transconductance, $$g_m = \frac{\Delta I_c}{\Delta V_{be}} = \frac{3 \cdot 6 \times 10^{-3}}{24 \times 10^{-3}} = \mathbf{0 \cdot 15 \text{ S}}$$

(*iv*) Voltage gain,

$$A_v = \frac{R_L \times \Delta I_c}{\Delta V_{be}} = \frac{4 \cdot 8 \times 10^3 \times 3 \cdot 6 \times 10^{-3}}{24 \times 10^{-3}} = \mathbf{720}$$

Problem 2.18. The Boolean expression for a logic circuit is given by

$$y = A . \overline{B} + \overline{A} . B$$

(*a*) Find the output *y*, if the inputs are A = 0, B = 0 ; A = 1 ; B = 0 ; A = 0, B = 1 and A = 1, B = 1.

(*b*) Identify, which basic gate is represented by the given Boolean expression.

Sol. (*a*) $y = A . B + \overline{A} . B$

For A = 0, B = 0 :

$$y = 0 . \overline{0} + \overline{0} . 0 = 0 . 1 + 1 . 0 = 0 + 0 = \mathbf{0}$$

For A = 1, B = 0 :

$$y = 1 . \overline{0} + \overline{0} . 0 = 1 . 1 + 0 . 0 = 1 + 0 = \mathbf{1}$$

For A = 0, B = 1 :

$$y = 0 . \overline{1} + \overline{0} . 1 = 0 . 0 + 1 . 1 = 0 + 1 = \mathbf{1}$$

For A = 1, B = 1 :

$$y = 1 . \overline{1} + \overline{1} . 1 = 1 . 0 + 0 . 1 = 0 + 0 = \mathbf{0}$$

(*b*) The truth table of the logic circuit represented by the given Boolean expression is

A	B	*y*
0	0	0
1	0	1
0	1	1
1	0	0

It is the truth table of **exclusive OR gate (XOR gate).**

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 2.01. What is depletion region in a *p-n*-junction ? (*I.S.S.C.E. 1997 ; C.B.S.E. 1992*)

Ans. A thin layer between *p* and *n* sections of the junction diode devoid of free electrons and holes is called depletion layer.

Q. 2.02. Can we measure the potential barrier of a *p-n* junction by putting a sensitive voltmeter across its terminals ?

Ans. In the depletion layer, there are no free electrons or holes and in the absence of forward bias, it offers infinite resistance. Therefore, potential barrier in the *p-n* junction can not be measured with a voltmeter.

Q. 2.03. Which type of biasing gives a semiconductor diode very high resistance ? (*C.B.S.E. 1996*)

Ans. Reverse biasing.

Q. 2.04. Fill in the blanks :

(*i*) When a *p-n* junction is forward biased, then the motion of charge carriers across the barrier is due to .... (drift, diffusion) and when it is reverse biased, then the motion of charge carriers is due to .... (drift, diffusion)

(*ii*) An ideal *p-n* junction diode conducts, when .... biased and does not conduct, when .... biased. (forward, reverse ; forward, reverse) (*Text Question*)

Ans. (*i*) diffusion, drift (*ii*) forward, reverse.

Q. 2.05. In the Fig. 2.56, is the diode D forward or reverse biased ? (*C.B.S.E. 1997*)

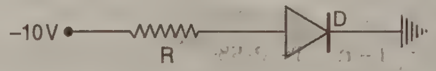

Fig. 2.56

Ans. Since *n*-section is connected to earth and *p*-section is at − 10 V, the diode is ***reverse biased.***

For details, refer to conceptual SAQ 2.02 and 2.03.

Q. 2.06. Draw a *p-n* junction with reverse bias. (*C.B.S.E. 1996*)

Ans. Refer to Fig. 2.05 (*a*).

Q. 2.07. How is an *n-p-n* transistor represented symbolically ? (*H.P.S.S.C.E. 1999 ; C.B.S.E. 1991*)

Ans. Refer to Fig. 2.17.

Q. 2.08. Can two *p-n* junction diodes back to back work as a *p-n-p* transistor ?

Ans. No. It is because, the *n*-section acting as base will become very thick. In a transistor, base is always made thin.

Q. 2.09. Fill in the blanks :

(*i*) The base of a transistor is always .... and .... doped, compared to the emitter and collector. (thinner, thicker ; lightly, heavily)

(*ii*) For using a transistor as an amplifier, the base-emitter junction is .... biased and the base collector junction is .... biased. (forward, reverse ; forward, reverse) (*Text Question*)

Ans. (*i*) thinner, lightly (*ii*) forward, reverse.

Q. 2.10. In the Fig. 2.57, is (*i*) the emitter and (*ii*) the collector forward or reverse biased ? (*C.B.S.E. 2001 S*)

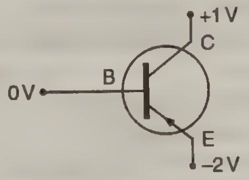

Fig. 2.57

Ans. Of the *p-n-p* transistor shown in Fig. 2.57,

(*i*) emitter is reverse biased and

(*ii*) collector is forward biased.

Q. 2.11. What is the relation between emitter current (I_e), base current (I_b) and collector current (I_c) at any instant in a properly biased common emitter transistor circuit ? Which one of the three has the smallest magnitude ? (*I.S.C.E. 1998*)

Ans. The relation between I_e, I_b and I_c : $I_e = I_b + I_e$

Of the three, I_b has the smallest magnitude.

Q. 2.12. Define current amplification factor in a common emitter mode of transistor. (*H.S.S.C.E. 1994*)

Ans. It is defined as the ratio of change in collector current to the change in base current at constant collector voltage. It is denoted by β.

$$\text{Mathematically, } \beta = \left(\frac{\Delta I_c}{\Delta I_b}\right)_{V_{ce}}$$

Q. 2.13. Write the relation between current gains α and β.

$$\textbf{Ans. } \beta = \frac{\alpha}{1-\alpha}$$

Q. 2.14. Calculate the current gain β of a transistor, if the current gain $\alpha = 0{\cdot}98$. (*I.S.C.E. 1995*)

Ans. Here, $\alpha = 0{\cdot}98$

$$\text{Now, } \beta = \frac{\alpha}{1-\alpha} = \frac{0{\cdot}98}{1-0{\cdot}98} = 49$$

Q. 2.15. Define the transconductance of a transistor. (*C.B.S.E. 1996*)

Ans. It is defined as the ratio of change in collector current to the change in base-emitter voltage. It is denoted by g_m.

$$\text{Mathematically, } g_m = \frac{\Delta I_c}{\Delta V_{be}}$$

Q. 2.16. What kinds of biasing are required to the collector and base of a transistor in a common emitter amplifier ? (*I.S.C.E. 1998*)

Ans. A collector is reverse biased, while a base is forward biased.

Q. 2.17. Would you prefer to use a transistor as a common base or a common emitter amplifier ?

Ans. A transistor as a common emitter amplifier is preferred for the reason that current gain in this case is more as compared to that in case of a common base amplifier.

Q. 2.18. Portable radio receiver sets are generally not made with electron tube circuits. Why ?

Ans. A portable radio receiver should be small in size and should work on d.c. A receiver set made of electron tube is bound to be large in size and works on a.c. Hence, radio receirs made with electron tube circuits are not portable.

Q. 2.19. What is a digital signal ?

Ans. The voltage signal that does not vary continuously but has only two levels of voltage.

Q. 2.20. A square wave (– 1 V to +1 V) is applied to *p-n* junction diode as shown below [Fig. 2.58]. Draw the output wave form. (*I.S.C.E. 1994*)

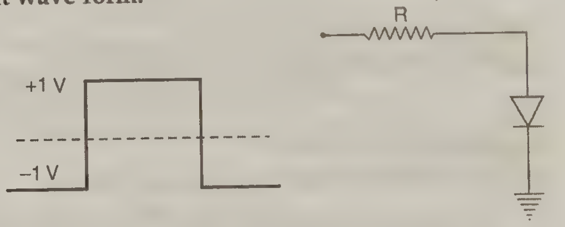

Fig. 2.58

Ans. When input is – 1 V, the diode gets reverse biased and no output is obtained. On the other hand, when input is +1 V, the diode gets forward biased and output obtained is +1 V. Therefore, corresponding to given input cycle, the output is of the shape as shown in Fig. 2.59.

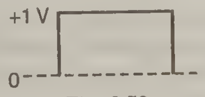

Fig. 2.59

Q. 2.21. Convert number 39 into binary system. (*H.S.S.C.E. 1997*)

Ans.

$$\begin{array}{r|l} 2 & 39 \\ \hline 2 & 19-1 \\ \hline 2 & 9-1 \\ \hline 2 & 4-1 \\ \hline 2 & 2-0 \\ \hline 2 & 1-0 \\ \hline & 0-1 \end{array}$$

The remainders in reverse order are 1, 0, 0, 1, 1 and 1. Hence, binary representation of decimal number 39 is **100111.**

Q. 2.22. What is a logic gate ? (*P.S.S.C.E. 1999, 1998 S ; H.S.S.C.E. 1997 S, 1993*)

Ans. A digital circuit which works according to some logical relationship between input and output voltages.

Q. 2.23. What do you understand by truth table of a logic gate ?

Ans. The truth table of a logic gate shows all possible inputs combination and the corresponding output combinations for a logic gate. It is also called ***table of combination.***

Q. 2.24. What is Boolean expression ?

Ans. The logical statement having only two values (either yes or no) is called Boolean expression. The functioning of a logic gate is based on its Boolean expression.

Q. 2.25. Name the logic gate realised using *p-n* junction diodes as shown in Fig. 2.60. Give its logic symbol. *(C.B.S.E. 2001)*

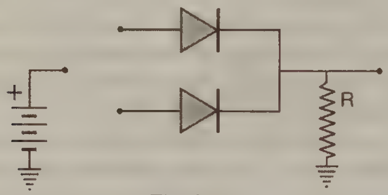

Fig. 2.60

Ans. It is OR gate.

For logic symbol of OR gate, refer to Fig. 2.33 (*a*).

Q. 2.26. Draw the logic symbol of OR gate. *(H.P.S.S.C.E. 2002 ; H.S.S.C.E. 1995)*

Ans. Refer to Fig. 2.33 (*a*).

Q. 2.27. Write the truth table for an OR gate. *(H.S.S.C.E. 2002 ; C.B.S.E. 1995)*

Ans. Refer to table in Fig. 2.33 (*c*).

Q. 2.28. Draw the logic symbol of AND gate. *(H.P.S.S.C.E. 2002 ; H.S.S.C.E. 1995 ; C.B.S.E. 1994, 1990)*

Ans. Refer to Fig. 2.35 (*a*).

Q. 2.29. Write the truth table for an AND gate. *(H.S.S.C.E. 2002 ; C.B.S.E. 1995)*

Ans. Refer to table in Fig. 2.35 (*c*).

Q. 2.30. Draw the logic symbol of NOT gate. *(H.P.S.S.C.E. 2002)*

Ans. Refer to Fig. 2.37 (*a*).

Q. 2.31. Write down the truth table for a NOT gate. *(H.S.S.C.E. 2002)*

Ans. Refer to table in Fig. 2.37 (*c*).

Q. 2.32. In the circuits shown, a switch which is opened represents the logic state 0 and the switch which is closed represents the logic state 1. The lamp L is lit, when output is logic state 1. What types of gates are represented by the circuits shown in (*i*) Fig. 2.61 (*a*) and (*ii*) Fig. 2.61 (*b*) ? *(C.B.S.E. 1995)*

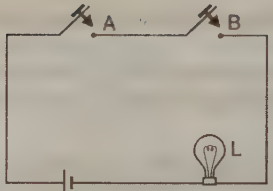

Fig. 2.61. (*a*)

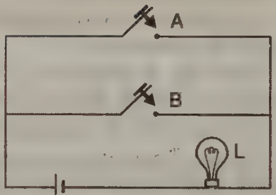

Fig. 2.61. (*b*)

Ans. (*i*) AND gate (*ii*) OR gate.

Q. 2.33. Draw the logic symbol for a NAND gate. *(C.B.S.E. 1993)*

Ans. Refer to Fig. 2.39 (*b*).

Q. 2.34. Write truth table of NAND gate. *(H.S.S.C.E. 2002 ; H.P.S.S.C.E. 1996 ; C.B.S.E. 1991)*

Ans. Refer to table in Fig. 2.40 (*b*).

Q. 2.35. Write down the truth table for a NOR gate. *(H.S.S.C.E. 2002)*

Ans. Refer to table in Fig. 2.42 (*b*).

Q. 2.36. Fill in the blanks :

(*i*) In a digital circuit, diodes and transistors are operated by a 5 V supply. The 1 state will correspond to .... (0 V, 5 V) and the 0 state to .... (0 V, 5 V).

(*ii*) Digital circuits can be made by repetitive use of .... gates. (AND, NAND)

(*iii*) An output 1 is obtained in a AND gate, when .... of the input terminals are at 1 state. (either, both)

(*iv*) An output 1 is obtained in a NOR gate, when .... input terminals are at 0 state. (either, both)

(*v*) If one terminal is an XOR gate is kept at 1; the output will be 0, when the other terminal is at .... (1, 0). *(Text Question)*

Ans. (*i*) 5 V, 0 V (*ii*) NAND (*iii*) both (*iv*) both (*v*) 1.

Q. 2.37. NAND or NOR gate may be called as digital building blocks. Why ?

Ans. The repeated use of NAND or NOR gates can produce all the three basic gates *i.e.* OR, AND and NOT gates. For this reason, these are called digital building blocks.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 2.01. Discuss the formation of a *p-n* junction.

Ans. Refer to section 2.01.

Q. 2.02. How is the depletion region formed in a *p-n* junction diode ? *(C.B.S.E. 2000, 1993)*

Ans. Refer to section 2.01.

Q. 2.03. How is potential barrier formed in a *p-n* junction diode ? *(H.S.S.C.E. 2002)*

Ans. Refer to section 2.01.

Q. 2.04. How does the width of the depletion region of a *p-n* junction vary, if the reverse bias applied to it increases ? *(C.B.S.E. 2002)*

Or

Why does the thickness of the depletion layer in a *p-n* diode vary with increase in reverse bias ? *(C.B.S.E. 1999)*

Ans. When a *p-n* junction is formed, a small potential difference (fictitious battery) is set up across the depletion layer. When the junction diode is reverse biased, the polarity of the applied d.c. source aids the fictitious battery. Due to this, potential drop across the junction increases and diffusion of holes and electrons across the junction decreases. It makes the width of the depletion layer larger.

Q. 2.05. In the following diagrams, indicate which of the diodes are forward biased and which are reverse biased. *(C.B.S.E. 1996 S)*

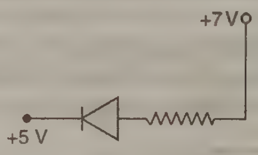

Fig. 2.62 (*a*)

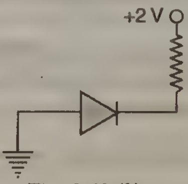

Fig. 2.62 (*b*)

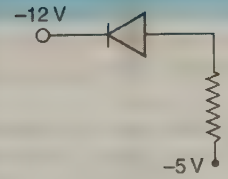

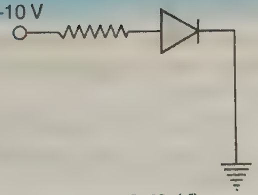

Fig. 2.62 (*c*) Fig. 2.62 (*d*)

Ans. Fig. 2.62 (*a*) : Forward biased.

Fig. 2.62 (*b*) : Reverse biased.

Fig. 2.62 (*c*) : Forward biased.

Fig. 2.62 (*d*) : Reverse biased.

For details, refer to conceptual SAQ 2.02 or 2.03.

Q. 2.06. Fig. 2.63 shows two *p-n* junctions diodes along-h a resistance R and a d.c. battery E. Indicate the path d direction of flow of appreciable current in the circuit. (*I.S.C.E. 1998*)

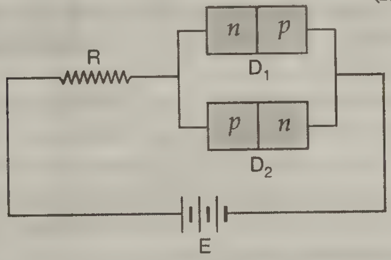

Fig. 2.63

Ans. In the circuit containing two junction diodes D_1 and , the diode D_2 is forward biased and D_1 is reverse biased. erefore, the path of appreciable current will be from sitive pole of the battery to its negative pole through istance R and junction diode D_2.

Q. 2.07. Draw the graph showing the variation of rrent with voltage for a *p-n* junction diode. (*C.B.S.E. 1993*)

Ans. Refer to Fig. 2.04 (*b*).

Q. 2.08. Which type of biasing results in very high sistance of a *p-n*-junction diode ? Draw a diagram owing this bias. (*C.B.S.E. Sample Q. Paper*)

Ans. The reverse biasing results in very high resistance a *p-n* junction diode.

For diagram showing reverse bias, refer Fig 2.05 (*a*).

Q. 2.09. Draw the V-I characteristics of a *p-n* junction ode. Show the Zener voltage on the characteristics curve. (*I.S.C.E. 1994*)

Ans. For V-I characteristics of *p-n* junction diode, fer to Figs 2.04 (*b*) and 2.05 (*b*). Zener voltage corres-onds to the straight portion of the graph [Fig. 2.05 (*b*)], owing the sudden rise in current corresponding to verse bias of − 10 V.

Q. 2.10. A diode is connected to 220 V (r.m.s.) a.c. in ries with a capacitor as shown in Fig. 2.64. What is the ltage V across the capacitor ? (*I.S.C.E. 1996*)

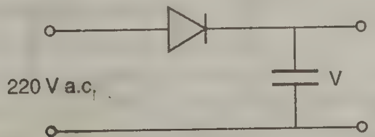

Fig. 2.64

Ans. A junction diode conducts during alternate half cycles of a.c. input supply. During a half cycle of conduction, the capacitor will charge itself to peak value of supply voltage. Therefore, voltage across the capacitor,

$$V = E_0 = E_{r.m.s.} \times \sqrt{2} = 220 \times \sqrt{2} = \mathbf{311{\cdot}1\ V}$$

Q. 2.11. Draw the circuit diagram of a half wave rectifier using a junction diode. (*H.S.S.C.E. 2002 ; I.S.C.E. 1995 ; Pre-degree Kerala, 1994*)

Ans. Refer to Fig. 2.07.

Q. 2.12. Draw a labelled circuit diagram of full wave rectifier using *p-n* junction diodes. (*C.B.S.E. 1995*)

Ans. Refer to Fig 2.09.

Q. 2.13. Draw a labelled circuit diagram showing use of *p-n* junctions as full wave rectifier. (*H.S.S.C.E. 2001, 1998, 1997*)

Ans. Refer to Fig. 2.09.

Q. 2.14. State the funciton of a Zener diode in a circuit. (*I.S.C.E. 1993*)

Ans. Refer to section 2.07.

Q. 2.15. What is a light emitting diode (LED) ? Draw a circuit diagram and explain its action. (*C.B.S.E. 1996 S*)

Ans. Refer to section 2.07 and Fig. 2.14.

Q. 2.16. Represent symbolically Zener diode, photodiode, *n-p-n* and *p-n-p* transistors. (*P.S.S.C.E. 1993*)

Ans. Refer to Figs. 2.11, 2.13 (*a*), 2.17 and 2.18.

Q. 2.17. Why is the base region of transistor usually made thin ? (*C.B.S.E. 2002*)

Or

In a transistor, base is made very thin. Explain. (*H.P.S.S.C.E. 1995*)

Or

Write the function of base region of a transistor. Why is this region made thin and slightly doped ? (*C.B.S.E. 1998 S*)

Ans. Due to the fact that base is doped lightly, the number density of majority carriers (electrons in *p-n-p* and holes in *n-p-n* transistors) is low. When emitter is forward biased, electron-hole combination takes place in base region. Since it is thin and lightly doped, only a small amount (about 5%) of electron-hole recombination will take place.

Q. 2.18. How does the collector current change in a junction transistor, if the base region has larger width ? (*C.B.S.E. 2000, 1999*)

Ans. The collector current will become smaller.

Also refer to SAQ 2.17.

Q. 2.19. Explain the conditions that must prevail in the base for a large current to flow in the collector circuit in spite of reverse bias.

Ans. Base should be made thin and it should be lightly doped. For details, refer to SAQ 2.17.

Q. 2.20. In a transistor, forward bias is always small as compared to the reverse bias. Explain the reason.

Ans. In a transistor, emitter is forward biased and collector is reverse biased. In case, forward bias is made large, majority carriers in the emitter drift towards the collector through the base region with large velocity. Since, their number is also very large, heat produced is so large that it breaks up the covalent bonds and the transistor gets spoiled.

However, if the reverse bias applied to collector is comparatively larger, no such effect is produced as the charge carriers drift only in collector region.

Q. 2.21. How will you test in a simple way whether the transistor is spoiled or in working order ?(*P.S.S.C.E. 2002*)

Ans. The two parts (part between the emitter and base and the part between base and collector) of a transistor in working order possesses low resistance in one direction and high resistance in the opposite direction. In a spoiled transistor, the resistance is low in both the directions. It can be checked with the help of a AVO-meter or by taking a battery cell and a milliammeter.

Q. 2.22. What is a *p-n-p* transistor ? How does it differ from a *n-p-n* transistor ? (*H.S.S.C.E. 2002*)

Ans. In a *p-n-p* transistor, a thin *p*-section is sandwitched between two *n*-sections. The holes are charge carriers in a *p-n-p* transistor.

In a *n-p-n* transistor, a thin *p*-section is sandwitched between two *n*-sections. In a *n-p-n* transistor, electrons are the charge carriers.

Q. 2.23. Give the working of a *p-n-p* transistor. (*H.S.S.C.E. 1995*)

Ans. Refer to section 2.10.

Q. 2.24. Why a transistor cannot be used as a rectifier ? (*P.S.S.C.E. 1991*)

Ans. To use a transistor as a rectifier, either its emitter-base portion or the collector-base portion has to be used. Since base is thin and lightly doped, either of the two portions will not work as a *p-n* junction diode. Hence, a transistor cannot be used as a rectifier.

Q. 2.25. In a transistor, emitter is always forward-biased, while the collector is reverse biased. Explain the answer.

Ans. In a transistor, the function of emitter and collector is same as that of cathode and plate respectively in a triode valve. The emitter will send charge carriers (electrons or holes) towards the base only, when it is forward-biased. On the other hand, the collector will collect them, when it is reverse-biased.

Q. 2.26. Draw a circuit diagram of a *p-n-p* transistor as an amplifier in a common emitter configuration. (*C.B.S.E. 1998 S*)

Ans. Refer to Fig. 2.28.

Q. 2.27. Draw the circuit diagram of an *n-p-n* transistor as an amplifier in common emitter configuration. (*C.B.S.E. 1998 S*)

Ans. Refer to Fig. 2.27.

Q. 2.28. Why the output voltage is out of phase with the input voltage in a common emitter transistor amplifier ? (*C.B.S.E. 1999*)

Ans. Refer to section 2.14.

Q. 2.29. Draw the circuit of a transistor as an amplifier. (*P.S.S.C.E. 1994*)

Ans. Refer to Fig. 2.27.

Q. 2.30. Draw the circuit diagram of an *n-p-n* transistor amplifier and show various potential drops. (*H.S.S.C.E. 1994*)

Ans. Refer to Fig. 2.27.

Q. 2.31. Define current gains, α and β of a transistor. (*I.S.C.E. 1994*)

Ans. α and β are known as current gains of a commo base amplifier and common emitter amplifier respectivel

To define α : It is defined as the ratio of change collector current to the change in emitter current at consta collector voltage.

To define β : It is defined as the ratio of change collector current to the change in base current at consta emitter current.

Q. 2.32. A transistor has a current gain of 30. If t collector resistance is 6 kilo-ohm, input resistance is 1 kil ohm, calculate its voltage gain. (*C.B.S.E. 1998*

Ans. Here, input resistance, $R_{in} = 1\ k\Omega$; outp (collector) resistance, $R_{out} = 6\ k\Omega$

Therefore, resistance gain, $\frac{R_{out}}{R_{in}} = \frac{6}{1} = 6$

Now, voltage gain = current gain × resistance gain
$= 30 \times 6 = 180$

Q. 2.33. Draw the circuit diagram of a transist oscillator. (*P.S.S.C.E. 1999 S, 1992 ; Pre-degree Kerala, 199*

Ans. Refer to Fig. 2.28.

Q. 2.34. What is the logic gate ? Mention the symb and truth table of AND logic gate. (*P.S.S.C.E. 2000, 199*

Ans. A logic gate is a digital circuit, which wor according to some logical relationship between input a output voltages. For symbol and truth table of AND ga refer to Figs. 2.35 (*a*) and 2.35 (*c*).

Q. 2.35. What is a 'logic gate' ? Mention the truth tab of AND gate. (*H.S.S.C.E. 199*

Ans. Logic gate. Refer to SAQ 2.34.

Truth table of AND gate. Refer to the table given in Fi 2.32 (*c*).

Q. 2.36. Give the logic symbol and truth table of AN gate. (*P.S.S.C.E. 1999 ; H.S.S.C.E. 1999*

Ans. Refer to Figs. 2.35 (*a*) and 2.35 (*c*).

Q. 2.37. Give logic symbol, Boolean expression a truth table of AND gate. (*P.S.S.C.E. 2002 ; H.P.S.S.C.E. 199*

Ans. Refer to section 2.23.

Q. 2.38. Describe in brief an OR gate. (*H.S.S.C.E. 199*

Ans. Refer to section 2.22.

Q. 2.39. Give logic symbol, Boolean expression a truth table of an OR gate. (*P.S.S.C.E. 2002 ; H.P.S.S.C.E. 199*

Ans. Refer to section 2.22.

Q. 2.40. Draw circuit diagram of OR gate. (*H.S.S.C.E. 1998 S, 199*

Ans. Refer to Fig. 2.34.

Q. 2.41. Give logic symbol, Boolean expression a truth table of a NOT gate ? (*P.S.S.C.E. 200*

Ans. Refer to section 2.24.

Q. 2.42. Name the logic gate shown in Fig. 2.65 a write its truth table. (*C.B.S.E. 199*

Ans. It is OR gate. For its truth table, refer to the tab given in Fig. 2.33 (*c*).

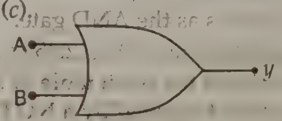

Fig. 2.65

Q. 2.43. Name the logic gate shown in Fig. 2.66 and e its truth table. (*C.B.S.E. 1996*)

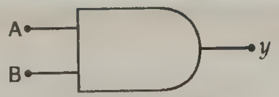

Fig. 2.66

Ans. It is AND gate. For its truth table, refer to table n in Fig. 2.32 (*c*).

Q. 2.44. Write the truth table for the combination of s shown in Fig. 2.67. (*H.S.S.C.E. 2000, C.B.S.E. 1997*)

Ans. The combination of the gates shown in Fig. 2.67 esents NAND gate. Its truth table is as given in Fig. 2.40 (*b*).

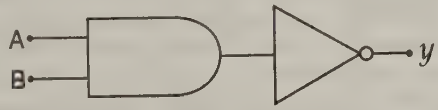

Fig. 2.67

Q. 2.45. Name the logic gate shown in Fig. 2.68 and te its truth table. (*C.B.S.E. 1996*)

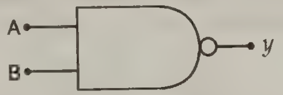

Fig. 2.68

Ans. It is NAND gate. For its truth table refer to table en in Fig. 2.40 (*b*).

Q. 2.46. Draw a logic circuit diagram showing how a ND gate can converted into a NOT gate. (*C.B.S.E. 1999*)

Ans. Refer to section 2.26.

Q. 2.47. Using a logic circuit, explain briefly how a nput NAND gate can be converted into a NOT gate. (*C.B.S.E. 1998 S*)

Ans. When the two inputs of NAND gate are joined, so t it has one input, it works as a NOT gate.

For details, refer to section 2.26 and Fig. 2.43 (*a*).

Q. 2.48. The output of a two-input NAND gate is fed input to a NOT gate. Write down the truth table for the al output of the combination. (*C.B.S.E. 1999*)

Ans. Let A and B be two inputs of NAND gate and y' its output. When its output y' is fed to the NOT gate, the al output will be as given in the adjoining truth table.

A	B	y'	y
0	0	1	0
1	0	1	0
0	1	1	0
1	1	0	1

Q. 2.49. The output of a 2-input NAND gate is fed to a OT gate. Write down the truth table for the output of the mbination for all possible inputs of A and B. (*C.B.S.E. 2002*)

Or

If the output of a 2-input NAND gate is fed as the input a NOT gate, (*i*) name the new logic gate obtained and (*ii*) rite down its truth table. (*C.B.S.E. 2001*)

Ans. (*i*) It functions as the AND gate.

(*ii*) For truth table, refer to Fig. 2.35 (*c*).

Q. 2.50. Write down the truth table of a logic circuit in hich an AND gate is followed by a NOT gate.

Ans. AND gate followed by a NOT gate results in NAND gate.

For its truth table, refer to the table given in Fig. 2.40 (*b*).

Q. 2.51. Explain, how a NAND gate can be used to obtain OR gate. (*H.P.S.S.C.E. 1999 S*)

Ans. Refer to section 2.26.

Q. 2.52. Discuss how the NOT gate is realised from a NAND gate.

Ans. Refer to section 2.26 and Fig. 2.43 (*a*).

Q. 2.53. Discuss how the AND gate is realised from the NAND gate.

Ans. Refer to section 2.26 and Fig. 2.44 (*a*).

Q. 2.54. Give the logic symbol and truth table of NOR gate. (*H.S.S.C.E. 2001*)

Ans. Refer to section 2.25.

Q. 2.55. Write truth table and Boolean expression of NOR gate. (*H.P.S.S.C.E. 2001*)

Ans. Refer to section 2.25.

Q. 2.56. If the output of a 2-input NOR gate is fed as the input to a NOT gate, (*i*) name the new logic gate obtained and (*ii*) write down its truth table. (*C.B.S.E. 2001*)

Ans. (*i*) If functions as the OR gate.

(*ii*) For truth table, refer to Fig. 2.33 (*c*).

Q. 2.57. Write down the truth table of a logic circuit in which an OR gate is followed by a NOT gate.

Ans. An OR gate followed by a NOT gate results in NOR gate.

For its truth table, refer to the table given in Fig. 2.42 (*b*).

Q. 2.58. Write the truth table for the following combination of gates shown in Fig. 2.69. (*C.B.S.E. 1998*)

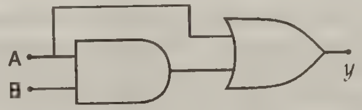

Fig. 2.69

Ans. In the combination of gates shown in Fig. 2.69, input (A) and output (say y') of the AND gate form the two inputs of the OR gate. The following truth table gives the final out put (y) of the combination of two gates.

A	B	y'	y
0	0	0	0
1	0	0	1
0	1	0	0
1	1	1	1

Q. 2.59. Write the truth table for the combination of gates shown in Fig. 2.70. (*C.B.S.E. 1998*)

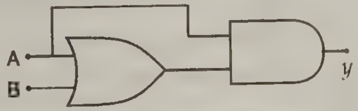

Fig. 2.70

Ans. In the combination of gates shown in Fig. 2.70, the input (A) and output (say y') of the OR gate form the two inputs of the AND gate. The truth table gives the final output (y) of the combination of two gates.

A	B	y'	y
0	0	0	0
1	0	1	1
0	1	1	1
1	1	1	1

Q. 2.60. Identify the logic gates marked, X, Y in Fig. 2.71. Write down the output at y, when A = 1, B = 1 and A = 0 and B = 1. *(C.B.S.E. 2001)*

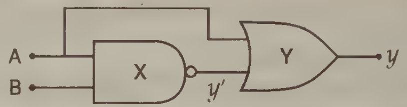

Fig. 2.71

Ans. The logic gate marked X is NAND gate, while the gate marked as Y is OR gate.

Corresponding to input B, let y' be output of NAND gate X. Then, inputs of OR gate Y are A and y'. The output at y will be as given in Fig. 2.72.

A	B	y'	y
1	1	0	1
0	1	1	1

Fig. 2.72

Q. 2.61. Identify the logic gates marked X, Y in Fig. 2.73. Write down the output at y, when A = 1, B = 1 and A = 0 and B = 0. *(C.B.S.E. 2001)*

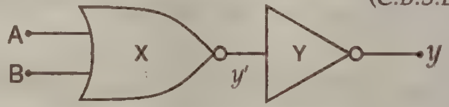

Fig. 2.73

Ans. The logic gate marked as X is NOR gate, while t gate marked as Y is NOT gate.

Let y' be output of NOR gate X. Then, output at y w be as given in Fig. 2.74.

A	B	y'	y
1	1	0	1
0	0	1	0

Fig. 2.74

Q. 2.62. Identify the logic gates marked X, Y in Fig. 2. Write down the output at y, when A = 1, B = 1 and A = B = 0. *(C.B.S.E. 200*

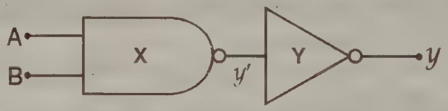

Fig. 2.75

Ans. The logic gate marked as X is NAND gate, wh the gate marked as Y is NOT gate.

Let y' be output of NAND gate X. Then, output at y w be as given in Fig. 2.76.

A	B	y'	y
1	1	0	1
0	0	1	0

Fig. 2.76

TECHIE STUFF – CONCEPTUAL SHORT ANSWER QUESTIONS

For ambitious, brilliant & curious Students

Q. 2.01. An n-type semiconductor is the one which has excess of free electrons and p-type semiconductor is deficient in these. When a p-n junction is formed, the electrons should flow from n to p region. But all the electrons do not do so. Explain, Why.

Ans. Though the semiconductors are called n-type or p-type, yet electrically they are neutral. When p-n junction is formed, electrons flow from n to p region. But as they do so, p-type becomes increasingly negative, while n-type becomes positive. This increasing potential difference across the p-n junction set up due to the electron flow attains a value, which then prevents the further flow of electrons. That is why all the electrons do not flow from n to p-type semiconductor.

Q. 2.02. In the following circuits, which of the diodes is forward-biased and which is reverse-biased and why ?

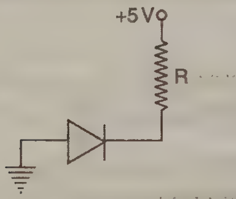

Fig. 2.77 (*a*)

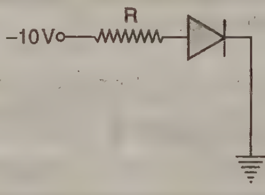

Fig. 2.77 (*b*)

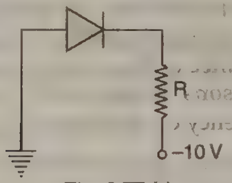

Fig. 2.77 (*c*)

Ans. The circuit shown in Fig. 2.77 (*a*) can be redrawn shown in Fig. 2.78.

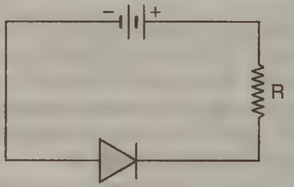

Fig. 2.78

As the p-section is connected to negative terminal of t battery, the diode has been *reverse biased.*

By redrawing the circuit diagrams, it can be shown th diode in circuit shown in Fig. 2.77 (*b*) is *reverse biased* and the circuit shown in Fig. 2.77 (*c*), the diode is *forward biase*

Q. 2.03. In the following circuits, which of the diod is forward biased and which is reverse biased ? *(C.B.S.E. 200*

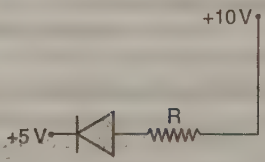

Fig. 2.79 (*a*)

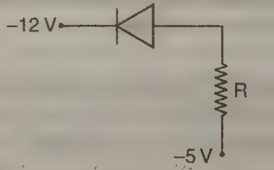

Fig. 2.79 (*b*)

Ans. The circuit shown in Fig. 2.79 (*a*) can be redrawn shown in Fig. 2.80.

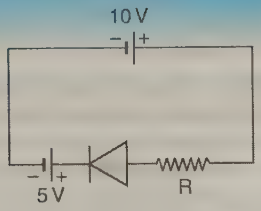

Fig. 2.80

The battery of 10 V makes *p*-section at +10 V, while the tery of 5 V makes *n*-section at + 5 V. Therefore, *p*-section at net + 5 V *w.r.t.* *n*-section. Hence, the diode in the circuit own in Fig. 2.79 (*a*) is *forward biased.*

Similarly, by redrawing the circuit shown in Fig. 2.79 (*b*), an be shown that the *p*-section is at net 7 V *w.r.t.* *n*-section d hence the diode is *forward biased.*

Q. 2.04. The circuit shown in Fig. 2.81 contains two diodes, each with a forward resistance of 50 Ω and with inite backward resistance. If the battery voltage is 6 V, d the current through the 100 Ω resistance.

(*I.I.T. 1997*)

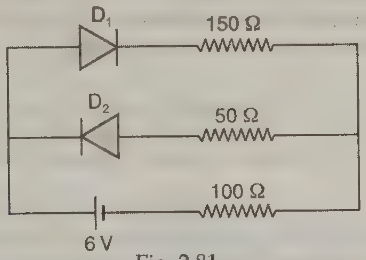

Fig. 2.81

Ans. Since the diode D_2 is reverse biased and it has finite backward resistance, no current will flow through ode D_2. Only the diode D_1 will allow current to flow in the rcuit, as it is forward biased.

Total resistance of the circuit

$$= 150 + 100 + \text{forward resistance of diode } D_1$$
$$= 150 + 100 + 50 = 300\ \Omega$$

Therefore, current in the circuit (or through 100 Ω sistance),

$$I = \frac{E}{R} = \frac{6}{300} = 0{\cdot}02\ A$$

Q. 2.05. Explain the following :

(*i*) A transistor is a temperature-sensitive device.

(*ii*) A transistorised circuit starts working immediately ter the circuit is switched on, whereas a vacuum tube rcuit takes some time to start working.

Ans. (*i*) A transistor contains free electrons and holes as arge carriers. When properly biased (emitter forward biased nd collector reverse biased), they carry current through the ansistor in external circuit. In case, temperature increases, ovalent bonds break up, resulting in an additional large umber of free electrons and holes. If transistor (when hot) is perated now, the current will be very strong, which may esult in excessive heat and ultimately in a complete break own of semiconductor device.

(*ii*) A vacuum tube is based upon thermionic emission. vacuum tube circuit will require some time, so that cathode ets heated and starts emitting electrons. On the other hand, a transistor, as there is no filament and hence no heating s required, the transistorised circuit starts working mmediately, when the circuit is switched on.

Q. 2.06. In only one of the circuits given below, the lamp L lights. Which circuit is it ? Give reason for your answer.

(*C.B.S.E. 2001 S*)

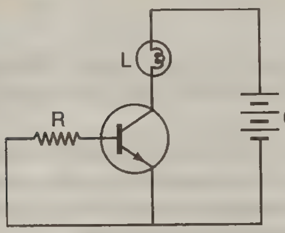

Fig.2.82

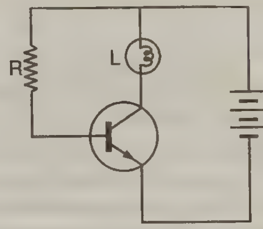

Fig. 2.83

Ans. In the circuit shown in Fig. 2.83, the lamp will light. It is because, the *n-p-n* transistor in the circuit can conduct only when its base is positive.

Q. 2.07. In the circuit shown in Fig. 2.84, a voltmeter V is connected across lamp L. What changes would occur at lamp L and the voltmeter V, if the resistor R is reduced in value ? Give reason for your answer.

(*C.B.S.E. 2001 S, 1999 S*)

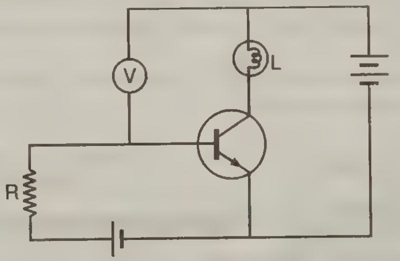

Fig.2.84

Ans. In the circuit shown in Fig. 2.67, the *n-p-n* transitor is forward biased. If resistor R is reduced, emitter current I_e will increase. The collector current flowing through the lamp is given by

$$I_c = I_e - I_b$$

It follows that due to increase in I_e, I_c will also increase. It will lead to make the lamp glow *more brilliantly*.

The voltmeter V measures potential difference across L. Due to increase in current through lamp, potential difference across lamp and hence reading of the voltmeter will **increase.**

Q. 2.08. The gain of a common emitter amplifier is given by $A_v = -g_m R_L$. Does it mean that if we keep on increasing indefinitely R_L, the gain of the amplifier will also increase indefinitely ? Explain your answer.

(*C.B.S.E. Sample Q. Paper*)

Ans. No, the gain of amplifier will not increase indefinitely on increasing R_L indefinitely. We know that

$$V_{ce} = V_{cc} - I_c R_L$$

Therefore, as R_L is increased, V_{ce} decreases and when V_{ce} becomes less than V_{be} (base voltage), both the junctions get forward biased and the saturation starts.

Q. 2.09. All India Radio broadcasts at 710 kcps, whereas BBC broadcasts at 1380 kcps on the same medium wave band. For changing over from All India Radio to BBC, the capacitance of the variable capacitor has to be decreased. Give reasons in support of your answer.

Ans. The frequency of oscillations is given by

$$f = \frac{1}{2\pi\sqrt{LC}}$$

As both the stations are tuned on the same band (medium wave band), the value of L is same in both the cases and therefore,

$$f \propto \frac{1}{\sqrt{C}}$$

Since in changing over from All India Radio (710 kcps) to BBC (1380 kcps), frequency increases, the capacitance of variable capacitor has to be decreased.

Q. 2.10. In the following circuits, if the input wave form is as shown in the Fig. 2.85, what will be the output wave form across the diode in circuits shown in Fig. 2.86 (*a*) and Fig. 2.86 (*b*) ? Assume that the diode is ideal.

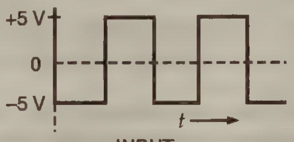

Fig. 2.85

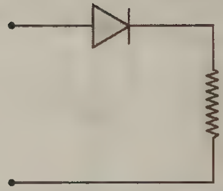

Fig. 2.86 (*a*)

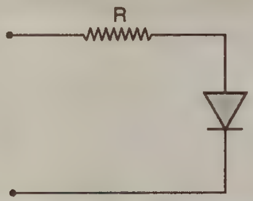

Fig. 2.86 (*b*)

Ans. ***The input cycle shown in Fig. 2.85*** : The inp digital nature *i.e.* it is either – 5 V or + 5 V.

Circuit shown in Fig 2.86 (a) : When the input l – 5 V, the diode in the circuit shown in Fig. 2.86 (*a*) be reverse biased. No output is obtained across resistanc long it remains – 5 V. When the input level becomes the diode gets forward biased and current flows throu resistance R. As diode is ideal, the output across R exactly 5 V. Thus, for the given waveform of the inp output will vary between 0 and 5 V and will be as sh Fig. 2.87.

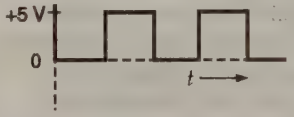

Fig. 2.87

Circuit shown in Fig. 2.86 (b) : In this case, the conducts, when the input level is – 5 V and it do conduct, when input level is + 5 V. Due to ideal na diode, the output obtained across R will be between – 5 0 and will be as shown in the Fig. 2.88.

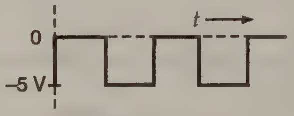

Fig. 2.88

FREQUENTLY ASKED SHORT ANSWER QUESTIONS

Carrying 3 Marks

1. Show diagrammatically a forward biased and a reverse biased *p-n* junction. (*C.B.S.E. 1990*)
2. Distinguish between forward biasing and reverse biasing in *p-n* junction. Discuss its use. (*H.P.S.S.C.E. 1995*)
3. Draw a circuit diagram for *p-n* junction diode in forward bias. Sketch the voltage versus current graph for the same. (*C.B.S.E. 1995*)
4. What is a *p-n* junction diode ? Define the term dynamic resistance for the junction diode. (*H.S.S.C.E. 1999*)
5. What is rectification ? Explain with the help of a circuit diagram, how a junction diode acts as a half-wave rectifier. (*I.S.C.E. 1994*)
6. How a *p-n* junction diode can be used as half-wave rectifier ? (*H.P.S.S.C.E. 1998 S*)
7. Explain the forward and reverse bias characteristic curve of a *p-n* junction. Draw the circuit diagram of *p-n* diode as a full-wave rectifier. (*P.S.S.C.E. 1996 S*)
8. Draw the circuit diagram of a full-wave rectifier and briefly explain its working principle. (*C.B.S.E. 2001*)
9. With the help of circuit diagram explain, the working of *p-n* junction diode as a full-wave rectifier. (*C.B.S.E. 2000 ; H.S.S.C.E. 1999, 1998 S*)
10. What do you mean by rectification ? With the help of a circuit diagram, explain the use of a *p-n* junction diode as a full-wave rectifier, giving its input and output wave-forms. (*C.B.S.E. 1999 S*)
11. Explain the function of a *p-n* junction diode as full-wave rectifier. (*P.S.S.C.E. 2002, 1998 S ; H.S.S.C.E. 2001, 1999 S ; H.P.S.S.C.E. 2000, 1999*)
12. Draw the current versus voltage characteristic curve of a Zener diode. Indicate the position of Zener voltage. Draw a labelled circuit diagram of a d.c. voltage regulator using a Zener diode. (*I.S.C.E. 1998*)
13. What is a Zener diode ? Explain its action in reg supply voltage. (*H.S.S.C.E*
14. What is a Zener diode ? How is it symbol represented ? With the help of a circuit diagram, the use of Zener diode as a voltage stabilizer. (*C.B.S.E.*
15. What is a zener diode and a photo diode ? Give the use of such diodes.
16. Distinguish between the light emitting diode an diode. Draw their biasing circuits. (*C.B.S.E. Sample Q*
17. Give the symbol of *n-p-n* and *p-n-p* transistors. Sh biasing of an *n-p-n* transistor and explain transistor (*C.B.S.*
18. With the help of a circuit diagram, explain the act *n-p-n* transistor. (*C.B.S.E.*
19. What is an *n-p-n* transistor ? How does it diffe *p-n-p* transistor ? Give their symbols. Explain tra action. (*C.B.S.E*
20. Describe the working of a *n-p-n* transistor as comm amplifier. Define current amplification. (*H.S.S.C.E.*
21. Explain through a labelled diagram the working transistor (common-base configuration) as an am (*H.P.S.S.C.*
22. Explain the working of an *n-p-n* transistor as an a and determine its voltage gain. (*C.B.S.E. 1995 ; H.S.S.C.*
23. Discuss the working of *p-n-p* transistor as amplifi common-base circuit. (*H.P.S.S.C.E*
24. Write the construction of *p-n-p* transistor. Ho represented symbolically ? Explain its operation

type of emitter base and collector base biasing is required for the use of transistor as common-base amplifier ? (C.B.S.E. 1996 S)

5. Discuss the working of a *p-n-p* transistor as a common-base amplifier and determine its voltage gain. (H.S.S.C.E. 2001 ; P.S.S.C.E. 1996)

6. Explain with the help of a labelled circuit diagram the use of a transistor as an amplifier. (C.B.S.E. 1996, 1995)

7. Explain the working and amplifying action of a transistor. (P.S.S.C.E. 1996)

8. Describe a transistor as an amplifier. (H.S.S.C. E. 1996)

9. Describe the principle, construction and working of a transistor. (H.S.S.C.E. 2002, 1996)

0. Explain the amplifying action of a transistor. (P.S.S.C.E. 1997 S)

1. With the help of a circuit diagram, explain the use of an *n-p-n* transistor as an amplifier. (H.S.S.C.E. 1997 S)

2. Explain through a labelled diagram, the working of an *n-p-n* transistor as an amplifer (common-emitter configuration). (H.P.S.S.C.E. 2002 ; 1996)

3. Draw a labelled circuit diagram for a common-emitter amplifier using *n-p-n* transistor. Write down the expression for its voltage gain. What is the phase difference between input and output signals ? (C.B.S.E. 2002)

4. Draw the circuit diagram of a common-emitter amplifier. What is the phase difference between the input and output signals State two reasons, why a common-emitter amplifier is preferred to a common-base amplifier. (C.B.S.E. 2001)

5. Fig. 2.89 shows the circuit diagram of a common-emitter amplifier. Explain the function of (*i*) resistor R_1, (*ii*) resistor R_2, (*iii*) resistor R_3 and capacitor C_3. (*iv*) capacitors C_1 and C_2.

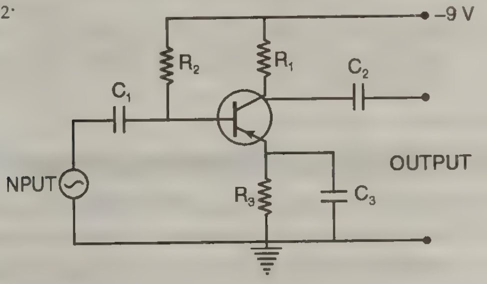

Fig. 2.89.

In the circuit, which junction is forward biased and which one is reverse biased ? (I.S.C.E. 1993)

36. Explain through a labelled diagram, the working of *p-n-p* transistor as an oscillator. (H.P.S.S.C.E. 2002 ; H.S.S.C.E. 2001)

37. With the help of a labelled circuit diagram, explain the use of a transitor as an oscillator. (C.B.S.E. 2000, 1998)

38. Explain through a diagram, the working of transistor as an oscillator. (H.S.S.C.E. 2001 ; H.P.S.S.C.E. 1998 S)

39. Describe a junction transistor and explain its use as an oscillator. (H.S.S.C.E. 1995)

40. Describe a junction transistor. Show with the help of a circuit diagram, how it can be used as an oscillator. (H.S.S.C.E. 1995 ; C.B.S.E. 1991)

41. Explain transistor as an oscillator. (H.S.S.C.E. 2001, 2000, 1993, 1992)

42. Explain the advantages and disadvantages of semiconducting devices compared to vacuum tube devices. (P.S.S.C.E. 2002)

43. Write a short note of integrated circuits. Give their uses.

44. Give symbol, truth table and logic statement of OR gate. (H.S.S.C.E. 1996)

45. What is a logic gate and its truth table ? Draw the logic symbol of the OR gate. Explain its working and obtain the truth table for it.

46. Give the logic, truth table and Boolean expression for OR gate. How is it realised in practice ? (H.S.S.C.E. 1993)

47. Draw the symbol of an AND gate. What type of truth table does it follow ? How can one realise such a gate in actual practice by using a junction diode for two-input feed ? (P.S.S.C.E. 1996)

48. Give the logic symbol, truth table and Boolean expression for AND gate. How is it obtained in practice ? (H.S.S.C.E. 1992)

49. Discuss the working of the NOT and AND gates. Write down the truth table in each case.

50. Give the truth tables and symbols of AND, NAND and NOR logic gates. (P.S.S.C.E. 1993)

51. Give the truth tables and logic symbols of OR, NOR and NAND logic gates. (P.S.S.C.E. 1999 S)

52. What is a digital circuit, a logic gate, truth table and Boolean expression ? Draw the logic symbols of the OR, AND and NOT gates.

53. Explain how a NAND gate is obtained from AND and NOT gates. Give its logic symbol and truth table.

54. Explain how a NOR gate is formed. Give its logic symbol and truth table.

55. Explain how a NAND gate can be used to obtain all the three basic logic gates.

56. Explain, how AND logic gate can be realised from NAND logic gate. (P.S.S.C.E. 1999 S)

57. Explain, how XOR gate is obtained from OR, AND and NOT logic gates. Also give the logic symbol and truth table of XOR gate. (P.S.S.C.E. 1999 S)

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS

Carrying 5 Marks

1. Define the terms 'potential barrier' and 'depletion region' for a *p-n* junction diode. State how the thickness of depletion region will change when the *p-n* junction diode is (*i*) forward biased, (*ii*) reverse biased. (C.B.S.E. 1998)

2. What is a *p-n* junction ? Explain with the help of a diagram, how depletion layer is formed near the junction. Also explain what happens to this layer, when the junction is (*i*) forward biased and (*ii*) reverse biased. (H.S.S.C.E 2001)

3. What is a *p-n* junction ? How is potential barrier caused in it ? Discuss the characteristics of a *p-n* junction diode. (H.S.S.C.E. 2002)

4. What is a *p-n* junction ? Discuss its action in forward bias and reverse bias arrangement. (H.S.S.C.E. 2002)

5. For a *p-n* junction, draw (*i*) the circuit diagram for forward biasing (*ii*) circuit diagram for reverse biasing (*iii*) the current-voltage characteristics. (*Pre-degree Kerala, 1991*)

6. Why does a *p-n* junction diode offer low resistance in forward bias and a high resistance in reverse bias ? Explain the characteristic curves of this diode by drawing suitable circuit diagrams. (P.S.S.C.E. 1998)

7. Explain the use of *p-n* junction diode as rectifier. Draw the circuit diagram of a full-wave rectifier and explain its working. Draw the input and output waveforms. (C.B.S.E. 1990)

8. What is a rectifier ? Explain the working of a full-wave rectifier giving a neat circuit diagram as well as the input and output waveforms. (H.S.S.C.E. 2002)

9. Describe the characteristics of a semiconductor diode and how it can be used as a full-wave rectifier. *(H.S.S.C.E. 2000)*
10. Explain briefly, why a junction diode acts as a rectifier. Draw a labelled diagram of a full-wave rectifier, explaining the functions of its various components. *(I.S.C.E. 1996, 1993)*
11. Define the terms `potential barrier' and `depletion region' for a *p-n* junction. Explain, with the help of a circuit diagram, the use of a *p-n* diode as a full-wave rectifier. Draw the input and output wave-forms. *(C.B.S.E. 1998)*
12. Give a circuit diagram for common-base characteristics of *p-n-p* transistor. How are input and output characteristics drawn ? Explain them. *(H.S.S.C.E. 1993)*
13. Draw the circuit diagram for *p-n-p* common-base transistor characteristics. Discuss the characteristics. *(H.S.S.C.E. 1997 S)*
14. Draw a circuit diagram to obtain the characteristics of a *n-p-n* transistor in common-emitter configuration. Describe how you will obtain input and output characteristics. Give shape of the curves. *(C.B.S.E. 2001)*
15. Describe the consutrction of a transistor. Explain its working as a common-base amplifier. *(P.S.S.C.E. 2000)*
16. With the help of a labelled circuit diagram, explain the working of *n-p-n* transistor as a common-base amplifier and derive an expression for its voltage gain. *(P.S.S.C.E. 2001)*
17. What is an amplifier ? With the help of a circuit diagram, explain the function of a *p-n-p* transistor as an amplifier. *(H.S.S.C.E. 2002)*
18. Drawing a labelled circuit diagram, explain the working principle of a common-emitter transistor amplifier. State the phase relation between input and out signals. *(C.B.S.E. 2000)*
19. Discuss common emitter amplifier using *n-p-n* transistor. Find its current gain, voltage gain and power gain. *(P.S.S.C.E. 2002, 2000)*
20. With the help of a labelled circuit diagram, explain working of a *p-n-p* transistor as a common-emit amplifier and derive an expression for its voltage gai *(P.S.S.C.E. 20*
21. Draw a practical single stage circuit for a common-emi audio frequency amplifier using an *n-p-n* transistor an single battery. Describe, how (*i*) temperature stabilisat is achieved, (*ii*) base-bias is provided and (*iii*) undesira feed-back of amplified signal into the base-emitter circ is avoided. *(I.S.C.E. 19*
22. Draw a circuit diagram to show the connections for operation of a *p-n-p* transistor as an amplifier. Explain different biasing. What is the phase relationship betw the input and output voltages in this case ? Obtain expression for its current gain. *(C.B.S.E. 1996*
23. Explain through a labelled circuit diagram, the work of a transistor as an amplifier (common-emitter confi ration). Obtain an expression for the current gain, volt gain and power gain. *(H.S.S.C.E. 1999 S ; H.P.S.S.C.E. 1999 ; C.B.S.E. 1996, 19*
24. What is an oscillator ? Discuss the use of a junct transistor as an oscillator. *(H.S.S.C.E. 20*
25. Give the logic symbol, truth table and Boolean express for AND gate. How is it realised in practice ? *(H.S.S.C.E. 20*
26. Draw the logic symbol of OR gate. Write its truth table a How can one realise such a gate in actual practice by us junction diodes ? *(P.S.S.C.E. 20*
27. What do you understand by logic gate ? Why is it called ? Discuss AND gate ? *(H.S.S.C.E. 20*
28. Give the logic symbol, truth table and Boolean express for AND gate. How is it realised in practice ? *(H.S.S.C.E. 20*
29. Draw the logic symbol of AND gate. Write its truth ta also. How can one realise such a gate in actual practice using junction diodes ? *(P.S.S.C.E. 20*

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On p-n junctions

1. In a forward biased silicon diode, current occurs at close to 0·7 V and increases rapidly with very small further potential difference increase. What current will flow, when there is a 200 Ω resistor in series with the diode with a 10 V battery across the series combination ? **[Ans.** 46·5 mA]
2. A *p-n* junction diode when forward biased has a potential drop of 0·5 V, which is assumed to be independent of current. The current in excess of 10 mA through the diode produces a large Joule heating, which damages (burns) the diode. If we want to use a 1·5 V battery to forward bias the diode, what should be the value of the resistor used in series with the diode so that the maximum current does not exceed 5 mA ? **[Ans.** 200 Ω]
3. Refer to the Zener diode circuit shown in Fig. 2.49. If E = 12 V, V_Z = 9 V, R = 200 Ω and R_L = 1·5 kΩ, calculate the power dissipated in (*a*) resistance R (*b*) load resistance R_L and (*c*) the Zener diode. **[Ans.** (*a*) 0·045 W, (*b*) 0·054 W, (*c*) 0·081 W]
4. In the circuit using a Zener diode voltage stabiliser [Fig. 2.49], what is the smallest value of load resistance for stabilisation to be possible. Given, R = 100 Ω, E = 5 V and Zener diode is of 3 V. **[Ans.** 150 Ω]
5. A full-wave recitifier makes use of two identical junction diodes having negligible forward resistance. What is the r.m.s. value of voltage across R_L, when a sinusoidal volt supply of peak value 100 V is fed to the rectifier. **[Ans.** 70·7

Type B. On Characteristics of a transistor

6. Fig. 2.90 gives the variation of I_b as a function of V_{be} at fi V_{ce} = 20 V. (*a*) Find the voltage corresponding to I_b = 40 and 80 μA ; (*b*) Find the resistance R= V_{be}/I_b at these points and the dynamic resistance. **[Ans.** (*a*) 0·7 V, 0·8 V ; (*b*) 17·5 kΩ, 10 kΩ, 2·5

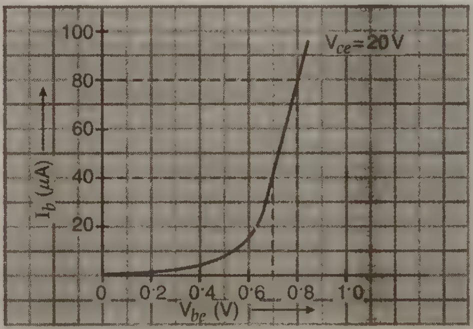

Fig. 2.90.

7. A certain *n-p-n* transistor has the common-emitter output characteristics as shown in Fig. 2.91.
(*a*) Find the emitter current at $V_{ce} = 10$ V and $I_b = 60\ \mu A$.
(*b*) Find α at that point. **[Ans.** (*a*) 6·06 mA ; (*b*) 0·99]

8. A certain transistor has common-emitter input characteristics as shown in Fig. 2.90 and the common emitter output characteristics as shown in Fig. 2.91.

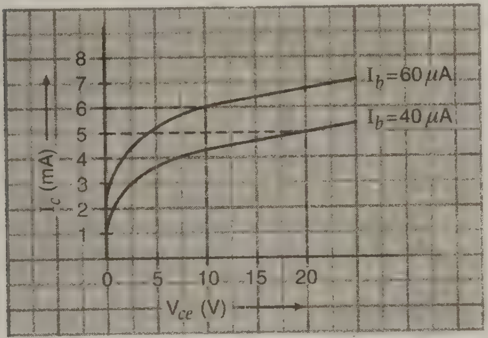

Fig. 2.91.

(*a*) Find I_c, when $V_{be} = 0{\cdot}7$ V and $V_{ce} = 20$ V. (*b*) Find β of the transistor at that point. **[Ans.** (*a*) 5 mA ; (*b*) 125]

Type C. On Transistor as an amplifier

9. For a common base amplifier, emitter current is 5·2 mA and base current is 0·22 mA. Find the current gain of the amplifier. **[Ans.** 0·958]

10. For a transistor working as common base amplifier, current gain is 0·97 and base current is 0·12 mA. Calculate the collector and emitter current. **[Ans.** 3·88 mA, 4 mA]

11. In a common base transistor amplifier, if the input resistance is 200 ohm and load resistance is 20 kiloohm, find (*i*) voltage gain (*ii*) power gain. Given, current gain of common base transistor is 0·95. (*H.P.S.S.C.E. 1993*)
[Ans. (*i*) 95 ; (*ii*) 90·25]

12. In the *n-n-p* transistor circuit shown in Fig. 2.92, what is the potential difference between base and collector ? What is the biasing (forward or reverse) between emitter-base and collector-base junctions ?

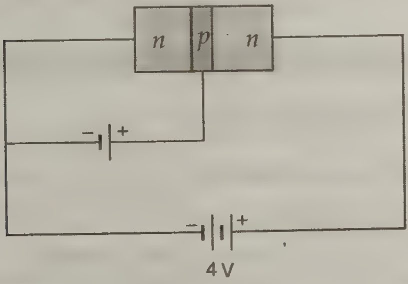

Fig. 2.92.

[Ans. 2 V, 2 V (forward), 2 V (reverse)]

13. Calculate emitter current for which $\beta = 100$ and base current $I_b = 20\ \mu A$. (*H.P.S.S.C.E. 2002*) **[Ans.** 2·02 mA]

14. For a common-emitter amplifier, current gain is 60. If the emitter current is 6·6 mA, calculate the collector and base current. **[Ans.** 6·49 mA, 0·108 mA]

15. In a common-emitter mode of transistor, d.c. current gain is 20 and the emitter current is 7 mA. Calculate (*i*) base current and (*ii*) collector current. (*C.B.S.E. 2002*)
[Ans. (*i*) 0·333 mA, (*ii*) 6·667 mA]

16. For a common-emitter amplifier, current gain is 60. If the emitter current is 7·7 mA, calculate the base current and collector current. Also calculate current gain, when the same transistor is working as common-base amplifier.
(*P.S.S.C.E. 2001*) **[Ans.** 0·126 mA, 7·574 mA, 0·984]

17. The input resistance of a common-emitter amplifier is 2 kΩ and a.c. current gain is 20. If the load resistor used is 5 kΩ, calculate (*i*) the voltage gain of the amplifier and (*ii*) the transconductance of the transistor used. (*C.B.S.E. 1999*)
[Ans. (*i*) 50 ; (*ii*) 0·01 S]

18. A change of 8·0 mA in the emitter current causes a change of 7·9 mA in the collector current. How much change in base current is required to have the same change of 7·9 mA in the collector current ? Find the values of α and β.
[Ans. 0·1 mA, 0·99, 79]

19. In the circuit shown in Fig. 2.93, the base current I_b is 10 μA and the collector current is 5·2 mA. Calculate V_{be} and V_{ce}. Can this transistor circuit be used as an amplifier ?

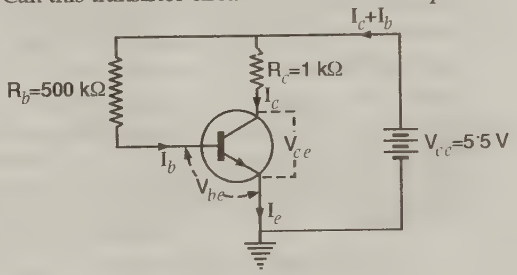

Fig. 2.93.

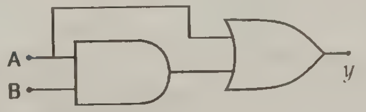
[Ans. $V_{be} = 0{\cdot}5$ V, $V_{ce} = 0{\cdot}3$ V. It cannot work as an amplifier as both the emitter-base and collector base junctions are forward biased]

Type D. On Logic gate and its Truth table

20. Express by a truth table, the output *y* for all possible inputs A and B in the logic circuit shown in Fig. 2.94.

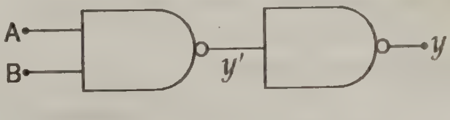


Ans.

A	B	*y*
0	0	0
1	0	1
0	1	0
1	1	1

Fig. 2.94

21. Produce the truth table of the combination of two NAND gates arranged as shown in Fig. 2.95. Hence, show that it behaves as AND gate.

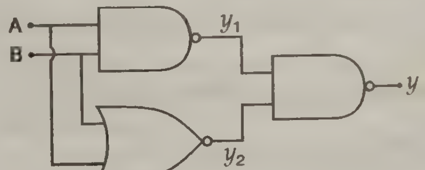


Ans.

A	B	*y*
0	0	0
1	0	0
0	1	0
1	1	1

Fig. 2.95

22. Produce the truth table of the combination of gates shown in Fig. 2.96.

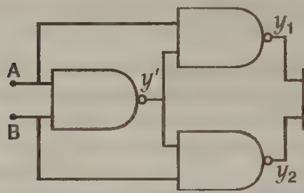


Ans.

A	B	*y*
0	0	1
1	0	0
0	1	0
1	1	1

Fig. 2.96

23. Produce the truth table of the combination of four NAND gates arranged as shown in Fig. 2.97. Hence, show that it behaves as XOR gate.



Ans.

A	B	y
0	0	0
1	0	1
0	1	1
1	1	0

Fig. 2.97

MISCELLANEOUS PROBLEMS

24. A junction diode of negligible forward resistance is used as a half-wave rectifier to rectify a sinusoidal voltage supply 30 V (r.m.s.), 50 Hz. The output is obtained across a load resistance R_L of 10 kΩ. Calculate (*a*) the peak value of output current, (*b*) the reading of d.c. milliammeter connected in series to R_L and (*c*) the reading of the d.c. voltmeter connected across a capacitor of 16 μF connected in parallel to R_L.

[**Ans.** (*a*) 4·24 mA (*b*) 1·35 mA (*c*) $30\sqrt{2}$ V]

25. The circuit shown in Fig. 2.98 uses a Zener diode of 12 V as a voltage regulator to run a 12 V, 6 W tape recorder on 110 V d.c. line. What should be the value of the resistance R, if the d.c. supply varies from 102-115 V ?

(*I.S.C.E. 1996*) [**Ans.** 180 Ω]

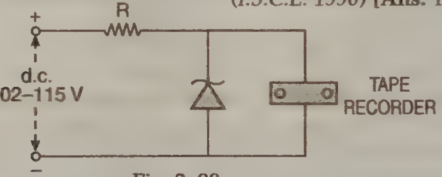


Fig. 2. 98

26. In Fig. 2.99, circuit symbol of logic gate and input wave forms are given. Name the logic gate. Write its truth table and give the output wave form. (*C.B.S.E. 2002*)

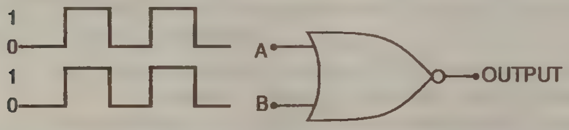

Fig. 2. 99

[**Ans.** NOR gate, truth table as given in Fig. 2.42 (*b*),

27. Identify which basic gate, OR, AND and NOT is represented by the circuits in the dotted line boxes, *a*, *b* and *c* shown in Fig. 2.100.

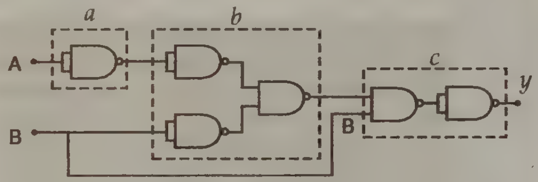

Fig. 2.100

Give the truth table for the entire circuit for all possible values of A and B. [**Ans.** (*a*) NOT ; (*b*) OR ; (*c*) AND]

A	B	y
0	0	0
1	0	0
0	1	1
1	1	1

28. In the circuit shown in Fig. 2.101, if we assume that when the input voltage at the base resistance is 5 V, V_{be} is zero and V_{ce} is also zero, what is I_b, I_c and β.

[**Ans.** $I_b = 25\ \mu$A, $I_c = 3{\cdot}33$ mA, $\beta = 133{\cdot}2$]

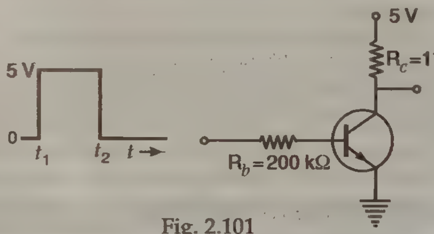

Fig. 2.101

29. The Boolean expression for the logic circuits as given below :

(*a*) $y = A.\overline{B} + A.B$ (*b*) $y = A.B + \overline{A.B}$

Find the output y in each case, if the inputs are A = 0, B = 0 ; A = 1, B = 0 ; A = 0, B = 1 and A = 1, B = 1.

[**Ans.** (*a*) 0, 1, 0, 1 ; (*b*) 1, 1, 1, 1]

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. E.M.F. of battery, E = 10 V

Voltage drop across junction diode, $V_d = 0{\cdot}7$ V

Therefore, voltage drop across series resistor,

$$V = E - V_d = 10 - 0{\cdot}7 = 9{\cdot}3 \text{ V}$$

Hence, current in the circuit,

$$I = \frac{V}{R} = \frac{9{\cdot}3}{200} = 4{\cdot}65 \times 10^{-2} \text{ A} = \mathbf{46{\cdot}5\ mA}$$

2. Effective forward bias, V = 1·5 – 0·5 = 1 V

Current desired through *p-n* junction,

$$I = 5 \text{ mA} = 5 \times 10^{-3} \text{ A}$$

Let R be resistance of the resistor used in series with the diode. Then,

$$R = \frac{V}{I} = \frac{1}{5 \times 10^{-3}} = \mathbf{200\ \Omega}$$

3. Refer to Fig. 2.49 :

(*a*) $V = E - V_Z = 12 - 9 = 3$ V

$$\therefore \quad I = \frac{V}{R} = \frac{3}{200} = 0{\cdot}015 \text{ A}$$

Power dissipated in resistance R,

$$P_R = V\,I = 3 \times 0{\cdot}015 = \mathbf{0{\cdot}045\ W}$$

(*b*) Current through R_L, $I_L = \dfrac{9}{1{\cdot}5 \times 10^3} = 0{\cdot}006$ A

Power dissipated in R_L,

$$P_L = V_Z\, I_L = 9 \times 0{\cdot}006 = \mathbf{0{\cdot}054\ W}$$

(*c*) Current through Zener diode,

$$I_Z = I - I_L = 0{\cdot}015 - 0{\cdot}006 = 0{\cdot}009 \text{ A}$$

Power dissipated in Zener diode,

$$P_Z = V_Z\, I_Z = 9 \times 0{\cdot}009 = \mathbf{0{\cdot}081\ W}$$

4. Voltage drop across series resistor,

$$V = E - V_Z = 5 - 3 = 2 \text{ V}$$

Current through series resistor,

$$I = \frac{V}{R} = \frac{2}{100} = 0{\cdot}02 \text{ A}$$

The smallest value of load resistance for which stabilisation occurrs is that which allows a negligible (almost zero) Zener current.

Therefore, current through load resistance,

$$I_L = I = 0{\cdot}02 \text{ A}$$

Hence, smallest value of load resistance,

$$R_L = \frac{V_Z}{I_L} = \frac{3}{0{\cdot}02} = 150\ \Omega$$

5. Here, $E_0 = 100$ V

$$\therefore \quad E_{r.m.s.} = \frac{100}{\sqrt{2}} \text{ V}$$

A full-wave rectifier gives output corresponding to both the half cycles. Therefore, r.m.s. value of voltage for a complete cycle will be same as that over a half cycle. Hence,

$$V_{r.m.s.} = \sqrt{(100/\sqrt{2})^2} = \frac{100}{\sqrt{2}} = \mathbf{70{\cdot}7\ V}$$

6. (*a*) From V_{be} - I_b characteristic at $V_{cc} = 20$ V [Fig. 2.90], corresponding to $I_b = 40\ \mu$A, $V_{be} = \mathbf{0{\cdot}7\ V}$

and corresponding to $I_b = 80\ \mu$A, $V_{be} = \mathbf{0{\cdot}8\ V}$

(*b*) $$R \text{ (at } V_{be} = 0{\cdot}7 \text{ V)} = \frac{0{\cdot}7}{40 \times 10^{-6}} = 1750\ \Omega = \mathbf{17{\cdot}5\ k\Omega}$$

$$R \text{ (at } V_{be} = 0{\cdot}8\text{V)} = \frac{0{\cdot}8}{80 \times 10^{-6}} = 10{,}000\ \Omega = \mathbf{10\ k\Omega}$$

$$\text{Dynamic resistance} = \frac{\Delta V_{be}}{\Delta I_b} = \frac{0{\cdot}8 - 0{\cdot}7}{80 \times 10^{-6} - 40 \times 10^{-6}}$$

$$= \frac{0{\cdot}1}{40 \times 10^{6}} = 2500\ \Omega = \mathbf{2{\cdot}5\ k\Omega}$$

7. (*a*) From V_{be} - I_b characteristic at $V_{ce} = 20$ V [Fig. 2,90], corresponding to $V_{be} = 0{\cdot}7$ V, $I_b = 40\ \mu$A

Now, from V_{ce} - I_c characteristic at $I_b = 40$ mA [Fig. 2.91], corresponding to $V_{ce} = 20$ V, $I_c = \mathbf{5\ mA}$

(*b*) Now, $$\beta = \frac{I_c}{I_b} = \frac{5 \times 10^{-3}}{40 \times 10^{-6}} = \mathbf{125}$$

8. (*a*) From V_{ce} - I_c characteristic at $I_b = 60\ \mu$A [Fig. 2.91], corresponding to $V_{ce} = 10$ V, $I_c = 6$ mA

Now, $I_e = I_c + I_b = 6 \text{ mA} + 60\ \mu\text{A} = \mathbf{6{\cdot}06\ mA}$

(*b*) Also, $$\alpha = \frac{I_c}{I_e} \frac{6}{6{\cdot}06} = \mathbf{0{\cdot}99}$$

9. $$\alpha = \frac{I_c}{I_e} \frac{I_e - I_b}{I_e} = \frac{5{\cdot}2 - 0{\cdot}22}{5{\cdot}2} = \mathbf{0{\cdot}958}$$

10. $$\frac{I_c}{I_e} = 0{\cdot}97 \quad \text{or} \quad I_c = 0{\cdot}97\, I_e$$

or $I_c = 0{\cdot}97\,(I_c + I_b)$ or $0{\cdot}03\, I_c = 0{\cdot}97\, I_b$

$$\text{or} \quad I_c = \frac{0{\cdot}97 \times 0{\cdot}12}{0{\cdot}03} = \mathbf{3{\cdot}88\ mA}$$

Now, $I_e = I_c + I_b = 3{\cdot}88 + 0{\cdot}12 = \mathbf{4{\cdot}0\ mA}$

11. $$\text{Resistance gain} = \frac{R_{out}}{R_{in}} = \frac{20 \times 10^3}{200} = 100$$

(*i*) Voltage gain = current gain × resistance gain
= 0·95 × 100 = **95**

(*ii*) Power gain = voltage gain × current gain
= 95 × 0·95 = **90·25**

12. Here, V_{ce} = **2 V (forward)**

and V_{cc} = **4 V (reverse)**

$\therefore \quad V_{cb} = 4 - 2 = \mathbf{2\ V}$

13. Now, $$\beta = \frac{I_c}{I_b} = \frac{I_e - I_b}{I_b} \quad \text{or} \quad 100 = \frac{I_e - 20}{20}$$

or $I_e = 2020\ \mu\text{A} = \mathbf{2{\cdot}02\ mA}$

14. Here, $$\frac{I_c}{I_b} = 60 \quad \text{or} \quad I_b = \frac{I_c}{60}$$

Also, $I_e = I_c + I_b$ or $6{\cdot}6 = I_c + I_c/60$

or $I_c = \mathbf{6{\cdot}49\ mA}$

$$\therefore \quad I_b = \frac{6{\cdot}49}{60} = \mathbf{0{\cdot}108\ mA}$$

15. Proceed as in problem no. 14.

16. Now, $$\beta = \frac{I_c}{I_b} = \frac{I_e - I_b}{I_b} \quad \text{or} \quad 60 = \frac{7{\cdot}7 \times I_b}{I_b}$$

or $I_b = \mathbf{0{\cdot}126\ mA}$

Now, $I_c = I_e - I_b = 7{\cdot}7 - 0{\cdot}126 = \mathbf{7{\cdot}574\ mA}$

Also, $$\beta = \frac{\alpha}{1-\alpha} \quad \text{or} \quad 60 = \frac{\alpha}{1-\alpha}$$

or $\alpha = \mathbf{0{\cdot}984}$

17. $$\text{Resistance gain} = \frac{R_{out}}{R_{in}} = \frac{5}{2} = 2{\cdot}5$$

(*i*) Voltage gain = current gain × resistance gain
= 20 × 2·5 = **50**

(*ii*) Transconductance, g_m = current gain/R_{input}
= 20/2 × 10^3 = **0·01 S**

18. From the relation : $I_e = I_c + I_b$, we have

$$\Delta I_e = \Delta I_c + \Delta I_b$$

When $\Delta I_e = 8{\cdot}0$ mA, $\Delta I_c = 7{\cdot}9$ mA

$$\therefore \quad \Delta I_b = \Delta I_e - \Delta I_c = 8{\cdot}0 - 7{\cdot}9 = \mathbf{0{\cdot}1\ mA}$$

Also, $$\alpha = \frac{\Delta I_c}{\Delta I_e} = \frac{7{\cdot}9}{8{\cdot}0} = \mathbf{0{\cdot}99}$$

Further, $$\beta = \frac{\Delta I_c}{\Delta I_e} = \frac{7{\cdot}9}{0{\cdot}1} = \mathbf{79}$$

19. Proceed as in solved problem no. 2.11.

20. Proceed as in SAQ 2.58.

21. The truth table of the combination of gates shown in Fig. 2.95 is produced as below :

A	B	y'	y
0	0	1	0
1	0	1	0
0	1	1	0
1	1	0	1

≡

A	B	y
0	0	0
1	0	0
0	1	0
1	1	1

Since it is the truth table of AND gate, the given combination of gates represents **AND gate.**

22. The truth table of the combination of gates shown in Fig. 2.96 is produced as below :

A	B	y_1	y_2	y
0	0	1	0	1
1	0	1	1	0
0	1	1	1	0
1	1	0	1	1

≡

A	B	y
0	0	1
1	0	0
0	1	0
1	1	1

23. The truth table of combination of gates shown in Fig. 2.97 is produced as below :

A	B	y'	y_1	y_2	y
0	0	1	1	1	0
1	0	1	0	1	1
0	1	1	1	0	1
1	1	0	1	1	0

≡

A	B	y
0	0	0
1	0	1
0	1	1
1	1	0

Since it is the truth table of XOR gate, the given combination of gates represents **XOR gate.**

24. Here, $E_{r.m.s.} = 30$ V

Therefore, peak value of supply voltage,

$$E_0 = E_{r.m.s.} \times \sqrt{2} = 30\sqrt{2} \text{ V}$$

(*a*) Since the forward resistance of diode is negligible, peak value of current through R_L,

$$I_0 = \frac{E_0}{R_L} = \frac{30\sqrt{2}}{10 \times 10^3} = 3\sqrt{2} \times 10^{-3}\ \text{A} = \mathbf{4{\cdot}24\ mA}$$

(*b*) The d.c. milliammeter connected in series to load resistance R_L measures the average value of current over the complete cycle. Therefore,

$$\text{reading of d.c. milliammeter} = \frac{(2I_0/\pi)+0}{2} = \frac{I_0}{\pi}$$

$$= \frac{4{\cdot}24}{\pi} = \mathbf{1{\cdot}35\ mA}$$

(*c*) When a capacitor is connected across R_L, the capacitor charges to peak supply and when diode is not conducting, it discharges through R_L.

Now, time period of supply voltage, $T = \frac{1}{f} = \frac{1}{50} = 0{\cdot}02$ s

Time constant of CR-circuit,

$$CR = 16 \times 10^{-6} \times 10 \times 10^3 = 0{\cdot}16\ \text{s}$$

Since CR >> T, the output voltage across capacitor will practically remain equal to the peak value of supply voltage and hence output will be as shown in Fig. 2.102 given below.

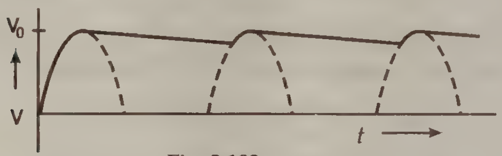

Fig. 2.102

Hence, reading of d.c. voltmeter connected across C

$$= \mathbf{30\sqrt{2}\ V}$$

25. Operating voltage of the tape recorder = 12 V
Power rating of the tape recorder = 6 W
Therefore, current drawn by the tape recorder (load resistance),

$$I_L = \frac{6}{12} = 0{\cdot}5\ \text{A}$$

Now, Zener diode should provide stabilised supply to the tape recorder, when supply voltage varies between 102–115 V. For this, the value of R should be chosen so that a negligible current flows through Zener diode, when supply voltage is minimum *i.e.* 102 V.

Now, $R = \frac{E - V_Z}{I}$

When E = 102 V, $I_Z = 0$ or $I = I_L$

$$\therefore \quad R = \frac{102 - 12}{0{\cdot}5} = \mathbf{180\ \Omega}$$

It may be pointed out that when supply voltage rises to 115 V, the current through series resistor R and the Zener diode increases. The increase in potential drop across R leaves the supply voltage of 12 V to the tape recorder unchanged.

26. Logic gate shown in Fig. 2.99 is **NOR gate**. The truth table of the logic gate will be as given in Fig. 2.42 (*b*).

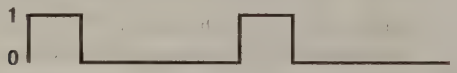

Fig. 2.103

The output wave form will be as shown in the Fig. 2.103

27. ***In dotted line box a*** **:** Refer to section 2.26. When the tw inputs of NAND gate are joined, it acts as **NOT gate.**

In dotted line box b **:** Refer to section 2.26, when output of two NOT gates are fed to a NAND gate, th arrangement acts as **OR gate.**

In dotted line box c **:** Refer to section 2.26, when the input of NAND gate are fed to a NOT gate, the arrangement act as **AND gate.**

Let *y′* be output of logic gate in dotted line box *a* and *y′′* be output of logic gate in box *b*.

The truth table of the whole arrangement will be as give below :

A	B	*y′*	*y′′*	*y*
0	0	1	1	0
1	0	0	0	0
0	1	1	1	1
1	1	0	1	1

≡

A	B	*y*
0	0	0
1	0	0
0	1	1
1	1	1

28. Refer to solved problem no. 2.11 :
When input voltage at the base resistance is 5 V,

$$V_{be} = V_{ce} = 0$$

Also, $\quad V_{cc} = 5\ \text{V}$

Applying Kirchhoff's second law to the closed part of th circuit containing R_c and collector-emitter junction, w have

$$V_{ce} = V_{cc} - I_c R_c$$

$$\therefore \quad 0 = 5 - I_c \times 1{\cdot}5 \times 10^3$$

$$\text{or} \quad I_c = 3{\cdot}33 \times 10^{-3}\ \text{A} = \mathbf{3{\cdot}33\ mA}$$

Applying Kirchhoff's second law to the closed part of th circuit containing R_b and emitter-base junction, we have

$$V_{cc} = V_{be} + I_b R_b$$

$$\therefore \quad 5 = 0 + I_b \times 200 \times 10^3$$

$$\text{or} \quad I_b = 25 \times 10^{-6}\ \text{A} = \mathbf{25\ \mu A}$$

$$\text{Now,} \quad \beta = \frac{I_c}{I_b} = \frac{3{\cdot}33 \times 10^{-3}}{25 \times 10^{-6}} = \mathbf{133{\cdot}2}$$

29. (*a*) Here, $y = A.\overline{B} + A.B$

For A = 0, B = 0 :

$$y = 0.\overline{0} + 0.0 = 0.1 + 0.0 = 0 + 0 = \mathbf{0}$$

For A = 1, B = 0 :

$$y = 1.\overline{0} + 1.0 = 1.1 + 1.0 = 1 + 0 = \mathbf{1}$$

For A = 0, B = 1 :

$$y = 0.\overline{1} + 0.1 = 0.0 + 0.1 = 0 + 0 = \mathbf{0}$$

For A = 1, B = 1 :

$$y = 1.\overline{1} + 1.1 = 1.0 + 1.1 = 0 + 1 = \mathbf{1}$$

(*b*) Here, $y = A.B + \overline{A.B}$

For A = 0, B = 0 :

$$y = 0.0 + \overline{0.0} = 0.0 + \overline{0} = 0 + 1 = \mathbf{1}$$

For A = 1, B = 0 :

$$y = 1.0 + \overline{1.0} = 1.0 + \overline{0} = 0 + 1 = \mathbf{1}$$

For A = 0, B = 1 :

$$y = 0.1 + \overline{0.1} = 0.1 + \overline{0} = 0 + 1 = \mathbf{1}$$

For A = 1, B = 1 :

$$y = 1.1 + \overline{1.1} = 1.1 + \overline{1} = 1 + 0 = \mathbf{1}$$

Competitive Examination File (Unit IX)

REVISION AT A GLANCE

Chapter 1. Solids

☐ **Crystalline materials.** *The materials, in which atoms (or molecules) are arranged in a definite and regular way throughout he body of the crystal.*

☐ **Amorphous materials.** *The materials, in which atoms (or molecules) are arranged in an irregular manner.*

☐ **Crystal lattice.** *It is an infinite array of atoms (or molecules) in space, such that at every point, an atom or a molecule has got he identical surroundings.*

☐ **Unit cell.** *It is the smallest block, whose repetition in three dimensions builds up the whole crystal.*

The three sides a, b and c of the unit cell are called ***primitives*** or ***lattice constants.***

The set of three lines drawn parallel to the lines of intersection of the faces of the unit cell are called ***crystallographic axis.***

The angles α, β and γ between the three crystallographic axes are called ***interfacial angles.***

☐ **Single crystal.** *The crystal in which the ordered arrangement of atoms (or molecules) extends throughout the piece of the crystal.*

The physical properties, such as mechanical, thermal, electrical and optical of a single crystal are different in different directions. In other words, a single crystal is ***anisotropic.***

The small sized single crystal is called ***monocrystal.***

☐ **Polycrystal.** *The crystalline solid, which is made of a large number of monocrystals with well developed faces joined together.* Polycrystals are ***isotropic.***

☐ **Liquid crystal.** *The organic crystalline solid, which on heating becomes fluid like but retains its anisotropic property.*

Liquid crystals change the plane of polarisation of light and are used in ***liquid crystal displays (L.C.D.).***

☐ **Energy bands in solids.** Due to interaction between closed packed atoms in solids, the splitting of energy levels take place and it gives rise to formation of energy bands. The energy band formed by a series of levels containing valence electrons is called ***valence band*** and the lowest unfilled energy band formed just above the valence band is called ***covalent band.***

In some solids, there is a energy gap between valence and conduction band. This energy gap is called ***forbidden energy gap.***

The behaviour of conductors, semiconductors and insulators can be explained on the basis of energy bands.

☐ **Conductors.** The conduction and valence bands partly overlap each other in case of conductors. In other words, there is no forbidden energy gap in conductors.

☐ **Semiconductors.** The conduction and valence bands are separated by the small width ($\approx$ 1 eV) of forbidden energy gap. The valence band is completely filled, while the conduction band is empty. The electrons cross from valence band to conduction band even when a small amount of energy is supplied.

☐ **Insulators.** The width of forbidden energy gap between valence and conduction band is quite large ($\approx$ 10 eV). Ordinarily, electrons cannot jump from valence to conduction band even on applying a strong electric field.

☐ **Intrinsic semiconductors.** A semiconductor free from all types of impurities is called ***intrinsic semiconductor.*** At 0 K, a semiconductor is an insulator *i.e.* it possesses zero conductivity. When temperature is increased, a few covalent bonds break up and release the electrons. These electrons move to conduction band leaving behind equal number of holes in valence band. The conductivity of an intrinsic semiconductor is due to both electrons and holes.

☐ **Doping.** *The process of adding impurity atoms (pentavalent or trivalent) to a pure semiconductor, so as to increase its conductivity in a controlled manner is called doping.* The impurity atoms added are very small ($\approx$ 1 in 10^6 semiconductor atoms). The pentavalent impurity atoms are called ***donor atoms,*** while trivalent impurity atoms are called ***acceptor atoms.***

☐ **Extrinsic semiconductor.** A semiconductor doped with a suitable impurity, so as to possess conductivity much higher than the semiconductor in pure form is called extrinsic semiconductor.

***n*-type semiconductor.** When a pentavalent impurity, such as arsenic or antimony or phosphorus is added to a pure semiconductor, the number of free electrons become more than the holes in the semiconductor and such an extrinsic semiconductor is called n-type semiconductor. In other words, in a n-type semiconductor, electrons are majority carriers and holes are minority carriers.

***p*-type semiconductor.** When a trivalent impurity, such as indium or galium or boron is added to a pure semiconductor, the semiconductor becomes deficient in electrons *i.e.* number of holes become more than the number of electrons. Such a semiconductor is called p-type semiconductor. It has holes as majority carriers and electrons as minority carriers.

☐ **Electrical conductivity of a semiconductor.** The conductivity of a semiconductor is determined by the mobility (μ) of both electrons and holes and their concentration.

Mathematically : $\sigma = e\,(n_e \mu_e + n_h \mu_h)$

Here, n_e and n_h represent number density, while μ_e and μ_h represent mobility of electrons and holes respectively.

Some Useful Facts :

1. Valence band is formed of the outermost energy levels having electrons, while conduction band is formed of lowest unfilled energy levels.
2. The highest energy level, which an electron can occupy in the valence band at 0 K is called ***Fermi level.***
3. Both *n*-type and *p*-type semiconductors are electrically neutral.
4. In semiconductors, electron mobility is greater than hole mobility.
5. The conductivity of a semiconductor increases with temperature.

Chapter 2. Semiconductor devices

☐ ***p-n* junction.** *The device obtained by growing a p-type semiconductor over a n-type semiconductor or vice-versa is called a p-n junction.* It conducts in one direction only. It is also called a ***junction diode.***

☐ **Depletion layer.** *It is a thin layer formed between the p and n-sections and devoid of holes and electrons.* Its width is about 10^{-6} m. A potential difference of about 0·7 V is produced across the junction, which gives rise to a very high electric field ($\approx 10^6$ V m^{-1}).

☐ **Forward biasing.** The *p-n* junction is said to be forward biased, when positive terminal of the external battery in the circuit is connected to *p*-section and negative terminal to *n*-section of the junction diode.

Flow of majority carriers across the junction from both the sections of the junction diode is responsible for the ***forward current.***

☐ **Reverse biasing.** The *p-n* junction is said to be reverse biased, when positive terminal of the external battery in the circuit is connected to *n*-section and negative terminal to *p*-section of the junction diode.

The flow of minority carriers across the junction from both the sections of the junction diode is responsible for the ***reverse current.***

☐ **Transistor.** *A three section semiconductor device formed by growing a thin layer of p-type semiconductor between two comparatively thick layers of n-type semiconductor and vice-versa.*

The thin layer at the centre is lightly doped and is called ***base (B).*** The other two layers serve as ***emitter (E)*** and ***collector (C).*** When the emitter is forward biased, the majority carriers move across the base so as to reach the collector biased in reverse manner. A small recombination of holes and electrons takes place in the base region.

If I_e, I_b and I_c are emitter current, base current and collector current respectively, then

$$I_e = I_b + I_c$$

☐ **Current gain.** (*a*) ***In common base configuration :***

d.c. current gain, $$\alpha = \frac{I_c}{I_e}$$

and a.c. current gain, $$\alpha_{a.c.} = \frac{\Delta I_c}{\Delta I_e}$$

(*b*) ***In common emitter configuration :***

d.c. current gain, $$\beta = \frac{I_c}{I_b}$$

and a.c. current gain, $$\beta_{a.c.} = \frac{\Delta I_c}{\Delta I_b}$$

The values of α and β are related to each other as :

$$\beta = \frac{\alpha}{1-\alpha}$$

☐ **Voltage gain.** *It is defined as the ratio of output voltage to the input voltage.*

☐ **Resistance gain.** *It is defined as the ratio of resistance in output circuit to the resistance in input circuit.* It can be proved that

voltage gain = current gain × resistance gain

☐ **Power gain.** *It is defined as the ratio of output power to input power.* It can be proved that

power gain = current gain × voltage gain = (current gain)^2 × resistance gain

☐ **Digital signal.** A signal which has only two levels of voltage. A digital signal does not vary continuously with time as in case of a analogue signal. The two levels of a digital signal are represented as 0 and 1.

☐ **Logic gate.** *A digital circuit, which works according to some logical relationship between input and output voltages is called a logic gate.*

☐ **Truth table.** *It is a table, which shows all possible input combinations and the corresponding output combination for a logic gate.* Truth table is also called ***table of combinations.***

☐ **Boolean algebra.** The algebra based on the binary nature of logic (either true or false) is called Boolean algebra.

In Boolean algebra :

(*a*) The addition sign (+) implies OR. The Boolean expression,

$y = A + B$ implies y equals A OR B.

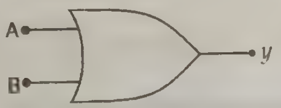
(*b*) The multiplication sign (.) implies AND. The Boolean expression,

$y = A.B$ implies y equals A AND B.

(*c*) The bar sign (–) implies NOT. The Boolean expression,

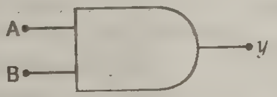
$y = \overline{A}$ implies y equals NOT A

☐ **The OR gate.** It is a digital circuit having two inputs and one output.
Its Boolean expression is $y = A + B$. The symbol and truth table of **OR** gate are as given below :



A	B	y
0	0	0
1	0	1
0	1	1
1	1	1

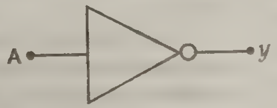
☐ **The AND gate.** It is also a digital circuit having two inputs and one output.
Its Boolean expression is $y = A.B$. The symbol and truth table of AND gate are as given below :



A	B	y
0	0	0
1	0	0
0	1	0
1	1	1

☐ **The NOT gate.** It is a digital circuit having one input and one output.

Its Boolean expression is $y = \overline{A}$. The symbol and truth table of NOT gate are as given below :



A	y
0	1
1	0

Some Useful Facts :

1. A potential difference of about 0·7 V is produced across the *p*-*n* junction due to diffusion of holes and electrons across it. It results in a very strong electric field of the order of 10^6 V m^{-1}.

2. During forward bias, the resistance of the junction diode is low and during reverse bias, the junction diode possesses very high resistance.

3. When reverse bias is made sufficiently high, the reverse current increases abruptly due to breaking of covalent bonds near the junction. This phenomenon is called ***avalanche breakdown*** and is used in Zener diodes.

4. In a transistor, emitter is always forward biased and collector is always reverse biased.

5. The logic gates are used to perform switching action *i.e.* either on (or yes) or off (or no).

NUMERICAL PROBLEMS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Solids

Problem 1.01. A doped semiconductor has impurity levels 40 meV (millielectron volt) below the conduction band. (*a*) Is the material *n*-type or *p*-type ? (*b*) In a thermal collision, an amount of energy *k* T is given to the extra electron loosely bound to the impurity ion and this electron is just able to jump into the conduction band. Calculate the temperature T.

Given, Boltzmann's constant, $k = 8{\cdot}62 \times 10^{-5}$ eV K^{-1}.

Sol. (*a*) In a semiconductor, the forbidden energy gap between valence and conduction bands is of the order of 1 eV. Since in the doped semiconductor, energy gap is much smaller (40 meV), the impurity levels in the doped semiconductor corresponds to donor energy level. Hence, the doped semiconductor is of ***n*-type**.

(*b*) Here, $kT = 40$ meV $= 40 \times 10^{-3}$ eV

$$\therefore T = \frac{40 \times 10^{-3}}{k} = \frac{40 \times 10^{-3}}{8{\cdot}62 \times 10^{-5}} = \mathbf{464\ K}$$

Problem 1.02. A *p*-type semiconductor has acceptor energy levels 54 meV (millielectron volt) above the valence band. Find the maximum wavelength of the radiation, which can create a hole ?

Sol. Energy required to create a hole

= energy required to transfer an electron from valence to conduction band

$= 54$ meV $= 54 \times 10^{-3}$ eV $= 54 \times 10^{-3} \times 1{\cdot}6 \times 10^{-19}$ J

If λ is the wavelength of the radiation, which can create a hole, then

$$\frac{hc}{\lambda} = 54 \times 10^{-3} \times 1{\cdot}6 \times 10^{-19}$$

$$\text{or } \lambda = \frac{hc}{54 \times 10^{-3} \times 1{\cdot}6 \times 10^{-19}}$$

$$\text{or } \lambda = \frac{6{\cdot}62 \times 10^{-34} \times 3 \times 10^{8}}{54 \times 10^{-3} \times 1{\cdot}6 \times 10^{-19}} = \mathbf{2{\cdot}3 \times 10^{-5}\ m}$$

Problem 1.03. Energy of the photon of sodium light of wavelength 5890 Å equals the energy gap between valence and conduction band of a semiconductor.

(*a*) Find the minimum energy E required to create a hole-electron pair.

(*b*) Find the value of E/*k* T at a temperature of 400 K. Given, Boltzmann's constant, $k = 1{\cdot}38 \times 10^{-23}$ J K^{-1}.

Sol. (*a*) The minimum energy required to create a hole-electron pair,

E = energy gap between valence and conduction band
= energy of sodium light of wavelength 5890 Å

$$= \frac{hc}{\lambda} = \frac{6{\cdot}62 \times 10^{-34} \times 3 \times 10^{8}}{5890 \times 10^{-10}} = 3{\cdot}372 \times 10^{-19}\ \text{J}$$

$$= \frac{3{\cdot}372 \times 10^{-19}}{1{\cdot}6 \times 10^{-19}} = \mathbf{2{\cdot}11\ eV}$$

$$(b)\ \text{Now, } \frac{E}{kT} = \frac{3{\cdot}372 \times 10^{-19}}{1{\cdot}38 \times 10^{-23} \times 400} = \mathbf{61{\cdot}1}$$

Chapter 2. Semiconductor devices

Problem 2.01. A potential barrier of 0·6 V exists across a *p-n* junction. (*a*) If the depletion region is 6 × 10^{-7} m wide, what is the intensity of the electric field in this region ? (*b*) An electron with speed 5 × 10^5 m s^{-1} approaches the *p-n* junction from the *n*-region. With what speed will it enter the *p*-region ?

Sol. (*a*) Here, barrier voltage, V = 0·6 V

and width of depletion region, $d = 6 \times 10^{-7}$ m

Therefore, electric field in the depletion region,

$$E = \frac{V}{d} = \frac{0{\cdot}6}{6 \times 10^{-7}} = \mathbf{10^{8}\ V\ m^{-1}}$$

(*b*) Let *u* be the velocity of electron, with which it enters the depletion region and *v* be the velocity, with which it leaves the depletion region. The barrier voltage across the depletion region acts on the electon, so as to decrease its energy, say by an amount V *e*. Therefore,

$$\frac{1}{2} m u^2 - V e = \frac{1}{2} m v^2 \quad \text{or} \quad v^2 = u^2 - \frac{2 V e}{m}$$

$$\text{or } v^2 = (5 \times 10^5)^2 - \frac{2 \times 0{\cdot}6 \times 1{\cdot}6 \times 10^{-19}}{9{\cdot}1 \times 10^{-31}}$$

$$= 2{\cdot}5 \times 10^{11} - 2{\cdot}1 \times 10^{11} = 0{\cdot}4 \times 10^{11}$$

$$\text{or } v = \mathbf{2 \times 10^{5}\ m\ s^{-1}}$$

Problem 2.02. What is the input voltage needed to maintain 15 V across the load resistance R_L of 2 kΩ, assuming that the series resistance R is 200 Ω and the Zener diode requires a minimum current of 10 mA to work satisfactorily [Fig. 2.01]. What is the Zener rating requried ?

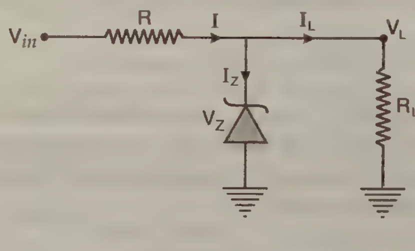


Fig. 2.01

Sol. Here, R = 200 Ω, R_L = 2 kΩ = 2 × 10^3 Ω,

I_Z = 10 mA = 10 × 10^{-3} A and V_L = 15 V

Let I be current through the series resistance. Current through the load resistance is given by

$$I_L = \frac{V_L}{R_L} = \frac{15}{2 \times 10^3} = 7{\cdot}5 \times 10^{-3}\ \text{A} = 7{\cdot}5\ \text{mA}$$

If I_Z is current through Zener diode, then current through series resistance,

$$I = I_Z + I_L = 10 + 7{\cdot}5 = 17{\cdot}5\ \text{mA}$$

Now, V_{in} = potential drop across R + V_L

$= I \times R + V_L = 17{\cdot}5 \times 10^{-3} \times 200 + 15$

$= 3{\cdot}5 + 15 =$ **18·5 V**

Since V_Z is always equal to V_L, break down voltage of Zener diode should be **15 V** and its current rating should be **17·5 mA.**

Problem 2.03. In a *p-n-p* transistor circuit, the collector current is 10 mA. If 90% of the holes reach the collector, find emitter and base currents. (*I.I.T. 1992*)

Sol. Since 90% of the holes reach the collector,

$$I_c = \frac{90}{100} \times I_e = 0{\cdot}9\, I_e$$

$$\text{or} \quad I_e = \frac{I_c}{0{\cdot}9} = \frac{10}{0{\cdot}9} = \mathbf{11{\cdot}1\ mA}$$

Also, $I_b = I_e - I_c = 11{\cdot}1 - 10 =$ **1·1 mA**

Problem 2.04. A *n-p-n* transistor is connected in common emitter configuration in which collector supply is 8 V and the voltage drop across the load resistance of 800 Ω connected in the collector circuit is 0·8 V. If current amplification factor α is 25/26, determine collector-emitter voltage and base current. If the input resistance of the transistor is 200 Ω, calculate the voltage gain and power gain. (*Roorkee, 1994*)

Sol. Fig. 2.02 shows an *n-p-n* transistor in common-emitter configuration.

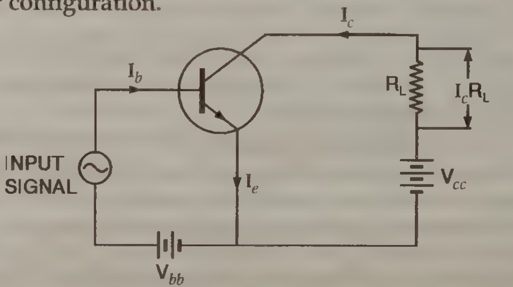

Fig. 2.02.

Here, collector supply, $V_{cc} = 8\text{ V}$;
load resistance, $R_L = 800\ \Omega$
and voltage drop across load resistance, $I_c R_L = 0{\cdot}8\text{ V}$
Now, collector-emitter voltage is given by

$$V_{ce} = V_{cc} - I_c R_L = 8{\cdot}0 - 0{\cdot}8 = \mathbf{7{\cdot}2\ V}$$

Now, $I_c R_L = 0{\cdot}8\text{ V}$

$$\therefore \quad I_c = \frac{0\cdot8}{R_L} = \frac{0\cdot8}{800} = 10^{-3}\text{ A} = 1\text{ mA}$$

Now, current amplification factor,

$$\alpha = \frac{I_c}{I_e} = \frac{25}{26},$$

$$\therefore \quad I_e = \frac{26}{25} \times I_c = \frac{26}{25} \times 1 = 1\cdot04\text{ mA}$$

Also, base current,

$$I_b = I_e - I_c = 1{\cdot}04 - 1 = \mathbf{0{\cdot}04\ mA}$$

The current gain of the transistor in common-emitter nfiguration,

$$\beta = \frac{\alpha}{1-\alpha} = \frac{25/26}{1-25/26} = 25$$

Now, input voltage, $= I_b \times$ input resistance
$= 0{\cdot}04 \times 10^{-3} \times 200 = 8 \times 10^{-3}\text{ V}$

Since output voltage $= I_c R_L = 0{\cdot}8\text{ V}$,

$$\text{voltage gain} = \frac{\text{output voltage}}{\text{input voltage}} = \frac{0\cdot8}{8\times10^{-3}} = \mathbf{100}$$

Also, power gain $= \beta \times$ voltage gain
$= 25 \times 100 = \mathbf{2500}$

Problem 2.05. An amplifier is represented by the ircuit shown in Fig. 2.03. Here, R_{in} is the input resistance of the amplifier and V_{in}, the voltage appearing across it. This voltage is amplified by a factor of A_v and appears across the load as voltage V_o. An external voltage V_s is applied at the input terminals of the amplifier via series resistor R_s. What will be the apparent gain $A_v' = \frac{V_o}{V_s}$ of the amplifier ? Express the gain in terms of A_v, R_s and R_{in}.

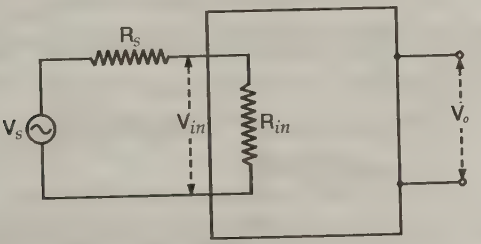

Fig. 2.03

Sol. Let I_{in} be the input current. Then,

$$I_{in} = \frac{V_s}{R_s + R_{in}}$$

$$\therefore \ V_{in} = I_{in} \times R_{in} = \frac{V_s}{R_s + R_{in}} \times R_{in}$$

Since input voltage is amplified by a factor A_v, the voltage appearing across load,

$$V_o = A_v \times V_{in} = A_v \times \frac{V_s R_{in}}{R_s + R_{in}}$$

Hence, apparent voltage gain,

$$A_v' = \frac{V_o}{V_s} = A_v \times \frac{V_s R_{in}}{R_s + R_{in}} \Big/ V_s = \mathbf{A_v \times \frac{R_{in}}{R_s + R_{in}}}$$

Problem 2.06. The Boolean expression for a logic circuit is given by

$$y = \overline{(\overline{A} + \overline{B})}\,.\,A\,.\,B$$

(*a*) Find the output *y*, if the inputs are A = 0, B = 0 ; A = 1, B = 0 ; A = 0, B = 1 and A = 1, B = 1.

(*b*) Identify, which basic gate is represented by the given Boolean expression.

Sol. (*a*) Here, $y = \overline{(\overline{A} + \overline{B})}\,.\,A\,.\,B$

For A = 0, B = 0 :

$$y = \overline{(\overline{0} + \overline{0})}\,.\,0\,.\,0 = \overline{(1+1)}\,.\,0\,.\,0 = \overline{1}\,.\,0\,.\,0 = 0\,.\,0\,.\,0 = \mathbf{0}$$

For A = 1, B = 0 :

$$y = \overline{(\overline{1} + \overline{0})}\,.\,1\,.\,0 = \overline{(0+1)}\,.\,1\,.\,0 = \overline{1}\,.\,0\,.\,0 = 0\,.\,1\,.\,0 = 0$$

For A = 0, B = 1 :

$$y = \overline{(\overline{0} + \overline{1})}\,.\,0\,.\,1 = \overline{(1+0)}\,.\,0\,.\,1 = \overline{1}\,.\,0\,.\,1 = 0\,.\,0\,.\,1 = \mathbf{0}$$

For A = 1, B = 1 :

$$y = \overline{(\overline{1} + \overline{1})}\,.\,1\,.\,1 = \overline{(0+0)}\,.\,1\,.\,1 = \overline{0}\,.\,1\,.\,1 = 1\,.\,1\,.\,1 = \mathbf{1}$$

(*b*) The truth table of the logic circuit represented by the given Boolean expression is

A	B	*y*
0	0	0
1	0	0
0	1	0
1	1	1

It is the truth table of AND gate.

MULTIPLE CHOICE QUESTIONS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Solids

PART I. TEXT BASED QUESTIONS

1. **Which of the following is not a property of a crystalline substance ?**
(A) Sharp melting point.
(B) Bounded by flat surfaces.
(C) Isotropic.
(D) Long range order.

2. **Which property makes the crystalline solids to have sharp melting points ?**
(A) Equal strength of all the interatomic bonds.
(B) Anisotropic.
(C) Long range order.
(D) none of the above.

3. **Polycrystals**
(A) are in fact amorphous in nature.
(B) have orderly arrangement throughout their bodies.
(C) donot have orderly arrangement throughout their bodies.
(D) none of the above.

4. **If there are 4 atoms per unit cell in a solid, the crystal is**
(A) tetragonal (B) simple cubic
(C) body-centred cubic (D) face-centred cubic
(*C.E.T. 1999*)

5. **Co-ordination number means**
(A) the co-ordinates of an atom in crystal lattice.
(B) atoms per unit cell.
(C) atoms per unit volume.
(D) closest neighbouring atoms to a particular atom.

6. **For an FCC unit cell, the ratio of the radius of atoms to lattice parameter is**
(A) $1:2$ (B) $1:2\sqrt{2}$
(C) $2:1$ (D) $1:4$ (*C.E.T. 1998*)

7. **The number of atoms per unit cell in BCC lattice is**
(A) 1 (B) 2
(C) 4 (D) 9 (*C.B.S.E. 2002*)

8. **In BCC structure of lattice constant a, the minimum distance between atoms is :**
(A) $\sqrt{3}\,a/2$ (B) $\sqrt{2}\,a$
(C) $a/\sqrt{2}$ (D) $a/2$ (*C.B.S.E. 2001*)

9. **Sodium has body centred packing. If the distance between two nearest atoms is 3·7 Å , then lattice parameter is**
(A) 4·8 Å (B) 4·3 Å
(C) 3·9 Å (D) 3·3 Å (*C.B.S.E. 1999*)

10. **The type of bonds in a silicon crystal is**
(A) ionic (B) metallic
(C) covalent (D) vander Waals
(*Karnataka Entrance, 1991*)

11. **Which of the following is not a semiconductor ?**
(A) germanium (B) silicon
(C) arsenic (D) all of these. (*A.F.M.C. 1997*)

12. **In a semiconductor, the forbidden energy gap between the valence band and the conduction band is of the order of**
(A) 1 MeV (B) 0·1 MeV
(C) 1 eV (D) 5 eV (*C.B.S.E. 1988*)

13. **The main difference between conductors, semiconductors and insulators is because of**
(A) work function.
(B) binding energy of electrons.
(C) width of forbidden energy gap.
(D) mobality of electrons.

14. **In an insulator, the forbidden energy gap between th valence band and conduction band is of the order of**
(A) 5 eV (B) 1 eV
(C) 2 MeV (D) 10^{-3} eV (*C.E.T. 1999*

15. **When the conductivity of a semiconductor is only due t breaking of the covalent bands, the semiconductor is calle**
(A) donor. (B) acceptor.
(C) intrinsic. (D) extrinsic.

16. **If N is Avagadro number, M is atomic weight and ρ, th density, the number of free electrons per unit volume of monovalent metallic crystal can be expressed as**
(A) $\rho\,N/M$ (B) $N/\rho\,M$
(C) $M\,N/\rho$ (D) $\rho\,M/N$ (*C.B.S.E. 1990*

17. **A small impurity is added to germanium to get *p*-typ semiconductor. This impurity is a**
(A) trivalent substance.
(B) pentavalent substance.
(C) bivalent substance.
(D) monovalent substance. (*A.I.I.M.S. 1992*

18. **To obtain a *p*-type germanium semiconductor, it must b doped with**
(A) arsenic (B) antimony
(C) indium (D) phosphorus.
(*C.B.S.E. 1997*

19. **The impurity atoms with which pure silicon should b doped to make a *p*-type semiconductor are those of**
(A) phosphorus (B) boron
(C) antimony (D) aluminium
(*C.E.T. 1998 ; I.I.T. 1988*

20. **When arsenic is added as an impurity to silicon, th resulting material is**
(A) *n*-type semiconductor.
(B) *p*-type semiconductor.
(C) *n*-type conductor. (D) none of these.
(*C.B.S.E. 1996*

21. **When Ge crystal is doped with phosphorus atoms, then i becomes**
(A) insulator (B) *p*-type
(C) *n*-type (D) superconductor.
(*A.F.M.C. 1995*

22. **A *p*-type semiconductor is**
(A) a silicon crystal doped with arsenic impurity.
(B) a silicon crystal doped with aluminium impurity.
(C) a germanium crystal doped with boron impurity.
(D) a germanium crystal doped with phosphorus impurity
(*N.C.E.R.T. 1979*

23. **An *n*-type and a *p*-type silicon can be obtained by doping pure silicon with**
(A) sodium and magnesium respectively.
(B) phosphorus and boron respectively.
(C) boron and phosphorus respectively.
(D) indium and sodium respectively. (*C.E.T. 1991*)

24. **Holes are charge carriers in**
(A) intrinsic semiconductors.
(B) ionic solids.
(C) *p*-type semiconductors.
(D) metals. (*I.I.T. 1996*)

25. **In a *p*-type semiconductor, the majority carriers of current are :**
(A) holes (B) electrons
(C) protons (D) neutrons. (*C.B.S.E. 1999*)

26. **An *n*-type semiconductor is**
(A) negatively charged. (B) positively charged.

(C) neutral.
(D) negatively or positively charged depending upon the amount of impurity. *(A.F.M.C. 1988)*

7. A semiconductor is known to have an electron concentration of 8×10^{13} cm^{-3} and hole concentration of 5×10^{12} cm^{-3}. The semiconductor is
(A) *n*-type. (B) *p*-type.
(C) intrinsic. (D) insulator.

8. The temperature coefficient of resistance of a semiconductor
(A) is always positive. (B) is always negative.
(C) is zero.
(D) may be positive or negative or zero.

ART II. THOUGHT-BASED QUESTIONS

29. The volume of atoms to the volume of unit cell is called
(A) packing fraction.
(B) packing coefficient.
(C) co-ordination number.
(D) lattice parameter. *(A.F.M.C. 1995)*

30. The valence electron in alkali metal is a
(A) *f*-electron (B) *p*-electron
(C) *s*-electron (D) *d*-electron *(C.B.S.E. 1990)*

31. The electronic configuration for a noble gas is
(A) $1s^2\,2s^2\,2p^6$ (B) $1s^2\,2s^2\,2p^5$
(C) $1s^2\,2s^2\,2p^6\,3p^6\,4s^2$ (D) $1s^2\,2s^2$ *(C.B.S.E. 1993)*

32. In a good conductor, the energy gap between the conduction band and the valence band is
(A) infinity. (B) wide.
(C) narrow. (D) zero.
(Karnataka Entrance, 1993)

33. When a semiconductor is heated,
(A) number of electrons increases, while that of holes decreases.
(B) number of holes increases, while that of electrons decreases.
(C) number of electrons and holes remains same.
(D) number of electrons and holes increases equally.
(Pre-Medical/Dental 1993)

34. Doping of a semiconductor (with small traces of impurity atoms) generally changes the resistivity as follows :
(A) Decreases.
(B) Does not alter.
(C) May increase or decrease depending on the dopant.
(D) Increases. *(Karnataka Entrance, 1994)*

35. The mobility of conduction electrons is greater than that of holes. It is because,
(A) electrons are negatively charged.
(B) electrons are lighter
(C) electrons experience a lesser number of collisions.
(D) drift velocity acquired per unit electric field is greater for electrons.

Chapter 2. Semiconductor devices

ART I. TEXT-BASED QUESTIONS

1. The depletion layer in the *p-n* junction region is caused by
(A) diffusion of carriers.
(B) drift of electrons.
(C) drift of holes.
(D) migration of impurity ions. *(Pre-Medical/Dental 1994)*

2. The cause of the potential barrier in a *p-n* junction diode is :
(A) depletion of positive charges near the junction.
(B) concentration of positive charges near the junction.
(C) depletion of negative charges near the junction.
(D) concentration of positive and negative charges near the junction. *(C.B.S.E. 1998)*

3. The potential barrier in the depletion layer is due to
(A) ions (B) holes
(C) electrons (D) forbidden gap.
(B.H.U. 1999)

4. The barrier potential of a silicon diode at room temperature is
(A) 0·3 V (B) 0·7 V
(C) 1 V (D) 2 mV *(C.E.T. 1998)*

5. A *p-n* junction has a thickness of the order of
(A) 1 cm (B) 1 mm
(C) 10^{-6} cm (D) 10^{-12} cm *(B.I.T. 1990)*

6. Diffusion of free electrons across the junction of an unbiased diode produces
(A) forward bias (B) reverse bias
(C) breakdown (D) depletion layer.
(C.E.T. 1998)

7. Which of the following statements is not true ?
(A) The resistance of intrinsic semiconductors decreases with increase of temperature.
(B) Doping pure Si with trivalent impurities gives *p*-type semiconductors.
(C) The majority carriers in *n*-type semiconductors are holes.
(D) A *p-n* junction can act as a semiconductor diode.
(I.I.T. 1997)

8. A semiconducting device is connected in a series circuit with a battery and a resistance. A current is found to pass through the circuit. The polarity of the battery is reversed, then the current drops to almost zero. The device may be a / an
(A) *p-n* junction.
(B) intrinsic semiconductor.
(C) *p*-type semiconductor.
(D) *n*-type semiconductor. *(C.B.S.E. 1998)*

9. In forward bias, the width of depletion layer in a *p-n* junction
(A) decreases. (B) remains unchanged.
(C) increases. (D) first (A) and then (C)
(C.B.S.E. 1999)

10. In a *p-n* junction, the hole current due to drift of charges is from
(A) *n*-section to *p*-section.
(B) *p*-section to *n*-section.
(C) *n*-section to *p*-section, if the junction is forward biased and in the opposite direction, if it is reverse biased.
(D) *p*-section to *n*-section, if the junction is forward biased and in the opposite direction, if it is reverse biased.

11. In a *p-n* junction, the hole current due to diffusion of charges is from
(A) *n*-section to *p*-section.
(B) *p*-section to *n*-section.
(C) *n*-section to *p*-section, if the junction is forward biased and in the opposite direction, if it is reverse biased.
(D) *p*-section to *n*-section, if the junction is forward biased and in the opposite direction, if it is reverse biased.

12. In a *p-n* junction, diffusion current is greater than the drift current (in magnitude),
(A) if the junction is forward biased.
(B) if the junction is reverse biased.
(C) if the junction is unbiased.
(D) cannot be predicted.

13. For conduction of a *p-n* junction, the biasing is
(A) high potential on *n*-side and low potential on *p*-side
(B) high potential on *p*-side and low potential on *n*-side

(C) same potential on p and n sides

(D) undetermined. (C.B.S.E. 2002)

14. When we apply reverse bias to a junction diode, it

(A) lowers the potential barrier.

(B) raises the potential barrier.

(C) increases the majority carrier current.

(D) decreases the majority carrier current. (C.E.T. 1991)

15. In case of p-n junction diode at high value of reverse bias, the current rises sharply. The value of reverse bias is known as

(A) cut off voltage. (B) Zener voltage.

(C) inverse voltage. (D) critical voltage.

(C.E.T. 1991)

16. In a p-n junction diode not connected to any circuit,

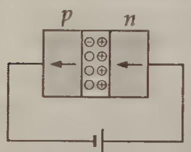
(A) the potential is same everywhere.

(B) the p-type side is at a higher potential than the n-type side.

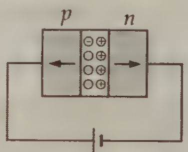
(C) there is an electric field at the junction directed from the n-type side to the p-type side.

(D) there is an electric field at the junction directed from the p-type side to the n-type side. *(I.I.T. 1998)*

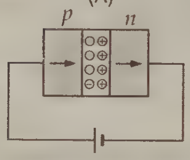
17. In the case of forward biasing of p-n junction, which one of the following figures correctly depicts the direction of flow of carriers ?



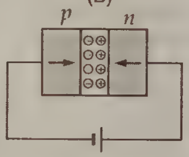
(A)



(B)



(C)



(D)

(C.B.S.E. 1995 ; A.F.M.C. 1995)

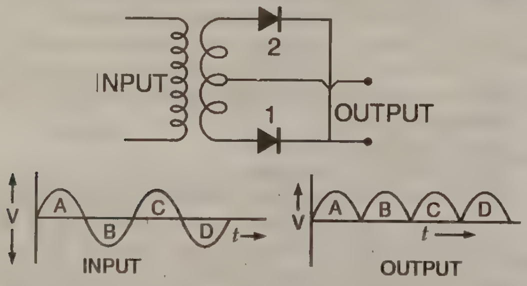
18. A p-n-junction diode can be used as :

(A) rectifier. (B) modulator

(C) demodulator (D) amplifier.

(C.B.S.E. 1999 ; A.F.M.C. 1997)

19. A full-wave rectifier circuit along with the output is shown in the figure. The contribution from the diode 1 is (are)



(A) C (B) A, C

(C) B, D (D) A, B, C, D *(I.I.T. 1996)*

20. The part of a transistor which is heavily doped to produce a large number of majority is called

(A) emitter. (B) base.

(C) collector.

(D) any one out of emitter, base and collector.

(Pre-Medical/Dental, 1993)

21. When n-p-n transistor is used as an amplifier, then

(A) electrons move from base to collector.

(B) holes move from emitter to base.

(C) electrons move from collector to base.

(D) holes move from base to emitter. (C.B.S.E. 199

22. To use a transistor as an amplifier (common-bas configuration),

(A) both junctions are forward biased.

(B) both junctions are reverse biased.

(C) the emitter-base junction is forward biased and bas collector junction is reverse biased.

(D) no biasing voltages are required.

(Pre-Medical/Dental ,199

23. In a common-base amplifier, the phase difference betwee the input signal voltage and the output voltage (acros collector and base) is

(A) 0 (B) $\pi/4$

(C) $\pi/2$ (D) π (C.B.S.E. 199

24. For a transistor, the current amplification factor is 0·8. Th transistor is connected in common-emitter configuratio The change in collector current, when the base curren changes by 6 mA is

(A) 4·8 mA (B) 6 mA

(C) 8 mA (D) 24 mA (C.E.T. 199

25. For a transistor I_c / I_e = 0·96. The current gain in commo emitter configuration is

(A) 6 (B) 12

(C) 24 (D) 48 (C.B.S.E. 200

26. In a common-base configuration of a transistorm $\Delta I_c / \Delta I$ = 0·98. Then current gain in common-emitter configuratio of transistor will be

(A) 49 (B) 98

(C) 4·9 (D) 24·5 (C.B.S.E. 200

27. In n-p-n transistor circuit, the collector current is 10 mA If 90% of the electrons emitted reach the collector,

(A) the emitter current will be 9 mA.

(B) the emitter current will be 11 mA.

(C) the base current will be 1 mA.

(D) the base current will be 0·1 mA. (I.I.T. 199

28. If α and β are current gains in common-base and common emitter configurations of a transistor, then β is equal to

(A) $1/\alpha$ (B) $\alpha/(1+\alpha)$

(C) $\alpha/(1-\alpha)$ (D) $\alpha - 1/\alpha$ (C.B.S.E. 200

29. The current relationship between the two current gain α and β in a transistor is

(A) $\beta = \dfrac{\alpha}{1+\alpha}$ (B) $\beta = \dfrac{\alpha}{1-\alpha}$

(C) $\alpha = \dfrac{\beta}{1+\beta}$ (D) $\alpha = \dfrac{1+\beta}{\beta}$ (C.B.S.E. 1997

30. The current gain β of a transistor is 50. The input resistanc of the transistor, when used in the common emitte configuration, is 1 kΩ. The peak value of the collector a.c current for an a.c. peak input voltage of 0·01 V is

(A) 100 μA (B) 250 μA

(C) 500 μA (D) 800 μA (C.B.S.E. 1999

31. A transistor is preferred to a triode valve, because it

(A) can withstand larger changes in temperature.

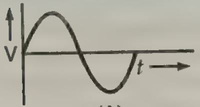
(B) has a higher input impedance.

(C) can handle large powers.

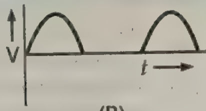
(D) does not require a heater.

(C.P.M.T. 1986 ; N.C.E.R.T. 1978

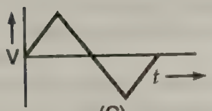
32. Which of the following represents the digital signal :



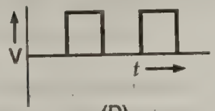
(A)



(B)



(C)



(D)

33. In the binary number system, 111 represents

(A) one. (B) three.

(C) seven. (D) one hundred and eleven.

34. Boolean algebra is essentially based on

(A) logic (B) truth

(C) numbers (D) symbol *(A.I.I.M.S. 1999)*

35. In Boolean algebra, $y = A + B$ implies :

(A) y equals A or B.

(B) y equals sum of A and B.

(C) y equals neither A nor B.

(D) y equals A and B.

36. In Boolean algebra, $y = A.B$ implies

(A) y equals A and B. (B) y equal A or B.

(C) y equals product of A and B .

(D) y equals neither A nor B.

37. In Boolean algebra, $y = \overline{A}$ implies

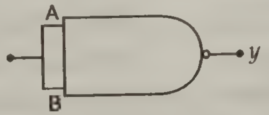
(A) y equals A.

(B) y is not equal to A.

(C) y is equal to – A.

(D) none of the above.

38. The symbol shown in the adjoining figure represents



(A) NOT gate (B) OR gate

(C) AND gate (D) NOR gate *(C.B.S.E. 1996)*

39. A truth table is given below. Which of the following has this type of truth table ?

A	B	y
0	0	1
1	0	0
0	1	0
1	1	0

(A) XOR gate

(B) NOR gate

(C) AND gate

(D) OR gate

(C.B.S.E. 1996)

40. In the truth table given below, A and B are inputs and Y, the output. Which of the following has this type of truth table ?

A	B	y
0	0	1
1	0	0
0	1	0
1	1	0

(A) AND gate.

(B) NOR gate.

(C) OR gate.

(D) XOR gate.

(C.E.T. 1999 ; C.B.S.E. 1997)

41. Which of the following gates corresponds to the truth table given below :

A	B	y
0	0	1
1	0	1
0	1	1
1	1	0

(A) NAND

(B) AND

(C) XOR

(D) OR

(C.B.S.E. 2002, 2001, 1998, 1994 ; A.F.M.C. 1995)

42. The adjoining truth table represents

(A) AND gate

(B) NOR gate

(C) OR gate

(D) NAND gate

(C.B.S.E. 2000)

A	B	y
0	0	0
1	0	0
0	1	0
1	1	1

PART II. THOUGHT-BASED QUESTIONS

43. When a potential difference is applied across, the current passing through

(A) an insulator at 0 K is zero.

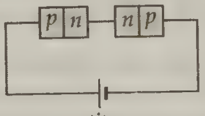
(B) a semiconductor at 0 K is zero.

(C) a metal at 0 K is finite.

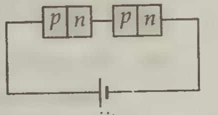
(D) a p-n diode at 300 K is finite, if it is reverse biased.

(I.I.T. 1999)

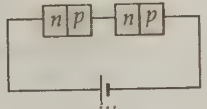
44. The identical p-n junction may be connected in series with a battery in three ways as shown in the circuits given below. The potential drops across the two p-n junctions are equal in



(*i*)



(*ii*)



(*iii*)

(A) circuit (*i*) only.

(B) circuits (*i*) and (*ii*)

(C) circuits (*ii*) and (*iii*)

(D) circuits (*i*) and (*iii*).

(A.F.M.C. 1997)

45. In which of the following figures, junction diode is forward biased ?

(A)

(B)

(C)

(D)

(C.B.S.E. 2000)

46. When a p-n junction diode is forward-biased, the flow of current across the junction is mainly due to

(A) drift of charges.

(B) diffusion of charges.

(C) both drift and diffusion of charges.

(D) depends on the nature of the material.

(Pre-Medical/Dental, 1994)

47. When a p-n junction diodie is reverse-biased, the flow of current across the junction is mainly due to

(A) diffusion of charges.

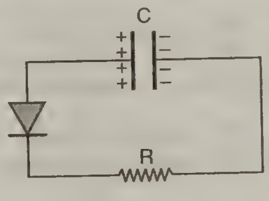
(B) drift of charges.

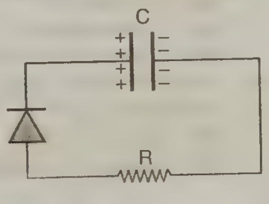
(C) both drift and diffusion of charges.

(D) depends upon the nature of the material.

(C.E.T. 1999)

48. Two identical capacitors each of capacitance C are charged to the same potential V and are used to forward and reverse bias two identical junction diodes as shown in figures.





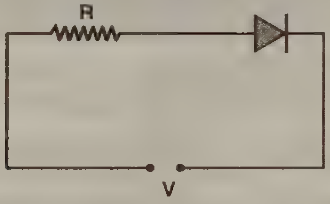
The charges on the two capacitors at a time t = CR are

(A) (*i*) C V (*ii*) C V **(B)** (*i*) C V/*e* (*ii*) C V

(C) (*i*) C V (*ii*) C V/*e* **(D)** (*i*) C V/*e* (*ii*) C V/*e*

Here, *e* = 2·718 is mathematical constant.

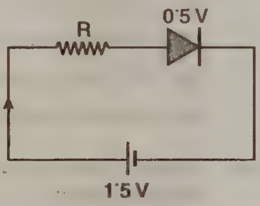
49. For a given circuit of ideal *p-n* junction diode, which of the following is correct ?



(A) In forward biasibng, the voltage across R is V.
(B) In reverse biasing, the voltage across R is V.
(C) In forward biasing, the voltage across R is 2 V.
(D) In reverse biasing , the voltage across R is 2 V.

(C.B.S.E. 2002)

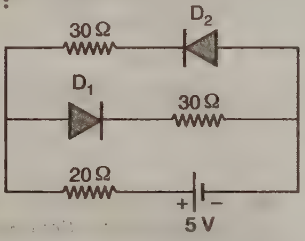
50. The diode used in the circuit shown in figure has a constant voltage drop at 0·5 volt at all currents and a maximum power rating of 100 mW. What should be the value of the resistor R connected in series to the dioide for obtaining maximum current ?



(A) 5 Ω
(B) 5·6 Ω
(C) 6·76 Ω
(D) 10 Ω

(C.B.S.E. 1997)

51. If internal resistance of cell is negligible, then current flowing through the cell is :



(A) 0·06 A
(B) 0·1 A
(C) 0·08 A
(D) 0·02 A

(C.B.S.E. 2001)

52. The circuit shown in the figure contains two diodes each with a forward resistance of 50 Ω and with infinite backward resistance. If the battery voltage is 6 V, the current through the 100 Ω resistance (in ampere) is

(A) zero
(B) 0·02
(C) 0·03
(D) 0·036.

(I.I.T. 1996)

53. In which of the configurations of a transistor, the voltage gain is highest ?

(A) Common-base. **(B)** Common-emitter.
(C) Common-collector. **(D)** Same in all the three.

54. In which of the configurations of a transistor, the power gain is highest ?

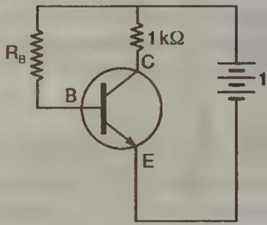
(A) Common-base. **(B)** Common-emitter.
(C) Common-collector. **(D)** Same in all the three.

55. A transistor is used in the common-emitter mode as amplifier. Then,

(A) the base-emitter junction is forward-biased.
(B) the base-emitter junction is reverse-biased.
(C) the input signal is connected in series with the volta applied to bias the base-emitter junction.
(D) the input signal is connected in series with the volta applied to bias the base-collector junction.

(I.I.T. 19

56. In the circuit shown in the figure, the transistor used h a current gain $\beta = 100$. What should be the bias resistor R so that $V_{ce} = 5$ V. (Neglect V_{be}).



(A) 200 × 10^{-3} Ω
(B) 10^6 Ω
(C) 500 Ω
(D) 2 × 10^3 Ω

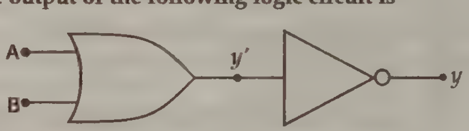
(Pre-Medical/Dental, 19

57. An oscillator is an amplifier with

(A) a large gain. **(B)** negative feedback.
(C) positive feedback. **(D)** no feedback.

(C.B.S.E. 1995 ; Pre-Medical/Dental, 19

58. The output of the following logic circuit is

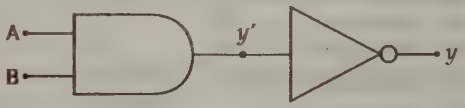


(A) $y = \overline{A + B}$ **(B)** $y = \overline{A} + \overline{B}$
(C) $y = \overline{A . B}$ **(D)** $y = \overline{A} . \overline{B}$

59. The combination of the two basic gates shown in MCQ . represents

(A) NAND gate. **(B)** NOR gate.
(C) NOT gate. **(D)** XOR gate.

60. The output of the following logic circuit is

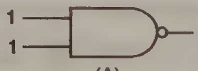


(A) $y = \overline{A + B}$ **(B)** $y = \overline{A} + \overline{B}$
(C) $y = \overline{A . B}$ **(D)** $y = \overline{A} . \overline{B}$

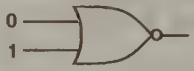
61. The combination of the two basic gates shown in MCQ. represents

(A) NAND gate. **(B)** NOR gate.
(C) NOT gate. **(D)** XOR gate.

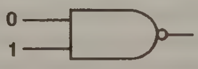
62. Which of the following gates will have an output of 1



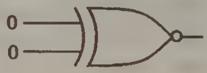
(A)



(B)



(C)

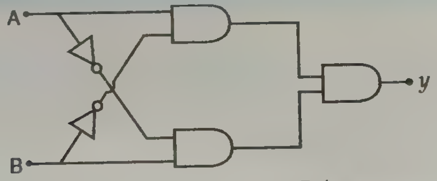


(D)

(A) D **(B)** A
(C) B **(D)** C

(C.B.S.E. 199

3. Which of the following truth table is true ?



(A)

A	B	y
0	0	0
1	0	1
0	1	1
1	1	0

(B)

A	B	y
0	0	0
1	0	0
0	1	1
1	1	1

(C)

A	B	y
0	0	0
1	0	1
0	1	1
1	1	1

(D)

A	B	y
0	0	1
1	0	1
0	1	0
1	1	0

64. How many AND gates are required to form NAND gate ?
(A) 1 (B) 2
(C) 3 (D) 4 *(B.H.U. 1997)*

ANSWERS TO MULTIPLE CHOICE QUESTIONS

PRINCIPLES OF COMMUNICATION

1. **Analog and Digital Communication**
2. **Space Communication**
3. **Line Communication**

I think there's a world market for about five computers."

– Thomas Watson (Founder of IBM)

CHAPTER 1

Analog and Digital Communication

1.01. INTRODUCTION

In the early days, people used to send messages through trained pigeons. However, this mean of communication was not reliable. So that general masses could ommunicate with one and another, a messanger called *harkara* used to pass through various towns and people used to receive the messages sent by their friends and elatives from him or could deliver the messages to him. One will appreciate that as such, a messanger would require a lot of time to cover the distance between two destinations and will get fatigued. Therefore, this method also proved to be quite mpracticable. As a remedy, the messanger was provided a horse so that he could move between two destinations quite swiftly. Thus, providing a horse to the messanger, the task of communication became much easier and quicker. As a matter of fact, this method overcame the problem of sending the messages from one place o other only to some extent. However, it laid the foundation of modern methods of communication. With the advent of elctronics, the messages in the form of electric ignals are made to sit on high frequency carrier waves (in place of putting a man on the back of the horse) and the person at the other end can pick the message with he help of some electronic gadget. This mean of communication is known as adioacommunication and is used to send and receive the messages in the form of analog signals. With the advancement of technology, analog communication systems are being replaced by digital communication systems. Before making a study (in principle) of analog and digital communication systems, it is worthwhile to have ust an overview of them.

Analog communication systems. *The communication systems, which make use of analog signals, are called analog communication systems.*

A few of them are as given below :

1. ***Telegraphy.*** It was used for sending electric signals in the form of a code (dots and dashes). Now, optical and audible coded signals can be sent over large distances. The telegraph messages can also be sent through radiowaves, microwaves and artificial satellites.

2. ***Telephony.*** It enables to send voice signals from one place to another by means of wires. In the recent past, it was made more reliable by making use of microwaves and communication satellites. The use of optical fibres in this field has totally evolutionised it.

3. ***Radio network.*** This system makes use of radiowaves for broadcasting speech and music. The long distance transmission of audio signal is achieved by mixing (modulating) it with radiowaves of high frequency.

4. ***Radar.*** It is contraction of *Ra*dio *d*etection *a*nd *r*anging. It is an electronic system used for determining the distance (range) and direction of objects using microwaves.

5. ***Television network.*** It is an electronic system that transmits and receives visual images and sound using very-high frequency (VHF) or ultra-high frequency (UHF) radiowaves.

6. ***Teleprinting.*** It is a system, which makes use of a machine similar to a ypewriter, on which messages can be typed and telegraphed to distant receivers. It can print out the incoming messages also.

7. ***Telex.*** It is contraction of ***Tele***type writer ***ex***change service. Telex* is a telegraphic system using telephone lines through which direct current pulses representing characters typed on a typewriter are sent.

---

* It has been superseded by the FAX machine.

Digital communication systems. *The communication systems, which make use of digital signals, are called digital communication systems.*

The following are a few such latest systems :

1. ***Fax.*** It is used for facsimile transmission and receiving of texts (documents), photographs, etc.

2. ***Mobile telephone network.*** It enables to make use of a portable (mobile) telephone. Such telephones are also called cellular phones, because they operate within a network of ***radiocells***. The first generation mobile phones operated with analog signals. The mobile phones, which are presently in use, operate with digital signals and are called second generation mobile phones.

3. ***Electronic mail (e-mail).*** The messages sent via a computer network are called e-mails. The messages produced using word processing programs are transmitted over the world-wide network, called internet and they get stored in a computer, called a mail server. Anyone connected to the internet can contact the mail server to check, whether it is holding mail for him/her.

4. ***Teleconferencing.*** It is a system in which persons sitting at coloured television screens see and talk to each other via a computer-communication network. It saves travelling cost as well as the time that would otherwise be lost in journey.

5. ***Telemetry.*** It is a system of transmitting data (usually measurements) from a spacecraft to earth using radiowaves.

6. ***Communication satellites.*** They are used to relay radio and television programs. They have proved of immense use in the field of telecommunication and for sending data signals from one part of the earth to another.

7. ***Global positioning system*** **(*GPS*).** It is a navigation system based on a network of earth-orbiting satellites. The users can find their positions within an accuracy of 100 m by receiving signal from the satellite. A user needs to be within the range of four satellites (out of 24 satellites orbiting the earth).

1.02. COMMUNICATION SYSTEM

The exchange of information between a sender and a receiver is called ***communication*** *and the setup used to achieve this task is called a* ***communication system.***

In principle, a communication system consists of following three main parts :

1. Transmitter
2. Communication channel
3. Receiver

In order to familarise ourselves with the three parts of a communication system, consider that two persons A and B are communicating with each other in the following three situations :

(*a*) At first instance, suppose that the two persons are so close that they can communicate directly with each other. Then, the speaker (say person A) is acting as ***transmitter*** and the listener (the other person B) as the ***receiver.*** The air, through which sound waves travel from the speaker to the listener plays the role of ***communication channel.*** The communication channel is also called ***transmission medium*** or ***link.***

(*b*) Now, assume that the two persons are separated by a distance of several kilometres and it is not possible for them to communicate directly. One of the possible ways is to connect the transmitter and the receiver with the help of wires as is done in telephone as a communication system. The signal in the form of sound waves is converted into electrical pulses with a microphone, which then travel along the long wires. The signal in the form of electrical pulses is converted back into sound waves with the help of a loud speaker. Both the microphone and the loudspeaker are said to act as ***transducers*** (device that converts energy in one form to another). Thus, in this mode of communication, information is not exchanged in its original form between the speaker and the listener. The transmitter performs the job of transducer before sending the information to the receiver. Similarly, the receiver also accomplishes the job of transducer before making the information reach the listener.

(*c*) Let us now consider that the two persons are separated by a very large distance, say more than several thousand kilometres so that it is not possible to connect the transmitter and receiver with long wires. In such a situation, the two persons can exchange information between them through radio communication (wireless communication). The sound signal is converted into electrical signal with the help of a transducer as before. The electrical signal corresponding to the sound signal is called audio signal. Its frequency range is from 20 Hz to 20 kHz and is associated with a small amount of energy. If it is radiated in free space as such, it will die out soon. So that the audio signal can travel up to several thousand kilometres, it is mixed with high frequency radiowaves, called ***carrier waves***. This process is calld ***modulation*** and the signal so obtained is called ***modulated signal***. The power of the signal is further boosted up by using a suitable amplifier and then the signal is radiated into the space with the aid of an antenna, called ***transmitting antenna***. Therefore, in this mode of communication, transmitter constitutes a transducer, modulator, amplifier and a transmitting antenna. The free space, through which the modulated signal travels acts as the communication channel. The receiver of this type of communication system consists of a ***pick-up antenna*** (to pick the signal), ***demodulator*** (to separate out the audio signal from the modulated signal), ***amplifier*** (to boost up the audio signal, which may have got weakened) and the ***transducer*** (to convert back audio signal in the form of electrical pulses into sound waves).

The radiocommunication system is schematically as shown in Fig. 1.01.

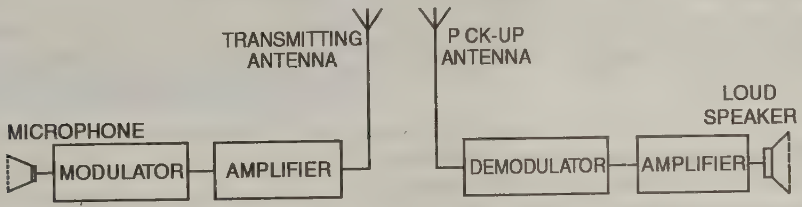

Fig. 1.01

1.03. ANTENNA

In a communication system, antenna plays a vital role. It is employed for both transmitting and receiving the radio frequency signals.

A Hertz antenna is a straight conductor of length equal to half wavelength $\left(\frac{\lambda}{2}\right)$ of the radio signal to be transmitted or received. The transmitting antenna converts electrical energy into electromagnetic waves, whereas the pick-up antenna converts electromagnetic waves into electrical energy. When the transmitting antenna is placed vertically, it produces vertically polarized waves and when placed horizontally, it produces horizontally polarised waves.

A Marconi antenna is quarter wave $\left(\frac{\lambda}{4}\right)$ long. It is placed vertically with its lower end touching the ground. The ground provides a reflection of the voltage and current distributions set up in the antenna. It is fed near the ground. The emitted electromagnetic waves from antenna-ground system are same as that from a Hertz antenna.

There is a large variety of antennas with each type having its own preferred range of applications. A microwave antenna is used in radar systems and for receiving broadcasts directly from the satellites. Such an antenna has a parabolic reflector with a dipole (also called horn feed) at the focus of the reflector. A microwave antenna can transmit waves in a particular direction and can receive waves, which are directed towards it.

1.04. ANALOG AND DIGITAL SIGNAL

In communication systems, a signal means a time varying electrical signal containing information or intelligence. The different signals have their own characteristics, such as amplitude and frequency.

The signals are of the following two types :

1. Analog signal. An analog signal is a continuous function of time. In other words, amplitude of an analog signal varies continuously with time. Such signals can be easily generated from the source of information by using an appropriate transducer. For example, pressure variations in the sound waves can be converted into corresponding current or voltage pulses with the help of a microphone. Similarly, a photocell may be used to convert light intensity variations into current and voltage pulses.

In the simplest form of an analog signal, the amplitude of the signal varies sinusoidally with time and may be represented by the equation

$$E = E_0 \sin \omega t \qquad \text{...(1.01)}$$

It represents an analog signal of a single frequency $f \left(= \dfrac{\omega}{2\pi}\right)$. Such a signal is graphically as shown in Fig. 1.02.

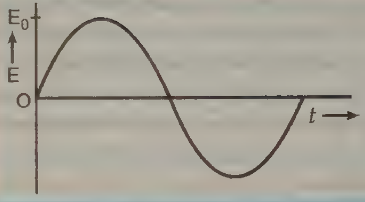

Fig. 1.02

The frequency of analog signals associated with speech or music varies over a range between 20 Hz to 20 kHz. The range over which the frequencies of a signal vary is called its ***bandwidth***. This information bearing signal is also called ***baseband signal***. The term baseband designates the band of frequencies representing the signal supplied by the source of information.

2. Digital Signal. A digital signal is a discontinuous function of time. The pulses in a digital signal do not vary continuously with time as in an analog voltage signal. Instead, it has only two voltage levels *i.e.* either low (zero) or high (some constant value of voltage). The two levels in a digital signal are coded usually in binary code. When voltage is low, it is represented by binary digit 0 and when it is high, it is represented by the binary digit 1 as shown in Fig. 1.03.

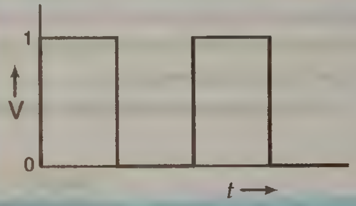

Fig. 1.03

1.05. RADIO COMMUNICATION

Sound offers a flexible means of communication between us. Nature has equipped a human being with its own transmitter and receiver in the form of mouth and ears. However, sound as a means of communication has some disadvantages. Firstly, as such, it cannot travel to a far off listener and secondly, if several persons are speaking at the same time, the listener may find it difficult to sort out the different messages from different persons.

In 1844, telegraphy was developed as a means of communication by Samuel Morse. The information could be sent from one place to another along wires through ***Morse Code***, which consisted of dots and dashes. In 1876, Alexander Graham Bell invented telephone, which could send voice message from one person to another. As such, if a person wanted to talk to other persons, their telephones had to be connected through wires leading to a wild jumble of wires. It became obvious that this technique of communication *i.e.* connecting every telephone to every other telephone was not going to work and it led to the development of wireless radio-communication.

The transmitting and receiving a message in the form of a radiowave signal between two stations without connecting them with wires is known as wireless radio-communication.

In 1865, James Clerk Maxwell predicted the existence of electromagnetic waves, which can propagate through the free space (vacuum) with the speed of light. These waves were first produced and detected by Heinrich Hertz in 1887 using a spark gap transmitter and detector. In 1901, Guglielmo Marconi and his associates succeeded in sending radio signal across the Atlantic by making use of antenna. The transmitting antenna helps the radio oscillator (which generates radio waves) to radiate the energy of the radiowaves into the space. The function of the antenna in transmission of radiowaves is same as that of the resonance tube or the sonometer used with a tuning fork. When the length of the antenna is equal to a quarter or one half of the wavelength of the radio signal, the standing electrical waves are set up along it, which are then strongly radiated into the space. The receiving antenna connected to the detector works in a similar fashion. When the transmitted signal is intercepted by the receiving antenna, the induced electrical waves are set up in it.

1.06. ANALOG MODULATION

The process of producing a continuous high frequency waves, some characteristic of which varies as a function of the instantaneous value of the audio signal, is called analog modulation.

In the process of modulation, the audio signal, called ***modulating wave*** (or ***baseband signal***), is mixed with a high frequency wave, called ***carrier wave*** and the wave so produced is called ***modulated wave***. In the analog modulation, carrier wave is continuous in nature and is usually a sinusoidal waveform. Fig. 1.04 is the block diagram illustrating the process of modulation.

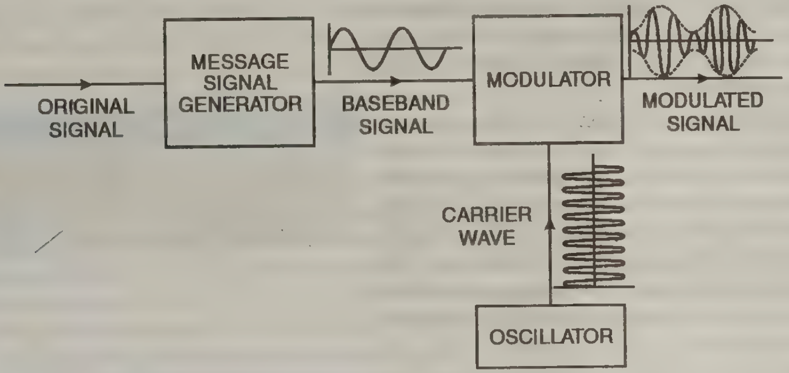

Fig. 1.04

The original signal (in the form of speech or music) in fed to the message signal generator (such as a microphone), which converts it into an electrical signal. The signal so obtained is called baseband or modulating signal. The oscillator generates the high frequency waves, called carrier waves. The modulator, then, carries out the superposition of the baseband signal and the carrier waves. The nature of the modulator depends upon the type of modulation to be carried out, which may be one of the following three types :

1. Amplitude modulation **2.** Frequency modulation **3.** Phase modulation.

In order to understand the three methods of modulation in principle, consider that the instantaneous voltage of the modulated wave is given by

$$e = A \sin (\omega t + \phi),$$

where A, ω and ϕ represent the amplitude, frequency and phase of the modulated wave.

Amplitude modulation. *When the modulating wave is superimposed on a high frequency carrier wave in a manner that the frequency of the modulated wave is same as that of the carrier wave but its amplitude is modified in accordance with that of the modulating wave, the process is called amplitude modulation.*

In amplitude modulation, the amplitude A of the modulated wave is varied in accordance with the modulating wave, while ω and ϕ remain constant.

Frequency modulation. *When the modulating wave is superimposed on a high frequency carrier wave in a manner that the amplitude of the modulated wave is same as that of the carrier wave but its frequency is modified in accordance with the amplitude of the modulating wave, the process is called frequency modulation.*

In frequency modulation, the frequency ω of the modulated wave is varied in accordance with the modulating wave, while A and ϕ remain constant.

Phase modulation. *When the modulating wave is superimposed on a high frequency carrier wave in a manner that the magnitude of the phase angle of the modulated signal varies in accordance with the amplitude of the modulating wave, the process is called phase modulation.*

In phase modulation, the phase ϕ of the modulated wave is varied in accordance with the modulating wave, while A and ω remain constant. It may be noted that phase modulation is not of much practical importance in itself, but it is sometimes used as an intermediate step in achieving frequency modulation. However, we shall restrict ourselves to the study of amplitude and frequency modulation processes only.

1.07. NEED FOR MODULATION

The sound waves within the range of human hearing have frequency from 20 Hz to 20 kHz. The sound waves cannot be transmitted from a radio transmitter by converting them into electrical waves (audio signal) directly for the following reasons :

1. For efficient transmission and reception, the transmitting and receiving antennae must have a length equal to quarter wavelength of the audio signal. For a frequency of 15 kHz of audio signal, the length of the antenna* comes out to be of the order of 5000 m. To set up a vertical antenna of this size is practically impossible.

2. The energy radiated from an antenna is practically zero, when the frequency of the signal to be transmitted is below 15 kHz. It also makes the direct transmission of audio signal as impracticable.

3. Due to the fact that all audio signals from different sources possess frequencies in the same range *i.e.* 20 Hz to 20 kHz, an audio signal can not be transmitted directly. It is because, the audio signal from different transmitting stations will get hopelessely and inseparably mixed up.

The above said difficulties faced during the transmission of audio signal, if transmitted directly, are overcome by the process of modulation. For example, when a carrier wave of frequency 1 MHz is used for transmission of audio signal, the antenna required will be of length 75 m only, which can be easily set up. Further, the energy radiated from the antenna for a radio signal of frequency 1 MHz is quite appreciable and the signal can travel upto a large distance, before it dies out. The problem of mixing up of the signals from the different transmitting stations is overcome by allocating different frequencies of the carrier waves to different transmitting stations.

Self-test Question

Show that the length of antenna required to transmit a radio signal of frequency 1 MHz is about 75 m.

1.08. AMPLITUDE MODULATION

The amplitude modulation is produced by varying the amplitude of the carrier waves in accordance with the amplitude of the modulating wave (audio signal). Let the instantaneous values of the voltage of the carrier waves and the modulating signal be represented by

$$e_c = E_c \cos \omega_c t \quad \text{...(1.01)}$$

and

$$e_m = E_m \cos \omega_m t \quad \text{...(1.02)}$$

respectively. The frequency of carrier waves ω_c is usually much greater than the frequency of audio signal ω_m. Figs. 1.05 (*a*) and 1.05 (*b*) show the graphical representations of the voltages of the carrier waves and the audio signal with time.

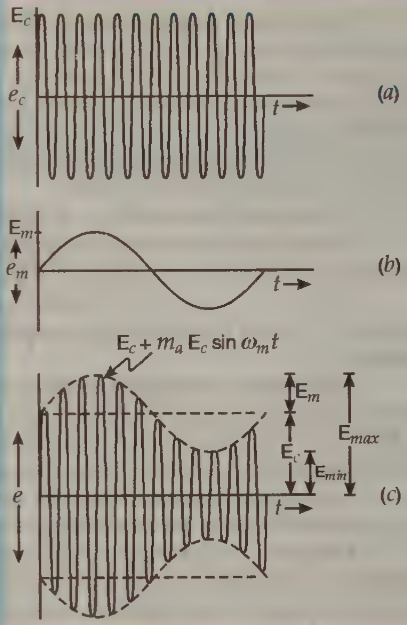

Fig. 1.05

In amplitude modulation, the amplitude of the modulated signal is varied in accordance with the amplitude of the modulating signal so that the frequency of the modulated wave is equal to the frequency of the carrier waves. Accordingly, let the instantaneous voltage of the modulated signal be given by

$$e = A \cos \omega_c t, \quad \text{...(1.03)}$$

where A is amplitude of the modulated signal. Since amplitude of modulated signal should vary in accordance with the audio signal, we assume that

$$A = E_c + k_a e_m, \quad \text{...(1.04)}$$

where the proportionality constant k_a determines the maximum variation in amplitude of the modulated wave for a given modulating signal. In amplitude modulation, the degree of modulation is defined by a term called ***modulation index***, which is given by

$$m_a = \frac{k_a E_m}{E_c} \quad \text{...(1.05)}$$

The modulation index is also called ***modulation factor*** or ***depth of modulation***.

Fig. 1.05 (*c*) gives the sketch of amplitude modulated signal with time. The amplitude of modulated signal varies between E_{min} $(= E_c - E_m)$ and E_{max} $(= E_c + E_m)$. It can be proved that

$$m_a = \frac{E_{max} - E_{min}}{E_{max} + E_{min}} \quad \text{...(1.06)}$$

From the detailed study of amplitude modulation, it is found that the expression for instantaneous value of the voltage (or amplitude) of the modulated signal consists of three terms. The first term represents a wave form of carrier frequency ω_c and the second term of frequency $(\omega_c + \omega_m)$, called the ***upper sideband***. The third term represents a wave form of frequency $(\omega_c - \omega_m)$ and is known as ***lower sideband***. Since the frequency of the modulating signal is much smaller than the frequency of the carrier waves, all the three frequencies in the modulated wave are roughly the same and lie in radio frequency range.

---

*Length of antenna $= \frac{\lambda}{4} = \frac{1}{4}\left(\frac{c}{f}\right) = \frac{1}{4} \times \frac{3 \times 10^8}{15 \times 10^3} = 5000$ m

Bandwidth. The modulated signal lies in the frequency range from $\omega_c - \omega_m$ to $\omega_c + \omega_m$ *i.e.* $2\,\omega_m$. It is called the bandwidth of the transmitted signal. Thus,

$$\text{band width} = 2 \times \text{frequency of audio signal} \qquad \text{...(1.07)}$$

In practice, the audio signal is always complex rather than consisting of a single pure frequency ω_m. For example, the voice of a person or a piece of music always consists of a band of frequencies of different amplitudes and phases. If such an audio signal has frequencies ranging from ω_1 to ω_2 $(\omega_2 > \omega_1)$, then each frequency in the audio signal produces a pair of sidebands on modulation. The entire signal, then, produces two sidebands symmetrically disposed about the carrier. The bandwidth in case of a complex audio signal is equal to twice the maximum frequency (ω_2) of the audio signal *i.e.*

$$\text{band width} = 2 \times \text{maximum frequency of audio signal} \qquad \text{...(1.08)}$$

Importance of modulation index. The modulation index determines the strength and quality of the transmitted signal. If the modulation index is small, the amount of variation in the carrier amplitude will be small. Consequently, the audio signal being transmitted will not be strong. The greater the degree of modulation, the stronger and clearer will be the audio signal during reception.

Amplitude modulation is most basic and is widely used for broadcasting speech and music. It is because, the equipments required in AM modulation are simple and cheaper. Further, carrier waves used are of low frequency (0·5 to 20 MHz). However, atmospheric and man made electrical discharges, called noise, also get amplitude modulated along with the message signal. Due to this, reception of signal is not clear particularly in case of weak radio signals.

1.09. FREQUENCY MODULATION

The frequency modulation is produced by varying the frequency of the carrier waves in accordance with the amplitude of the modulating wave. Let the instantaneous values of the voltage of the carrier waves and the modulating signal be represented as

$$e_c = E_c \cos \omega_c t \qquad \text{...(1.09)}$$

and

$$e_m = E_m \cos \omega_m t \qquad \text{...(1.10)}$$

respectively. Fig. 1.06 (*a*) and 1.06 (*b*) show the graphical representations of the voltages of the carrier waves and the audio signal with time.

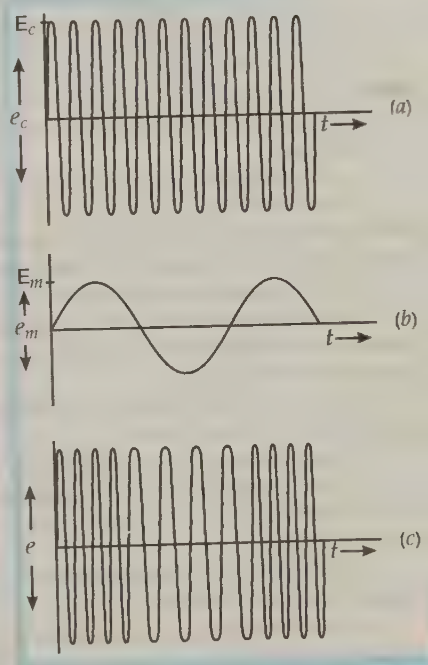

Fig. 1.06

In frequency modulation, the frequency of the modulated signal is varied in accordance with the amplitude of the modulated signal so that the amplitude of the modulated wave is same as that of the carrier waves. Accordingly, let the instantaneous voltage of the modulated signal be given by

$$e = E_c \sin \theta, \qquad \text{...(1.11)}$$

where θ is some function of carrier and modulating frequencies. Since the instantaneous angular frequency $\omega(t)$ of the modulated wave should vary in accordance with the amplitude of the modulating wave, we assume that

$$\omega(t) = \omega_c + k_f e_m, \qquad \text{...(1.12)}$$

where the proportionality constant k_f determines the maximum variation in frequency of the modulated wave for a given modulating signal.

Fig. 1.06 (*c*) gives the sketch of frequency modulated signal with time. It can be proved that the frequency of modulated signal varies between $f_{min} \left(= f_c - \dfrac{k_f E_m}{2\pi} \right)$ and $f_{max} \left(= f_c + \dfrac{k_f E_m}{2\pi} \right)$. The maximum swing of the frequency of modulated wave from the carrier frequency is called ***frequency deviation*** (δ). Thus,

$$\delta = f_{max} - f_c = f_c - f_{min} \qquad \text{...(1.13)}$$

The ratio of frequency swing to the frequency of modulated signal is called ***modulation index*** for frequency modulation. It is denoted by m_f.

$$\therefore \qquad m_f = \frac{\delta}{f_m} = \frac{f_{max} - f_c}{f_m} = \frac{f_c - f_{min}}{f_m} \qquad \text{...(1.14)}$$

As said earlier, in frequency modulation, the amplitude of the modulated signal is same as that of the carrier waves but its frequency changes in accordance with the modulating signal. From the detailed study of frequency modulation it is found that the modulated signal consists of carrier and an apparently infinite number of sidebands, whose frequencies are $(f_c \pm f_m)$, $(f_c \pm 2f_m)$, $(f_c \pm 3f_m)$, ... The number of sidebands depends on the modulation index m_f . The number of sidebands increases, when frequency deviation is increased by keeping frequency of the modulating signal constant. On the other hand, the number of sidebands decreases, when the frequency of modulating signal is increased by keeping frequency deviation constant. It may be pointed out that the sidebands are separated from the carrier by f_m, $2f_m$, $3f_m$, ... *i.e.* they have a recurrence frequency of f_m. The sidebands are disposed symmetrically about the carrier and the sidebands at equal distances from the carrier have equal amplitudes. The amplitude of the sideband separated largely from the carrier becomes negligible. Due to this, the number of significant sideband pairs is limited.

Bandwidth. In frequency modulated signal, the information (audio signal) is contained in the sidebands. Since the sidebands are separated from each other by the frequency of modulating signal (f_m),

$$\text{bandwidth} = 2\,n \times \text{frequency of modulating signal,} \qquad \text{...(1.15)}$$

where n is the number of significant sideband pairs.

Frequency modulation is now fast replacing amplitude modulation for broadcasting speech and music. Frequency modulated signals have larger bandwidth. So that FM signals on the adjacent signals donot interfere, carrier waves of higher frequency have to be used. In FM transmission, the message signal is in the form of frequency variations of carrier waves. Therefore, noise which gets amplitude modulated does not harm the message signal. As a result, in FM broadcasts the reception is of much better quality. The following table gives the range of frequency allotted for FM radio and TV broadcasts :

Types of broadcast	Frequency band
FM radio	88 to 108 MHz
VHF TV	47 to 230 MHz
UHF TV	470 to 960 MHz

1.10. ADVANTAGES OF FREQUENCY MODULATION.

The following are a few advantages of frequency modulation over amplitude lulation :

1. FM reception is quite immune to noise as compared to AM reception.

Noise is a form of amplitude variations in the transmitted signal due to atmosphere, industries, etc. In FM receivers, the noise can be reduced by increasing the frequency deviation or by making use of amplitude limiters.

2. FM transmission is highly efficient as compared to AM transmission.

In FM transmission, all the transmitted power is useful ; whereas in AM transmission, most of the power goes waste in the transmitted carrier, which contains no useful information.

3. Due to a large number of sidebands, FM transmission can be used for the stereo sound transmission.

Disadvantages. The following are a few disadvantages of FM transmission :

1. The bandwidth in FM transmission is about 10 times as large as that needed in AM transmission. As a result, much wider frequency channel is required in FM transmission.

2. FM reception is limited to line-of-sight. Due to this, area of reception for FM is much smaller than that for AM.

3. FM transmitting and receiving equipments are very complex as compared to those employed in AM transmission.

1.11. DEMODULATION

The process of detection or demodulation is the inverse of modulation. In the process of detection, audio signal is separated from the modulated signal, which on being fed to the loud speaker or headphone, reproduces the original speech or music. The action of a diode as detector is basically the same as that of a half-wave rectifier.

Fig. 1.07 shows the basic circuit for using a junction diode as a detector. The input circuit consists of a parallel combination of an inductor L and a variable capacitor C, called *tuned circuit*. It helps to select the desired modulated radio frequency signal from the different signals picked up by the antenna. Due to its rectifying action, the output of the diode is a series of positive half cycles of radio frequency current pulses, whose peaks vary in accordance with the modulating audio signal. If this rectified output is fed to the headphone directly, its diaphram will vibrate with the high frequency of the carrier waves and therefore nothing would be heard. In order to extract the audio signal, the rectified output is fed to the parallel combination of the capacitor C′ and the resistor R. The value of the capacitance of the capacitor C′ is so chosen that its reactance to the high frequency carrier waves is low but is appreciable to the low frequency audio waves. As such, the capacitor C′ acts as a by-pass for carrier waves and the audio frequency voltage appears across the resistor R, which then sends the current through the head phone so as to produce original speech or music.

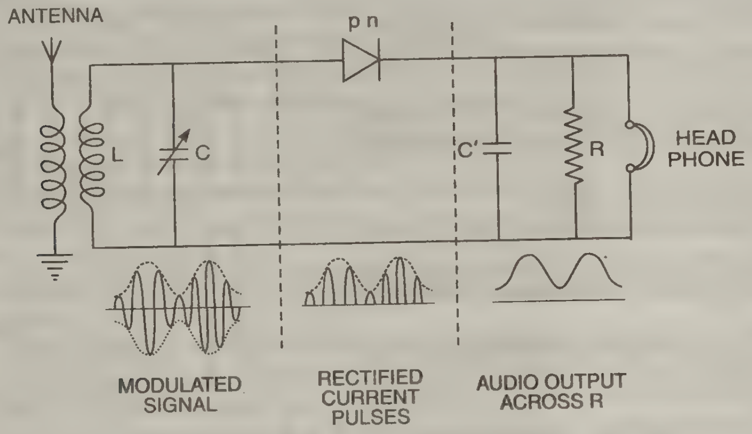

Fig. 1.07

1.12. BASIC ELEMENTS OF MODULATION AND DETECTION OF AN AUDIO SIGNAL

Fig. 1.08 illustrates the basic elements required to transmit and receive back an audio signal.

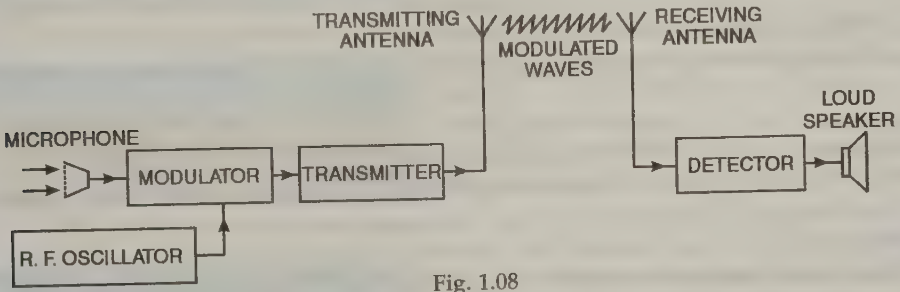

Fig. 1.08

A brief description of the various elements is as given below :

1. An oscillator generates radio frequency waves *i.e.* carrier waves.

2. A microphone converts the sound waves into electrical waves *i.e.* audio signal.

3. The modulator mixes up the audio signal with the carrier waves and feeds the modulated waves to the transmitter.

4. The transmitting antenna radiates the modulated waves into the space.

5. The receiving antenna intercepts the transmitted signal.

6. The detector demodulates (separates out) the audio signal from the modulated waves.

7. The loud speaker converts the demodulated audio signal back into the sound waves.

1.13. PULSE MODULATION

Analog modulation (both AM and FM modulations) are extensively employed for radio and TV transmission. As already said, in analog modulation, some parameter of sinusoidal carrier is varied in accordance with the instantaneous value of the modulating signal. In pulse modulation, the carrier is no longer a continuous sinusoidal wave but consists of pulse train. In this type of modulation also, some parameter of the carrier (a pulse train) is varied in accordance with the instantaneous value of modulating signal.

The pulse modulation is of the following two types :

1. **Pulse Amplitude Modulation (PAM).** In pulse amplitude modulation, amplitude of the pulses of the carrier pulse train is varied in accordance with the instantaneous value of modulating signal.

2. **Pulse Time Modulation (PTM).** In pulse time modulation, timing of the pulses of the carrier pulse train is varied in accordance with the instantaneous value of the modulating signal.

Pulse time modulation is, further, of the following two types :

(a) *Pulse Width Modulation* (PWM). In pulse width modulation, the width of the pulses of carrier pulse train is varied in accordance with the instantaneous value of the modulating signal. It is also called **Pulse Duration Modulation (PDM)** or **Pulse Length Modulation (PLM).**

(b) *Pulse Position Modulation* (PPM). In pulse position modulation, the position of the pulses of the carrier wave train is varied in accordance with the instantaneous value of the modulating signal.

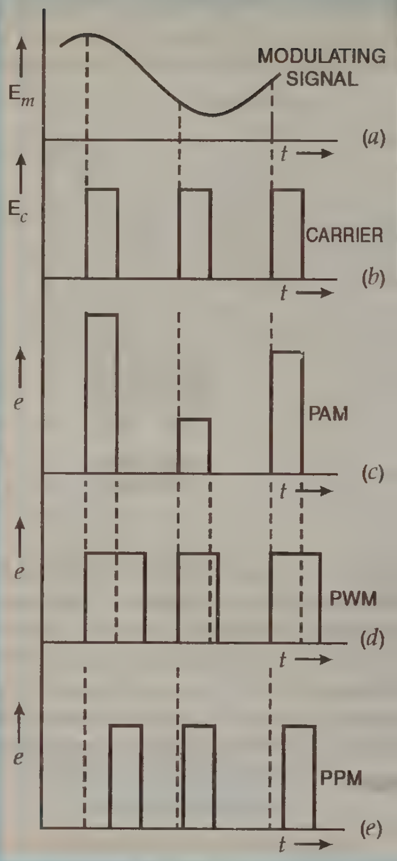

Fig. 1.09

Fig. 1.09 (*a*) shows a modulating signal, whose amplitude E_m is function of time. For the sake of simplicity, it is shown to have only a positive amplitude at different instants of time. In practice, however, the amplitude of the modulating signal may be positive as well as negative. The carrier is a train of pulses of fixed amplitude and spaced uniformly in time [Fig. 1.09 (*b*)].

The amplitude of the modulating signal is measured several times during each cycle of the signal. It is called ***sampling*** of the signal. From Fig. 1.09 (*a*), it follows that the amplitudes of the modulating signal at different sampling instants are different.

In PAM, the variation in the amplitude of each pulse of the carrier pulse train is according to the amplitude of the modulating signal at the sampling instant. Likewise, the PAM signal appears as shown in Fig. 1.09 (*c*). In PAM, the information about the baseband or modulating signal lies in the amplitude of a pulse.

Fig. 1.09 (*d*) shows the PWM signal, in which the width of each pulse changes in accordance with the amplitude of the modulating signal at the sampling instant. In PWM, the information about the baseband signal lies in the trailing edge of the pulse.

Finally, in PPM, the shift in the position of each pulse is according to the amplitude of the modulating signal at the sampling instant. The PPM signal obtained is as shown in Fig. 1.09 (*e*). In PPM, the information about the baseband signal lies in the leading edge of the pulse.

Key point

To achieve Pulse Code Modulation, an analog signal is sampled, quantised and then coded.

1.14. PULSE CODE MODULATION

The pulse amplitude, pulse width and pulse position modulations are not completely digital, as the amplitude, width or position of the pulses transmitted may vary continuously in accordance with variations in baseband signal. A completely digital modulation is obtained by **Pulse Code Modulation (PCM).** Since pulse amplitude modulation (PAM) is the simplest pulse modulation process, the PAM signals are used to obtain PCM signals. An analog signal is pulse code modulated by following the three operations explained as below :

Watch out !

In the sampling process (for the conversion of analog signal into digital signal), the analog signal is sampled at intervals of about 125 μs *i.e.* 8000 samples are taken every second !

1 ***Sampling.*** *It is the process of generating pulses of zero width (duration) and of amplitude equal to the instantaneous amplitude of the analog signal.*

Thus, in sampling process, the amplitude of analog signal is measured several times during each cycle of the signal. According to sampling theorem (known as Nyquist theorem), if a signal is bandlimited to B Hz (*i.e.* there are no frequency components beyond B Hz in the frequency spectrum of the signal), the sampling frequency must be atleast 2 B Hz. The number of samples taken per second is called ***sampling rate.***

For example, consider that voltage amplitude of an analog signal varies between 0 to 7 V as shown in Fig. 1.10. Suppose that when the signal is sampled,

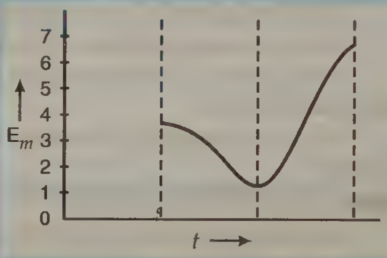

Fig. 1.10

its amplitude at three discrete times is measured to be 3·7 V, 1·3 V and 6·8 V respectively. The three sampled pulses of zero width having amplitudes 3·7 V, 1·3 V and 6·8 V have been shown separately in Fig. 1.11. As such, the analog signal is said to have become **pulse amplitude modulated (PAM).**

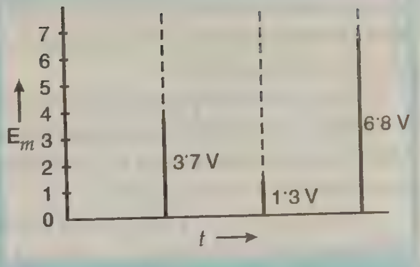

Fig. 1.11

2. ***Quantisation.*** *The process of dividing the maximum amplitude of the analog voltage signal into a fixed number of levels is called quantisation.*

Let us divide the amplitude (7 V) of the analog voltage signal into eight levels viz 0, 1, 2, 3, 4, 5, 6 and 7 V. These levels are called ***quantisation levels.*** Pulses having amplitude between – 0·5 V to 0·5 V are approximated (quantised) to a value 0 V, pulses having amplitudes between 0·5 to 1·5 V are approximated to a value 1 V and so on. Therefore, the amplitude of the three pulses will be approximated to values 4 V, 1 V and 7 V respectively. The pulses so obtained are called ***quantised pulses*** and are as shown in Fig. 1.12.

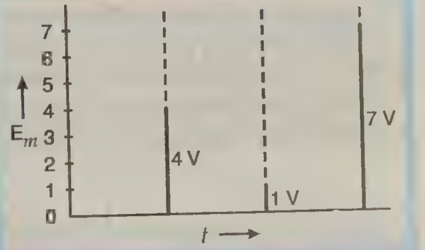

Fig. 1.12

3. Coding. *The process of digitising the quantised pulses according to some code is called coding.*

The most popular code is the binary code. Therefore, each quantised pulse is given a digital code, which is a binary number. The size of the binary number *i.e.* how many bits it has, depends on the number of quantisation levels. Since there are eight levels, a three-bit binary code will suffice. The three-bit binary code corresponding to various quantisation levels is as given in the adjoining table. Zeros have been added to the left of any number that is less than three bits.

Quantisation level	Binary code
0	000
1	001
2	010
3	011

7	111

Therefore, The three quantised pulses having amplitudes 4 V, 1 V and 7 V will be coded as 100, 001 and 111 respectively. These coded values are combination of binary digits (bits) 0 and 1. As shown in Fig. 1.13, all the pulses have the same amplitude but possess different lengths. Each binary digit is allocated a fixed period of time. The length of the pulse is the time, for which it is high or low. Binary zeros (0) are represented by 0 volt and binary ones (1) by a fixed voltage (oftenly +5 volt is used). A series of several consecutive 1's or 0's represents a longer pulse. The signal is now said to be **pulse code modulated (PCM).**

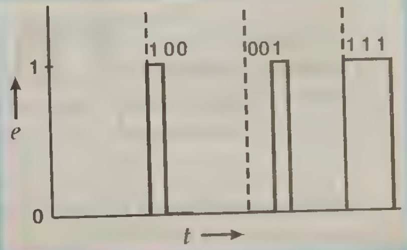

Fig. 1.13

Key point

In case the amplitude of analog signal is divided into 16 quantisation levels, then a 4-bit binary code is used to code the quantised pulses.

An analog signal is described by its `frequency range'. This term has no meaning for a digital signal. Instead, a digital signal is described by the ***bit rate*** *i.e.* number of bits per second (binary digits per second).

Key point

A digital signal is described by the bit rate *i.e.* number of binary digits (bits) per second.

To calculate the bit rate, one should know the sampling rate and the number of quantisation levels. The sampling rate is the number of samples per second. The levels determine the binary code and the number of bits per sample required. Therefore,

$$\text{bit rate} = \text{sampling rate} \times \text{number of bits per sample} \qquad \text{...(1.16)}$$

1.15 DATA TRANSMISSION AND RETRIEVAL

The pulse code modulated signal is a series of 1's and 0's. If they are to be transmitted over copper wires, they can be directly transmitted as two voltage levels, +V corresponding to 1 and – V corresponding to 0. But if they are to be transmitted through space, then some form of modulation has to be employed. Just as in case of analog modulation, the following three modulation techniques are used to transmit a PCM signal :

1. Amplitude Shift Keying (ASK). In amplitude shift keying, two different amplitudes of the carrier represent the two binary values of the PCM signal. The binary value 1 is represented by the presence of carrier of some constant amplitude, while the binary value 0 is represented by the absence of carrier *i.e.* by carrier of zero amplitude. For this reason, this method is also known as **On-Off Keying (OOK).**

2. Frequency Shift Keying (FSK). In frequency shift keying, the binary values of the PCM signal are represented by two frequencies, which are offset from the carrier frequency f_c by equal and opposite amounts f and $-f$. The frequency $f_c + f$ represents the binary value 1, while the frequency $f_c - f$ represents the binary value 0.

3. Phase Shift Keying (PSK). In phase shift keying, the binary value of 0 corresponds to zero phase shift and the binary value 1 corresponds to a phase shift of π.

Fig. 1.14 (*a*) shows a typical PCM signal 110100100 and Fig. 1.14 (*b*) represents the waveform of modulated signal due to ASK method. From the figure, it follows that carrier is present, when binary value of the signal is 1 and is absent, when binary value of the signal is 0.

Fig. 1.14 (*c*) represents the waveform of modulated signal achieved by FSK method. It follows that frequency of the carrier increases by a certain amount, when binary value of the signal is 1 and decreases by an equal amount corresponding to binary value 0 of the signal.

Finally, Fig. 1.14 (*d*) shows the waveform of modulated signal obtained by PSK method. The carrier is without any phase change corresponding to binary value 0 of the signal and its phase changes by π, whenever the binary value of the signal is 1.

It may be pointed out that FSK method is preferred as it gives optimum performance in the presence of noise. The ASK method is rarely used as it does not give a satisfactory value for probability of error.

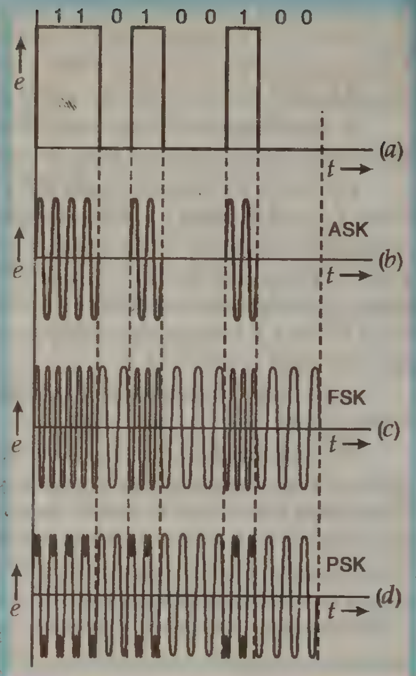

Fig. 1.14

Fig. 1.15 shows the block diagram of the trasmitter of a PCM communication system for the transmission of digital data.

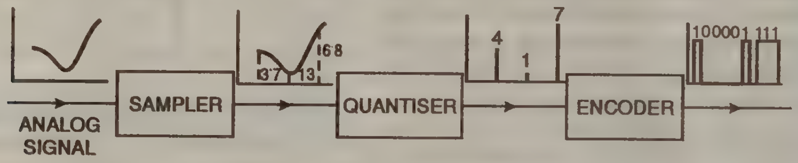

Fig. 1.15

The analog signal is sampled by the sampler. The sampled pulses are then quantised by the quantiser. The encoder codes the quantised pulses according to the binary code. After modulating the PCM signal by one of the three methods viz ASK, FSK or PSK method, the modulated signal is, then, transmitted into free space in the form of bits.

The Jargon

The encoder is also called Analog to Digital (A/D) Converter.

Fig. 1.16 shows the block diagram for the receiver of a PCM communication system for retreiving the digital data.

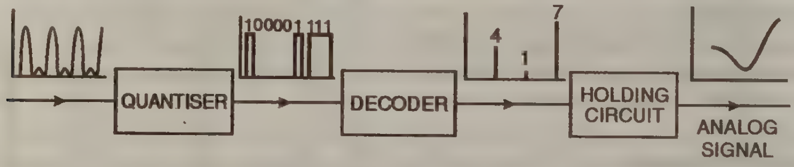

Fig. 1.16

The received signal is first quantised by the quantiser of the receiver. This quantiser is differnt from the quantiser of the transmitter. It is because, it has to take a decision about the presence or absence of a pulse. Likewise, there are only two quantisation levels. The output of the quantiser is PCM signal, which then goes to decoder. It performs the inverse operation of the encoder. The output of the decoder is a sequence of quantised pulses. To reconstruct the original analog signal, a typical circuit, called holding circuit is used.

The Jargon

The decoder is also known as Digital to Analog (D/A) Converter.

1.16 MERITS OF DIGITAL COMMUNICATION

The following are a few merits of digital communication :

1. Digital signals are easy to receive. All the receiver needs to do is to detect, whether a pulse is high or low.

2. AM and FM signals become corrupted over much short distances as compared to digital signals. From a corrupted AM or FM signal, the audio signal cannot be reproduced faithfully. However, in case of digital signals, as long as the receiver can distinguish between `high' and `low', the original signal can be reproduced accurately.

3. The signals lose power as they travel. This is called ***attenuation***. When AM and FM signals are amplified to restore power, the noise is amplified as well and the quality of the signal is lowered. However, a digital signal can be `cleaned up' to restore quality and amplified at different stages by ***regenerators*** to restore the power.

Key point

In a digital signal, the information is carried by the pattern of pulses and not by the shape of the pulses..

4. The digital signals do not get distorted by the noise. The noise may change the shape of the pulses, but not the pattern of the pulses. It is the pattern of the pulses that carries information in the digital signals.

5. Once an AM or FM signal is transmitted, anyone with a suitable receiver can listen in. However, the digital signals can be coded so that only the person, they are intended for, can receive them.

6. Both AM and FM transmissions constitute `real time systems', which means that the signal can be received only at the time, it is transmitted. However, digital signals can be stored in the absence of the person at the receiving end.

7. The digital signals can be stored as digital data or used to produce a display on a computer monitor or converted back into analog signal to drive a loud speaker.

1.17. MODEM

The name ***modem*** is a contraction of the term ***mo***dulator and ***dem***odulator. As the name suggests, a modem performs functions of both modulator and demodulator. In the transmitting mode, modem acts as a modulator and in the receiving mode, it acts as a demodulator.

Fig. 1.17 shows the communication circuit between a transmitting digital device (such as a business machine or a terminal) and a receiving digital device (such as a computer) through a telephone line. When telephone line (analog medium) is used for data communication between the two digital devices, two modems are required, one near each digital device as shown in the figure.

Key point

A modem acts as a modulator in transmitting mode and as a demodulator in receiving anode.

The jargon

An input/output device, which allows a user to communicate directly with a computer system is called a terminal.

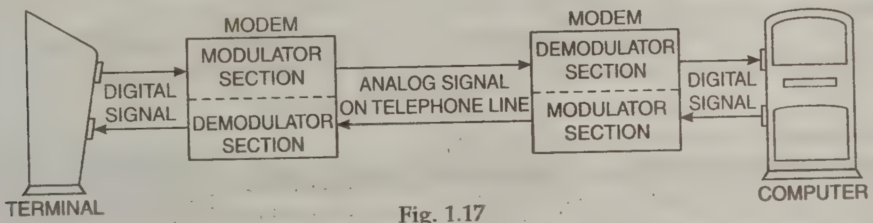

Fig. 1.17

Since digital signals can not be transmitted along the telephone line, the digital data has to be converted into analog signal. The modem placed near the transmitting device (terminal) converts the digital data from the terminal into analog form and then transmits the audio signal after modulating it with carrier along the telephone line. The demodulator section of the modem placed near the receiving device (computer) demodulates the carrier to retrieve the data. This digital data is processed by the computer and the processed data is modulated to the analog form by the modem and returned via the telephone line to the terminal, where the analog signals are demodulated by the modem to digital form.

Modems are described depending upon their mode of operation. The modems can be used to transmit and retrieve the data in the following three modes :

1. **Simplex mode.** *It is mode of using a modem, in which data signals can be transmitted between the transmitter and the receiver in only one direction.*

In this mode, the modem operates as either a send-only or a receive-only device. As in this mode, the modem uses only one transmission channel, no signalling can be made from the receiver to the transmitter so as to send acknowledgement or request for retransmission of data.

2. **Half-duplex.** *It is the mode of using a modem, in which data signals can be transmitted between the transmitter and the receiver in both directions, but only in one direction at a time.*

In this mode, the modem makes use of one transmission channel, but the channel must be bidirectional. Further, in this mode, the line must be `turned around' each time the direction of transmission of data is reversed. This involves a special switching circuit and consumes a small amount of time. As a result, the speed of data transfer reduces. It is because, the same circuit has to be shared for transmission of data in the opposite direction.

3. **Full-duplex.** *It is the mode of using a modem, in which data signals can be transmitted between the transmitter and the receiver in both directions at the same time.*

In this mode, the efficiency improves as the line turn-around time required in the half-duplex arrangement is eliminated. In this mode, two circuits are required, either two 2-wire circuits or one 4-wire circuit. As shown in Fig. 1.17, modems are placed at each end of the circuit to provide modulation and demodulation.

It is worthwhile to note that whereas the use of modems allows higher speeds of transmission of digital data on a given analog line, it also reduces the effects of noise and distortion.

1.18. FAX (FACSIMILE)

The electronic transmission of a document at a distant place via telephone line is known as facsimile or FAX.

Fig. 1.18 is the block diagram showing the function of various parts of a FAX machine to produce a duplicate copy of the document at the receiver end.

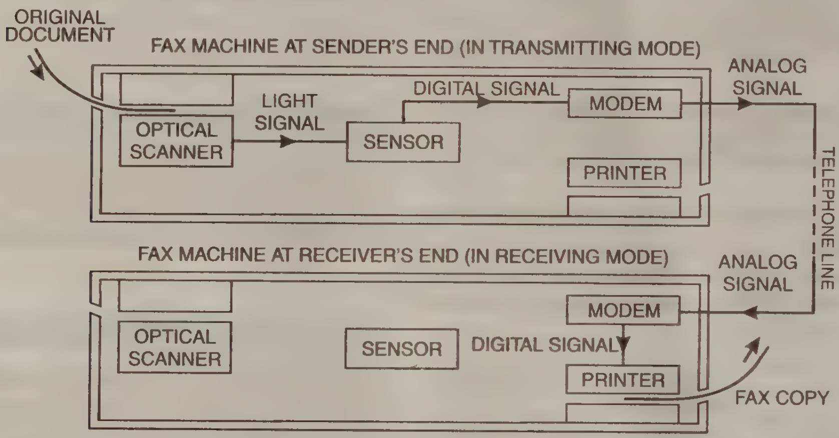

Fig. 1.18

In order to send FAX copy of some document, the sender dials in the phone number of the FAX machine at the receiver's end. The FAX machine at the sender's end is, then, in ***transmitting mode*** and that at the receiver's end in ***receiving mode***. When a FAX machine is in receiving mode, only its printer is active so as to accept the incoming signal through the modem inside it. When the document is fed into the machine, the optical scanner scans the document in the form of tiny parallel strips in turn. When an intense beam of light from a source (not shown in the figure) falls on the scanned document, the amount of light that bounces back is detected by the sensors. Where ink is present, little light is reflected creating an electrical pulse of low voltage. A pulse of high voltage results, when light is reflected from white paper. A modem inside the machine converts these digital pulses into analog signals which is then transmitted to the receiving FAX machine via the telephone line. The modem in the FAX machine at the receiving end converts the analog signals back into digital pulses. The printer of the FAX machine prints these digital pulses faithfully in the form of dots to build up a facsimile copy of the original document. Each FAX machine has its own number, which is dialed in via the sender's FAX machine.

SOLVED NUMERICAL QUESTIONS

Type A. On Analog modulation

Problem 1.01. An audio signal of amplitude one-half the carrier amplitude is employed in amplitude modulation. What is the modulation index ?

Sol. Here, $E_m = 0{\cdot}5\,E_c$

$\therefore \quad E_{max} = E_c + 0{\cdot}5\,E_c = 1{\cdot}5\,E_c$

and $\quad E_{min} = E_c - 0{\cdot}5\,E_c = 0{\cdot}5\,E_c$

$$\text{Now, } m_a = \frac{E_{max} - E_{min}}{E_{max} + E_{min}} = \frac{1{\cdot}5\,E_c - 0{\cdot}5\,E_c}{1{\cdot}5\,E_c + 0{\cdot}5\,E_c} = \frac{E_c}{2\,E_c} = \mathbf{0{\cdot}5}$$

Problem 1.02. In an amplitude modulator, the tank circuit consists of a coil of inductance 3·6 mH and a capacitor of capacitance 2·5 pF. If an audio signal of frequency 15 kHz modulates the carrier generated by the tank circuit, find the frequencies of the sidebands.

Sol. Here, $L = 3{\cdot}6$ mH $= 3{\cdot}6 \times 10^{-3}$ H ;

$C = 25$ pF $= 2{\cdot}5 \times 10^{-12}$ F ; $f_m = 15$ kHz

The frequency of carrier generated by the tank circuit,

$$f_c = \frac{1}{2\pi\sqrt{LC}} = \frac{1}{2\pi\sqrt{3{\cdot}6 \times 10^{-3} \times 2{\cdot}5 \times 10^{-12}}}$$

$$= 1{\cdot}678 \times 10^6 \text{ Hz} = 1678 \text{ kHz}$$

Frequency of upper sideband,

$$f_c + f_m = 1678 + 15 = \mathbf{1693\ kHz}$$

and frequency of lower sideband,

$$f_c - f_m = 1678 - 15 = \mathbf{1663\ kHz}$$

Problem 1.03. An audio signal of 3·2 kHz modulates a carrier of frequency 84 MHz and produces a frequency deviation of 96 kHz. Find (*a*) frequency modulation index and (*b*) frequency range of the frequency modulated wave.

Sol. Here $f_m = 3{\cdot}2$ kHz ; $f_c = 84$ MHz $= 84 \times 10^3$ kHz

frequency deviation, $\delta = 96$ kHz

(*a*) Now, frequency modulation index,

$$m_f = \frac{\delta}{f_m} = \frac{96}{3\cdot 2} = 30$$

(*b*) Frequency range of the modulated wave

$$= f_c \pm f_m = 84 \times 10^3 \pm 3\cdot 2 \text{ kHz}$$
$$= 83\cdot 997 \times 10^3 \text{ kHz to } 84\cdot 003 \times 10^3 \text{ kHz}$$
$$= \mathbf{83\cdot 997 \text{ MHz to } 84\cdot 003 \text{ MHz}}$$

Type B. On Pulse modualtion

Problem 1.04. For a 4-bit D/A converter, work out the output voltage for each of the following input voltage combinations : (*i*) 0001 (*ii*) 0010 (*iii*) 0100 (*iv*) 1000 (*v*) 1001 and (*vi*) 1101. (*Text Problem*)

Sol. Suppose that binary values 0 and 1 of the digital signal correspond to 0 V and 1 V respectively.

(*i*) For input voltage 0001 :

$$\text{Output voltage} = 1 \times 2^0 + 0 \times 2^1 + 0 \times 2^2 + 0 \times 2^3$$
$$= 1 + 0 + 0 + 0 = \mathbf{1 \text{ V}}$$

(*ii*) For input voltage 0010 :

$$\text{Output voltage} = 0 \times 2^0 + 1 \times 2^1 + 0 \times 2^2 + 0 \times 2^3$$
$$= 0 + 2 + 0 + 0 = \mathbf{2 \text{ V}}$$

(*iii*) For input voltage = 0100 :

$$\text{Output voltage} = 0 \times 2^0 + 0 \times 2^1 + 1 \times 2^2 + 0 \times 2^3$$
$$= 0 + 0 + 4 + 0 = \mathbf{4 \text{ V}}$$

(*iv*) For input voltage 1000 :

$$\text{Output voltage} = 0 \times 2^0 + 0 \times 2^1 + 0 \times 2^2 + 1 \times 2^3$$
$$= 0 + 0 + 0 + 8 = \mathbf{8 \text{ V}}$$

(*v*) For input voltage 1001 :

$$\text{Output voltage} = 1 \times 2^0 + 0 \times 2^1 + 0 \times 2^2 + 1 \times 2^3$$
$$= 1 + 0 + 0 + 8 = \mathbf{9 \text{ V}}$$

(*vi*) For input voltage 1101 :

$$\text{Output voltage} = 1 \times 2^0 + 0 \times 2^1 + 1 \times 2^2 + 1 \times 2^3$$
$$= 1 + 0 + 4 + 8 = \mathbf{13 \text{ V}}$$

Problem 1.05. Pulse code modulation is also used for digital audio recording. Some compact discs used a 32-bit code. How many quantisation levels would this give ?

Sol. The number of quantisation levels = 2^n, where n is the number of bits per sample.

Since compact discs used 32-bit code, $n = 32$

Therefore, number of quantisation levels

$$= 2^{32} = \mathbf{4\cdot 3 \times 10^9}$$

Problem 1.06. Calculate the bit rate for a signal, which has a sampling rate of 8 kHz and where 16 quantisation levels have been used.

Sol. If n is the number of bits per sample, then number of quantisation level = 2^n

Since the number of quantisation levels is 16,

$$2^n = 16 \quad \text{or} \quad n = 4$$

Now, bit rate = sampling rate × number of bits per sample

$$= 8000 \times 4 = \mathbf{32{,}000 \text{ bits s}^{-1}}$$

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. What do you mean by communication ?

Ans. *The communication is the processing, sending and receiving of information with the help of a suitable communication system and transmission medium.*

Q. 1.02. What is a transducer ? Give one example.

Ans. *A device which converts energy in one form to another is called a transducer.*

In radiocommunication, microphone is used to convert sound signal into electrical signal. Here, the microphone acts as a transducer.

Q. 1.03. What is an analog communication system ?

Ans. *The communication system, which makes use of analog signals (the signal which varies continuously with time), is called analog communiction system.*

Q. 10.4. What is a digital communication system ?

Ans. *The communication system, which makes use of digital signal (the signal, which has only two values-either high or low), is called digital communication system.*

Q. 1.05. What is modulation ?

Ans. *The process of producing a high frequency wave, some characteristic of which varies as a function of the instantaneous value of the audio signal, is called modulation.*

Q. 1.06. What is modulated wave ?

Ans. *The signal wave that results on superimposing the modulating wave on carrier wave is called modulated wave.*

Q. 1.07. Define amplitude modulation.

Ans. *When the modulating wave is superimposed on a high frequency carrier wave in a manner that the frequency of the modulated wave is same as that of the carrier wave but its amplitude is modified in accordance with that of the modulating wave, the process is called amplitude modulation.*

Q. 1.08. What is modulation index ?

Ans. *The degree, to which the carrier wave is modulated, is called modulation index.*

Q. 1.09. What is the importance of modulation index ?

Ans. The modulation index determines the strength and quality of the transmitted signal. When modulation index is high, the reception will be strong and clear.

Q. 1.10. What do you mean by bandwidth ?

Ans. *The frequency range, in which a transmitting system makes transmission, is called bandwidth.*

Q. 1.11. Give the expression for band width in AM transmission.

Ans. In AM transmission,

band width = 2 × maximum frequency of the audio signal

Q. 1.12 What is frequency modulation ? (*Text Question*)

Ans. *When the modulating wave is superimposed on a high frequency carrier wave in a manner that the amplitude of the modulated wave is same as that of the carrier wave but its frequency is modified in accordance with the amplitude of the modulating wave, the process is called frequency modulation.*

Q. 1.13. What do you mean by frequency deviation ?

Ans. *The maximum swing of the frequency of modulated wave from the carrier frequency is called frequency deviation.*

Q. 1.14. Give the expression for bandwidth in FM modulation.

Ans. In FM transmission,

bandwidth = 2 n × frequency of modulating signal, where n is the number of significant sidebands.

Q. 1.15. Which of the two–AM or FM is preferred for high fidelity reception ?

Ans. Frequency modulation is preferred for high fidelity reception.

Q. 1.16. What is noise ?

Ans. *The undesired electrical signals are termed as noise.*

When a signal is transmitted, the undesired signals get mixed with it leading to distortion of the signal.

Q. 1.17. How can you decrease noise in FM receivers ?

Ans. Noise can be decreased in FM receivers by increasing the frequency deviation.

Q. 1.18. What is demodulation ?

Ans. *The process of separating out the audio signal from the modulated signal is known as demodulation.* The process of demodulation is the inverse of modulation.

Q. 1.19. Define pulse amplitude modulation.

Ans. *The process of modulation, in which amplitude of the pulses is varied in according with the modulating signal, is called pulse amplitude modulation.*

Q. 1.20. What do you mean by quantisation ?

Ans. *The process of dividing the maximum value of the analog voltage signal into a fixed number of levels in order to convert a pulse amplitude modulated signal into a binary code is calle quantisation.*

Q. 1.21. What do you mean by sampling of an analo signal ?

Ans. *The proces of generating pulses of zero width (duration and of amplitude equal to the instantaneous amplitude of the analo signal is called sampling.*

Q. 1.22. How is bit rate related to the sampling rate

Ans. Bit rate = sampling rate × number of bits per sampl

Q. 1.23. AM and FM transmission are said to be `rea time systems'. What does it imply ?

Ans. It implies that the AM and FM signals can b received only at the time it is transmitted.

Q. 1.24. What is a modem ?

Ans. A modem performs functions of both modulato and demodulator. In the transmitting mode, modem acts a a modulator, while in the receiving mode, it acts as demodulator.

Q. 1.25. What is FAX ?

Ans. *The electronic transmission of a document at a distan place via telephone line is called FAX.*

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 1.01. Do the telegraphy and telemetry mean the same communication system ? Explain.

Ans. Refer to section 1.01.

Q. 1.02. The audio signal can not be transmitted directly into the space. Why ?

Ans. 1. The length of the antenna required is so large (≈ 500 m) that it is practically impossible to set up it.

2. The energy radiated from the antenna in audio frequency range is practically zero.

3. The audio signals transmitted from the different broadcasting stations will get inseparably mixed up.

Q. 1.03. A radio broadcast is transmitted using *amplitude modulation* at a *carrier frequency* of 680 kHz. Explain the meaning of each of the italicised words.

(*Text Question*)

Ans. Amplitude modulation. Refer to VSQ 1.07.

Carrier frequency. The message signals in low frequency range cannot be efficiently radiated into space and die out over a small distance. This difficulty is overcome by modulating the message signal with waves of high frequency. Such waves of high frequency are called carrier waves and their frequency as carrier frequency.

Q. 1.04. What is a carrier wave ? Why high frequency carrier waves are employed for transmission ?

(*Text Question*)

Ans. Carrier wave. Refer to SAQ. 1.03.

As the message signal propagates through the space, it gets attenuated with distance, so that the transmission can be done over a large distance, the message signal is modulated with high frequency waves, called carrier waves.

Q. 1.05. What is the need for modulation ?

Ans. Refer to section 1.07.

Q. 1.06. Why should transmitters broadcasting programmes use different carrier frequencies ?

(*Text Question*)

Ans. If all the transmitters broadcast programmes b using same carrier frequency, then it will not be possible t tune the receiver to a particular transmission. Further, as th frequency spectrum of all the message signals are identica they will get inseparably mixed up.

Q. 1.07. What are the limitations of amplitude modula tion ?

Ans. 1. The quality of audio signal is not good.

2. The atmospheric and industrial noise affect the audi signal.

3. The efficiency of amplitude modulation is low.

Q. 1.08. What are the advantages of FM transmission

Ans. 1. FM reception is quite immune to noise a compared to AM reception.

2. It gives high fidelity reception due to large number o sidebands.

3. The efficiency of FM transmission is high.

Q. 1.09. What are the advantages of AM over FM transmission ?

Ans. 1. FM transmission requires much wider channe as compared to AM transmission.

2. The reception of FM signal is limited to line-of-sight As a result, the area in which FM transmission can be receive is much smaller than in case of AM transmission.

Q. 1.10. What is a noise ? What are their causes ?

Ans. *The undesired electrical signals are termed as noise.*

The noises are of two types :

Internal noise. The undesired electrical signals arisin due to thermal motion of electrons within the system (due t their random motion, recombination or diffusion) are terme as internal noise.

External noise. The undesired electrical signals arisin due to nearby radio frequency transmitters, electrical circuits sparks, fluroscent lights, etc are termed as external noise.

Q. 1.11. Why is an FM signal less susceptible to noise than an AM signal ? *(Text Question)*

Ans. In FM transmission, the message signal is in the form of frequency variations of carrier waves. During modulation process, the noise gets amplitude modulated. Since it brings about variations only in the amplitude of carrier waves, it does no harm to the message signal. For this reason, FM signal is less susceptible to noise than an AM signal is.

Q. 1.12. What do you mean by pulse amplitude modulation and pulse code modulation ?

Ans. Refer to sections 1.13 and 1.14.

Q. 1.13. What is the difference between bit rate and sampling rate ? Give the relation between the two.

Ans. Refer to section 1.14.

Q. 1.14. Give three main merits of digital communication.

Ans. 1. The digital signals do not get distorted by the noise. It is because, noise may change the shape of the pulse, but not the pattern of the pulses.

2. Digital signals are very easy to receive.

3. The digital signals can be coded.

FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Antenna length

1. Calculate the length of half wave dipole at (*a*) 30 MHz, (*b*) 300 MHz and (*c*) 3000 MHz. What inference do you draw from these results ? *(Text Problem)*
   [Ans. (*a*) 5 m, (*b*) 50 cm, (c) 5 cm, length of dipole decreases as frequency increases)]

Type B. On Analog modulation

2. An audio signal of amplitude (*a*) equal to (*b*) 1·5 times the carrier amplitude is employed in amplitude modulation. Find the modulation index in each case.
   [Ans. (*a*) 1 (*b*) 1·5]
3. An audio signal in frequency range 370 Hz to 2·5 kHz modulates a carrier of frequency 80 kHz. Find the range of (*a*) upper sideband and (*b*) lower sideband.
   [Ans. (*a*) 80·37 to 82·5 kHz (*b*) 77·5 to 79·63 kHz]
4. An audio signal of 2·8 kHz modulates a carrier of frequency 90 MHz producing a frequency deviation of 84 kHz. Find (*a*) frequency modulation index and (*b*) frequency range of the modulated wave.
   [Ans. (*a*) 30 (*b*) 89·916 to 90·084 MHz]

Type C. On Pulse modulation

5. (*a*) How many bits are needed to represent the following decimal numbers as binary number ? (*i*) 16, (*ii*) 32 and (*iii*) 64.
   (*b*) Each of the decimal numbers in (*a*) can be written as 2^n, where *n* is a whole number. Show that the answers to (*a*) can all be written as $(n + 1)$.
   [Ans. (*a*) (*i*) 5, (*ii*) 6, (*iii*) 7]

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. *(a) When f = 30 MHz :*

$$\lambda = \frac{c}{f} = \frac{3 \times 10^8}{30 \times 10^6} = 10 \text{ m}$$

Therefore, length of half wave dipole,

$$l = \frac{\lambda}{2} = \frac{10}{2} = \mathbf{5\ m}$$

(b) When f = 300 MHz :

$$\lambda = \frac{c}{f} = \frac{3 \times 10^8}{300 \times 10^6} = 1 \text{ m}$$

Therefore, length of half wave dipole,

$$l = \frac{\lambda}{2} = \frac{1}{2} = 0 \cdot 5 \text{ m } = \mathbf{50\ cm}$$

(c) When f = 3000 MHz :

$$\lambda = \frac{c}{f} = \frac{3 \times 10^8}{3000 \times 10^6} = 0 \cdot 1 \text{ m}$$

Therefore, length of half wave dipole,

$$l = \frac{\lambda}{2} = \frac{0 \cdot 1}{2} = 0 \cdot 05 \text{ m } = \mathbf{5\ cm}$$

It follows that as the frequency of the carrier increases, the length of the half wave dipole decreases.

2. (*a*) Here, $E_m = E_c$

$$\therefore \quad E_{max} = E_c + E_c = 2\,E_c \text{ and } E_{min} = E_c - E_c = 0$$

$$\text{Now, } m_a = \frac{E_{max} - E_{min}}{E_{max} + E_{min}} = \frac{2\,E_c - 0}{2\,E_c + 0} = \mathbf{1}$$

(*b*) $E_m = 1{\cdot}5\ E_c$

$$\therefore \quad E_{max} = E_c + 1{\cdot}5\ E_c = 2{\cdot}5\ E_c$$

$$\text{and } \quad E_{min} = E_c - 1{\cdot}5\ E_c = -\,0{\cdot}5\ E_c$$

$$\text{Now, } m_a = \frac{2 \cdot 5\,E_c - (-\,0 \cdot 5\,E_c)}{2 \cdot 5\,E_c - 0 \cdot 5\,E_c} = \mathbf{1{\cdot}5}$$

3. Frequency range of audio signal,

f_m = 370 Hz to 2·5 kHz
= 0·37 kHz to 2·5 kHz

Carrier frequency, f_c = 80 kHz

(*a*) Frequency range of upper side band
= 80 + 0·37 to 80 + 2·5
= **80·37 kHz to 82·5 kHz**

(*b*) Frequency range of lower side band
= 80 – 2·5 to 80 – 0·37
= **77·5 kHz to 79·63 kHz**

4. Here, $f_m = 2{\cdot}8$ kHz, $f_c = 90$ MHz $= 90 \times 10^3$ kHz, $\delta = 84$ kH

(*a*) Here, $m_f = \dfrac{\delta}{f_m} = \dfrac{84}{2 \cdot 8} = \mathbf{30}$

(*b*) Frequency range of modulated wave
$= f_c + f_m = 90 \times 10^3 \pm 2{\cdot}8$ kHz
$= 89{\cdot}997 \times 10^3$ kHz to $90{\cdot}003 \times 10^3$ kHz
= **89·997 MHz to 90·003 MHz**

5. (*a*) (*i*) ***To find bits in decimal number 16 :***

$$\begin{array}{c|l} 2 & 16 \\ \hline 2 & 8-0 \\ \hline 2 & 4-0 \\ \hline 2 & 2-0 \\ \hline 2 & 1-0 \\ \hline & 0-1 \end{array}$$

The remainders in reverse order are
1, 0, 0, 0, 0.

Therefore, number of bits in decimal numbe 16 are **5**.

(*ii*) ***To find bits in decimal number 32 :***

Proceeding as above, it can be obtained that remainders in reverse order are 1, 0, 0, 0, 0, 0,.

Therefore, number of bits in decimal number 32 is **6**.

(*iii*) ***To find bits in decimal number 64 :***

Proceeding as above, it can be obtained that remainders in reverse order are 1, 0, 0, 0, 0, 0, 0.

Therefore, number of bits in decimal number 64 is **7**.

(*b*) The each of the three given decimal numbers, say N can be represented as

$$N = 2^n$$

(*i*) Now, $16 = 2^n$ or $n = 4$

Therefore, number of bits in decimal number 16, which is 5, is equal to 4 + 1 *i.e.* $\boldsymbol{n + 1}$.

(*ii*) Now, $32 = 2^n$ or $n = 5$

Therefore, number of bits in decimal number 32, which is 6, is equal to 5 + 1 *i.e.* $\boldsymbol{n + 1}$.

(*iii*) Now, $64 = 2^n$ or $n = 6$

Therefore, number of bits in decimal number 64, which is 7, is equal to 6 + 1 *i.e.* $\boldsymbol{n + 1}$.

CHAPTER 2

Space Communication

2.01. EARTH'S ATMOSPHERE

The gaseous envelope surrounding the earth is called earth's atmosphere.

At sea level, by volume, dry air contains 78·08% nitrogen, 20·95% oxygen, ·93% argon, 0·03% carbon dioxide, 0·0018% neon and traces of gases, such as elium, kyrpton and xenon. In addition to the above, air contains water vapours, ydro-carbons, hydrogen peroxide, sulphur compounds and dust particles. The ompo-sition of earth's atmosphere varies very slightly with altitude. It remains ame up to a height of 100 km, but its density goes on decreasing as we go up. The arth's atmosphere has no sharp boundary. It has been divided into a number of egions (or layers) as shown in Fig. 2.01. They are as explained below :

1. Troposphere. This region extends up to 12 km from the surface of the earth. ts density varies from 1 kg m^{-3} at the surface of earth to 0·1 kg m^{-3} at the top of his layer. All the water vapours of the atmosphere are contained in this layer. In his part of atmosphere, temperature decreases with height from 290 K to 220 K.

2. Stratosphere. This region of atmosphere extends from 12 km from the surface of earth upto 50 km and it forms practically clear sky. The density of atmosphere in this region varies from 0·1 kg m^{-3} to 10^{-3} kg m^{-3} and the temperature varies from 220 K to 280 K. At the upper extreme of this region, there is a layer of ozone between 30 to 50 km from the surface of earth, in which most of the atmospheric ozone is concentrated. Ozone layer absorbs a large proportion of ultra-violet radiation radiated by the sun and therefore it protects the life on earth from its harmful effects. The ozone layer is also called ***ozonosphere***.

3. Mesosphere. The region of earth's atmosphere between 50 to 80 km from the surface of earth is called mesosphere. The density of the atmosphere in this region varies from 10^{-3} kg m^{-3} to 10^{-5} kg m^{-3} and the temperature varies from 290 K to 180 K.

4. Ionosphere. This region of earth's atmosphere extends from 80 km to 400 km from the earth's surface. This is the outermost part of the atmosphere and it receives maximum energy from the sun. As we go up, the temperature increases with altitude from 180 K to 700 K and the density of this region varies from 10^{-5} kg m^{-3} to 10^{-10} kg m^{-3}.

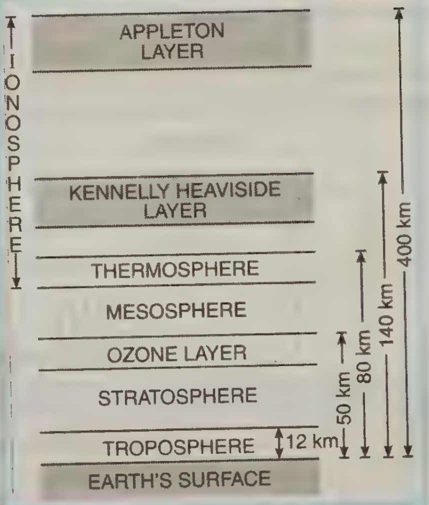

Fig. 2.01

Due to low pressure in this part of atmosphere, ionisation is produced by ultra-violet radiation and X-rays from the sun. As a result, the concentration of electrons and positive ions is very large in this region and for this reason, it is called *ionosphere*. At about 90 km from earth's surface, the electron concentration becomes very large and extends vertically up to 140 kilometres approximately. This layer of electrons is known as ***Kennelly Heaviside layer***. The electron density, then, decreases considerably ; until at a height of about 250 km, a belt of electrons is again met. It is known as ***Appleton layer***. It extends up to 400 km.

Key point ✓

The electromagnetic waves of radio frequencies are reflected by ionosphere and this effect is used for transmission of radio signals round the curved surface of the earth.

The ionosphere plays an important role in the transmission of radiowaves round the curved surface of earth. It is because of its property of reflecting electromagnetic waves of radio frequencies. However, it proves an obstacle in radioastronomy, as it reflects a large part of radiowaves from the stars.

2.02. PROPAGATION OF ELECTROMAGNETIC WAVES

A stationary electric charge produces a static electric field around it. A steady current implies the uniform flow of electric charges. Since a steady electric current produces a steady magnetic field around it, it follows that an electric charge in uniform motion produces a steady or stationary electric field. On the other hand, an accelerated charge produces a magnetic field, which varies with time and space. Since an electromagnetic wave is associated with a magnetic field, which is dependent on time and space, it follows that an accelerated charge is the source of electromagnetic waves. The most common way of possessing accelerated motion is to possess simple harmonic motion. Therefore, a charge oscillating harmonically with a frequency f produces electric and magnetic fields at that point, which vary sinusoidally with the frequency f and then produce electromagnetic waves of the same frequency.

The electromagnetic waves propogate in the form of varying electric and magnetic fields, which are mutually perpendicular to each other.

The variations in electric and magnetic fields in an electromagnetic wave are perpendicular to each other and to the direction of propagation of the wave. As said earlier, electromagnetic waves do not require any material medium and they propagate in free space with the velocity of light.

In 1865, Maxwell had predicted the propagation of electromagnetic waves in the form of varying electric and magnetic fields, which produce each other. It was concluded that the accelerated charge is the source of electromagnetic waves. In 1887, Hertz experimentally demonstrated the production of electromagnetic waves by using a spark oscillator and then succeeded in detecting them upto a distance of several hundred metres.

Fig. 2.02 shows the experimental arrangement (in principle) to transmit electromagnetic waves produced by an LC-circuit (tank circuit) using a half-wave antenna. Due to the oscillating charge on capacitor, the two ends of the antenna become alternately positive and negative, when the LC-circuit produces LC-oscillations. As a result, the electric field is always parallel to the plane of the antenna, while the magnetic field is at right angles to it. The orientation of the electric field with respect to the surface of earth is known as ***polarisation*** of the electromagnetic wave. If the plane of the electromagnetic wave is horizontal in respect to earth, the wave is said to be ***horizontally polarised***. On the other hand, if the electric field is oriented vertically, the wave is said to be ***vertically polarised***. For the vertical orientation of the antenna, electric and magnetic fields constituting the electromagnetic waves propagate in space as shown in the figure. Since the intensity of the two fields varies sinusoidally with the amplitude of the current oscillations, the fields are represented by travelling sine-waves at right angles to each other. Further, as the antenna is vertical, the electric field is also vertically oriented and hence the waves are therefore, vertically polarised. If the antenna is turned parallel to horizontal, the electromagnetic waves would be horizontally polarised. Thus, wave polarisation is primarily a function of the antenna orientation.

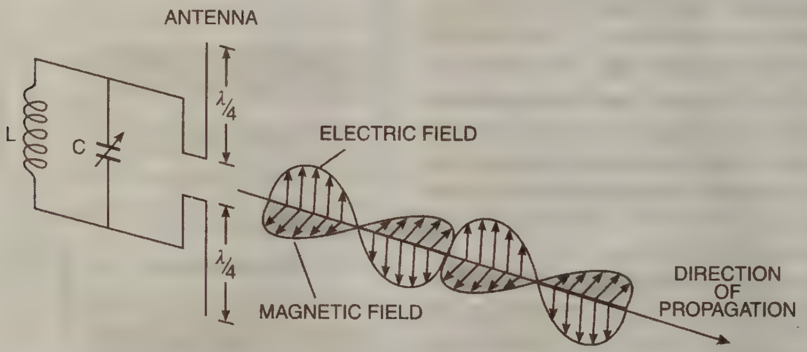

Fig. 2.02

It may be pointed out that the velocity of electromagnetic waves in free space is equal to the ratio of the amplitudes of electric and magnetic fields *i.e.*

$$c = \frac{E}{B} \qquad \text{...(2.01)}$$

2.03. CLASSIFICATION OF RADIOWAVES

In the field of radiocommunication, radiowaves are used. The radiowaves range from 3 kHz to about 300 GHz (1 GHz = 10^3 MHz) in the electromagnetic spectrum. The radiowaves have been subdivided into the following classes :

Frequency Band	Frequency Range	Wavelength Range	Typical use
Very-Low Frequency (VLF)	3 kHz to 30 kHz	10 km to 100 km	Long distance point-to-point communication.
Low Frequency (LF)	30 kHz to 300 kHz	1 km to 10 km	Marine and navigational aids.
Medium Frequency (MF)	300 MHz to 3 MHz	100 m to 1 km	Broadcasting and marine.
High Frequency (HF)	3 MHz to 30 MHz	10 m to 100 m	Communication of all types.
Very-High Frequency (VHF)	30 MHz to 300 MHz	1 m to 10 m	TV, Radar, air navigation, FM and SW transmission.
Ultra-High Frequency (UHF)	300 MHz to 3 GHz	10 cm to 1 m	Radar, microwave reyals and short-distance communication.
Super-High Frequency (SHF)	3 GHz to 30 GHz	1 cm to 10 cm	Radar, radio relays, navigation and experimental
Extermely-High Frequency (EHF)	30 GHz to 300 GHz	1 mm to 1 cm	Experimental

2.04. SPACE COMMUNICATION (RADIOWAVE PROPAGATION)

Depending on the type of transmission, following are the three types of space communication :

1. Amplitude modulated communication
2. Frequency modulated communication
3. Microwave communication

2.05. AMPLITUDE MODULATED COMMUNICATION

In amplitude modulated communication, propagation of radiowaves from the transmitting antenna to the receiving antenna takes place in the following two important ways :

1. Ground wave propagation　　　2. Sky wave propagation

1. Ground wave propagation. The ground wave propagation may be further subdivided into two categories :

(a) Surface wave propagation. *When the radiowaves from the transmitting antenna propagate along the surface of the earth so as to reach the receiving antenna, the wave propagation is called surface wave propagation.*

The transmitted radiowave is supported at the lower edge by the ground. The radiowaves have to be vertically polarised so as to prevent the short circuiting of the electric field component of the wave. The radiowave induces current in the ground over which it passes. It attenuates to some extent due to partial energy absorption by the ground.

The jargon ......

The loss of power in a signal, as it travels, is called attenuation.

The surface wave gets attenuated due to one other reason also. As the wave propagates over the earth, it gradually tilts over. It is called diffraction effect. At some distance from the transmitting antenna, the wave 'lies down and dies'. The maximum range of such a transmitter depends on its frequency as well as its power. Surface wave propagation is of importance only for medium and long wave signals. All amplitude modulated radio signals received in day time propagate by means of surface waves. For TV and FM signals (signals of very high frequency), the ground wave propagation is not used. It is because, at high frequency, the ground wave signal is reduced in strength by absorption to such an extent that it virtually becomes useless beyond an area of a few kilometres around the transmitting antenna.

(b) Space wave propagation. *When the radiowaves from the transmitting antenna reach the receiving antenna either directly or after reflection from the ground or in troposphere, the wave propagation is called space wave propagation.*

The troposphere is the portion of the atmosphere closest to the earth. It extends upto 12 km from the surface of the earth. The radiowaves reflected from the troposphere are also called ***tropospheric waves***. From the transmitting antenna, the radiowaves follow path 1, so as to reach the receiving antenna directly, path 2 so as to reach after reflection from ground and path 3 in order to reach after reflection from the troposphere [Fig. 2.03]. Since in none of the three cases, the radiowaves

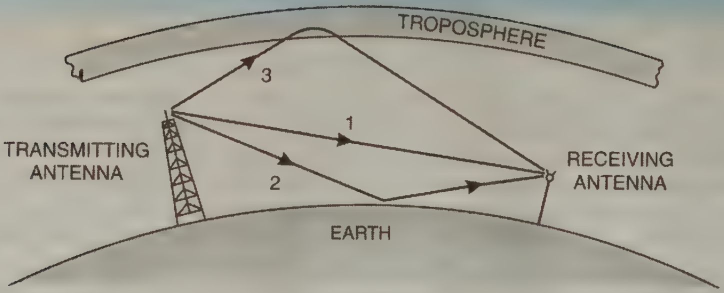

Fig. 2.03

are subjected to continuous absorption by the earth, the signal in this case can reach considerably farther than in case of ground wave propagation. Therefore, space wave propagation can be utilised for transmitting high frequency TV and FM signals. However, undesirable effects occur in space wave propagation due to phase reversal (by 180°) of the ground- reflected wave. For example, if the ground-reflected and direct waves reach the antenna after travelling the same length of the path (or differing by some integral multiple of the wavelength), they will arrive at the antenna 180° out of phase with each other and thus almost completely cancel out. However, if the path lengths of the two waves differs by one half wavelength (or phase difference 180°), the effective path difference will become integral multiple of wavelength. Then, the two waves will reinforce each other, resulting in increased signal strength. It follows that if the height of the receiving antenna is increased, the respective path lengths of the of the waves will alter and alternate points of maximum and minimum signal strengths will be encountered. This phenomenon is called ***selective fading.***

2. Sky wave propagation. *When the radiowaves from the transmitting antenna reach the receiving antenna after reflection in the ionosphere, the wave propagation is called sky wave propagation.*

The upper part of the atmosphere absorbs large amounts of radiant energy from the sun. The intensive heating of the atmosphere during day time causes ionisation, resulting in free electrons, positive ions and negative ions. However, due to different chemical compositions and physical properties of the atmosphere at different heights, the ionisation in the atmosphere is not uniform. The electron concentration is found to be large first in a layer extending from 90 km to 140 km from the surface of earth, called ***Kennelly Heaviside layer*** (or ***E-layer***) and then in a layer extending from 250 km to 400 km, called ***Appleton layer*** (or ***F-layer***). During the night, E-layer disappears almost completely. Therefore, it cannot be used for high frequency radio communication via sky wave during night time. The F-layer proves most useful for long distance transmission of high frequency radiowaves (2 to 30 MHz).

Fig. 2.04 shows the sky wave propagation due to reflection of radiowaves from E and F-layers of the ionosphere. The radiowaves which are radiated at a small vertical angle along the path 1 are reflected from the F-layer and return to earth at a great distance from the transmitting antenna. On the other hand, the radiowaves which are radiated at a somewhat greater vertical angle are reflected from the E-layer. Since it enters the ionosphere sooner (E-layer is closer to the earth), it is reflected back more quickly and at a shorter distance from the transmitting antenna.

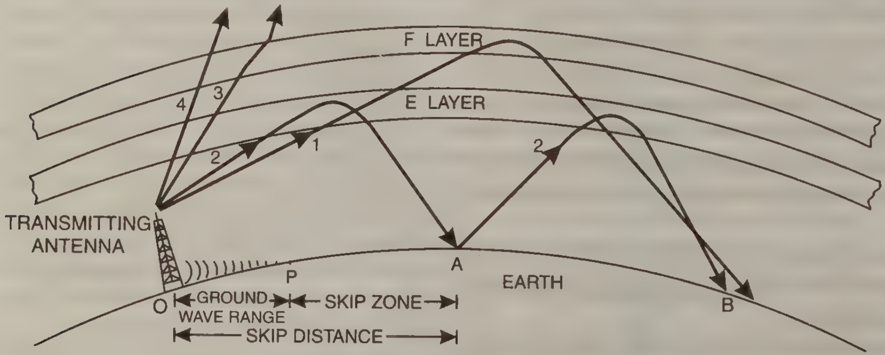

Fig. 2.04

The distance between the transmitting antenna and the point A, where the sky wave s first received after returning to earth is called ***skip distance***. However, the signal can be heard up to some point, say P via ground wave. The distance OP is called ***ground wave range***. Therefore, over the distance between points P and A, no signal will be heard. It is called ***skip zone***. In case the sky wave signal remains sufficiently strong after returning to the earth at point A, it may be reflected by the earth and again by E-layer, thus returning to the earth in a series of hops, separated by the skip distance. In this manner, the signal can be transmitted all over the earth.

As the vertical angle of the radiowaves w.r.t. earth is increased, the ionospheric layers become uncapable of reflecting them back to the earth. As shown in Fig. 2.04, the radiowaves transmitted along the paths 3 and 4 pass through the ionosphere after undergoing refraction (bending). The angle above which the radiowaves are no longer reflected by the ionospheric layer is called ***critical angle of radiation***. The radiowaves above this angle may be refracted by the ionosphere, but they are not reflected back to the earth. The value of the critical angle depends on the density of ionisation (or electron concentration) and on the frequency of the radiowaves. As the frequency increases, the ionosphere becomes progressively less effective. Therefore, with the increase in frequency, the value of the vertical angle should also be decreased so that the waves can reach the earth after reflection. At frequencies above 30 MHz (approximately), the signal is no longer reflected back, even when the vertical angle is smallest possible. The exact frequency at which this occurs depends on the density of ionisation, which is affected, in turn, by sun spot cycles and by daily and seasonal variations. In fact, the height of the ionospheric layers and their density of ionisation vary from hour to hour, day to day, month to month and season to season. It makes the sky wave propagation least reliable as sudden fadeouts and disappearances of signals occur so often.

2.06. FREQUENCY MODULATED COMMUNICATION

The TV signals are frequency modulated. The transmission of TV signals cannot be obtained through ground wave propagation, as such signals get absorbed by ground due to their high frequency. On the other hand, TV signals cannot be transmitted via sky wave propagation, as ionosphere is unable to reflect radio waves of frequencies greater than 40 MHz. Therefore, the only way out for the transmission of TV signals is that the receiving antenna should directly intercept the signal from the transmitting antenna. To achieve larger TV coverage, transmission of TV signal is done from a tall antenna.

Fig. 2.05 shows a TV antenna AB of height h. Due to curvature of the earth, the transmitted signal can be received upto a maximum distance AR_1 (or AR_2) from the antenna. Let $AR_1 = AR_2 = d$ (say). Therefore, the TV signal will be received in a circle of radius d. As said earlier, the distance d is limited by the curvature of earth. Let us derive the relation between height (h) of the TV antenna and the maximum distance (d), up to which the TV signal can be received.

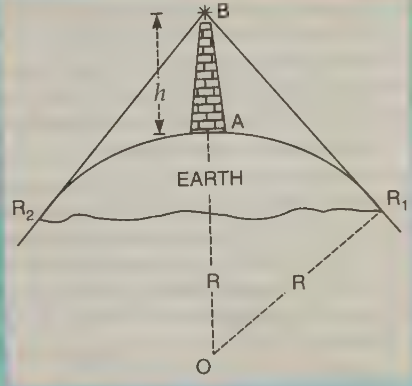

Fig. 2.05

From right angled triangle OBR_1, we have

$$OB^2 = BR_1^2 + OR_1^2$$

Taking $BR_1 \approx AR_1 = d$, we have

$$(R + h)^2 = d^2 + R^2$$

or $$d^2 = h^2 + 2\,h\,R$$

Since h is small as compared to the radius of the earth, h^2 can be neglected as compared to $2\,h\,R$. Therefore,

$$d^2 = 2\,h\,R$$

or $$d = \sqrt{2\,h\,R} \qquad ...(2.02)$$

The above equation gives the estimate of the distance up to which TV signals will be received, when a transmitting antenna of height h is used.

2.07. MICROWAVE COMMUNICATION

The radiowaves of frequencies greater than TV signals are called ***microwaves***. These waves have wavelengths of the order of a few millimetres. Because of their small wavelengths, microwaves can be transmitted as a beam in a particular direction. The microwaves are used in radars to site the aeroplanes in space and to know their distances from the radar station. The distance is calculated by noting the time delay in receiving the reflected signal. In recent times, microwaves have totally changed the concept of telecommunication. Now, with the help of geostationary satellites, it is possible to send signal from one point on earth to practically any other point on the earth.

[redacted]

An artificial object placed in orbit around the earth (or any other planet) is called a satellite.

A satellite moves in an orbit around the earth under the action of gravitational pull. It can be easily deduced that period of revolution of the satellite in an orbit at a height x above the surface of earth,

$$T = 2\pi\sqrt{\frac{(R+x)^3}{g}} \qquad \text{...(2.03)}$$

where R is radius of the earth.

There are hundreds of artificial satellites revolving around the earth, which are used for different purposes. Depending on the task to be performed by the satellite, it is put in a suitable orbit. A geostationary satellite always stays over the same place above the earth *i.e.* it appears stationary relative to the earth.

For a satellite to appear stationary, the following conditions should be satisfied :

1. *It should revolve in an orbit concentric and coplanar with the equitorial plane.*

2. *Its sense of revolution should be same as that of the rotation of earth about its own axis i.e. anticlockwise direction (from west to east).*

3. *Its period of revolution around the earth should be the same as that of earth about its own axis i.e. exactly 24 hours.*

The equation (2.03) can be used to find the height of the geostationary satellite. From equation (2.03), we have

$$x = \left(\frac{T^2\, R^2\, g}{4\pi^2}\right)^{1/3} - R$$

Since period of revolution earth, T = 24 hour = 24 × 3600 s ; radius of earth, R = 6400 km and $g = 9{\cdot}8\ \text{m s}^{-2} = 0{\cdot}0098\ \text{km s}^{-2}$, we have

$$x = \left(\frac{(24 \times 3600)^2 \times 6400^2 \times 0{\cdot}0098}{4\pi^2}\right)^{1/3} - 6400 = 35{,}930\ \text{km}$$

Thus, a satellite will appear stationary, if it revolves around the earth from west to east in an orbit coplanar with equitorial plane and at a height of about 36000 km above the surface of the earth. Such an orbit is known as ***synchronous*** or ***geostationary orbit*** or ***parking orbit*** and the satellite revolving in this orbit is called ***geostationary satellite*** or simply a ***stationary satellite***. The orbital velocity of the geostationary satellite comes out to be about $3{\cdot}08\ \text{km s}^{-1}$. Such a satellite will always appear to be over the same place relative to an observer on the earth. The communication satellites are normally put into a ***geostationary orbit***.

Microwave communication systems are used for long distance communication. Since at microwave frequencies, electromagnetic waves cannot bend across the obstacles, such as the top of the buildings, mountains, etc, it is therefore necessary that microwave transmission is in line-of-sight. Due to curvature in the surface of earth, the range of microwave transmission is very small (≈ 50 km). The range of microwave transmission is also limited by the fact that signals gets weaker and weaker as it propagates. However, these problems are overcome by using ***repeaters*** at intervals between the transmitter and the receiver. Due to this, the cost of transmission of signal between the two stations increases.

The problems faced in a microwave communication system are solved to a large extent by using a geostationary satellite as a communication satellite. A communication satellite is basically a microwave relay station placed in geostationary orbit around the earth. When the signal from the transmitting station on earth is beamed to the satellite, it reflects the signal back to the receiving station on earth. As such, the satellite provides point-to-point link between two earth stations. A geostationary satellite can establish communication link over a large area of the earth, but a single satellite cannot be used to connect people all around the earth. The communication link all around the earth is established by putting three geostationary satellites in synchronous orbit, 120° apart from each other. It is done by transmitting the signal from one such satellite to the other.

In case two communication satellites operate in the same frequency band or close frequency bands, the signals undergo distortion due to interference effects. his problem is overcome by making use of frequency bands of proper spacing for ifferent satellites. In India, the satellite communication is achieved through its two ommunication satellites INSAT-2 B and INSAT-2 C.

Merits of satellite communication. The satellite communication has the ollowing points of merit over other terrestrial means of communication :

1. The satellite relays are wide area broadcasts, whereas the terrestrial relays re point-to-point.

2. The satellite communication can be used for establishing mobile ommunication with great ease.

3. The satellite communication proves much economical as compared to errestrial communication, more so when distances involved are very long. In fact, he cost of satellite communication is independent of the distance.

4. In remote and hilly areas, such as Himachal Pradesh, Ladakh, etc, satellite ommunication is most cost effective.

5. For search, rescue and navigation, satellite communication is far accurate nd economical as compared to other systems.

The communication satellites are now being used in ***Global Positioning System*** GPS). The ordinary users can find their positions within an accuracy of 100 m.

Drawbacks 1. From security and privacy point of view, the communication satellites are complete disaster. It is because, signalling from the communication satellite is open to all *i.e.* everybody can hear everything.

2. The satellite equipment is subject to extreme environmental stresses. If a system on the satellite goes bad, it is almost impossible to repair it.

3. Due to extremely large communication path length (about 2 × 36,000 km), there is a time delay between transmission and reception. This delay causes a time gap during talking, which proves quite annoying.

9.09. REMOTE SENSING

Any method of obtaining and recording information from a distance is called remote sensing.

In remote sensing, information about an object or area under investigation is acquired through sensors, which are not in direct contact with the target of investigation. Areal photography is one kind of remote sensing. Areal photographs of the target are taken from a large distance. This technique was earlier used for military purposes.Now, the areal photography is used in archaeology, survey of earth resources and in town and country planning. Such sensors are placed on the satellite revolving round the earth, which takes photographs or collects the desired data and transmits them back to earth.

Acquiring information about an object under investigation through sensors, which are not in direct contact with the target, is called remote sensing.

The following two types of satellites are used for long distance communication :

1. Passive satellites. *The satellites, which are used only for reflecting the signal back to the earth, are called passive satellites.*

A passive satellite is not equipped with electronic devices, which may be used for processing or amplifying the signal. A reflector on the satellite merely reflects the signal back to the earth. So that signal of suitable strength reaches the earth station back after reflection, the signal from the transmitting earth station has to beamed with good enough power. It, therefore, requires a very powerful transmitter.

2. Active satellites. *The satellites, which carry various equipments so as to process the signal, amplify it and then retransmit it back to the earth, are called active satellites.*

The electronic devices used for these purposes are usually high resolution cameras, microwave scanners, infra-red scanners, etc. Such devices are called ***active devices*** or ***sensors*** and can be commanded from the earth stations. Therefore, remote sensing is possible only through active satellites. The power required for operating such devices is derived from the solar panels of the satellite. These devices can record the information gathered by them. The information collected by the sensors is beamed down to earth in digital form, which is then converted into maps and pictures by the computers.

Uses of various types of sensors. 1. The photographs taken by the camera provide a variety of information including archaeological evidence and weather data.

2. Microwave sensors make use of radar waves and enable us to see through clouds.

3. Infra-red sensors can measure temperature differences over an area.

Now a days, remote sensing is used in geological surveys, water resources surveys, meteorology (weather forecasting), climatology (monitoring climate changes), oceanography (temperature of sea surface and monitoring oil pollution) and coastal studies (sewage and industrial waste monitoring). Apart from this, remote sensing is employed in land surveys, forestry and natural disasters.

SOLVED NUMERICAL PROBLEMS

Problem 2.01. Calculate the time delay between the reception of the ground wave and the sky wave for a receiver at a distance of 200 km from the transmitter, given that the reflecting ionosphere layer is effectively at a height of 100 km.

Sol. Let A and B be respectively transmitter and receiver on the surface surface of earth [Fig. 2.06].

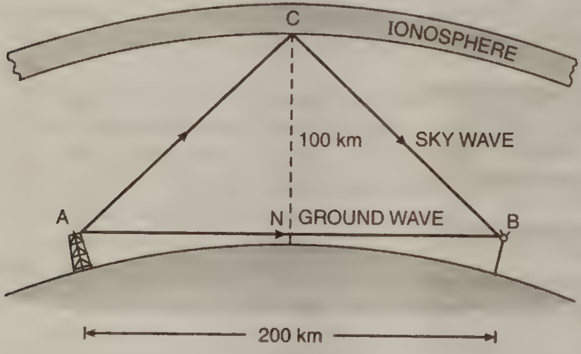

Fig. 2.06

Here, distance between transmitter and receiver

$$AB = 200 \text{ km} = 2 \times 10^5 \text{ m}$$

Height of ionoshpere layer,

$$CN = 100 \text{ km} = 10^5 \text{ m}$$

Let t_g be time of travel of ground wave. Then,

$$t_g = \frac{AB}{c} = \frac{2 \times 10^5}{3 \times 10^8} = 6{\cdot}67 \times 10^{-4} \text{ s}$$

The sky wave follows that path AC and then CB to reach the receiver. Therefore, distance transversed by the sky wave,

$$AC + CB = \sqrt{AN^2 + CN^2} + \sqrt{BN^2 + CN^2}$$

$$= \sqrt{100^2 + 100^2} + \sqrt{100^2 + 100^2} = 283 \text{ km}$$

$$= 2{\cdot}83 \times 10^5 \text{ m}$$

Let t_s be time of travel of sky wave. Then,

$$t_s = \frac{AC + CB}{c} = \frac{2{\cdot}83 \times 10^5}{3 \times 10^8} = 9{\cdot}43 \times 10^{-4} \text{ s}$$

Hence, time delay, $t_s - t_g = 9{\cdot}43 \times 10^{-4} - 6{\cdot}67 \times 10^{-4}$

$$= \mathbf{2{\cdot}76 \times 10^{-4} \text{ s}}$$

Problem 2.02. (*a*) A TV tower has height of 80 m. Find the radius of the circle within which the transmission can be observed, if radius of earth is 6·4 × 10⁶ m.

(*b*) How much population is covered by the TV broadcast, if the average population density around tower is 800 km⁻² ? (*H.S.S.C.E. 1996*)

Sol. (*a*) Here, $h = 80$ m ; $R = 6{\cdot}4 \times 10^6$ m

If d is the radius of the circle within which the transmission can be observed, then

$$d = \sqrt{2hR} = \sqrt{2 \times 80 \times 6{\cdot}4 \times 10^6} = \mathbf{3{\cdot}2 \times 10^4 \text{ m}}$$

(*b*) Area in which transmission can be viewed,

$$A = \pi d^2 = \pi \times (3{\cdot}2 \times 10^4)^2$$

$$= 3{\cdot}217 \times 10^9 \text{ m}^2 = 3{\cdot}217 \times 10^3 \text{ km}^2$$

Since average population density, $\sigma = 800 \text{ km}^{-2}$, the population covered by the transmission

$$= A \times \sigma = 3{\cdot}217 \times 10^3 \times 800 = \mathbf{2{\cdot}574 \times 10^6}$$

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 2.01. What is a ground wave ? (*HS.S.C.E. 1998 S*)

Ans. A radiowave signal propagating from one point to another following the surface of earth is called a surface or ground wave.

Q. 2.02. Why are short waves used in long distance broadcasts ? *Or* (*C.B.S.E. 1993*)

Long distance radio broadcasts use short wavebands. Why ? (*Text Question*)

Ans. The short waves (wavelength less than 200 m or frequencies greater than 1500 kHz) are absorbed by the earth due to their high frequency but are effectively reflected by F-layer in ionosphere. After reflection from ionosphere, the short waves reach the surface of earth back only at a large distance from the transmitter. For this reason, short waves are used in long distance transmission.

Q. 2.03. State the reason why ground waves cannot be transmitted above the frequency range of 1500 kHz. (*C.B.S.E. 2001*)

Or

Why is the transmission of signals using ground waves restricted upto a frequency of 1500 kHz ? (*C.B.S.E. 1999, 1998 S*)

Ans. It is because, on further increasing the frequency of the signal, the absorption of the signal from the ground increases.

Q. 2.04. Why ground wave propagation is not suitable for high frequency ? (*Text Question*)

Ans. Refer to VSQ 2.03.

Q. 2.05. It is necessary to use satellites for long distance TV transmission. Why ? (*H.P.S.S.C.E. 1998 S ; H.S.S.C.E. 1992, Text Question*)

Ans. Television signals are not reflected by ionosphere. The TV signals from an earth station are reflected back to earth by making use of artificial satellite.

Q. 2.06. State two factors by which the range of nsmission of signals by a TV tower can be increased. (*C.B.S.E. 1998 S*)

Ans. 1. By increasing the height of the tower.

2. By increasing the height of the receiving antenna, so t it may directly intercept the signal from the transmitting tenna.

Q. 2.07. "Greater the height of a TV transmitting tenna, greater is its coverge." Explain. (*P.S.S.C.E. 2001, 1993*)

Ans. Here, $d=\sqrt{2hR}$

In case, height of tower (h) is increased, the distance (d) up to which TV coverage can be done will also increase.

Q. 2.08. What is a passive satellite ?

Ans. *The satellite, which is used only for reflecting the signals back to earth stations, is called a passive satellite.*

A passive satellite does not have equipments on it, so as to amplify the signal received from the earth.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 2.01. In a radio receiver, the short-wave and edium-wave stations are tuned by using the same pacitor but coils of different inductance. Explain, why the ductance in the former case is less than that in the latter se. (*Roorkee, 1986*)

Ans. Suppose that the short-wave station receives gnals of short wavelengths(λ_s), while the medium-wave ation receives that of medium wavelengths (λ_m).

Let f_m and f_s be corresponding frequencies of the edium-wave and short-wave signals. If c is speed of the diowaves, then

$$f_m=\frac{c}{\lambda_m} \quad \text{and} \quad f_s=\frac{c}{\lambda_s}$$

Since $\lambda_m>\lambda_s, f_m<f_s$.

Let L_m and L_s be the inductances of the medium-wave nd short-wave coils respectively and C be the capacitance f the capacitor of the tuning circuit (LC- circuit used for ning the signal). Then,

$$f_m=\frac{1}{2\pi\sqrt{L_m C}} \qquad ...(i)$$

and

$$f_s=\frac{1}{2\pi\sqrt{L_s C}} \qquad ...(ii)$$

Dividing the equation (*i*) by (*ii*), we have

$$\frac{f_m}{f_s}=\sqrt{\frac{L_s}{L_m}}$$

Since $f_m<f_s$, it follows that

$$L_s<L_m$$

e.the inductance of short-wave coil is less than that of the nedium-wave coil.

Q. 2.02. Explain the two ways, by which electromagnetic waves are propagated in atmosphere. (*P.S.S.C.E. 1998*)

Ans. Refer to section 2.05.

Q. 2.03. Why is short wave communication over long distance not possible via ground waves ? (*H.S.S.C.E. 1998 S*)

Ans. Refer to section 2.05 and VSQ 2.02.

Q. 2.04. Explain the terms (*i*) ground waves and (*ii*) sky waves. (*H.S.S.C.E. 1999 S ; H.P.S.S.C.E. 1996, 1991*)

Ans. Refer to section 2.05.

Q. 2.05. Why sky waves are not used in the transmission of television signals ? (*C.B.S.E. 2002, 2001, 1993 ; P.S.S.C.E. 1998 S*)

Or

Why is the transmission of signals using sky waves restricted to frequencies greater than 30 MHz ? (*C.B.S.E. 1999*)

Ans. The television signals have frequencies in 100-200 MHz range. As ionosphere cannot reflect radio waves of frequency greater than 40 MHz back to earth, the sky waves cannot be used in the transmission of TV signals.

Q. 2.06. What is role of sky wave propagation in transmission of high frequency signals ? Explain. (*H.S.S.C.E. 1999 S*)

Ans. Refer to section 2.05.

Q. 2.07. Optical and radiotelescopes are built on the ground, but X-ray astronomy is possible only from satellites orbiting the earth. Why ? (*Text Question*)

Ans. The earth's atmosphere is transparent to visible light and radiowaves, but absorbs X-rays. Therefore, X-ray astronomy is possible only from satellites orbiting the earth.

Q. 2.08. What is an active satellite ? How is it different from a passive satellite ?

Ans. *The satellite that is equipped with electronic devices so a receive the signal from the earth station, process it, amplify it and then retransmit it, is called an active satellite.*

In addition, an active satellite carries different types of sensors (camera, infra-red scanner, microwave scanner, etc), which transmit information in the form of data and pictures to the earth stations. A passive satellite does not have any such equipement on it. It is used only for reflecting the signals back to the earth stations.

REQUENTLY SKED NUMERICAL ROBLEMS

For Practice

1. A ratio can tune to any station in the 7·5 MHz to 12 MHz band. What is the corresponding wavelength band ? (*Text Problem*) **[Ans. 25 m to 40 m band]**
2. A TV tower has height of 100 m. How much population is covered by the TV broadcast, if the average population density around the tower is 1000 km^{-2} ? Given, radi earth = 6·37 × 10^6 m. **[Ans. 4 ×**
3. A TV tower has a height of 150 km. How much po tion the TV broadcast covers, if the average popul density around the tower is 1000 km^{-2} ? Radius of is 6·4 × 10^6 m. (*Text Problem*) **[Ans. 6·032 ×**

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. Let λ_1 and λ_2 be wavelengths corresponding to frequencies 7·5 MHz and 12 MHz respectively. Then,

$$\lambda_1 = \frac{c}{f_1} = \frac{3 \times 10^8}{7{\cdot}5 \times 10^6} = 40 \text{ m}$$

and $$\lambda_2 = \frac{c}{f_2} = \frac{3 \times 10^8}{12 \times 10^6} = 25 \text{ m}$$

Therefore, wavelength band corresponding to the given frequency band is **25 m to 40 m.**

2. Here, $h = 100$ m, $R = 6{\cdot}37 \times 10^6$ m

Radius of circle within which transmission can be vie

$$d = \sqrt{2hR} = \sqrt{2 \times 100 \times 6{\cdot}37 \times 10^6} = 3{\cdot}57 \times 10^4 \text{ m}$$

Area in which transmission can be viewed,

$A = \pi d^2 = \pi \times (3{\cdot}57 \times 10^4)^2 = 4{\cdot}004 \times 10^9 \text{ m}^2 = 4 \times 10^3$ k

Population density = 1000 km^{-2}

Therefore, population covered by transmission

$= 4 \times 10^3 \times 1000 = 4 \times 10^6$

3. Proceed as in problem no. 2.

Line Communication

3.01. TRANSMISSION MEDIUM

The link, which transfers information (message signal) from the information source to the destination, is called transmission medium or link.

In any communication system, transmission medium plays an important role. In fact, transmission media are the electronic roadways along which the signal is transferred from information source to the destination. So that the transmitted signal is received faithfully at the destination, it should not get distorted due to the transmission medium or pick up any extraneous noise.

The transmission media are of the following two types :

1. Guided transmission medium. *The transmission medium, which enables the message signal to reach the destination by making it to follow a guided path, is called a guided transmission medium.*

A guided transmission medium is used for point-to-point communication. For example, in telephone as a communication system, the signal from the source reaches the destination by travelling along the copper wires. Thus, copper wires in telephone as the communication system act as guided transmission medium. Apart from copper parallel-wire lines ; twisted-wire lines (called twisted pairs) coaxial cables and optical fibres are other examples of guided transmission medium.

2. Unguided transmission medium. *The transmission medium, which enables the message signal to reach the destination along an unguided path, is called an unguided transmission medium.*

In space communication, there is no point-to-point contact between the transmitter and the receiver. Therefore, free space acts as an unguided transmission medium in space communication.

However, in any transmission medium, the signal gets attenuated or suffers energy loss and is subject to degradations by random signals and noise. Therefore, in any communication system, there is a maximum permitted distance between the transmitter and the receiver, beyond which the system ceases to give intelligible communication. For trouble free transmission over a long distance, these factors necessitate the installation of ***repeaters*** at intervals. A repeater is a line receiver, which amplifies and equilizes the attenuated signal and then retransmits it for its continued transmission down the link. It also helps to remove signal distortion and to increase signal level.

3.02. LINE COMMUNICATION

In line communication, the response of transmission medium towards the signal to be transmitted plays an important role. The transmission characteristics of line communication depends upon the nature of the transmission medium and the nature of the signal.

Following guided transmission media are used in line communication :

1. Parallel-wire line (Ribbon). In a parallel-wire line, two metallic wires run parallel to each other inside a protective insulation coating (usually PVC insulation) as shown in Fig. 3.01. The metallic wires may be hard or flexible depending on the power to be handled. For high power transmission, hard wires are used.

The parallel-wire line is employed, where balanced properties of the communication system are the main consideration factors. For this reason, such a wire line is also called ***balanced line***. For example, TV antenna is a folded-dipole antenna. For connecting the TV to its antenna, the impedance of the parallel-wire line must match that of the TV. As such, parallel-wire line is found to be suitable to be used as TV antenna wire.

A system of conductors is found to radiate energy in the form of radio frequency waves, when the separation between the two wires approaches a half-wavelength

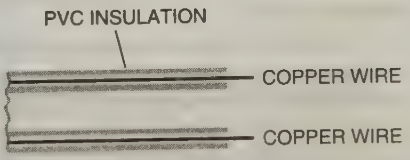

Fig. 3.01

Parallel wire lines are not used for transmission of a microwave signal. It is because, at microwave frequencies, the energy loss becomes quite appreciable.

at the operating frequency. Likewise, when a parallel line wire is used as a transmission line, it also radiates energy. Since the energy loss becomes of serious magnitude at the frequency of microwaves, parallel-wire lines are never used for microwaves. As the attenuation of signal increases with the length of the wire, a parallel-wire line is used for transmission of signal only up to a small distance.

2. Twisted pair. Such a wire line consists of two insulated copper wires twisted around each other along their lengths as shown in Fig. 3.02. In a parallel-wire line, the current due to signal produces magnetic field around each of the two wires. The interference between the two magnetic fields may cause unacceptable variations in the level of signal current, which may result in a distorted signal at the receiving end. In order to minimise this effect, the two metallic wires are twisted around each other. The twisted-wire line is found to be suitable for narrow band transmission. When used in a computer network, such wires can transmit data up to a speed of 1500 bits per second. They are commonly used in the installation of telephone systems.

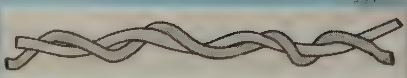

Fig. 3.02

Let us estimate how many message signals can be transmitted over a twisted pair. An analog voice signal has a bandwidth of 3 kHz. In case it is to be transmitted as a modulated signal, it requires a bandwidth of 6 kHz. Therefore, if 100 such signals are to be transmitted over the twisted pair without their interfering with each other, one will require a bandwidth of 6 × 100 *i.e.* 600 kHz.

In case the transmission of message signal is required to a large distance, the length of the pair of wires also becomes large. As a result, there is loss of power along the wires due to their finite resistance. Further, at high frequencies, a copper wire begins to act as antenna and start radiating energy in the surrounding medium. As a result, the message signal gets attenuated.

The attenuated signal is usually boosted by using repeaters (amplifiers). Keeping all the factors in view, the transmission of signal over twisted pair is limited to a bandwidth of about 2 MHz (about 300 speech signals) and to a distance upto 10 km.

Merits. (*i*) They are quite cheap.

(*ii*) They are very easy to install.

(*iii*) They can be easily tapped.

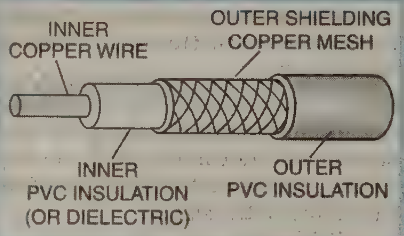
(*iv*) They are less prone to electrical disturbances (noise) as compared to parallel-wire line.

(*v*) They can be used for transmitting both analog and digital signals.

Demerits. (*i*) They can be used only up to a very small distance.

(*ii*) They get easily broken during strong winds.

3. Coaxial cables. It consists of a central copper wire surrounded by a PVC insulation over which a sleeve of copper mesh is placed. The copper mesh is covered with an outer shield of thick PVC material as shown in Fig. 3.03. The signal is transmitted by the inner copper wire, which is electrically shielded by the outer copper mesh. The outer copper mesh is always grounded (connected to earth). The use of coaxial cables does not necessitate the matching of the impendance of the different parts of a communication system. For this reason, it is also called an ***unbalanced line.***



INNER COPPER WIRE
OUTER SHIELDING COPPER MESH
INNER PVC INSULATION (OR DIELECTRIC)
OUTER PVC INSULATION

Fig. 3.03

Coaxial cables have a distinct advantage over the twisted pair. Since the copper mesh surrounds the central copper wire carrying the signal, the coaxial cables prove to be immune to external electrical disturbances. It is because, the magnetic fields produced by the electrical disturbances are unable to affect the signal[*]. Further, the loss of energy in coaxial cables is quite low in comparison to twisted pair, as the outer conductor (copper mesh) is invariably grounded. In some coaxial cables, the inner PVC insulation is replaced by a dielectric.

Key point ✓

The loss of energy is quite low, when transmission of even high frequency signal is done with a coaxial cable. Further, coaxial cables are immune to external electrical disturbances.

Impedance of a coaxial cable. As said earlier, a coaxial cable consists of two conductors. Since each conductor has a certain length and diameter, it will have a resistance (R) and an inductance (L). Further, as the two conductors are very close to each other, they will possess some capacitance (C) between them. In case the coaxial cable has dielectric in place of the inner PVC insulation, the current leakage[†] through dielectric can be represented by a shunt resistance (G). Fig. 3.04 (*a*) shows the

---

[*] The magnetic field due to an electric current cannot penetrate inside a hollow conductor.

[†] A dielectric is never perfect in its insulation.

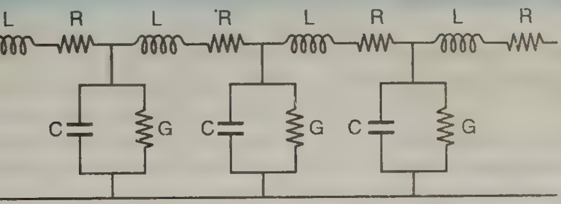


Fig 3.04 (*a*)

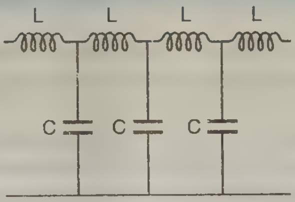

Fig. 3.04 (*b*)

ulting equivalent circuit for a coaxial cable. It may be pointed out that L, R, C l G represent the respective quantities per unit length of the coaxial cable. It is ause, they are distributed throughout the length of the cable.

When the coaxial cable is used to transmit a radio frequency signal (frequency y high), the inductive reactance ($X_L = 2\pi f L$) is very large as compared to R. On other hand, capacitive susceptance $\left(\frac{1}{X_C} = 2\pi f L\right)$ is also very large as npared to the shunt conductance $\left(\frac{1}{G}\right)$. In view of this, R and G can be ignored the equivalent circuit of the coaxial cable. As such, the equivalent circuit is nplified to as shown in Fig. 3.04 (*b*). Since the cable does not offer any ohmic istance at radio frequency, no loss of energy and hence no attenuation of radio quency signal occurs, when transmitted along it. Because of this reason, the use coaxial cables in cable TV network becomes specially important. The attenuation signal along a coaxial cable is quite low ($\approx$ 5 to 10 dB km^{-1}).

Reduced attenuation in coaxial cables increases the repeater spacing to about km and permits much larger bandwidth ($\approx$ 20 MHz). In other words, coaxial bles can be used to transmitt about 3300 speech signals without their interfering th each other.

Merits. **(*i*)** Although coaxial cables are costlier than parallel-wire line or twisted ir, yet they are quite inexpensive keeping in view their performance.

(*ii*) They are easily available.

(*iii*) They are immune to noise upto a good level.

(*iv*) They can be used to transmit data upto a speed of 10 megabits per second.

(*v*) They are extensively used in long distance telephone lines and as cables for closed circuit TV.

(*vi*) The attenuation of signal is very low along coaxial cables.

Demerits. **(*i*)** They are more expensive than twisted pairs.

(*ii*) It is more difficult to tap them as compared to twisted pairs.

3.03. TELEPHONE LINKS

Telephone is the most common means of communication. Individual telephone s in a locality are connected to telephone exchange box using a twisted pair. Such ephone exchange boxes in different localities in a city are connected by a thick ble, which carries various twisted pairs to the main telephone exchange. So that umber of persons can communicate with each other, direct connections by means a pair of copper wires have to be made between them. One can easily visualise at this method may work only when the number of persons involved is small. It because, if this method is adoped to connect a large number of persons, it will ad to a wild jumble of wires passing over houses and trees all over the city. The lution to this problem was found through *multiplexing.*

Multiplexing. *Simultaneous transmission of number of messages over a single annel is known as multiplexing.*

Key note

Simultaneous transmission of a number of messages over a single channel without their interfering with each other is called multiplexing.

The channel may be a pair of wires or free space. If the message is transmitted such (without modulation), the different massage signals over a single channel ll interfere with one another. It is because, the frequency spectrum (or bandwidth) all the message signals are identical. However, different message signals can be ansmitted over a single channel without interference using multiplexing chniques. There are following two types of multiplexing techniques :

1. *Frequency division multiplexing.* It makes used of analog modulation of essage signals.

(*ii*) ***Time division multiplexing.*** It makes use of pulse modulation of message signals.

As said earlier, twisted pair can provide a bandwidth of 2 MHz, while coaxial cable, a bandwidth of 20 MHz. Microwave communication has helped in increasing the bandwidth further.

Microwave link. It is quite a popular method of telephone link as it does not incur the expense of laying wire lines and cables. In microwave system, high frequency radio waves are used to transmit the voice signal. However, at microwave frequencies, the electromagnetic waves cannot bend across the obstacles, such as the top of the buildings and mountains. Therefore, it is necessary that microwave transmission is in the ***line-of-sight*** *i.e.* the transmitter and receiver of a microwave system, which are mounted on high towers, should be in a line. Due to curvature in the surface of earth, the range of microwave transmission is limited to just 50 km. The range of microwave transmission is also limited by the fact that signals become weak after covering a certain distance and require power amplification. To transmit over longer distances, it is necessary to bounce the microwave signal through a chain of towers to negotiate the curvature in the surface of the earth [Fig. 3.05]. To overcome the problem of power amplification of weak signals in microwave link system, repeaters are used at intervals of about 25 to 30 km between the transmitting and receiving stations. The first repeater is placed in line-of-sight of the transmitting station and the last repeater is placed in line-of-sight of the receiving station. Two consecutive repeaters are also placed in line-of-sight of each other. By making use of multiplexing technique, microwave transmission system can send thousands of voice signals at the same time.

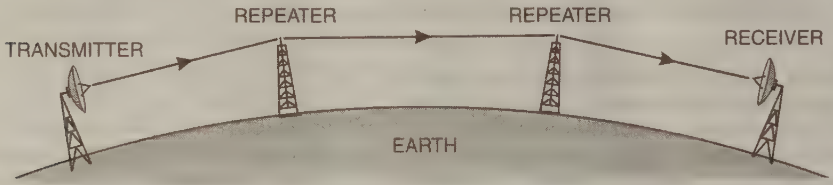

Fig. 3.05

Key point

In microwave transmission syste
transmitter and receiver must be in
line-of-sight. It is because, at microw
frequencies electromagnetic wa
cannot bend around the obstac
(mountains and other structures on
surface of the earth) in their path. Furt
curvature in the surface of earth also po
a problem.

Communication satellite link. The main problem with microwave link system is that the curvature in the surface of earth, mountains and other structures often block the line-of-sight. Due to this, several repeaters are normally required for long distance transmission, which increases the cost of signal transmission between the two stations. This problem has been overcome by using communication satellites.

A communication satellite is basically a microwave relay station placed in geostationary orbit around the earth. Such a satellite is stationary relative to earth and always stays over the same point on the ground. The Indian communication satellites INSAT-2 B and INSAT-2 C are positioned in such a way in the outer space that they are accessible from any place in India.

Key point

The communication satellites are used
transmission of signals to overcome
problems faced in microwave tra
mission due to curvature in surface of
earth and blocking of line-of-sight by
obstacles.

Fig. 3.06 shows the block diagram as to how a typical long distance call from a calling subscriber to a called subscriber is made by making use of communication satellite as a telephone link. The call from the calling subscriber is routed to the local exchange through a 2-wire line, which is then transmitted to the main exchange through coaxial cable. From the main exchange, the call is routed to earth satellite

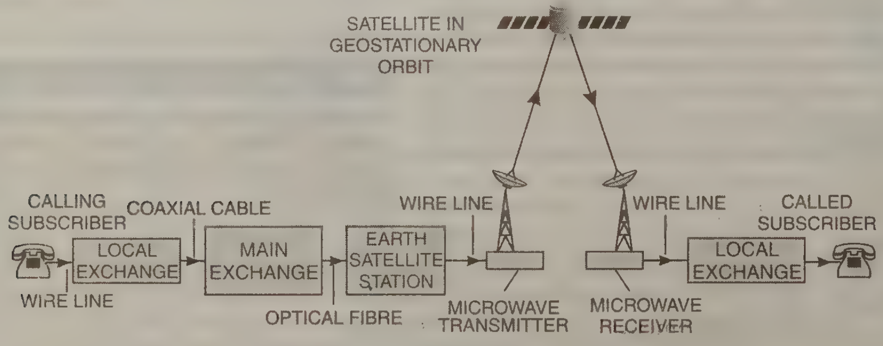

Fig. 3.06

ation (which acts as a transmitter) by means of optical fibre. The earth satellite ation, then transmits the call to the microwave system by simply 2-wire line. The gnal is finally transmitted to the communication satellite, which beams it back to e microwave system at the far receiving end. The signal travels from the receiver the called subscriber in a similar manner, as it does from calling subscriber to the ansmitter. It may be pointed out that the signal gets quite weak while traversing s long onward and return path (≈ 2 × 36,000 km) between the earth and the satellite. his aspect is taken care of by the electronic devices on the satellite. Such devices nplify the signal before sending it back to the earth. To avoid the interference of e incoming weak signal and the powerful retransmitted signal, the transmission equency of the microwave system on earth is kept different from the retransmission equency of the system in the satellite.

Advantages. 1. The satellite link serves as a single microwave relay station isible from any point of a very very large area on the surface of the earth.

2. The transmission and reception costs are independent of the distance between ie caller and the receiver.

3. The quality of the received signal is much the same as that of the transmitted gnal.

4. Three communication satellities (120° apart from each other) can be used to rovide the communication link over whole of the earth.

5. The transmission station can receive back its own transmission and check, vhether the satellite has transmitted the signal correctly or not.

Drawbacks. 1. The high cost of placing the satellite into its orbit is one of the najor drawbacks of this system.

2. The signal delay caused by the extreme length of the transmission path etween sender and receiver produces echo, which proves quite annoying.

However, this problem is negated with electronic echo cancellers and upressors.

3. This system also suffers from the point of view of security and privacy. The ignal transmitted from the satellite can be heard by any individual.

However, this problem has also been overcome by coding the transmitted ignal.

3.04. OPTICAL COMMUNICATION

The use of optical carrier waves for transmission of information from one place to nother is called optical communication.

Historically, as early as in 1880, Alexander Graham Bell was successful in ransmitting a speech signal using a light beam. Some investigation of optical communication continued in the early part of the twentieth century but its use was limited to low capacity communication links. This was due to both the lack of suitable optical sources and the problem that light transmission in the atmosphere is restricted to line-of-sight. Furthermore, light transmission is severely affected by the disturbances, such as rain, dust, fog, snow, etc. It led to the use of radiowaves for the transmission of information signal, as the radiowaves are far less affected by these atmospheric conditions and can be transmitted over considerably large distances. Since information carrying capacity of carrier waves is directly related to the band width (the greater the carrier frequency, the larger the available transmission bandwidth and hence greater the information-carrying capacity of the communication system), radio communication was developed so as to use radiowaves of even higher frequencies (VHF and UHF).

A renewed interest in optical communication began in 1960 with the invention of laser. It provided a powerful optical source, together with the possibility of modulation at high frequency. In addition, the long distance transmission of signals looked a practical possibility due to low beam divergence characteristic of the laser. However, the atmospheric disturbances (rain, dust, fog, snow, etc) tended to restrict the transmission of signal with lasers to short distance only. To avoid degradation of optical signal by the atmosphere, in 1966, optical fibres were developed as waveguides. Such systems were viewed as a replacement for coaxial cables in transmission systems. The optical fibres developed initially exhibited very high signal attenuation (≈ 1000 dB km^{-1}) in comparison to coaxial cables (5 to 10 dB km^{-1}). In addition to it, there were serious problems involved in jointing the fibre cables in a satisfactory manner. However, within 10 years, optical fibre losses were reduced to 5 dB km^{-1} and suitable low loss jointing techniques were perfected.

In optical communication, light is transmitted in the form of light pulses along an optical fibre as transmission medium. Since wavelength of light is very small as compared to the radio frequency waves, it provides a very large bandwidth and can carry a huge amount of information. In order to have an estimate, consider that light emitted from a He–Ne laser is used for optical communication. The wavelength of light emitted from He–Ne laser is 6328 Å, which corresponds to the frequency $4{\cdot}74 \times 10^{14}$ Hz. Suppose that just 1% of this frequency bandwidth *i.e.* $4{\cdot}74 \times 10^{12}$ Hz is used to transmit TV signals, which require a bandwidth of about 4·7 MHz. Thus, number of TV channels, which can be accommodated in a bandwidth of $4{\cdot}74 \times 10^{12}$ Hz is given by

$$n = \frac{4{\cdot}74 \times 10^{12}}{4{\cdot}7 \times 10^{6}} = 10^{6}$$

Thus, optical communication makes it possible to transmit a tremendously large number of channels simultaneously.

Before taking up the study of an optical communication system, it is necessary to learn about optical fibre and a few optical sources, such as LED, LASER and LASER diode.

3.05. OPTICAL FIBRE

The optical fibres are used to transmit light signals from one place to another without any practical loss in the intensity of the light signal.

An optical fibre consists of a very thin ***glass core*** (about 5 μm to 50 μm in diameter) surrounded by a glass coating, called ***cladding***, as shown in Fig. 3.07. The glass core and cladding are enclosed in a protective jacket made of plastic. The refractive index of the glass used for making core (μ_1) is a little more than the refractive index of the glass used for making the cladding (μ_2) *i.e.* $\mu_1 > \mu_2$. In a typical optical fibre, the values of the refractive indices of the core and the cladding materials may be of the order of 1·52 and 1·48 respectively.

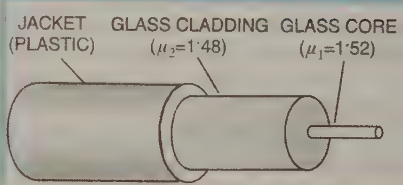

Fig. 3.07

Transmission of light by optical fibre. Consider that a ray of light is incident along AO (at a large angle of incidence) on the glass core from air. It will get refracted along the path OP inside the core and then after suffering refraction at the core-cladding interface, it may follow the path PQ inside the cladding. However, if the angle of incidence is decreased to a value, so that the ray of light inside the core meets the core-cladding interface at an angle equal to or greater that the critical angle for it, then the ray of light will undergo total internal reflection. Fig. 3.08 shows the path of the ray of light, when it comes to incident on the core-cladding interface at critical angle C.

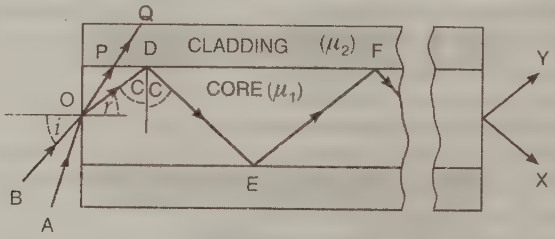

Fig. 3.08

We know that the value of the critical angle at the interface of a pair of media having refractive indices μ_1 and μ_2 is given by

$$\sin C = \frac{\mu_2}{\mu_1} \qquad (\mu_1 > \mu_2)$$

The optical fibre, for which $\mu_1 = 1{\cdot}52$ and $\mu_2 = 1{\cdot}48$, the calculations show that

$$C = 77° \text{ (approx)}$$

It can be easily deduced that the maximum angle of incidence (i) in air, for which all the incident light is totally reflected at the interface of a pair of media having refractive indices μ_1 and μ_2, is given by

$$\sin i = \sqrt{\mu_1^{\,2} - \mu_2^{\,2}} \qquad \ldots(3.01)$$

This value of the maximum angle of incidence is known as *acceptance angle*.

Again, the optical fibre, for which $\mu_1 = 1{\cdot}52$ and $\mu_2 = 1{\cdot}48$, the calculations show hat

$$i = 20°$$

So, for glass core of refractive index 1·52 and cladding of refractive index 1·48, beam of light incident on the glass core from air, making an angle of incidence not nore than 20°, will be totally reflected at the core-cladding interface. Since the angle f incidence at the interface is greater than the critical angle, the ray of light will ndergo total internal reflections again and again inside the optical fibre. As a result, he light is transmitted from one end of the optical fibre to its other end. The glass ised for making the core is of highest quality, so that there is a negligible absorption f light inside the core. Therefore, the light signal comes out almost as bright as it oes in – even if the fibre is several kilometres long. The optical fibres can be as long s 200 km.

Watch Out !

The glass used to make an optical fibre is so much transparent that if the seas were made of it, one could see the sea-beds easily.

From Fig. 3.08, it follows that the ray of light will emerge from the fibre in the irection X after odd number of multiple reflections and in the direction Y after even umber of multiple reflections.

Fibre attenuation. In practice, a very small part of light energy is lost from an ptical fibre due to imperfect transparency (absorption) or due to light leaving the ibre as a result of scattering of light sideways by impurities in the glass fibre. This eduction in energy of the light is called ***attenuation*** and is described by the relation,

$$I = I_0 e^{-\alpha x} \qquad \ldots(3.02)$$

vhere I_0 is intensity of light, when it enters the fibre and I, the intensity of the light t a distance x along the fibre. The constant α is characteristics of the fibre and is alled ***absorption coefficient*** or ***attenuation coefficient.*** It is usually measured as **er kilometre** of the optical fibre. In terms of the power of the light pulses, the elation (3.02) may be written as

$$P = P_0 e^{-\alpha x} \qquad \ldots(3.03)$$

The attenuation of light signal can also be expressed as the ratio $\dfrac{I}{I_0}\left(\text{or } \dfrac{P}{P_0}\right)$.

Thus, attenuation $= \dfrac{I}{I_0}$

In practice, the attenuation is measured on logarithmic scale in the units of **decibel (dB)** using the relation,

$$\text{attenuation (in } dB) = 10 \log_{10} \frac{I}{I_0} \qquad \ldots(3.04)$$

Since $I < I_0$, the attenuation is always negative.

3.06. DIFFERENT TYPES OF OPTICAL FIBRES

The optical fibres are of the following two types :

1. Monomode optical fibre. A monomode optical fibre has a very narrow core of diameter about 5 μm or less, so that the cladding is relatively big ($\approx$125 μm in diameter) as shown in Fig. 3.09 (a).

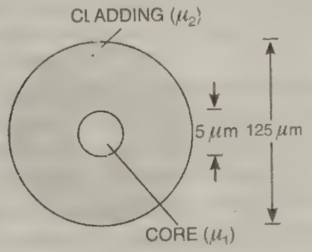

Fig. 3.09 (a)

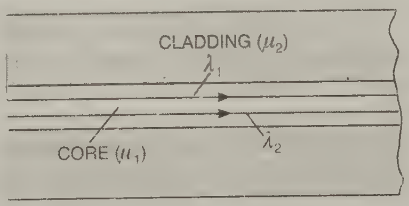

Fig. 3.09 (b)

Fig. 3.09 (b) shows the light paths followed by two wavelengths* λ_1 and λ_2 inside a monomode fibre. In such optical fibres, there is practically no loss in the intensity of the output light signal.

2. Multimode optical fibre. The multimode optical fibres may be subclassified as below :

(i) Step-index multimode fibre. The diameter of the core in step-index multimode fibre is about 50 μm *i.e.* very large as compared to that of a monomode fibre [Fig. 3.10 (*a*)]. It has a constant refractive index μ_1 from its centre to the boundary of the core. The refractive index, then, changes to a lower value μ_2, which remains constant throughout the cladding. Since the refractive index steps down from μ_1 to μ_2 at the core-cladding interface, it is called step-index optical fibre.

---

* Since no light singal is perfectly monochromatic, a narrow band of wavlengths is always present in the signal.

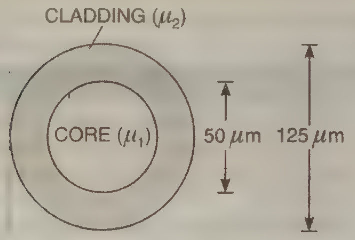

Fig. 3.10 (*a*)

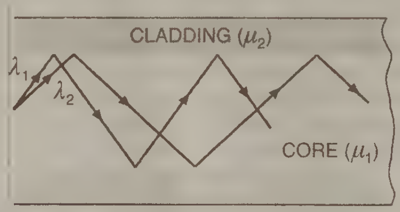

Fig. 3.10 (*b*)

Fig. 3.10 (*b*) shows the light paths followed by two wavelengths λ_1 and λ_2 ($\lambda_1 > \lambda_2$) inside the core of the optical fibre. Since refractive index of a material depends on the wavelength of the light, the two wavelengths follow different paths. As such, the two wavelengths will reach the other end of the optical fibre after covering unequal paths (the wavelength λ_1 travels a longer path than λ_2) and hence at different times. It results in a faulty and distorted signal of lesser intensity. Such an optical fibre is called a multimode fibre, as the different wavelengths in the light signal follow multi light paths inside the fibre. In a step-index multimode fibre, the overall time difference between two wavelengths reaching the other end is of the order of 33×10^{-9}s per kilometre length of the fibre.

(ii) Graded-index multimode fibre. A multimode fibre, whose refractive index decreases smoothly from its centre to the outer surface of the fibre (cladding) is called a graded-index multimode fibre. As such, there is no noticeable boundary between the core and the cladding as shown in Fig. 3.11 (*a*).

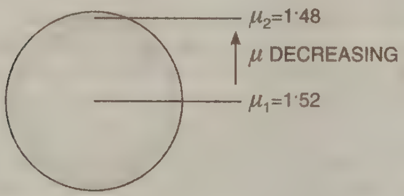

Fig. 3.11 (*a*)

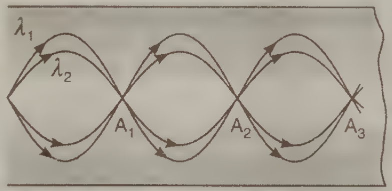

Fig. 3.11 (*b*)

Fig. 3.11 (*b*) shows the light paths followed by two wavelengths λ_1 and λ_2 inside a graded-index multimode fibre. The two wavelengths still follow different light paths inside the fibre. At some layer in the fibre, different for each, the rays are totally reflected. But unlike the step-index fibre, the two wavelengths come to focus at the same point A_1 and then again at A_2 and so on. It is possible, because the refractive index of the material of fibre is lesser for wavelength λ_1 than that of λ_2 and hence speed of wavelength λ_1 is greater than that of λ_2. So the wavelength λ_1 travels a longer path than λ_2 but at a greater speed, so that time of travel is same for both the wavelengths. Thus, in a graded-index multimode fibre, all the wavelengths arrive at the other end of the fibre at the same time. However, there is a small overall time difference ($\approx 10^{-9}$ s per kilometre) between the two wavelengths reaching the other end of the graded-index multimode fibre. Thus, the disadvantage of time delay is considerably reduced in such a fibre in comparison to step-index multimode fibre.

3.07. LIGHT EMITTING DIODE (LED)

A Light Emitting Diode (LED) is a semiconductor *p*-*n* junction diode that emits light, when forward biased.

As studied in Unit IX, a junction diode is formed, when a *p*-type semiconducting material is placed in contact with *n*-type semiconducting material. A thin layer at the junction is devoid of electrons and holes and is called depletion layer. When the junction diode is forward biased, the barrier potential and the width of depletion layer reduces. Due to this, holes from the *p*-section and electrons from the *n*-section of the junction diode cross through the depletion layer. As the holes and electrons encounter, they recombine. The each recombination of a hole and an ctron results in the release of energy. The energy of the emitted photon is equal he amount of energy required to liberate an electron from the valence bond. Thus, velength of the photon of light emitted is determined by the energy gap ΔE tween the valence and conduction band of the semiconductor. The wavelength the light photon is given by the empirical formula,

$$\lambda \text{ (in nm)} = \frac{hc}{\Delta E}$$

In case of silicon and germanium diodes, the energy released is in infra-red gion. In the junction diode made of gallium arsenide or indium phosphide, the ergy is released in visible region. A light emitting diode serves as a good optical urce and is used in optical communication.

Watch Out !

A bright red LED lights up 0·25 s faster than a filament lamp.

A car stoplight becomes visible some time after the brakes have been applied. Therefore, a car stoplight equipped with LED will have a distinct advantage over the one having conventional filament lamp.

3.08. LASER

The term **LASER** stands for **L**ight **A**mplification by **S**timulated **E**mission adiation.

Key point

The word LASER is abbreviated form of the term **L**ight **A**mplification by **S**timulated **E**mission **R**adiation.

We know that when atom jumps from a higher energy state to a lower energy ate, it emits a photon of energy. In any ordinary source of light, atoms emit such hotons independently of each other. As such, the different photons emitted are not phase with each other and as a result, the light is emitted as a whole in the form an incoherent beam. In addition to this, the light emitted is not monochromatic. is because, energy of transition differs by a small amount from photon to photon. urthermore, the light obtained is not in the form of a strictly parallel beam.

Laser is a process by which we can obtain a beam of light, which is highly oherent, highly monochromatic and perfectly parallel. Such a beam is called laser*. laser beam can be sent to a far off place and return back without any practical ss of intensity.

3.09. VARIOUS ATOMIC CONCEPTS RELATED TO PRODUCTION OF LASER

To understand the production of a laser beam, one must know the following tomic processes :

Induced absorption. Consider that two energy states i (lower state) and j higher state) of an atom are associated with energies E_i and E_j respectively. ccording to Boltzmann, the ratio of the atoms in the energy states j and i at a emperature T is given by

$$\frac{N_j}{N_i} = \frac{e^{-E_j/kT}}{e^{-E_i/kT}} = e^{-(E_j/E_i)/kT} \qquad \text{...(3.05)}$$

Since E_j is greater than E_i, it follows that N_j is less than N_i. Therefore, the number f atoms present in the energy state i will be greater than the number of atoms in tate j as shown in Fig. 3.12 (*a*). However, if we shine radiation of frequency

$$\nu = \frac{E_j - E_i}{h}$$

on the atoms, more atoms will be raised to the higher energy state j on absorbing photons of energy $h\nu$ [Fig. 3.12 (*b*)]. This process is called ***induced*** or ***stimulated absorption.***

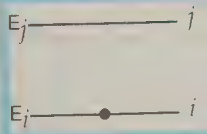

Fig. 3.12 (*a*)

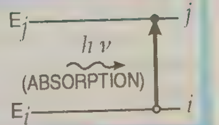

Fig. 3.12 (*b*)

Spontaneous emission. If an atom is present in the higher energy state, it tends to return to the lower energy state within a time of 10^{-8} s by emitting a photon of energy $E_j - E_i$. Fig. 3.13 (*a*) shows one such atom in the higher energy state j, which by emitting a photon of energy $E_j - E_i$ (= $h\nu$) at its own comes down to the lower energy state i as shown in Fig. 3.13 (*b*). This process is called ***spontaneous emission.***

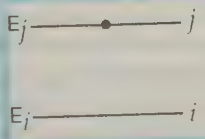

Fig. 3.13 (*a*)

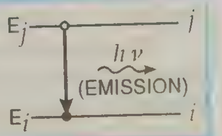

Fig. 3.13 (*b*)

It may be pointed out that during spontaneous emission, photons are emitted in a random manner. As a result of this, the emitted photons will not be in phase with each other. In other words, the beam of light obtained due to spontaneous emission is not a coherent beam.

Stimulated emission. In an atomic system, the higher energy states of the atoms are always populated to some extent, though the population is considerably small as compared to the lower energy state. If the photons of energy $h\nu$ (= $E_j - E_i$) are incident, the chief event that will take place is the induced absorption *i.e.* atoms will be raised from lower to higher energy state. But as the higher energy state is also populated a little [Fig. 3.14 (*a*)], the transition from higher to lower energy state also takes place. As such, the photons of energy $h\nu$ along with the incident photons are emitted [Fig. 3.14 (*b*)]. This process is called *stimulated* or *induced* **emission.**

---

*The word 'laser' is used both for the process and the beam of light obtained by this process.

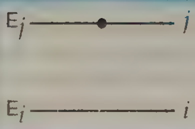

Fig. 3.14 (*a*)

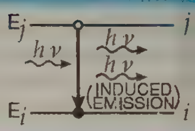

Fig. 3.14 (*b*)

Population inversion. When the higher energy state in an atomic system gets occupied due to induced absorption to a greater extent than the lower energy state, the phenomenon is called ***inverted population of energy levels*** or simply the ***population inversion***. However, the population inversion does not sustain in normal atomic systems, as the atoms tend to return to lower energy state by spontaneous emission.

The process of induced absorption for producing the inverted population of energy levels is also known as ***pumping***.

Metastable states. A metastable state is one, which has a mean life time of the order of 10^{-3} s or more *i.e.* much larger than 10^{-8} s, the life time of a higher energy state. Some atomic systems, such as chromium, neon, etc possess metastable states. The atom of such an atomic system, when in higher energy state, does not come down to lower energy state directly. It first returns to metastable state and then after a finite lapse of time of the order of 10^{-3} s, returns to the lower energy state. Since such atom stays in metastable state for a sufficiently large time, the population inversion can sustain in such atomic systems.

3.10. PRINCIPLE OF PRODUCTION OF LASER BEAM

In the last section, the fundamental atomic concepts involved in the production of laser were discussed. Let us now apply these concepts to understand the basic principle of producing a laser beam.

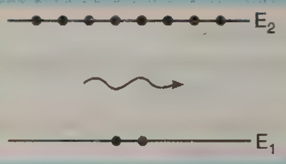

Fig. 3.15

For producing a laser beam, an atomic system is chosen, which has a metastable state. Fig. 3.15 shows an atomic system, which has a lower energy state associated with energy E_1 and a metastable state having energy E_2. Suppose that by some technique, the number of atoms in the metastable state E_2 is made much larger than those in energy state E_1. When photon of energy $E_2 - E_1$ is incident on one of the atoms present in the metastable state, the atom will drop to lower energy state E_1 emitting a photon of same energy as that of the incident photon, which is in phase with it and is emitted in the same direction. The two photons, then, interact with two more atoms present in the metastable state and so on and thus the photons go on multiplying. All these photons possess the same energy, phase and direction. This process is termed as ***amplification of light***. So that this process may take place smoothly, the following two requirements must be fulfilled :

1. *The metastable state should all the time have larger number of atoms than the number of atoms in lower energy state.*

In case it is not so, then a majority of the incident photons, instead of causing stimulated emission, will be used up in raising atoms from lower energy state to the metastable state, unless such a transition is forbidden in the atomic system. For sustained production of a laser beam, the atoms in the metastable state must always be greater than that in the lower energy state *i.e.* population inversion between the two states is must. In other words, the atoms must be kept continuously removed from the lower energy state and raised to the metastable stable to ensure population inversion. It is achieved through the process, called pumping.

2. *The photons emitted due to stimulated emission should stimulate other atoms to multiply the photons inside the system.*

In a way, it requires that the emitted photons should remain inside the system for enough time so that they can interact with the other atoms, before they come out of the system in the form of a beam. It may be achieved by using two reflectors (mirrors) at the two ends of the system so as to reflect the photons back and forth. However, one mirror should be partially transmitting, so as to allow the laser beam to emerge out of the system.

3.11. PRODUCTION OF LASER BEAM

The first successful laser was constructed by T.H. Maiman in 1960 using a small ruby rod and is known as ***ruby laser***. Within a span of 40 years, a variety of lasers have been developed. A few others are known as ***helium-neon laser, carbon dioxide laser, chemical laser, dye laser, junction laser***, etc. Of these, a few laser systems are three energy level systems, while the other are four energy level systems.

1. Ruby laser. Ruby is a crystal of aluminium oxide (Al_2O_3) doped with 0·05% chromium oxide. The adding of chromium oxide imparts red colour to ruby stal. Ruby laser consists of a ruby rod about 5 cm in length and 0·5 cm in diameter. e two faces of the rod are made optically plane and coated with silver. One face he rod is made reflector by thick coating, while the other face is partially coated allow the laser beam to emerge out of the ruby rod. A xenon flash lamp is wound ound the ruby rod. The necessary pumping energy is supplied to the ruby rod the high intensity flash produced by the xenon lamp. The ruby rod is kept cool circulating liquid nitrogen around it [Fig. 3.16].

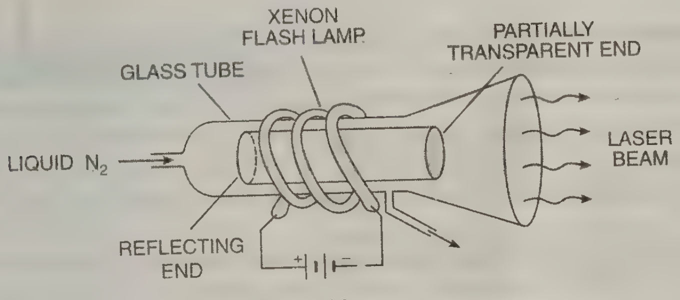

Fig. 3.16

Theory. Ruby laser is a three energy level system. The three energy levels in a romium ion are ground energy level E_0, a metastable level E_1(= 1·79 eV) and a ird higher energy level E_2 (= 2·26 eV) as shown in Fig. 3.17. Initially, the atoms e distributed in different energy levels following Boltzmann's law*. However, hen xenon lamp is flashed, it produces bursts of very intense light (yellowish reen) of wavelength 5500 Å. This light acts as pumping radiation for chromium ons and the atoms are raised from ground state to higher energy state E_2. Within a me of 10^{-8} s, the electrons rapidly drop to either energy level E_1 or directly to round energy level E_0. The energy released during the decay process is lost to the uby rod and before it raises its temperature, it is cooled by the liquid nitrogen used s the coolant. In a short time, there is population inversion *i.e.* metastable state E_1 ecomes more populated than the ground state.

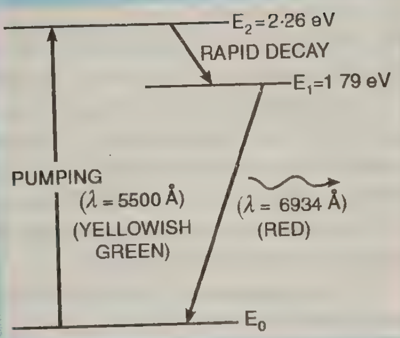

Fig. 3.17

At this stage, once a photon is produced due to spontaneous transition from netastable state E_1 to ground state E_0, another photon of same energy, phase and lirection is produced. The emitted photons suffer multiple reflection between the wo polished ends of the ruby rod. The process of amplification continues, till a quite ntense beam of laser emerges out from the partially transparent end of the rod. The vavelength (λ) of the laser beam obtained can be found from the relation

$$\frac{hc}{\lambda} = E_1 - E_0 \qquad \text{or} \qquad \lambda = \frac{hc}{E_1 - E_0}$$

Setting E_1 = 1·79 eV = $1·79 \times 1·6 \times 10^{-19}$J, $E_0 = 0$, $h = 6·62 \times 10^{-34}$J s and $c = 3 \times 10^8$ m s^{-1} we have

$$\lambda = \frac{6·62 \times 10^{-34} \times 3 \times 10^8}{1·79 \times 1·6 \times 10^{-19} - 0} = 6·943 \times 10^{-7} \text{ m} = 6943 \text{ Å}$$

2. Helium-neon laser. A drawback with the three level system (such as the ruby laser) is that it generally requires very high pumping power. It is because, the terminal state of the laser transition in ruby laser is the ground state. It necessitates that half the ground state atoms must be pumped into the metastable state to achieve population inversion. He-Ne laser is a four energy level system and in constrast to ruby laser, much less pumping power is required in this case.

The experimental arrangement consists of a cylindrical glass tube containing a mixture of helium (≈ 90%) and neon (≈10%) at low pressure. Two parallel mirrors M_1 and M_2 are fixed at the two ends of the glass tube. The mirror M_1 is thickly silvered, while the mirror M_2 is made slightly transmitting. To establish a strong electric field, a high voltage is applied across the electrodes A and C [Fig. 3.18].

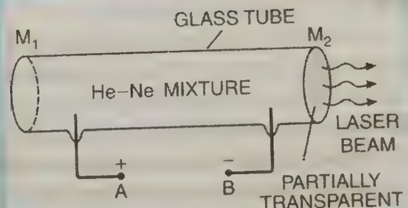

Fig. 3.18

---

*Refer to section 3.09

Theory. Fig. 3.19 shows the four energy levels in neon. They are ground energy level E_0, higher energy level $E_1 (= 18{\cdot}70 \text{ eV})$, metastable energy level $E_1 \ (= 20{\cdot}66 \text{ eV})$ and another high energy level E_3. Helium has a metastable energy level at 20·61 eV, which happens to be close to the metastable level E_2 of neon. It allows helium to be used for pumping neon atoms to the metastable state E_2. When atoms come down from metastable state E_2 to lower energy state E_1 after population inversion, an intense laser beam emerges out of the mirror M_2. The wavelength of the He-Ne laser beam is given by

$$\lambda = \frac{hc}{E_2 - E_1}$$

Here, $E_1 = 18{\cdot}70$ eV and $E_2 = 20{\cdot}66$ eV. It can be calculated that in case of He-Ne laser, the wavelength of the laser beam is equal to 6328 Å.

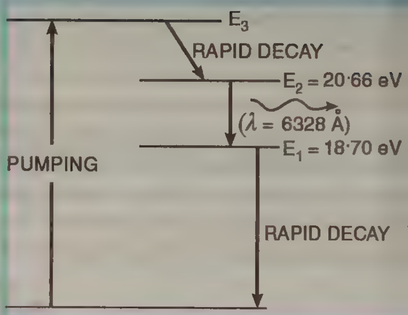

Fig. 3.19

3.12. APPLICATIONS OF LASER

Lasers have proved a boon to the growth of modern scientific world. Lasers have widespread applications in the fields like industry, medical science, telecommunication, scientific research, etc. A few such applications are as below :

1. In communication. Lasers are used to send signals over long distances through optical fibres. They allow to send thousands of signals at the same time due to narrow bandwidth.

2. In measuring long distances. Being highly coherent, laser beams can travel very large distances without any loss in their intensity. As such, a laser beam can be used to measure the distance of a distant object, such as moon.

3. In surgery. Lasers are used to perform practically bloodless surgery. As the laser beam cuts through tissue, it `heat seals' blood vessels and this technique is used in removing tumour from the body, the diseased part of the liver, etc. In the eye, a detached retina can be `welded' back to the wall of the eyeball by laser beam.

Laser beams are used to decolour skin blemishes. They are also used by dental surgeons for drilling of teeth.

4. In engineering. The laser beams are used by surveyors and engineers to ensure that roads, railway lines, pipes, oil tankers, buildings, etc are built accurately.

5. In industry. Laser beams are used to drill holes and cut the metal sheets. They do this job more quickly and accurately than metal drills and saws. In industries, laser beams are used to weld pieces of metal together.

6. In scientific research. Laser beams are used to study molecular structure and nature of chemical reactions.

7. In nuclear power production. A day is not far, when laser beams will be used in carrying out nuclear fusion reactions with much ease for power production.

8. In photography and entertainment. Laser beams can be used to photograph fast moving objects. They are also used in `compact disc' players. Laser TVs have been developed to produce big TV pictures on walls.

9. For national defence. Laser beams are used for controlling and guiding rockets, missiles, satellites and locating planes. Intense laser beams can be used to destroy tanks and planes.

10. In weather forecasting. Laser beams are used to obtain clear pictures of clouds and wind movements for the forecasting of weather. They are also used to measure variations in weather and detection of earthquakes, etc.

3.13. LASER DIODE

A LASER diode is obtained by polishing the two sides of a junction diode made of gallium arsenide. It has the advantage that the material can readily be made *n*-type or *p*-type by varying the relative amounts of the elements Ga and As in it. The two sides of the junction diode are polished so that one side acts as a full mirror and the other side as a partially reflecting surface.

When junction diode is forward biased, the holes and electrons recombine. The photons of light emitted due to recombination of holes and electrons get reflected back and forth between the two sides of the junction diode, till population inversion ccurs. The photons of light falling at this stage trigger the stimulated emission and n intense beam of light is emitted.

3.14. ELEMENTARY PRINCIPLES OF LIGHT MODULATION

The information carrying capacity of carrier waves is directly related to the andwidth. The greater the carrier frequency, the larger the available bandwidth and greater the information carrying capacity of the communication system. Since requency of light is very large as compared to that of the radiowaves, the use of ight as carrier of signal will be more advantageous. Further, a light signal can be efficiently transmitted by using optical fibres without any loss of energy (for practical purposes).

In order to transmit information signal via an optical fibre communication system, it is necessary to modulate light with the information signal. For the information signal, light acts as the carrier. To modulate light, some of its properties such as intensity, frequency, phase or polarisation (direction) are varied in accordance with the information signal. The choice of variation of any parameter is decided by the characteristics of the optical fibre, the available sources and detectors.

Principle of light modulation. There are several methods of carrying out light modulation, namely intensity modulation, frequency modulation, phase modulation, etc. The intensity modulation in itself can be carried out in the following two ways :

1. ***Direct optical modulation.*** It is the process of varying the intensity of light directly in accordance with the information signal to be transmitted. It is achieved by varying current through the optical source (LED or LASER) by biasing it corresponding to the information signal. As a result, when the light emerges out of the optical source, its intensity varies in accordance with the information signal.

However, this method causes a change in the wavelength of light and this defect is called system degradation. This problem is overcome in frequency modulation of the light. In this process, the frequency dependent current is passed through the source. The direct modulation of the optical source is quite satisfactory for the modulation bandwidths currently under investigation.

2. **External optical modulation.** External optical modulators are used, when frequency or phase of the light is to be modulated. They make use of non-semiconductor sources. However, such sources cannot be directly modulated at high frequency.

3.15. OPTICAL COMMUNICATION SYSTEM

Fig. 3.20 shows the block diagram for an optical fibre communication system.

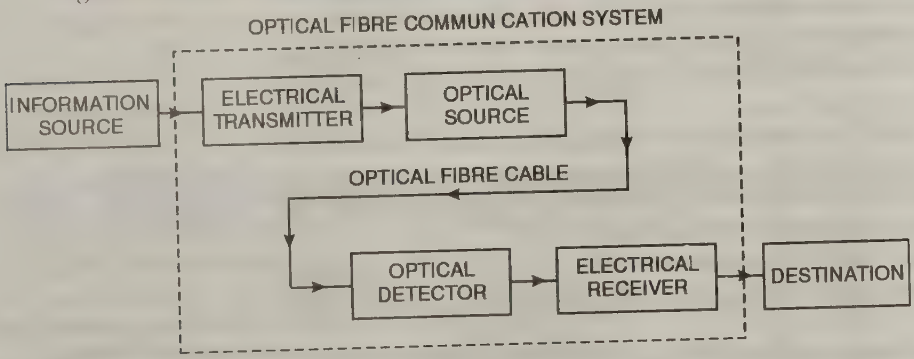

Fig. 3.20

The information source provides an electrical signal to an electrical transmitter, which drives an optical source to give modulation of the light waves. The optical source, which provides the electrical-optical conversion, may be either a semiconductor laser or light emitting diode (LED). The optical fibre cable is used as the transmission medium for the optical signal. At the receiver's end, the optical signal is detected by optical detector, which converts the optical signal into an electrical signal. The optical detector may be a photodiode or a phototransistor or a photoconductor. The electrical signal is further demodulated by the electrical receiver so as to reproduce the original information signal, which is then received at the destination.

3.16. ADVANTAGES OF OPTICAL FIBRE COMMUNICATION

The optical fibre communication is far more advantageous as compared to conventional electrical communication. A few advantages are as given below :

1. Enormous transmission bandwidth. The optical carrier frequency lies in the frequency range 10^{13} to 10^{16} Hz. Due to extremely high frequency of opical carrier waves, the transmission bandwidth and hence information-carrying capacity of an optical communication system is very large as compared to a coaxial cable system.

2. Small size and weight. Optical fibres have very small diameters, which are often no greater than the diameter of a human hair. Even on being covered with protective coatings, they are far smaller and much lighter than coaxial cables.

3. Immunity to electrical disturbances. Optical fibres are made from glass or sometimes from a plastic polymer. Since such materials are electrical insulators, the optical fibres are free from spark hazards and short circuits. Furthermore, unlike metallic transmission lines, they do not exhibit earth loop and interface problems. As such, they are very ideal for transmission of information in electrically hazardous environments.

4. Immunity to interference. Optical fibres serve as dielectric waveguides and are therefore free from electromagnetic interference and radio frequency interference. The optical fibre cables are also not susceptible to lightning strikes, if used overheads rather than underground. Hence, optical fibre communication is unaffected by electrically noisy environment.

5. Immunity to crosstalk. In optical fibres, there is no optical interference between fibres. Therefore, even when many fibres are cabled together, unlike communication using electrical wires, crosstalk is negligible.

6. Signal security. The light from optical fibres does not radiate significantly and hence optical fibre communication provides a high degree of signal security. Further, any attempt to tap a message signal transmitted optically can be detected easily. This feature makes it extremely useful in military, banking and computer network applications.

7. Low transmission loss. The recent developments in optical fibre communication systems have resulted in fabricating optical fibres, which exhibit very low attenuation ($\approx 0{\cdot}2$ dB km^{-1}).

8. Ruggedness and flexibility. Although optical fibres are made from glassy substances, yet they can be bent or twisted without any damage. They prove superior in terms of storage, transportation, handling and installation in comparison to metallic cables.

9. System reliability. Due to low intensity loss property of optical fibre cables, the requirement of intermediate repeaters or line amplifiers to boost the transmitted signal strength is much reduced. Hence, with fewer repeaters, the reliability of an optical communication system is much enhanced. An optical fibre communication system possesses a predicted life time of the order of 20 to 30 years.

10. Potential low cost. The glass which is generally used to fabricate an optical fibre is made from sand. So, in comparison with copper wire lines, optical fibres prove quite inexpensive.

11. Ideal for multiplexing. Optical fibres can carry a large number of signals at the same time much more efficiently than that can be done in radio communication.

12. No signal jamming. Radio signals usually get jammed, when the signals are transmitted at the same frequency of radiowaves. Optical communication is free from jamming of signal for all practical purposes.

Drawbacks. The optical communication systems have a few drawbacks also, which are listed as below :

1. If there are any scratches on the optical fibre cable, the light signal can escape at such points. It is because, a ray of light can meet the surface of the scratch at an angle of incidence less than the critical angle. To ensure that the core of the cable stays smooth, the outer coating of the fibre cable has to be made tougher.

2. The optical fibre technology can be handled only by the experts in this field.

SOLVED NUMERICAL PROBLEMS

Problem 3.01. Work out the critical angle for light at the oundary between the core and the cladding of a step index bre, if the refractive of the core is 1·48 and of the cladding s 1·45. *(Text Problem)*

Sol. Here, $\mu_1 = 1{\cdot}48$ and $\mu_2 = 1{\cdot}45$

Now, $$\sin C = \frac{\mu_2}{\mu_1} = \frac{1{\cdot}45}{1{\cdot}48} = 0{\cdot}9797$$

or $$C = 78{\cdot}4°$$

Problem 3.02. Calculate the critical angle and the angle f acceptance, if the refractive indices of the glass core and he cladding are 1·7 and 1·5 respectively.

Sol. Here, $\mu_1 = 1{\cdot}7$ and $\mu_2 = 1{\cdot}5$

The critical angle for glass core and cladding as the two nedia is given by

$$\sin C = \frac{\mu_2}{\mu_1} = \frac{1{\cdot}5}{1{\cdot}7} = 0{\cdot}8824$$

or $$C = \mathbf{61{\cdot}9°}$$

The acceptance angle for the optical fibre is given by

$$\sin i = \sqrt{\mu_1^{\,2} - \mu_2^{\,2}} = \sqrt{(1{\cdot}7)^2 - (1{\cdot}5)^2} = 0{\cdot}8$$

or $$i = \mathbf{53{\cdot}1°}$$

Problem 3.03. Calculate the time taken for light to ravel through a glass optical fibre 30 m long (*a*) in axial mode (*b*) in highest order mode, given that the refractive index is 1·5 for glass and 1·3 for the cladding.

Sol. Here, $\mu_1 = 1{\cdot}5$, $\mu_2 = 1{\cdot}3$ and $l = 30$ m

(*a*) Speed of light in optical fibre,

$$v = \frac{c}{\mu_1} = \frac{3 \times 10^8}{1{\cdot}5} = 2 \times 10^8 \text{ m s}^{-1}$$

Therefore, time taken for light to travel through optical fibre in axial mode,

$$t = \frac{l}{v} = \frac{30}{2 \times 10^8} = 1{\cdot}5 \times 10^{-7} \text{ s} = \mathbf{150 \text{ ns}}$$

(*b*) Light in the highest order mode meets the fibre surface at the critical angle, which is given by

$$\sin C = \frac{\mu_2}{\mu_1} \quad \text{or} \quad \sin C = \frac{1{\cdot}3}{1{\cdot}5} = 0{\cdot}8667$$

or $$C = 60°$$

Refer to Fig. 3.08. If l is length of the optic fibre, then actual path length DE = x (say) is given by

$$x = \frac{l}{\sin C} = \frac{30}{\sin 60°} = \frac{30}{0{\cdot}8667} = 34{\cdot}6 \text{ m}$$

Therefore, time taken for light to travel through optical fibre in the highest order mode,

$$t = \frac{x}{v} = \frac{34{\cdot}6}{2 \times 10^8} = 1{\cdot}73 \times 10^{-7} \text{ s} = \mathbf{173 \text{ ns}}$$

Problem 3.04. The intensity of a light pulse travelling along a fibre decreases exponentially with distance according to the equation $I = I_0 e^{-\alpha x}$, where I_0 is the intensity at $x = 0$ and α is the attenuation constant. Show that the intensity reduces by 50% over a distance euqal to $\frac{\log_e 2}{\alpha}$. *(Text Problem)*

Sol. The intensity of light pulse over a distance x,

$$I = I_0 e^{-\alpha x} \qquad \ldots(i)$$

Suppose that intensity of light pulse reduces by 50% over a distance x'. Thus,

when $x = x'$, $I = \frac{50}{100} \times I_0 = 0{\cdot}5\, I_0$

Setting the above condition in equation (*i*), we have

$$0{\cdot}5\, I_0 = I_0 e^{-\alpha x'} \quad \text{or} \quad e^{-\alpha x'} = \frac{1}{0{\cdot}5} = 2$$

$$\text{or} \quad \alpha x' = \log_e 2 \quad \text{or} \quad x' = \frac{\log_e 2}{\alpha}$$

Problem 3.05. Attenuation can be expressed in decibels (*dB*) according to the equation $10 \log_{10} \frac{I}{I_0}$. Work out the attenuation in *dB* per km for a fibre in which the intensity falls by 50% over a distance of 50 km. *(Text Problem)*

Sol. Now, attenuation (in *dB*) = $10 \log_{10} \frac{I}{I_0}$

Therefore, when light falls by 50% *i.e.* when $I = 0{\cdot}5\, I_0$,

$$\text{attenuation} = 10 \log_{10} \frac{0{\cdot}5\, I_0}{I_0} = 10 \log_{10} 0{\cdot}5$$
$$= 10 \times (-0{\cdot}3010) = -3{\cdot}01 \; dB$$

This attenuation in signal occurs over a distance of 50 km. Therefore

$$\text{attenuation per km} = -\frac{3{\cdot}01}{50} = \mathbf{-0{\cdot}06 \; dB \; km^{-1}}$$

FAQs FREQUENTLY ASKED VERY SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 3.01. What is a transmission medium ?

Ans. *The link, which transfers information from the information source to the destination, is called transmission medium.*

Q. 3.02. What are the various transmission media used in communication systems ?

Ans. 1. 2-wire lines **2.** Coaxial cables **3.** Radio links **4.** Fibre links.

Q. 3.03. What is the main drawback of a 2-wire line ?

Ans. When a 2-wire line is used at microwave frequencies, the signal becomes weak due to energy radiated by the two conducting wires.

Q. 3.04. What is a coaxial cable ?

Ans. It consists of a central copper wire surrounded by a PVC insulation, over which a sleeve of copper mesh is placed. The copper mesh is further covered with an outer shield of thick PVC material.

Q. 3.05. What is the main advantage of using coaxial cable for transmitting a signal in place of 2-wire line ?

Ans. The copper mesh surrounding the central copper wire makes it immune to the external electrical disturbances.

Q. 3.06. What is the function of copper mesh in a coaxial cable ?

Ans. Due to electric current, the magnetic field inside a hollow conductor is always zero. When the central copper wire carries the signal, the copper mesh shields it electrically from the external electrical disturbances.

Q. 3.07. What do you mean by `switching circuit' in a telephone system ?

Ans. All the telephones in a locality are connected to the telephone exchange. When a calling subscriber dials in the called subscriber, the switching circuit interconnects the two.

Q. 3.08. What is an optical fibre ?

Ans. An optical fibre consists of a glass core (very thin thread of glass) surrounded by a glass coating of comparitively lesser refractive index. It is used to transmit optical signals from one place to another place.

Q. 3.09. What is `cladding' ?

Ans. A glass coating surrounding the glass core in an optical fibre is called cladding. The refractive index of cladding is a littile less than that of the glass core.

Q. 3.10. What does LASER stand for ?

Ans. The word LASER stands for Light Amplification by Stimulated Emission Radiation.

Q. 3.11. What are the main characteristics of a laser beam ?

Ans. A laser beam is highly coherent, highly monochromatic and perfectly parallel.

Q. 3.12. What is stimulated emission ?

Ans. *The emission of photons in an atomic system by shining photons of energy equal to the difference in energies associated with the higher and lower energy states alongwith the incident photons is called stimulated emission.*

Q. 3.13. What is a `metastable stable' ?

Ans. *The energy state in an atomic system, which has a mean life time much larger than the life time of a normal higher energy state, is called metastable state.*

Q. 3.14. What is `population inversion' ?

Ans. Normally, the number of atoms in a higher energy state is always less than those in the lower energy state.

The process of making number of atoms in higher energy state more than that in the lower energy state by induced absorption is called population inversion.

Q. 3.15. What do you mean by pumping ?

Ans. *The process of raising atoms from lower energy state to higher energy state by induced absorption is known as pumping.*

Q. 3.16. What do you mean by an `optical source' used in optical communication ?

Ans. In optical communication, an optical source is one, which can convert electrical energy into optical energy, which may be suitable for communication purposes.

Q. 3.17. Name two optical sources used in optical communication.

Ans. 1. Laser **2.** Light emitting diode (LED)

Q. 3.18. What is light modulation ?

Ans. *The process of modulating a light beam from an optical source in accordance with the information signal is called light modulation.*

Q. 3.19. What is direct intensity modulation ?

Ans. The process of light modulation, in which the intensity of light is varied in accordance with the message signal in a direct manner by biasing the optical source corresponding to the message signal, is known as direct intensity modulation.

FREQUENTLY ASKED SHORT ANSWER QUESTIONS

With Answers/Hints

Q. 3.01. Why do we prefer a twisted pair in comparison to parallel-wire line in communication systems ?

Ans. In a parallel-wire line, the interference between the magnetic fields produced by the signal current in the two wires causes distortion in the signal. This effect gets quite minimised in a twisted pair. In addition, the twisted pair is less prone to electrical disturbances. For these reasons, twisted pair is preferred to parallel-wire line.

Q. 3.02. Why does a parallel-wire line radiate energy ? How is this problem overcome in a twisted pair ?

Ans. A system of conductors always radiates energy in the form of radiowaves, when the separation between the two wires approaches a half-wavelength at the operating frequency. This effect becomes more pronounced at the frequency of microwaves. So that the two conductors donot remain at a finite constant distance of the order of wavelength of the transmitted signal, the two insulated copper wires are twisted around each other.

Q. 3.03. What is a coaxial cable ? Why is it superior to other wire-line systems ?

Ans. A coaxial cable consists of a central copper wire surrounded by a PVC insulation over which a sleeve of copper mesh is covered. The copper mesh is covered with an outer shield of a thick PVC material. The signal is transmitted by the inner copper wire, which is electrically shielded by the outer copper mesh. The other types of wire-lines pick up external electrical disturbances leading to distortion in the signal.

Q. 3.04. What are the merits of coaxial cables ?

Ans. Refer to section 3.02.

Q. 3.05. What are the advantages of using a communication satellite as a telephone link ?

Ans. Refer to section 3.03.

Q. 3.06. What is the principle of an optical fibre ? What is the necessary condition that should be obeyed for transmitting a signal with the help of it ?

Ans. An optical fibre is based on the principle of total internal reflection.

It states that *when a ray of light travelling from an optically denser medium to an optically rarer medium is incident at an angle greater than the critical angle for the two media, the ray of light is totally reflected back into the same medium.*

Necessary condition. The ray of light incident on the optical fibre in air should not be incident at an angle greater than the angle given by

$$\sin i = \sqrt{\mu_1^2 - \mu_2^2},$$

where the letters have their usual meanings.

Q. 3.07. What do you mean by `angle of acceptance' in optical fibres ? Give expression for it.

Ans. *The maximum angle of incidence in air, for which all the incident light is totally reflected at the core-cladding interface in an optical fibre, is called the angle of acceptance.*

It is given by

$$\sin i = \sqrt{\mu_1^2 - \mu_2^2},$$

where μ_1 and μ_2 are refractive indices of the glass core and cladding respectively.

Q. 3.08. What is the difference between monomode and multimode optical fibres ?

Ans. A monomode optical fibre has a very narrow core ($\approx 3 \mu m$ in diameter) ; while in a step-index multimode optical fibre, the diameter of the core is compartively very large ($\approx 50 \mu m$). In another type of multimode optical fibre, called graded-index multimode fibre, there is no noticeable boundary between the core and the cladding. Further, in a monomode optical fibre, different wavelengths travel along parallel light paths of equal lengths, whereas in a multimode optical fibres, the light paths of different wavelengths are not equal.

Q. 3.09. What is difference between step-index multimode and graded-index multimode optical fibres ?

Ans. A step-index multimode optical fibre has a constant refractive index from its centre to the boundary of the core and then refractive index changes to a lower value, which remains constant throughout the cladding. The different wavelengths reach the other end of the optical fibre following light paths of different lengths.

In graded-index multimode optical fibre, there is no noticeable boundary between the core and the cladding. The different wavelengths follow paths of different lengths, but reach the other end of the optical fibre, practically at the same time.

Q. 3.10. Why do we prefer a graded-index multimode optical fibre in comparison to step-index multimode optical fibre ?

Ans. In a multimode optical fibre, different wavelengths follow different light paths and therefore there is a time difference between the wavelengths reaching the other end of the optical fibre. In case of step-index multimode optical fibre, the overall time difference is of the order of 33 ns. However, in case of graded-index multimode optical fibre, the overall time difference between different wavelengths is much reduced ($\approx$ 1 ns).

Q. 3.11. What is the principle of LASER ? Name the basic atomic concepts involved in the production of a laser beam.

Ans. Principle. It is based on the principle that in the atomic systems possessing metastable states, the population inversion can be caused and then the process of stimulated emission can be used to produce highly coherent, highly monochromatic and perfectly parallel beam of light.

The various atomic concepts involved in the production of a laser beam are pumping, population inversion and stimulated emission.

Q. 3.12. Why do we prefer He-Ne laser in comparison to ruby laser ?

Ans. A ruby laser is a three level system and it generally requires very high pumping power. It is because, the terminal state of the laser transition in ruby laser is the ground state.

On the other hand, a He-Ne laser is a four level system and in contrast to ruby laser, much less pumping power is needed in this case.

Q. 3.13. Name a few applications of LASER.

Ans. Refer to section 3.12.

Q. 3.14. Name a few advanges of optical fibre communication.

Ans. Refer to section 3.16.

FAQs FREQUENTLY ASKED SHORT ANSWER QUESTIONS Carrying 3 Marks

1. What are parallel-wire and twisted pair ? Explain in brief. Give merits of twisted pair.
2. What is a coaxial cable ? What is its advantage over parallel-wire line ? Why does no attenuation of radio frequency signal occur, when transmitted along it ?
3. Why do we require line communication ? *(Text Question)*
4. Explain, how a coaxial cable can carry many telephone calls at the same time. *(Text Question)*
5. What is a communication channel ? Describe briefly the various communication channels employed in communication. *(Text Question)*
6. Explain microwave link in brief. How is the problem of line-of-sight transmission overcome ?
7. What is communication satellite link ? Explain in brief. Give its advantages and disadvantages.
8. What is an optical fibre ? Explain the various types of optical fibres.
9. What is the principle of optical fibre ? How is a light signal transmitted along it ? Show it with the help of a diagram.
10. Explain, why an optical fibre transmits light round bends. *(Text Question)*
11. Give the advantages of optical communication system.
12. Explain the terms induced absorption, spontaneous emission, stimulated emission and population inversion.
13. Explain the action of a ruby laser with the help of energy level diagram.
14. Explain, how He-Ne laser works. Give the necessary energy level diagram.
15. Give the various applications of LASER.
16. What is an LED ? Briefly describe its operational principle. *(Text Question)*
17. What is light modulation ? Explain, how the direct intensity modulation is carried out.

FAQs FREQUENTLY ASKED LONG ANSWER QUESTIONS Carrying 5 Marks

1. What is a 2-wire line ? Discuss the different types of 2-wire line systems giving the advantages of one over the other.
2. What is twisted pair and how is it employed for line communication ? Discuss its advantages and limitations. *(Text Question)*
3. Describe the construction of a coaxial cable ? How does its construction help in increasing the bandwidth ? Discuss source of its advantages over the twisted pair. *(Text Question)*
4. What is a microwave link ? What are its drawbacks ? How are the problems encountered in microwave link overcome in satellite link ?
5. What is remote sensing ? Explain briefly how it is carried out. Mention some of its applications. *(Text Question)*
6. What is an optical fibre ? Give its construction. With the help of a suitable diagram, explain as to how a signal may be transmitted from its one end to the other. What makes it efficient for transmitting a signal ?

7. What is the principle of an optical fibre ? What are the different types of optical fibres ? Explain them in brief giving a suitable diagram in each case.
8. What does LASER stand for ? Explain the various atomic concepts related to the production of a laser beam.
9. What is the principle of laser ? Explain the experimental arrangement and theory of ruby laser with the help of energy level diagram.
10. What is the merit of He-Ne laser over ruby laser ? Explain the experimental arrangement made in a He-Ne laser. Give the necessary theory of production of laser in such a system.
11. Explain the working of a semiconductor laser. It is an ideal light source for optical communication. Justify. *(Text Question)*
12. What is optical communication ? Give the main advantages of optical communication system.

FAQs FREQUENTLY ASKED NUMERICAL PROBLEMS

For Practice

Type A. On Optical fibre

1. An optical fibre is made from core glass of refractive index 1·62 and cladding of refractive index 1·53. Find the angle of acceptance. **[Ans.** 32·2°]
2. Calculate the critical angle and the angle of acceptance for an optical fibre, whose core and cladding are of refractive indices 1·68 and 1·55 respectively. **[Ans.** 67·3° ; 40·4°]
3. (*a*) Calculate the critical angle for a boundary between a glass fibre for which the refractive index is 1·6 and cladding for which the refractive index is 1·5
   (*b*) Calculate the ratio of the path lengths for the highest order mode and axial mode in the fibre described in (*a*). **[Ans.** (*a*) 69·6° (*b*) 1·067]
4. Calculate the difference in time taken to travel through a 40 m fibre by red light and blue light for which the fibre has refractive indices of 1·45 and 1·47 respectively. Take the velocity of light in vacuum to be 3×10^8 m s^{-1} and consider the axial mode only.
5. Calculate the attenuation in *d*B expected for a fibre-optic cable 300 m long with an absorption coefficient of 0·2 *d*B km^{-1}. **[Ans.** 0·26 *d*B]
6. In a particular digital communication system, the signal to noise ratio must not be less than 21 *d*B.
   (*a*) If the noise power is 10^{-20} W, what is the minimum power that the transmitted signal can have ?
   (*b*) If the attenuation is 2 *d*B km^{-1} and the initial power is 10^{-3} W, what is the maximum distance the signal can travel before it is regenerated ?
   [Ans. (*a*) $1{\cdot}259 \times 10^{-18}$ W (*b*) 74·5 km]

SOLUTIONS/HINTS TO NUMERICAL PROBLEMS FOR PRACTICE

1. Here, $\mu_1 = 1{\cdot}62$, $\mu_2 = 1{\cdot}53$

The acceptance angle for optical fibre is given by

$$\sin i = \sqrt{\mu_1^2 - \mu_2^2} = \sqrt{(1\cdot 62)^2 - (1\cdot 53)^2} = 0\cdot 5324$$

or $i = 32{\cdot}2°$

2. Proceed as in solved problem no. 3.02.
3. (**a**) Proceed as in solved problem no. 3.01.
   (**b**) Proceed as in solved problem no. 3.03.
4. Here, $\mu_r = 1{\cdot}45$, $\mu_b = 1{\cdot}47$

$c = 3 \times 10^8$ m s^{-1} and $l = 40$ m

Now, $$v_r = \frac{c}{\mu_r} = \frac{3 \times 10^8}{1{\cdot}45} = 2{\cdot}069 \times 10^8 \text{ m s}^{-1}$$

and $$v_b = \frac{c}{\mu_b} = \frac{3 \times 10^8}{1{\cdot}47} = 2{\cdot}047 \times 10^8 \text{ m s}^{-1}$$

Time of travel for red light through the fibre,

$$t_r = \frac{l}{v_r} = \frac{40}{2{\cdot}069 \times 10^8} = 1{\cdot}933 \times 10^{-7} \text{ s} = 193{\cdot}3 \text{ ns}$$

Also time of travel for blue light through the fibre

$$t_b = \frac{l}{v_b} = \frac{40}{2{\cdot}041 \times 10^8} = 1{\cdot}960 \times 10^{-7} \text{ s} = 196{\cdot}0 \text{ ns}$$

$\therefore$ $t_b - t_r = 196{\cdot}0 - 193{\cdot}3 = \mathbf{2{\cdot}7 \text{ ns}}$

5. Here, $\alpha = 0{\cdot}2$ *d*B km^{-1}, $x = 300$ m $= 0{\cdot}3$ km

The intensity of light pulse over a distance x is given by

$$\mathrm{I} = \mathrm{I}_0 e^{-\alpha x}$$

$$\therefore \quad \frac{\mathrm{I}}{\mathrm{I}_0} = e^{-\alpha x} = e^{-0{\cdot}2 \times 0{\cdot}3} = e^{-0{\cdot}06} = 0{\cdot}942$$

Therefore, attenuation (in *d*B)

$$= 10 \log_{10} \frac{\mathrm{I}}{\mathrm{I}_0} = 10 \log 0{\cdot}942$$

$$= 10 \times (-0{\cdot}026) = \mathbf{-0{\cdot}26\ dB}$$

6. (**a**) Here, ratio of signal to noise power (in *d*B) = 21 *d*B

noise power, $\mathrm{P}' = 10^{-20}$ W

Now, ratio of power (in *d*B) $= 10 \log_{10} \frac{\mathrm{P}}{\mathrm{P}'}$

$$\therefore \quad 21 = 10 \log_{10} \frac{\mathrm{P}}{10^{-20}} \quad \text{or} \quad \log_{10} \frac{\mathrm{P}}{10^{-20}} = 2{\cdot}1$$

$$\text{or} \quad \frac{\mathrm{P}}{10^{-20}} = 125{\cdot}9 \quad \text{or} \quad \mathrm{P} = \mathbf{1{\cdot}259 \times 10^{-18}\ W}$$

(*b*) Now, attenuation (in *d*B) $= 10 \log_{10} \frac{\mathrm{P}}{\mathrm{P}_0}$

Here, $\mathrm{P} = 1{\cdot}259 \times 10^{-18}$ W, $\mathrm{P}_0 = 10^{-3}$ W

Therefore, attenuation $= 10 \log_{10} \frac{1{\cdot}259 \times 10^{-18}}{10^{-3}}$

$$= \log 1{\cdot}259 \times 10^{-15} = 10 [\log 1{\cdot}259 + \log 10^{-15}]$$

$$= 10 [0{\cdot}1 + (-15)] = -149 \text{ dB}$$

Since attenuation per km is 2 *d*B km^{-1}, the maximum distance the signal can travel is given by

$$x = \frac{149}{2} = \mathbf{74{\cdot}5\ km}$$

Competitive Examination File (Unit X)

REVISION AT A GLANCE

Chapter 1. Analog and Digital Communication

☐ **Communication system.** *The setup used for exchaging information between a sender and a receiver is called communication em.*

☐ **Transmitter.** *The part of the communication system, which sends out the information is called transmitter.*

☐ **Receiver.** *The part of the communication system, which picks up the information sent out by the transmitter is called receiver.*

☐ **Communication channel.** *The medium or the link, which transfers message signal from the transmitter to the receiver of a munication system is called communication channel.*

☐ **Transducer.** *The device which converts energy in one form to another is called a transducer.*

☐ **Analog signal.** *A singal, which is a continuous function (usually a sinusoidal function) of time, is called an analog signal.*

☐ **Bandwidth.** *The frequency range of a signal is called its bandwidth.*

☐ **Baseband signal.** *The information bearing signal is called a baseband signal.*

☐ **Digital signal.** *A discrete signal (discontinuous function of time), which has only two levels (either low or high) is called a ital signal.*

☐ **Analog modulation.** *The process of producing a continuous high frequency wave, some characteristic of which varies as a function he instantaneous value of the audio signal, is called analog modulation.*

☐ **Amplitude modulation.** *When the modulating wave is superimposed on a high frequency carrier wave in a manner that the uency of the modulated wave is same as that of the carrier wave but its amplitude varies in accordance with the amplitude of the dulating wave, the process is called amplitude modulation.*

☐ **Frequency modulation.** *When the modulating wave is superimposed on a high frequency carrier wave in a manner that the plitude of the modulated wave is same as that of the carrier wave but its frequency varies in accordance with the amplitude of the dulating wave, the process is called frequency modulation.*

☐ **Phase modulation.** *When the modulating wave is superimposed on a high frequency carrier wave in a manner that the magnitude he phase angle of the modulated signal varies in accordance with the amplitude of the modulating wave, the process is called phase dulation.*

☐ **Modulation index.** *The degree, to which the carrier wave is modulated, is called modulation index.*

☐ **Demodulation.** *The process of separating out the audio signal from the modulated signal is called demodulation.*

☐ **Pulse modulation.** *The process of producing a train of pulses of the carrier, some characteristic of which varies as a function the instantaneous value of the message singal, is called pulse modulation.*

☐ **Pulse Amplitude Modulation (PAM).** *The process of pulse modulation, in which amplitude of the pulses of the carrier pulse in varies in accordance with the instantaneous value of the message signal.*

☐ **Pulse Width Modulation (PWM).** *The process of pulse modulation, in which the width of the pulses of the carrier pulse train ries in accordance with the instantaneous value of the message signal.*

☐ **Pulse Position Modulation (PPM).** *The process of pulse modulation, in which the position of the pulses of the carrier wave in varies with the instantaneous value of the message signal.*

☐ **Pulse Code Modulation (PCM).** *The process of converting an analog signal into a digital signal by sampling it in time, then antising and coding it, is called pulse code modulation.*

☐ **Sampling.** *It is the process of generating pulses of zero width (duration) and of amplitude equal to the instantaneous amplitude the analog signal.*

The number of samples of analog signal taken per second is called **sampling rate.**

☐ **Quantisation.** *The process of dividing the maximum amplitude of the analog voltage signal into a fixed number of levels is lled quantisation.*

☐ **Coding.** *The process of digitising the quantised pulses according to some code (usually binary code) is called coding.*

☐ **Bit rate.** *The number of binary digits (bits) per second, which describe a digital signal is called its bit rate.*

Mathematically : Bit rate = sampling rate × number of bits per sample

☐ **Fax.** *The electronic transmission of a document at a distant place via telephone line is known as FAX.*

Chapter 2. Space Communication

☐ **Earth's atmosphere.** *The gaseous envelope surrounding the earth is called earth's atmosphere.*

☐ **Ground wave propagation.** It is of the following two types :

1. Surface wave propagation. *When the radiowaves from the transmitting antenna propagate along the surface of the earth so s to reach the receiving antenna, the wave propagation is called surface wave propagation.*

2. Space wave propagation. *When the radiowaves from the transmitting antenna reach the receiving antenna either directly or after reflection from the ground or in the troposphere, the wave propagation is called space wave propagation.*

☐ **Sky wave propagation.** *When the radiowaves from the transmitting antenna reach the receiving antenna after reflection in the ionosphere, the wave propagation is called sky wave propagation.*

☐ **Transmission of TV signals.** The TV signals are frequency modulated. The maximum distance upto which TV signals can be received is given by

$$d = \sqrt{2hR},$$

where h is height of the TV antenna and R, the radius of earth.

☐ **Communication satellite.** *An artificial satellite used for communication purposes is called communication satellite.*

☐ **Remote sensing.** *Any method of obtaining and recovering information from a distance is called remote sensing.*

Chapter 3. Line Communication

☐ **Transmission medium.** *The link, which transfers information (message signal) from the information source to the destination, is called transmission medium.*

☐ **Guided transmission medium.** *The transmission medium, which enables the message signal reach the destination by making it to follow a guided path is called a guided transmission medium.*

☐ **Unguided transmission medium.** *The transmission medium, which enables the message signal to reach the destination along an unguided path is called an unguided transmission medium.*

☐ **Multiplexing.** *Simultaneous transmission of a number of messages over a single channel is known as multiplexing.*

☐ **Optical Communication.** *The use of optical carrier waves for the transmission of information from one place to another is called optical communication.*

MULTIPLE CHOICE QUESTIONS FROM COMPETITIVE EXAMINATIONS

Chapter 1. Solids

RT I. TEXT BASED QUESTIONS

1. **An antenna is a device**
   (A) that converts electromagnetic energy into readio frequency signal.
   (B) that converts radio frequency signal into elecromagnetic energy.
   (C) that converts guided electromagnetic waves into free space electromagnetic waves nad vice-versa.
   (D) none of the above.
2. **An antenna behaves as a resonant circuit only when its length**
   (A) equals $\lambda/4$ (B) equals $\lambda/2$
   (C) equals $\lambda/2$ or its integral multiple
   (D) none of the above.
3. **In modulation process, radio frequency wave is termed as**
   (A) modulating wave (B) modulated wave
   (C) carrier wave (D) none of the above.
4. **Modulation is used to**
   (A) reduce the bandwidth used.
   (B) separate different transmissions from each other.
   (C) ensure that intelligence may be transmitted over long distances.
   (D) allow access to the intelligence at the same time to different persons.
5. **In amlitude modulation**
   (A) the amplitude of the carrier varies in accordance with the amplitude of the modulating signal.
   (B) the amplitude of the carrier remains constant.
   (C) the amplitude of the carrier varies in accordance with the frequency of the modulating signal.
   (D) none of the above.
6. **Amplitude modulation is used for broadcasting, because**
   (A) it is more noise immune than other modulation systems.
   (B) compared with other systems, it requires less transmitting power.
   (C) its circuitry is simple.
   (D) no other modulation system can provide the ncessary bandwidth for high fidelity.
7. **The purpose of oscillator in the AM transmitter is to**
   (A) provide modulating signal.
   (B) provide carrier.
   (C) provide enough power to meet transmission system requirement.
   (D) none of the above.
8. **Modulation index of an AM signal**
   (A) depends upon peak amplitude of modulating signal.
   (B) depends upon peak amplitudes of carrier and the modulating signal.
   (C) is a function of carrier frequency.
   (D) none of the above.
9. **An audio signal in the frequency range of 20 Hz to 10 kHz modulates the carrier. The bandwidth requirement is**
   (A) 20 kHz (B) 40 kHz
   (C) cannot be determined from the given data
   (D) none of the above.
10. **In frequency modulation**
    (A) frequency of the carrier remains constant.
    (B) carrier frequency varies in accordance with the modulating signal frequency.
    (C) carrier frequency varies in accordance with the modulating signal amplitude.
    (D) none of the above.
11. **Modulation index in an FM signal**
    (A) varies inversely as the frequency deviation.
    (B) varies directly as the modulating frequency.
    (C) varies directly as frequency deviation and inversely as the modulating frequency.
    (D) none of the above.
12. **Indicate which one of the following is not an advantage of FM over AM :**
    (A) Better noise immunity is provided.
    (B) Lower bandwidth is required.
    (C) The transmitted power is more useful.
    (D) Less modulating power is required.
13. **In a communication system, noise is most likely to affect the signal**
    (A) at the transmitter (B) in the transmission medium
    (C) in the information source
    (D) at the destination.
14. **The difference between phase and frequency modulation**
    (A) is purely theoretical, but practically they are same.
    (B) lies in the poorer audio response of phase modulator.
    (C) lies in the poorer audio response of frequency modulation.
    (D) lies in the definitions of their modulation index.
15. **While tuning in a certain broadcast station with a receiver, we are actually**
    (A) varying the local oscillator frequency.
    (B) varying the frequency of the radio signal to be picked up.
    (C) tuning the antenna.
    (D) none of the above.
16. **Digital signals**
    (A) donot provide a continuous set of values.
    (B) represent values as discrete steps.
    (C) utilise binary code system.
    (D) All of the above.
17. **In all pulse communication systems, carrier**
    (A) is necessarily a high repetition rate train of pulses.
    (B) is necessarily a high frequency continuous wave.
    (C) is either (A) or (B).
    (D) none of the above.
18. **Indicate which one of the following system is digital :**
    (A) Pulse Position Modulation
    (B) Pulse Code Modulation
    (C) Pulse Width Modulation
    (D) Pulse Amplitude Modulation.
19. **If a 10 kHz audio signal is to be sent accurately using 8-bit PCM digital signal how often should the signal be sampled ?**
    (A) 25 times every μs (B) twice every 25 μs
    (C) once every 50 μs (D) 10 times every μs.
20. **In a PCM system, the number of quantisation levels are 16 and the maximum signal, frequency is 4 kHz. The bit transmission rate is**
    (A) 64,000 bits s^{-1} (B) 16,000 bits s^{-1}
    (C) 32,000 bits s^{-1} (D) 32 bits s^{-1}.
21. **The pulse communication system that is higher immune to noise is**
    (A) PAM (B) PCM
    (C) PWM (D) PPM

22. **The most commonly used system of modulation for telegraphy is :**
(A) on-off keying (B) frequency shift keying
(C) analog modulation (D) pulse code modulation.

Chapter 2. Space Communication

PART I. TEXT BASED QUESTIONS

1. **High frequency waves are**
(A) absorbed in F layer (B) reflected by the E layer
(C) capable of use for long-distance transmission
(D) affected by the solar cycle.

2. **As electromagnetic waves travels in free space, only one of the following can happen to them :**
(A) Absorption (B) Attenuation
(C) Refraction (D) Reflection.

3. **The ground wave eventually disappears, as one moves away from the transmitter, because of**
(A) interference from the sky wave.
(B) loss of line-of-sight condition.
(C) maximum single-hop distance limitation.
(D) tilting.

4. **Frequencies in the UHF range normally propagate by means of**
(A) ground waves (B) sky waves
(C) surface waves (D) space waves.

5. **For television transmission, the frequency employed is normally in the range**
(A) 30 – 300 MHz (B) 30 – 300 GHz
(C) 300 – 300 kHz (D) 30 – 300 Hz
(Karnataka Entrance, 1990, 1989)

6. **The electromagnetic waves used in the telecommunication are**
(A) ultra-violet (B) infra-red
(C) visible (D) microwaves.

7. **The number of geostationary satellites needed fo uninterrupted global coverage is**
(A) 3 (B) 4
(C) 1 (D) 2

8. **The most commonly employed analog modulatio technique in satellite communication is the**
(A) amplitude modulation
(B) frequency modulation
(C) phase modulation (D) All the above.

9. **A payload that is invariably found on all communicatio satellites is the**
(A) photographic camera
(B) optical telescope
(C) transponder (D) none of the above.

10. **Satellite transponders**
(A) use a single frequency for reception and retransmissio of information to and from the earth.
(B) use a lower frequency for reception and highe frequency for retransmission.
(C) use a higher frequency for reception and a lowe frequency for retransmission.
(D) none of the above.

Chapter 3. Line Communication

PART I. TEXT BASED QUESTIONS

1. **Microwave link repeaters are typically 50 km apart,**
(A) because of atmospheric attenuation.
(B) because of the earth's curvature.
(C) to ensure that signal voltage may not harm the repeater.
(D) none of the above.

2. **Optical communication uses the frequency range of**
(A) 10^9 to 10^{10} Hz (B) 10^5 to 10^6 Hz
(C) 10^{14} to 10^{15} Hz (D) 10^{16} to 10^{17} Hz.

3. **Optical fibres rely for their operation on the phenomenon of**
(A) reflection (B) refraction
(C) dispersion (D) total internal reflection.

4. **An optical fibre has μ_{core} = 1·45 and μ_{clad} = 1·48. Is this statement true ?**
(A) Yes (B) No
(C) It may or may not be true.
(D) None of the above.

5. **One bel equals**
(A) 0·1 *d*B (B) 10 *d*B
(C) 100 *d*B (D) 1000 *d*B

6. **Losses is optical fibres is caused by**
(A) impurities in the glass.
(B) inperfect transparency of the glass.
(C) its extremely small area of cross-section.
(D) stepped index structure.

7. **Attenuation in optical fibre is mainly due to**
(A) scattering (B) absorption and scattering
(C) dispersion (D) none of the above.

8. **If the output power is reduced to 25% of its original value after passing through a fibre, the loss in *d*B is**
(A) 0·3 *d*B (B) 0·25 *d*B
(C) 3 *d*B (D) 6 *d*B

9. **A light beam after emerging an optical fibre makes a angle of 10° with the fibre core-fibre clad boundar surface. If the fibre core and fibre clad refractive indice are 1·5 and 1·49 respectively, can this beam propagat along the fibre ?**
(A) Yes (B) No
(C) The given data is insufficient to decide
(D) None of the above.

10. **If the core/cladding dimensions of an optical fibre ar given by 50/125 μm, the fibre type would be**
(A) single mode step index.
(B) single mode graded index.
(C) multimode step index.
(D) multimode graded index.

11. **The light emitting diode is usually made from**
(A) germanium (B) silicon
(C) gallium arsenide (D) none of the above.

12. **LEDs fabricated from gallium arsenide emit radiations i the**
(A) infra-red region (B) ultra-violet region
(C) visible region (D) none of the above.

13. **The output from a LASER is monochromatic. It means tha it is**
(A) directional (B) polarised
(C) narrow beam (D) single frequency.

14. **The type of source modulation required for digita communication using a fibre optic link set up is**
(A) frequency modulation
(B) amplitude modulation
(C) intensity modulation
(D) phase modulation.

ANSWERS TO MULTIPLE CHOICE QUESTIONS

hapter 1. Analog and Digital Communication

1. (C) 2. (C) 3. (C) 4. (B, C & D)5. (A) 6. (C) 7. (B) 8. (B) 9. (C) 10. (C)
11. (C) 12. (B) 13. (B) 14. (D) 15. (A) 16. (D) 17. (A) 18. (B) 19. (C) 20. (C)
21. (B) 22. (A)

hapter 2. Space Communication

1. (B & D) 2. (B) 3. (D) 4. (D) 5. (A) 6. (D) 7. (A) 8. (B) 9. (C) 10. (C)

hapter 3. Line Communication

11. (C) 12. (C) 13. (D) 14. (C)

Revision Techniques

WHY SHOULD YOU REVISE ?

You cannot expect to remember all the Physics that you have studied unless you revise. It is important to review all your course, so that you can answer the examination questions.

WHERE SHOULD YOU REVISE ?

In a quiet room, with a table and a clock. The room should be brightly lighted. A reading lamp on the table helps you to concentrate on your work and reduces eye-strain.

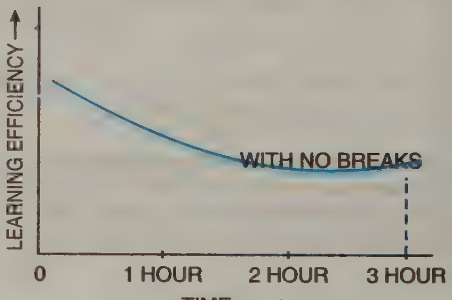
WHEN SHOULD YOU REVISE ?

Start your revision early each evening, before your brain gets tired.

HOW SHOULD YOU REVISE ?

If you sit down to revise without thinking of a definite finishing time, you will find that your learning efficiency falls lower and lower and lower.

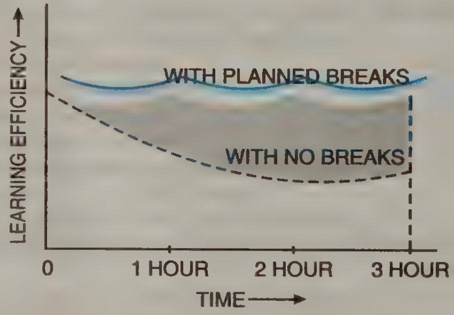
If you sit down to revise, saying to yourself that you will definitely stop work after 3 hours, then your learning efficiency falls at the beginning but *rises towards the end* as your brain realises it is coming to the end of the session (see Graph I).



Graph I

We can use this U-shaped curve to help us work more efficiently by splitting a 3 hour session into 3 shorter sessions, each of about 50 minutes with short, *planned* breaks between them.

The breaks *must* be planned beforehand so that the graph rises near the end of each short session [Graph II].



Graph II

The shaded area on the graph shows how much you gain :

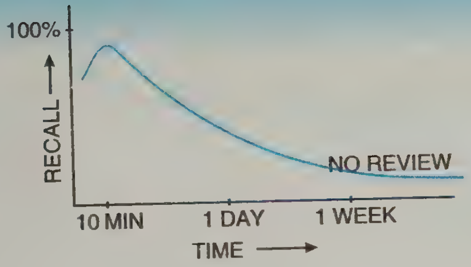
For example, if you start your revision at 6.00 p.m., you should look at your clock or watch and say to yourself, `I will work untill 7.00 p.m. and then stop – no earlier and not later.'

At 7.00 p.m. you should leave the table for a relaxation break of 10 minutes (or less), returning by 7.10 p.m. when you should say to yourself, `I will work untill 8.10 p.m. and then stop – not earlier and not later.'

Continuing in this way is more efficient and causes less strain on you. You get through more work and you feel less tired.

HOW OFTEN SHOULD YOU REVISE ?

The adjoining graphs show the amount of information that your memory can recall at different times after you have finished a revision session :

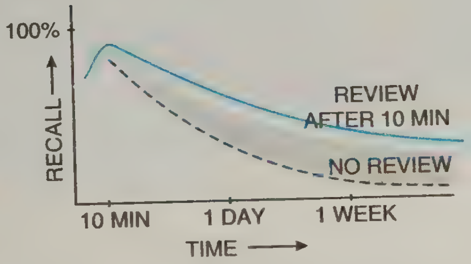


Surprisingly, the graph rises at the beginning. This is because your brain is still sorting out the information that you have been learning.

The graph soon falls rapidly so that after 1 day you may remember only about a quarter of what you have had learned [Graph III].

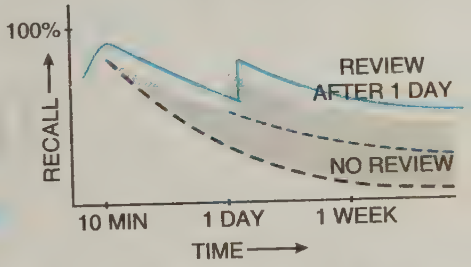
There are two ways of improving your recall and raising this graph

- 1. If you briefly *revise the same work again after 10 minutes* (at the high point of the graph) then the graph falls much more slowly [Graph IV].



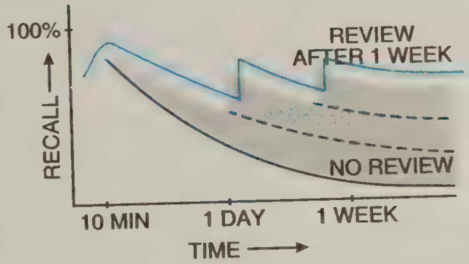
This fits in with your 10-minute break between revision sessions.

Using the example on the last page, when you return to your table at 7.10 p.m., the first thing you should do is ***review***, briefly, the work you learned before 7.00 p.m.



The graph can be lifted again by briefly reviewing the work *after 1 day* and then again *after 1 week*. That is, on Tuesday night you should look through the work you learned on Monday night and the work you learned on the previous Tuesday night, so that it is fixed quite firmly in your long-term memory [Graphs V and VI].

- 2. Another method of improving your memory is by taking care to try to ***understand*** all parts of your work. This makes all the graphs higher.



If you learn your work in a parrot-fashion (as you have to do with telephone numbers), all these graphs will be lower. On the occassions when you have to learn facts by heart, try to picture them as exaggerated, colourful images in your mind.

REMEMBER

The most important points about revision are that it must occur often and be repeated at the right intervals.

											MEAN DIFFERENCES								

ADD NUMBERS IN MEAN DIFFERENCE COLUMNS

Example : *Antilog 1·3377 = 2173 (for ·337)*
+3 (mean diff. for 7)
21·76 (decimal after 2 s.f.)
--- Indicates that the decimal point must be placed after the first 2 figures.

											MEAN DIFFERENCES								

ADD NUMBERS IN MEAN DIFFERENCE COLUMNS

Example : *Antilog 2·6459 = 4416 (for ·645)*
+9 (mean diff for 9)
0 04425

A simple rule :
(i) If the characteristic is positive, then put the decimal after (n+1) digits from the left
(ii) If the characteristic is negative, then put (n−1) zeros before the first significant digit

SUBTRACT NUMBERS IN MEAN DIFFERENCE COLUMNS

Example : Cos 14°16′ = 0·9694 (⇒for 14°12′
− 3 (⇒mean diff. for 4′)
0·9691

[Cos 14°16′ = Cos 14°12′ + 4′]

Caution : In all co-functions such as Cosine, Cot, Cosec we have to subtract the mean differences

SUBTRACT NUMBERS IN MEAN DIFFERENCE COLUMNS

Example : Cos 53°40′ = 0·5934 (⇒ for 53°36′)
− 9 (⇒ mean diff. for 4′)
0·5925

[Cos 53°40′ = Cos 53°36′ + 4′]

ADD NUMBERS IN MEAN DIFFERENCE COLUMNS

MEAN DIFFERENCES

1'	2'	3'	4'	5'
3	6	9	12	15

DIFFERENCE VALUES ARE THE SAME FOR ALL ROWS

3	6	9	12	15
1'	2'	3'	4'	5'

MEAN DIFFERENCES

Note : 180° = π rad.

$\theta^\circ = \frac{\pi \times \theta^\circ}{180^\circ}$ radians

Example : 23°20' = 0·4067 (⇒ for 23°18')
+ 6 (⇒ mean diff for 2')
0·4073

[23°20' = 23°18' + 2' = 0·4073 rad.]

DEGREES TO RADIANS

x° → rad.

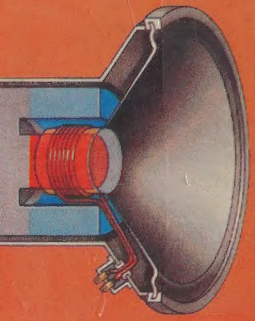
Example $\sqrt{84}$ = 9·165, $\sqrt{840}$ = 28·983 , $\sqrt[3]{8400}$ = 20·328

MODERN'S abc OF PHYSICS

The book presents the subject matter in full conformity with the syllabi prescribed by C.B.S.E., New Delhi and Education Boards of other Indian states. To keep pace with changing trends in education at national level, the whole text has been arranged strictly according to N.C.E.R.T. pattern. The main stress has been laid on SI. The symbols and signs used for various physical quantities are also in keeping with the recommendations at national and international levels.



The book provides a result-oriented training to young students. The whole text of the book is embedded with short notes in the form of **The jargon** (introducing apparently a new physical term with a proper definition), Key point (highlighting an important point in the text) and **Watch out** (bringing out the difference between the physical and apparent meaning of a physical term). Further, the text has been studded with simple **Self-Study Questions,** so as to provide an insight and a proper grip over the topic, as one learns it. The article work in each chapter of a unit is coupled with well graded and carefully selected **Solved Numerical Problems** for easy comprehension of the beginners. So that the students can prepare for the Annual Examinations in an independent manner, a large number of **Very Short Answer Questions** and **Short Answer Questions** have been incorporated in the book with proper Answers/Hints. **Unsolved Numerical Problems** for self-practice have been categorised into various types, so as to enable the students to choose the appropriate formula with ease. Further, detailed Hints/Solutions have been provided to Unsolved Numerical Problems. **Techie-Stuff** offers a special feature of the book. It contains real **Conceptual Numerical Problems** and **Conceptual Short Answer Questions.** It is aimed to provide intensive understanding and deep insight of the subject to the students, so that they get the feel of the type of questions asked in competitive examinations, such as I.I.T.

The Competitive Examination File in each unit forms another special feature of the book and consists of three parts. **Revision at a Glance** of the contents of a unit is for easy and handy reference of various physical laws, principles, terms and formulae in that unit and for its quick revision. **Numerical Problems from Competitive Examinations,** such as **I.I.T., Roorkee** and **I.S.M., Dhanbad** have been provided with solutions by adopting a novel technique in the form of **Thought Process.** Armed with this technique, the students will be able to attack the otherwise brainteasing and seemingly incomprehensible numerical problems with great ease. **Multiple Choice Questions** set in various competitive examinations, such as **C.B.S.E., A.I.I.M.S., A.F.M.C., M.N.R., C.P.M.T., I.I.T.,** etc have been thoroughly covered in the book. For the sake of easy preparation, these questions have been categorised into **Text-Based** and **Thought-Based** Multiple Choice Questions. The author is of the firm opinion that the learning is a continual and gradual process. With the Competitive Examination Files on different units at their disposal, the students would be able to master them steadily all through the academic year, while preparing for admission to professional courses.
